In addition the requirements of 5.3.2 and 5.3.3 are to be complied with.

5.3.2 Isolation and switching is to be by means of a circuit-breaker or switch arranged to open and close simultaneously all insulated poles. Where a switch is used as the means of isolation and switching, it is to be capable of:

- (a) switching off the circuit on load;
- (b) withstanding, without damage, the overcurrents which may arise during overloads and short-circuit.

In addition, these requirements do not preclude the provision of single pole control switches in final sub-circuits, for example light switches. For circuit-breakers, see 6.5 and 7.3.

5.3.3 Provision is to be made, in accordance with one of the following, to prevent any circuit being inadvertently energised:

- (a) the circuit-breaker or switch can be withdrawn, or locked in the open position;
- (b) the operating handle of the circuit-breaker or switch can be removed;
- (c) the circuit fuses, where fitted, can be readily removed and retained by authorised personnel.

5.3.4 Where a section board, distribution board or item of equipment can be supplied by more than one circuit, a switching device is to be provided to permit each incoming circuit to be isolated and the supply transferred to the alternative circuit. In addition, the requirements of 5.3.5 and 5.3.6 are to be complied with.

5.3.5 The switching device required by 5.3.4 is to be situated within or adjacent to the section board, distribution board or item of equipment. Where necessary, interlocking arrangements are to be provided to prevent circuits being inadvertently energised.

5.3.6 A notice is to be fixed to any section board, distribution board or item of equipment to which 5.3.4 applies warning personnel before gaining access to live parts of the need to open the appropriate circuit-breakers or switches, unless an interlocking arrangement is provided so that all circuits concerned are isolated before access is gained.

5.3.7 Tankers designed in accordance with IEC 60092-502: *Electrical Installations in Ships – Tankers – Special Features* (see 13.1.2) are to meet the requirements of 5.3 of that Standard.

5.3.8 Where high voltage equipment is contained in a room or protected area which also forms its enclosure, the access door(s) of the space is to be so interlocked that it cannot be opened until:

- the high voltage supply(ies) to the equipment is switched off;
- the equipment and its cable(s) are earthed down to dissipate stored energy sufficient to ensure personnel safety.

5.3.9 The access to the space(s) described in 5.3.8 are to be suitably marked to indicate the danger of high voltage.

5.4 Insulated distribution systems

5.4.1 A device(s) is to be installed for every insulated distribution system, whether primary or secondary, for power, heating and lighting circuits, to continuously monitor the insulation level to earth and to operate an alarm in the event of an abnormally low level of insulation resistance.

5.4.2 Where any insulated lower voltage system is supplied through transformers from a high voltage system, adequate precautions are to be taken to prevent the low voltage system being charged by capacitive leakage from the high voltage system.

5.4.3 Tankers designed in accordance with IEC 60092-502: *Electrical Installations in Ships – Tankers – Special Features* (see 13.1.2) are to meet the requirements of 5.3 of that Standard.

5.4.4 Where filters are fitted, for example to reduce EMC susceptibility, these are not to cause distribution systems to be unintentionally connected to earth.

5.5 Earthed distribution systems

5.5.1 No fuse, non-linked switch or non-linked circuit-breaker is to be inserted in an earthed conductor. Any switch or circuit-breaker fitted is to operate simultaneously in the earthed conductor and the insulated conductors. These requirements do not preclude the provision (for test purposes) of an isolating link to be used only when the other conductors are isolated.

5.5.2 For high voltage systems, where the earthed neutral system of generation and primary distribution is used, earthing is to be through an impedance in order to limit the total earth fault current to a magnitude which does not exceed that of the three phase short-circuit current for which the generators are designed.

5.5.3 Generator neutrals may be connected in common, provided that the third harmonic content of the voltage waveform of each generator does not exceed five per cent.

5.5.4 Where a switchboard is split into sections operated independently or where there are separate switchboards, neutral earthing is to be provided for each section or for each switchboard. Means are to be provided to ensure that the earth connection is not removed when generators are isolated.

5.5.5 A means of isolation is to be fitted in the earthing connection of each generator so that generators can be completely isolated for maintenance.

5.5.6 All earthing impedances are to be connected to the hull. The connections to the hull are to be so arranged that any circulating currents in the earth connections do not interfere with radio, radar, communication and control equipment circuits.

5.5.7 Tankers designed in accordance with IEC 60092-502: *Electrical Installations in Ships – Tankers – Special Features* (see 13.1.2) are to meet the requirements of 5.3 of that Standard.

5.6 Diversity factor

5.6.1 Circuits supplying two or more final sub-circuits are to be rated in accordance with the total connected load subject, where justified, to the application of a diversity factor. Where spare ways are provided on a section or distribution board, an allowance for future increase of load is to be added to the total connected load before application of any diversity factor.

5.6.2 A diversity factor may be applied to the calculation for size of cable and rating of switchgear and fusegear, taking into account the duty cycle of the connected loads and the frequency and duration of any motor starting loads.

5.6.3 For winches and crane motors the diversity factor is to be calculated and submitted when required.

5.7 Lighting circuits

5.7.1 Lighting circuits are to be supplied by final sub-circuits separate from those for heating and power. This does not preclude the supply from a lighting circuit supplying a single fixed appliance, such as a cabin fan, a dry shaver, a wardrobe or anti-condensation heater, taking a maximum current of 2 A.

5.7.2 Lighting for the following spaces is to be supplied from at least two final sub-circuits in such a way that failure of one of the circuits does not leave the space in darkness. One of these circuits may be an emergency circuit provided it is normally energised.

- Spaces that are required to be lit for the safe working of the ship, such as control stations, normal working spaces, etc.
- Spaces where there may be a hazard due to movement of crew, passengers and/or equipment, such as in corridors, working passage ways, stairways leading to boat decks, public rooms, etc.
- Spaces where there may be a hazard due to moving machinery and hot parts, such as in machinery spaces, workshops, large galleys, laundries, etc.

5.7.3 Lighting for enclosed hazardous spaces is to be supplied from at least two final sub-circuits to permit light from one circuit to be retained while maintenance is carried out on the other. One of these circuits may be an emergency circuit, provided it is normally energised in which case the arrangements are to comply with Section 3.

5.7.4 Emergency lighting is to be fitted in accordance with Section 3, see also Section 17.

5.7.5 Lighting of unattended spaces, such as cargo spaces, is to be controlled by multipole linked switches situated outside such spaces. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

5.7.6 Where lighting circuits in the cargo pump rooms of tankers are also used for emergency lighting, and have been interlocked with the ventilation, the interlocking arrangements are:

- not to cause the lighting to go out following a failure of the ventilation system; and
- not to prevent operation of the emergency lighting following the loss of the main source of electrical power.

5.8 Motor circuits

5.8.1 A separate final sub-circuit is to be provided for every motor for essential services, see 1.5.1.

5.9 Motor control

5.9.1 Every electric motor is to be provided with efficient means for starting and stopping so placed as to be easily operated by the person controlling the motor. Every motor above 0,5 kW is to be provided with control apparatus as given in 5.9.2 to 5.9.4.

5.9.2 Means to prevent undesired restarting after a stoppage due to low volts or complete loss of volts are to be provided. This does not apply to motors where a dangerous condition might result from the failure to restart automatically, e.g. steering gear motor.

5.9.3 Means for automatic disconnection of the supply in the event of excess current due to mechanical overloading of the motor are to be provided, *see also* 6.10.

5.9.4 Motor control gear is to be suitable for the starting current and for the full load rated current of the motor.

Section 6 System design – Protection

6.1 General

6.1.1 Installations are to be protected against over-currents including short-circuits, and other electrical faults. The tripping/fault clearance times of the protective devices are to provide complete and co-ordinated protection to ensure:

- (a) availability of essential and emergency services under fault conditions through discriminative action of the protective devices; as far as practicable the arrangements are also to secure the availability of other services;
- (b) elimination of the fault to reduce damage to the system and hazard of fire.

6.1.2 Short-circuit and overload protection are to be provided in each non-earthed line of each system of supply and distribution, unless exempted under the provisions of any paragraph in this Section.

6.1.3 The protection of circuits is to be such that a fault in a circuit does not cause the interruption of supplies used to provide emergency or essential services other than those dependent on the circuit where the fault occurred. For circuits used to provide essential services which need not necessarily be in continuous operation to maintain propulsion and steering but which are necessary for maintaining the vessel's safety, arrangements that ensure that a fault in a circuit does not cause the sustained interruption of supply to healthy circuits may be accepted. Such arrangements are to ensure the supply to healthy circuits is automatically re-established in sufficient time after a fault in a circuit.

6.1.4 Protection systems are to be developed using a systematic design procedure incorporating verification and validation methods to ensure successful implementation of the requirements above. Details of the procedures used are to be submitted when requested.

6.1.5 Short circuit protection is to be provided for each source of power and at each point at which a distribution circuit branches into two or more subsidiary circuits.

6.1.6 Where protection for generator power circuits is provided at the associated switchboard, the cabling between generator and switchboard is to be of a type, and installed in a manner such as to minimise the risk of short-circuit.

6.1.7 Protection for battery circuits is to be provided at a position external and adjacent to the battery compartments. Where arrangements comply with 1.1.3.5, the protection may be installed at a suitable location in the battery compartment.

6.1.8 Protection may be omitted from the following:

- (a) Engine starting battery circuits.
- (b) Circuits for which it can be shown that the risk resulting from spurious operation of the protective device may be greater than that resulting from a fault.

6.1.9 Short circuit protection may be omitted from cabling or wiring to items of equipment internally protected against short-circuit or where it can be shown that they are unlikely to fail to a short-circuit condition and where the cabling or wiring is installed in a manner such as to minimise the risk of short-circuit.

6.1.10 Overload protection may be omitted from the following:

- (a) one line of circuits of the insulated type;
- (b) circuits supplying equipment incapable of being overloaded, or overloading the associated supply cable, under normal conditions, and unlikely to fail to an overload condition.

6.2 Protection against short-circuit

6.2.1 Protection against short-circuit currents is to be provided by circuit-breakers or fuses.

6.2.2 The rated short-circuit making and breaking capacity of every protective device is to be adequate for the prospective fault level at its point of installation; the requirements for circuit-breakers and fuses are detailed in 6.5 and 6.6 respectively.

6.2.3 The prospective fault current is to be calculated for the following set of conditions:

- (a) all generators, motors and, where applicable, all transformers, connected as far as permitted by any interlocking arrangements;
- (b) a fault of negligible impedance close up to the load side of the protective device.

6.2.4 In the absence of precise data, the prospective fault current may be taken to be:

- (a) for alternating current systems at the main switchboard: 10 x f.l.c. (rated full load current) for each generator that may be connected, or, if the subtransient direct axis reactance, X''_d , of each generator is known, $\frac{\text{f.l.c.}}{X''_d \text{ (p.u.)}}$ for each generator, and 3 x f.l.c. for motors simultaneously in service.

The value derived from the above is an approximation to the r.m.s. symmetrical fault current; the peak asymmetrical fault current may be estimated to be 2,5 times this figure (corresponding to a fault power factor of approximately 0,1).

- (b) battery-fed direct current systems at the battery terminals:
 - (i) 15 times ampere hour rating of the battery for vented lead-acid cells, or of alkaline type intended for discharge at low rates corresponding to a battery duration exceeding three hours, or
 - (ii) 30 times ampere hour rating of the battery for sealed lead-acid cells having a capacity of 100 ampere hours or more, or of alkaline type intended for discharge at high rates corresponding to a battery duration not exceeding three hours and,
 - (iii) 6 x f.l.c. for motors simultaneously in service (if applicable).

6.3 Protection against overload

6.3.1 The characteristics of protective devices provided for overload protection are to ensure that cabling and electrical machinery is protected against overheating resulting from mechanical or electrical overload.

6.3.2 Fuses of a type intended for short-circuit protection only (e.g. fuse links complying with IEC 60269-1, of type 'a') are not to be used for overload protection.

6.4 Protection against earth faults

6.4.1 Every distribution system that has an intentional connection to earth, by way of an impedance, is to be provided with a means to continuously monitor and indicate the current flowing in the earth connection.

6.4.2 If the current in the earth connection exceeds 5 A there is to be an alarm and the fault current is to be automatically interrupted or limited to a safe value.

6.4.3 The rated short-circuit capacity of any device used for interrupting earth fault currents is to be not less than the prospective earth fault current at its point of installation.

6.4.4 Insulated neutral systems with harmonic distortion of the voltage waveform, which may result in earth fault currents exceeding the level given in 6.4.2 because of capacitive effects, are to be provided with arrangements to isolate the faulty circuit(s).

6.5 Circuit-breakers

6.5.1 Circuit-breakers for alternating current systems are to satisfy the following conditions:

- (a) the r.m.s. symmetrical breaking current for which the device is rated is to be not less than the r.m.s. value of the a.c. component of the prospective fault current, at the instant of contact separation (i.e. first half cycle, or time of interruption where an intentional time delay is provided to ensure suitability);
- (b) the peak asymmetrical making current for which the device is rated is not to be less than the peak value of the prospective fault current at the first half cycle, allowing for maximum asymmetry;
- (c) the power factor at which the device short-circuit ratings are assigned is to be no greater than that of the prospective fault current; alternatively for high voltage, the rated percentage d.c. component of the short-circuit breaking current of the device is to be not less than that of the prospective fault current.

6.5.2 Circuit-breakers for d.c. systems are to have a breaking current not less than the initial prospective fault current. The time constant of the fault current is not to be greater than that for which the circuit-breaker was tested.

6.5.3 The fault ratings considered in 6.5.1 and 6.5.2, are to be assigned on the basis that the device is suitable for further use after fault clearance.

6.5.4 Circuit-breaker selection is, and ratings are, to be in accordance with the relevant requirements of IEC 60092-202: *Electrical installations in ships – System design – Protection*. Alternative methods acceptable to LR of selecting suitable circuit-breakers may be considered.

6.6 Fuses

6.6.1 Fuses for a.c. systems are to have a breaking current rating not less than the initial r.m.s. value of the a.c. component of the prospective fault current.

6.6.2 Fuses for d.c. systems are to have a d.c. breaking current rating not less than the initial value of the prospective fault current.

6.7 Circuit-breakers requiring back-up by fuse or other device

6.7.1 The use of a circuit-breaker having a short-circuit current capacity less than the prospective short-circuit current at the point of installation is permitted, provided that it is preceded by a device having at least the necessary short-circuit capacity. The generator circuit-breakers are not to be used for this purpose.

6.7.2 The same device may back-up more than one circuit-breaker provided that no essential or emergency service is supplied from there, or that any such service is duplicated by arrangements unaffected by tripping of the device.

6.7.3 The combination of back-up device and circuit-breaker is to have a short-circuit performance at least equal to that of a single circuit-breaker satisfying the requirements of 6.5.

6.7.4 Evidence of testing of the combination is to be submitted for consideration; alternatively, consideration may be given to arrangements where it can be shown that:

- (a) the takeover current, above which the back-up device would clear a fault, is not greater than the rated short-circuit breaking capacity of the circuit-breaker and;
- (b) the characteristics of the back-up device, and the prospective fault level, are such that the peak fault current rating of the circuit-breaker cannot be exceeded and;
- (c) the Joule integral of the let-through current of the back-up device does not exceed that corresponding to the rated breaking current and opening time of the circuit-breaker.

6.8 Protection of generators

6.8.1 The protective gear required by 6.8.2 and 6.8.3 is to be provided as a minimum.

6.8.2 Generators not arranged to run in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of short-circuit, overload or under-voltage, all insulated poles. In the case of generators rated at less than 50 kW, a multipole linked switch with a fuse, complying with 5.3.2, in each insulated pole will be acceptable.

6.8.3 Generators arranged to operate in parallel are to be provided with a circuit-breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an under-voltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in accordance with the characteristics of the prime mover; a fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the breakers.

6.8.4 The generator circuit-breaker short-circuit and overload tripping arrangements, or fuse characteristics, are to be such that the machine's thermal withstand capability is not exceeded.

6.8.5 Generators having a capacity of 1500 kVA or above are to be equipped with a protective device which, in the event of a short-circuit in the generator or in the cables between the generator and its circuit breaker, will instantaneously open the circuit breaker and de-excite the generator.

6.8.6 The voltage and time delay settings of the under-voltage release mechanism(s) required by 6.8.2 and 6.8.3 are to be chosen to ensure that the discriminative action required by 6.1.1(a) is maintained.

6.9 Load management

6.9.1 Arrangements are to be made to disconnect automatically, after an appropriate time delay, circuits of the following categories, when the generator(s) is/are overloaded; sufficient to ensure the connected generating set(s) is/are not overloaded:

- (a) non-essential circuits;
- (b) circuits feeding services for habitability, see 1.5.2;
- (c) in cargo ships, circuits for cargo refrigeration.

NOTE:

For emergency generators see 3.2.14 and 3.3.14 as applicable.

6.9.2 If required, this load switching may be carried out in one or more stages, in which case the non-essential circuits are to be included in the first group to be disconnected.

6.9.3 The load management of power systems supplying electric propulsion motors is to satisfy the requirements of 15.2.

6.9.4 Consideration is to be given to providing means to inhibit automatically the starting of large motors, or the connection of other large loads, until sufficient generating capacity is available to supply them.

6.10 Feeder circuits

6.10.1 Isolation and protection of each feeder circuit is to be ensured by a multipole circuit-breaker or linked switch with a fuse in each insulated conductor. Protection is to be in accordance with 6.2 and 6.3. The protective devices are to allow excess current to pass during the normal accelerating period of motors.

6.11 Motor circuits

6.11.1 Motors of rating exceeding 0,5 kW and all motors for essential services are to be protected individually against overload and short-circuit. For motors which for essential services are duplicated, the overload protection may be replaced by an overload alarm; arrangements for steering gear motors are to comply with 14.1.

6.11.2 Protection for both the motor and its supply cable may be provided by the same device, provided that due account is taken of any differences between ratings of cable and motor.

6.11.3 Where operation of an item of equipment is dependent upon a number of motors, consideration may be given to the provision of a common means of short-circuit protection.

6.11.4 For motors for intermittent service, the characteristics of the arrangements for overload protection are to be chosen in relation to the load factor(s) of the motor(s).

6.11.5 Where fuses are used to protect polyphase motor circuits, means are to be provided to protect the motor from unacceptable overcurrent in the case of single phasing.

6.12 Protection of transformers

6.12.1 Short circuit protection for transformers is to be provided by circuit-breakers or fuses in the primary circuit and in addition, overload protection is to be provided either in the primary or secondary circuit.

6.12.2 Arrangements are to be made to prevent the primary windings of transformers being inadvertently energised from their secondary side when disconnected from their source of supply.

Section 7 Switchgear and control gear assemblies

7.1 General requirements

7.1.1 Switchgear and control gear assemblies and their components are to comply with one of the following standards amended where necessary for ambient temperature and other environmental conditions:

- (a) IEC 60439: *Low voltage switchgear and control gear assemblies*;
- (b) IEC 62271-200: *AC metal-enclosed switchgear and controlgear for rated voltages above 1 kV and up to and including 52 kV*;
- (c) IEC 60466: *AC insulated-enclosed switchgear for rated voltages above 1 kV and up to and including 38 kV*;
- (d) IEC 60255: *Electrical relays*;
- (e) acceptable and relevant National Standard.

In addition, the requirements of 7.2 to 7.19 are to be complied with.

7.2 Busbars

7.2.1 Busbars and their connections are to be of copper or aluminium, all connections being so made as to inhibit corrosion/oxidisation between current-carrying mating faces, which may result in poor electrical contact giving rise to overheating. Busbars and their supports are to be designed to withstand the mechanical stresses which may arise during short-circuits. A test report or calculation to verify the short-circuit withstand strength of the busbar system is to be submitted for consideration when required.

7.2.2 For bare conductors, where no precautions are taken against surface oxidisation, the temperature rise limit at rated normal current is not to exceed 45°C. Where suitable precautions are taken against surface oxidisation, e.g. by using silver, nickel or tin coated terminations, a temperature rise limit not exceeding 60°C is permitted. Where the busbar temperature rises are above 45°C it is to be ensured that there is no adverse effect on equipment adjacent to and/or connected to the busbars and that the temperature rise limits of any materials in contact with the busbars are not exceeded. A test report or calculation to verify the rated current assigned to the busbar system is to be submitted for consideration when required.

7.3 Circuit-breakers

7.3.1 Circuit-breakers are to comply with one of the following standards amended where necessary for ambient temperature:

- (a) IEC 60947-2: *Low voltage switchgear and Control gear Pt 2: Circuit-breakers*;
- (b) IEC 62271-100: *High-voltage switchgear and control gear – Pt 100: High-voltage alternating-current circuit-breakers*;
- (c) acceptable and relevant National Standard.

Type test reports to verify the characteristics of a circuit-breaker are to be submitted for consideration when required.

7.3.2 Circuit-breakers are to be capable of isolation.

7.3.3 Circuit-breakers are to be of the trip free type and, where applicable, be fitted with anti-pumping control.

7.3.4 High-voltage circuit-breakers are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

7.4 Contactors

7.4.1 High-voltage contactors are to comply with one of the following standards amended where necessary for ambient temperature.

- (a) IEC 60470: *High-voltage alternating current contactors*.
- (b) acceptable and relevant National Standard.

Type test reports to verify the characteristics of a contactor are to be submitted for consideration when required.

7.4.2 High-voltage contactors are to be of the withdrawable type or with equivalent means or arrangements permitting safe maintenance whilst the busbars are live.

7.5 Creepage and clearance distances

7.5.1 The shortest distances between conductive parts and between conductive parts and earth in air or along the surface of an insulating material, are to be suitable for the rated voltage having regard to the nature of the insulating material and the transient over voltages developed by switching and fault conditions. This requirement may be satisfied by subjecting each assembly type to an impulse voltage test in accordance with its constructional Standard or, alternatively, maintaining the minimum distances for bare conductive parts in switchgear and control gear assemblies given in Table 2.7.1.

7.5.2 Suitable shrouding or barriers are to be provided in way of connections to equipment, where necessary, to maintain the minimum distances in Table 2.7.1.

7.5.3 Creepage distances cannot be accurately specified as they depend upon the insulating material, dust deposits, humidity, etc. They are to be not less than the clearance distances given in Table 2.7.1, or less than 16 mm per 1000 V (rated voltage), whichever is the greater.

Table 2.7.1 Minimum clearance distances

Rated Voltage V	Minimum clearance (mm) between phases and earth		Minimum clearance (mm) between phases
	Earthed neutral	Insulated neutral	
≤660	16	19	19
1000	25	25	25
3600	55	55	55
7200	70	100	100
12000	85	140	140
15000	100	165	165

7.6 Degree of protection

7.6.1 Low voltage assemblies where the rated voltage between conductors or to earth exceeds 55 V a.c. or 250 V d.c. are to be of the deadfront or enclosed type. High-voltage assemblies are to be of the enclosed type.

7.6.2 Where switchboards or section boards are required to comply with 5.2.2, barriers are to be installed to provide protection for the independent sections against contamination due to the products of arcing, which may result in a fault.

7.7 Distribution boards

7.7.1 Distribution boards are to be suitably enclosed unless they are installed in a cupboard or compartment to which only authorised persons have access in which case the cupboard may serve as an enclosure, see 7.16.4.

7.8 Earthing of high-voltage switchboards

7.8.1 High-voltage switchboards are to be provided with suitable means to earth isolated circuits so that they are discharged and so maintained that they are safe to touch.

7.9 Fuses

7.9.1 Fuses are to comply with one of the following Standards amended where necessary for ambient temperature:

- (a) IEC 60269: *Low-voltage fuses*;
- (b) IEC 60282-1: *High voltage fuses Pt 1: Current-limiting fuses*;
- (c) acceptable and relevant National Standard for enclosed current-limiting fuses.

Type test reports to verify the characteristics of a fuse are to be submitted for consideration when required.

7.10 Handrails or handles

7.10.1 All main and emergency switchboards are to be provided with an insulated handrail or insulated handles suitably fitted on the front of the switchboard. Where access to the rear is required, a horizontal insulated handrail is to be suitably fitted on the rear of the switchboard.

7.11 Instruments for alternating current generators

7.11.1 For alternating current generators not operated in parallel, each generator is to be provided with at least one voltmeter, one frequency meter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase. Generators above 50 kVA are also to be provided with a wattmeter.

7.11.2 For alternating current generators operated in parallel, each generator is to be provided with a wattmeter, and one ammeter with an ammeter switch to enable the current in each phase to be read, or an ammeter in each phase.

7.11.3 For parallelling purposes, two voltmeters, two frequency meters and two synchronising devices, of which one at least is to be a synchroscope or a set of lamps are to be provided. One voltmeter and one frequency meter are to be connected to the busbars, the other voltmeter and frequency meter are to be switched to enable the voltage and frequency of any generator to be measured. Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by two or more generators operating in parallel, the two synchronising devices are to be independent of each other (see also 2.2.1).

7.11.4 Where the indications of voltage, frequency, current and power are displayed digitally, the indications are to be separately displayed.

7.12 Instrument scales

7.12.1 The upper limit of the scale of every voltmeter is to be approximately 120 per cent of the nominal voltage of the circuit, and the nominal voltage is to be clearly indicated.

7.12.2 The upper limit of the scale of every ammeter is to be approximately 130 per cent of the normal rating of the circuit in which it is installed. Normal full load is to be clearly indicated.

7.12.3 Kilowatt meters for use with alternating current generators which may be operated in parallel are to be capable of indicating 15 per cent reverse power.

7.12.4 Where the indications provided by the instrumentation required by 7.11 are displayed digitally, nominal voltage, over voltage, over current and reverse power indications are to be indicated by an appropriate means. The information provided is to be clearly visible and immediately available.

7.13 Labels

7.13.1 The identification of individual circuits and their devices is to be made on labels of durable material. The ratings of fuses and settings of protective devices are also to be indicated. Section and distribution boards are to be marked with the rated voltage.

7.14 Protection

7.14.1 See Section 6.

7.15 Wiring

7.15.1 Insulated wiring connecting components are to be stranded, flame retardant and manufactured in accordance with a relevant and acceptable National Standard.

7.16 Position of switchboards

7.16.1 An unobstructed space not less than 1 m wide is to be provided in front of switchboards and section boards. When switchboards and section boards contain withdrawable equipment the unobstructed space is to be not less than 0,4 m wide with this equipment in its fully withdrawn position.

7.16.2 Where necessary, the space at the rear of switchboards and section boards is to be ample to permit maintenance and in general not less than 0,6 m except that this may be reduced to 0,5 m in way of stiffeners or frames.

7.16.3 The spaces defined in 7.16.1 and 7.16.2 are to have non-slip surfaces. Where access to live parts within switchboards and section boards is normally possible the surface is, in addition, to be electrically insulated.

7.16.4 So far as is practicable, pipes are not to be installed directly above or in front of or behind switchboards, section boards and distribution boards. If such placing is unavoidable, suitable protection is to be provided in these positions, see Pt 5, Ch 13,2.

7.16.5 For switchgear and control gear assemblies, for rated voltages above 1 kV, arrangements are to be made to protect personnel in the event of gases or vapours escaping under pressure as the result of arcing due to an internal fault. Where personnel may be in the vicinity of the equipment when it is energised, this may be achieved by an assembly that has been tested in accordance with Annex A of IEC 62271-200 and qualified for classification **IAC** (internal arc classification).

7.17 Switchboard auxiliary power supplies

7.17.1 Where the operation of a protective device relies upon a power supply, an alarm is to be provided to indicate failure of the power supply, unless its failure causes automatic tripping of the protected circuit.

7.18 Testing

7.18.1 Tests in accordance with 7.18.2 to 7.18.4 are to be satisfactorily carried out on all assemblies, complete or in sections, at the manufacturer's premises, and a test report issued by the manufacturer, see also 1.3.2.

7.18.2 A high voltage test, see Section 20.

7.18.3 Calibration of protective devices and indicating instruments is to be verified by means of current and/or voltage injection.

7.18.4 Demonstration of the satisfactory operation of protection circuits, control circuits and interlocks by means of simulated functional tests.

7.18.5 For switchgear and control gear assemblies, for rated voltages above 1 kV, type tests are to be carried out, in accordance with Annex A of IEC 62271-200 and **IAC** (internal arc classification) assigned, to verify that the assembly will withstand the effects of an internal arc occurring within the enclosure at a prospective fault level equal to, or in excess of, that of the installation.

7.19 Disconnectors and switch-disconnectors

7.19.1 Disconnectors, switch-disconnectors and their components are to comply with one of the following standards, amended where necessary for ambient temperature and other environmental conditions:

- (a) IEC 60947-3: *Low voltage switchgear and control gear Part 3: switches, disconnectors, switch-disconnectors and fuse combination units*;
- (b) IEC 62271-102: *High-voltage switchgear and control gear – Pt 102: High-voltage alternating current disconnectors and earthing switches*;
- (c) acceptable and relevant National Standard.

Type test reports to verify the characteristics of a disconnector or switch-disconnector are to be submitted for consideration when required.

Section 8 Rotating machines

8.1 General requirements

8.1.1 Rotating machines are to comply with the relevant part of IEC 60092, or an acceptable and relevant National Standard, and the requirements of this section.

8.1.2 For all the rotating machines a manufacturer's test certificate is to be provided, see also 1.3.2 to 1.3.4.

8.1.3 For rotating machines of 100 kW and over intended for essential services, shaft materials are to comply with LR's *Rules for the Manufacture, Testing and Certification of Materials*.

8.1.4 Where welding is applied to shafts of machines for securing arms or spiders, stress relieving is to be carried out after welding. The finalised assembly is to be visually examined by the Surveyors, crack detection carried out by an appropriate method and the finished welds found sound and free from cracks.

8.1.5 The rotating parts of machines are to be so balanced that when running at any speed in the normal working range the vibration does not exceed the levels of IEC 60034: *Rotating electrical machines Part 14*.

8.1.6 The lubrication arrangement for bearings are to be effective under all operating conditions including the maximum ship inclinations defined by 1.9 and there are to be effective means provided to ensure that lubricant does not reach the machine windings or other conductors and insulators.

8.1.7 Means are to be taken to prevent the ill effects of the flow of currents circulating between the shaft and machine bearings or bearings of connected machinery.

8.1.8 Alternating current machines are to be constructed such that, under any operating conditions, they are capable of withstanding the effects of a sudden short-circuit at their terminals without damage.

8.1.9 AC generators and motors for electrical propulsion systems are to have at least one embedded temperature detector (ETD) in each phase of the machine winding in locations which may be subjected to the highest temperature. Where there are two coil sides per slot the ETD's are to be located between the insulated coil sides in the slot, see 15.1.3.

8.2 Rating

8.2.1 Generators, including their excitation systems, and continuously rated motors are to be suitable for continuous duty at their full rated output at maximum cooling air or water temperature for an unlimited period, without the limits of temperature rise in 8.3 being exceeded. Generators are to be capable of an overload power of not less than 10 per cent at their rated power factor for a period of 15 minutes without injurious heating. Other machines are to be rated in accordance with the duty which they have to perform and, when tested under rated load conditions, the temperature rise is not to exceed the values in 8.3.

8.2.2 When a rotating machine is connected to a supply system with harmonic distortion the rating of the machine is to allow for the increased heating effect of the harmonic loading.

8.2.3 The design and construction of smoke extraction fan motors are to be suitable for the ambient temperature and operating time required. Type test reports to verify the performance of the electric motor are to be submitted for consideration.

8.3 Temperature rise

8.3.1 The limits of temperature rise specified in Table 2.8.1, are based on the cooling air temperature and cooling water temperature given in 1.8.

8.3.2 If it is known that the temperature of cooling medium exceeds the values given in 1.8 the permissible temperature rise is to be reduced by an amount equal to the excess temperature of the cooling medium.

8.3.3 If it is known that the temperature of cooling medium will be permanently less than the values given in 1.8 the permissible temperature rise may be increased by an amount equal to the difference between the declared temperature and that given in 1.8 up to a maximum of 15°C.

8.4 Generator control

8.4.1 Each alternating current generator, unless of the self-regulating type, is to be provided with automatic means of voltage regulation; voltage build-up is not to require an external source of power. Provision is to be made to safeguard the distribution system should there be a failure of the voltage regulating system resulting in a high voltage.

8.4.2 The voltage regulation of any alternating current generator with its regulating equipment is to be such that at all loads, from zero to full load at rated power factor, the rated voltage is maintained within $\pm 2,5$ per cent under steady conditions. There is to be provision at the voltage regulator to adjust the generator no load voltage.

8.4.3 Generators, and their excitation systems, when operating at rated speed and voltage on no-load are to be capable of absorbing the suddenly switched, balanced, current demand of the largest motor or load at a power factor not greater than 0,4 with a transient voltage dip which does not exceed 15 per cent of rated voltage. The voltage is to recover to rated voltage within a time not exceeding 1,5 seconds.

8.4.4 The transient voltage rise at the terminals of a generator is not to exceed 20 per cent of rated voltage when rated kVA at a power factor not greater than 0,8 is thrown off.

8.4.5 Generators and their voltage regulation systems are to be capable of maintaining, without damage, under steady state short-circuit conditions a current of at least three times the full load rated current for a duration of at least two seconds or where precise data is available for the duration of any time delay which may be provided by a tripping device for discrimination purposes.

8.4.6 Generators required to run in parallel are to be stable from no load (kW) up to the total combined full load (kW) of the group, and load sharing is to be such that the load on any generator does not normally differ from its proportionate share of the total load by more than 15 per cent of the rated output (kW) of the largest machine or 25 per cent of the rated output (kW) of the individual machine, whichever is less.

Electrical Engineering

Part 6, Chapter 2

Section 8

Table 2.8.1 Limits of temperature rise of machines cooled by air

Limits of temperature rise of machines cooled by air, °C						
Part of machine	Method of temperature measurement	Insulation class				
		A	E	B	F	H
1. (a) a.c. windings of machines having output of 5000 kVA or more	ETD R	55 50	– –	75 70	95 90	115 110
(b) a.c. windings of machines having output of less than 5000 kVA	ETD R	55 50	– 65	80 70	100 95	115 110
2. Windings of armatures having commutators	R T	50 40	65 55	70 60	95 75	115 95
3. Field windings of a.c. and d.c. machines having d.c. excitation other than those in item 4	R T	50 40	65 55	70 60	95 75	115 95
4. (a) Field windings of synchronous machines with cylindrical rotors having d.c. excitation	R	–	–	80	100	125
(b) Stationary field windings of d.c. machines having more than one layer	R T	50 40	65 55	70 60	95 75	115 95
(c) Low resistance field windings of a.c. and d.c. machine and compensating windings of d.c. machines having more than one layer	R, T	50	65	70	90	115
(d) Single-layer windings of a.c. and d.c. machines with exposed bare or varnished metal surfaces and single-layer compensating windings of d.c. machines	R, T	55	70	80	100	125
5. Permanently short-circuited insulated windings	T	50	65	70	90	115
6. Permanently short-circuited uninsulated windings	T	The temperature rise of these parts shall in no case reach such a value that there is a risk to any insulation or other materials on adjacent parts or to the item itself				
7. Magnetic cores and other parts not in contact with windings	T					
8. Magnetic cores and other parts in contact with windings	T	50	65	70	90	110
9. Commutators and slip-rings open and enclosed	T	50	60	70	80	90
NOTES 1. Where water cooled heat exchangers are used in the machine cooling circuit the temperature rises are to be measured with respect to the temperature of the cooling water at the inlet to the heat exchanger and the temperature rises given in Table 2.8.1 shall be increased by 10°C provided the inlet water temperature does not exceed the values given in 1.8. 2. T = thermometer method R = resistance method ETD = embedded temperature detector 3. Temperature rise measurements are to use the resistance method whenever practicable. 4. The ETD method may only be used when the ETD's are located between coil sides in the slot.						

8.4.7 When generators are operated in parallel, the kVA loads of the individual generating sets are not to differ from the proportionate share of the total kVA load by more than five per cent of the rated kVA output of the largest machines.

8.5 Overloads

8.5.1 Machines are to withstand on test, without injury, the following momentary overloads:

- (a) **Generators.** An excess current of 50 per cent for 15 seconds after attaining the temperature rise corresponding to rated load, the terminal voltage being maintained as near the rated value as possible. The foregoing does not apply to the overload torque capacity of the prime mover.

- (b) **Motors.** At rated speed or, in the case of a range of speeds, at the highest and lowest speeds, under gradual increase of torque, the appropriate excess torque given below. Synchronous motors and synchronous induction motors are required to withstand the excess torque without falling out of synchronism and without adjustment of the excitation circuit preset at the value corresponding to rated load:

d.c. motors	50 per cent for 15 seconds;
polyphase a.c. synchronous motors	50 per cent for 15 seconds;
polyphase a.c. synchronous induction motors	35 per cent for 15 seconds;
polyphase a.c. induction motors	60 per cent for 15 seconds.

- (c) **Propulsion machines.** The overload tests for propulsion machines will be specially considered for each installation.
- (d) **Windlasses.** For the design and testing of windlass electric motors, see Pt 3, Ch 13,7.8.

8.6 Machine enclosure

8.6.1 Where water cooled heat exchangers are used in the machine cooling circuit there is to be provision for the detection of water leakage and the system is to be arranged so as to prevent the entry of water into the machine.

8.7 Direct current machines

8.7.1 The final running position of brushgear is to be clearly and permanently marked.

8.7.2 Direct current machines are to work with fixed brush setting from no load to the momentary overload specified without injurious sparking.

8.8 Survey and testing

8.8.1 On machines for essential services tests are to be carried out and a certificate furnished by the manufacturer. The tests are to include temperature rise, momentary overload, high voltage, and commutation. The insulation resistance and the temperature at which it was measured are to be recorded, see also 1.3.2 to 1.3.4.

8.8.2 In the case of duplicate machines, type tests of temperature rise, excess current and torque and commutation taken on a machine identical in rating and in all other essential details may be accepted in conjunction with abbreviated tests on each machine. Type tests for propulsion machines will be specially considered. For the abbreviated tests, each machine is to be run and is to be found electrically and mechanically sound and is to have a high voltage test and insulation resistance recorded.

8.8.3 A high voltage test, in accordance with Section 20, is to be applied to new machines, preferably at the conclusion of the temperature rise test. Where both ends of each phase are brought out to accessible separate terminals each phase is to be tested separately.

8.8.4 An impulse test is to be carried out on the coils of high voltage machines in order to demonstrate a satisfactory withstand level of the inter-turn insulation to voltage surges.

The test is to be carried out on all coils after they have been inserted in the slots and after wedging and bracing. Each coil shall be subjected to at least five impulses of injected voltage, the peak value of the injected voltage being given by the formula:

$$V_{\text{peak}} = 2,45V$$

where

$$V = \text{rated line voltage r.m.s.}$$

Alternative proposals to demonstrate the withstand level of inter-turn insulation will be considered.

Section 9 Converter equipment

9.1 Transformers

9.1.1 Paragraphs 9.1.2 to 9.1.12 apply to transformers rated for 5 kVA upwards.

9.1.2 Transformers are to comply with the requirements of IEC 60076: *Power transformers*, or an acceptable and relevant National Standard amended where necessary for ambient temperature, see 1.8.

9.1.3 Transformers may be of the dry type, encapsulated or liquid-filled type.

9.1.4 The temperature rise of the winding of transformers above the ambient temperatures given in 1.8, when measured by resistance during continuous operation at the maximum rating, is not to exceed:

- (a) For dry type transformers, air cooled:
 - insulation of Class A – 50°C
 - insulation of Class E – 60°C
 - insulation of Class B – 70°C
 - insulation of Class F – 90°C
 - insulation of Class H – 110°C
- (b) For liquid filled transformers:
 - 50°C – where air provides cooling of the fluid
 - 65°C – where water provides cooling of the fluid.

9.1.5 When a transformer is connected to a supply system with harmonic distortion, the rating of the transformer is to allow for the increased heating effect of the harmonic loading. Special attention is to be given to transformers connected for the purpose of reducing harmonic distortion.

9.1.6 The inherent regulation of transformers at their rated output is to be such that the total voltage drop to any point in the installation does not exceed that allowed by 1.7.

9.1.7 Transformers, except those for motor starting, are to be double wound.

9.1.8 Liquid fillings for transformers are to be non-toxic and of a type which does not readily support combustion. Liquid filled transformers are to have a pressure relief-device with an alarm and there is to be a suitable means provided to contain any liquid which may escape from the transformer due to the operation of the relief device or damage to the tank.

9.1.9 All transformers are to be capable of withstanding for two seconds, without damage, the thermal and mechanical effects of a short-circuit at the terminals of any winding.

9.1.10 When forced cooling is used, whether air or liquid, there is to be monitoring of the cooling medium and transformer winding temperatures with an alarm should these exceed preset limits. There are to be arrangements so that the load may be reduced to a level commensurate with the cooling available.

9.1.11 Where water cooled heat exchangers are used in transformer cooling circuits, there is to be provision for the detection of water leakage and the system is to be arranged so as to prevent the entry of water into the transformer.

9.1.12 The following tests are to be carried out on all transformers at the manufacturer's works, and a certificate of tests issued by the manufacturer, *see also* 1.3.2:

- (a) measurement of winding resistances, voltage ratio, impedance voltage, short-circuit impedance, insulation resistance, load loss, no load loss and current;
- (b) dielectric tests;
- (c) temperature rise test on one transformer of each size and type.

9.2 Semiconductor equipment

9.2.1 The requirements of 9.2.2 to 9.2.18 apply to semiconductor equipment rated for 5 kW upwards.

9.2.2 Semiconductor equipment is to comply with the requirements of IEC 60146: *Semiconductor converters*, or an acceptable and relevant National Standard amended where necessary for ambient temperature, *see* 1.8.

9.2.3 Semiconductor static power converter equipment is to be rated for the required duty having regard to peak loads, system transients and overvoltage.

9.2.4 Converter equipment may be air or liquid cooled and is to be so arranged that it cannot remain loaded unless effective cooling is maintained. Alternatively the load may be automatically reduced to a level commensurate with the cooling available.

9.2.5 Liquid cooled converter equipment is to be provided with leakage alarms and there is to be a suitable means provided to contain any liquid which may leak from the system in order to ensure that it does not cause an electrical failure of the equipment. Where the semiconductors and other current carrying parts are in direct contact with the cooling liquid, the liquid is to be monitored for satisfactory resistivity and an alarm initiated at the relevant control station should the resistivity be outside the agreed limits.

9.2.6 Where forced cooling is used there is to be temperature monitoring of the heated cooling medium with an alarm and shutdown when the temperature exceeds a preset value.

9.2.7 Cooling fluids are to be non-toxic and of low flammability.

9.2.8 Converter equipment is to be so arranged that the semiconductor devices, fuses, control and firing circuit boards may be readily removed from the equipment for repair or replacement.

9.2.9 Test and monitoring facilities are to be provided to permit identification of control circuit faults and faulty components.

9.2.10 Protection devices fitted for converter equipment protection are to ensure that, under fault conditions, the protective action of circuit-breakers, fuses or control systems is such that there is no further damage to the converter or the installation.

9.2.11 Converter equipment, including any associated transformers, reactors, capacitors and filters, if provided, is to be so arranged that the harmonic distortion, and voltage spikes, introduced in to the ship's electrical system are within the limits of 1.7.3 or restricted to a lower level necessary to ensure that it causes no malfunction of equipment connected to the electrical installation.

9.2.12 Overvoltage spikes or oscillations caused by commutation or other phenomena, are not to result in the supply voltage waveform deviating from a superimposed equivalent sine wave by more than 10 per cent of the maximum value of the equivalent sine wave.

9.2.13 When converter equipment is operated in parallel, load sharing is to be such that under normal operating conditions overloading of any unit does not occur and the combination of paralleled equipment is stable throughout the operating range.

9.2.14 When converter equipment has parallel circuits there is to be provision to ensure that the load is distributed uniformly between the parallel paths.

9.2.15 Transformers, reactors, capacitors and other circuit devices associated with converter equipment, or associated filters, are to be suitable for the distorted voltage and current waveforms to which they may be subjected and filter circuits are to be provided with facilities to ensure that their capacitors are discharged before the circuits are energised.

9.2.16 Any regenerated power developed during the operation of converter equipment is not to result in disturbances to the supply system voltage and frequency which exceeds the limits of 1.7.

9.2.17 Where control systems form an integral part of semiconductor equipment, they are to be designed and manufactured with regard to the environmental conditions to which they will be exposed in service and their performance is to be demonstrated during the test and trials programme.

9.2.18 Tests at the manufacturer's works of converter equipment and any associated reactors or filters are to include the high voltage test of 20.1, a temperature rise test on one of each size and type of converter equipment, and such other tests as may be necessary to demonstrate the suitability of the equipment for its intended duty. Details of tests are to be submitted for consideration when required, *see also* 1.3.2.

9.3 Uninterruptible power systems

9.3.1 Where uninterruptible power systems (UPS) are required to maintain essential services or provide emergency services, the requirements of this sub-Section apply. This sub-Section is in addition to the requirements of 9.1 to 9.2 and Section 11, as applicable.

9.3.2 UPS units are to be constructed in accordance with IEC 62040: *Uninterruptible power systems (UPS)*, or an acceptable and relevant National or International Standard.

9.3.3 The operation of a UPS is not to depend upon external services.

9.3.4 The type of UPS unit employed, whether off-line, line-interactive or on-line, is to be appropriate to the power supply requirements of the connected load equipment.

9.3.5 An external bypass, that is hardwired and manually operated, is to be provided for UPS to allow isolation of UPS for safety during maintenance and maintain continuity of load power.

9.3.6 UPS units are to be monitored and an audible and visual alarm is to be initiated in the navigating bridge or the engine control room, or an equivalent attended location for:

- power supply failure (voltage and frequency) to the connected load;
- earth fault;
- operation of battery protective device;
- battery discharge; and
- bypass in operation for on-line UPS units.

9.3.7 UPS units required to provide emergency services are to be suitably located for use in an emergency.

9.3.8 UPS units utilising valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the arrangements comply with 11.3.5. Ventilation arrangements in accordance with IEC 62040: *Uninterruptible power systems (UPS)*, or an acceptable and relevant National or International Standard, may be considered to satisfy the requirements of 11.5.10.

9.3.9 Output power is to be maintained for the duration required for the connected equipment.

9.3.10 The UPS battery capacity is, at all times, to be capable of supplying the designated loads for the time specified. Where it is proposed that additional circuits are connected to the UPS unit, details verifying that the UPS unit has adequate capacity are to be submitted for consideration, see 1.4.

9.3.11 On restoration of the input power, the rating of the charge unit is to be sufficient to recharge the batteries while maintaining the output supply to the load equipment.

9.3.12 Tests at the manufacturer's works are to include such tests necessary to demonstrate the suitability of a UPS unit for its intended duty and location. This is expected to include as a minimum the following tests:

- a temperature rise test and battery capacity test on one of each size and type of UPS;
- the high voltage test of 20.1;
- a ventilation rate test; and
- functional testing, including operation of alarms.

Details of tests are to be submitted for consideration when required, see also 1.3.2.

9.3.13 Where the supply is to be maintained without a break following a power input failure, this is to be verified after installation by practical testing.

Section 10 Electric cables and busbar trunking systems (busways)

10.1 General

10.1.1 The requirements of 10.1 to 10.15 apply to all electric cables for fixed wiring unless otherwise exempted. The requirements of 10.16 apply to busbar trunking systems (busways) where they are used in place of electric cables.

10.1.2 Electric cables for fixed wiring are to be designed, manufactured and tested in accordance with the relevant IEC Standard stated in Table 2.10.1 or an acceptable and relevant National Standard.

Table 2.10.1 Electric cables

Application	IEC Standard	Title
General constructional and testing requirements	60092–350	Low-voltage shipboard power cables. General construction and test requirements
Fixed power and control circuits	60092–353	Single and multicore non-radial field power cables with extruded solid insulation for rated voltages 1 kV and 3 kV
Fixed power circuits	60092–354	Single and three-core power cables with extruded solid insulation for rated voltages 6 kV, 10 kV and 15 kV
Instrumentation, control and communication circuits up to 60 V	60092–375	Shipboard telecommunication cables and radio frequency cables – General instrumentation, control and communication cables
Control circuits up to 250 V	60092–376	Shipboard multicore cables for control circuits
Mineral insulated	60702	Mineral insulated cables with a rated voltage not exceeding 750 V

10.1.3 Electric cables for electric propulsion systems are to be Type Approved in accordance with LR's *Type Approval System Test Specification Number 3* or, alternatively, surveyed by the Surveyors during manufacture and testing to assess compliance with the applicable International or National Standards and application of an acceptable quality management system.

10.1.4 Provided that adequate flexibility of the finished cable is assured, conductors of nominal cross-section area 2,5 mm² and less need not be stranded.

10.1.5 Electric cables for non-fixed wiring applications are to comply with an acceptable and relevant Standard.

Electrical Engineering

Part 6, Chapter 2

Section 10

10.1.6 For the purpose of this Section, pipes, conduits, trunking or any other system for the additional mechanical protection of cables are hereafter referred to under the generic name 'protective casings'.

10.2 Testing

10.2.1 Routine tests, consisting of at least:

- measurement of electrical resistance of conductors;
- high voltage test, see also Section 20;
- insulation resistance measurement;
- for high voltage cables, partial discharge tests are to be made in accordance with the requirements of the relevant publication or National Standard referred to in 10.1.2 at the manufacturer's works prior to despatch.

Evidence of successful completion of routine tests is to be provided by the manufacturer, see also 1.3.3.

10.2.2 Particular, special and type tests are to be made, when required, in accordance with the requirements of the relevant publication or National Standard referred to in 10.1.2 and a test report issued by the manufacturer.

10.3 Voltage rating

10.3.1 The rated voltage of any electric cable is to be not lower than the nominal voltage of the circuit for which it is used. The maximum sustained voltage of the circuit is not to exceed the maximum voltage for which the cable has been designed.

10.3.2 Electric cables used in unearthed systems are to be suitably rated to withstand the additional stresses imposed on the insulation due to an earth fault.

10.4 Operating temperature

10.4.1 The maximum rated conductor temperature of the insulating material for normal operation is to be at least 10°C higher than the maximum ambient temperature liable to be produced in the space where the cable is installed.

10.4.2 The maximum rated conductor temperatures for normal and short-circuit operation, for the insulating materials included within the standards referred to in 10.1.2 is not to exceed the values stated in Table 2.10.2.

10.4.3 Electric cables constructed of an insulating material not included in Table 2.10.2 are to be rated in accordance with the National Standard chosen in compliance with 10.1.2.

10.5 Construction

10.5.1 Electric cables are to be at least of a flame-retardant type. IEC 60332-1-2: *Tests on electric and optical fibre cables under fire conditions – Part 1-2: Test for vertical flame propagation for a single insulated wire or cable – Procedure for 1 kW pre-mixed flame*, will be acceptable.

Table 2.10.2 Maximum rated conductor temperature

Type of insulating compound	Maximum rated conductor temperature, °C	
	Normal operation	Short-circuit
Thermoplastics: –Based upon polyvinyl chloride or co-polymer of vinyl chloride and vinyl acetate –Based upon polyethylene	60 60	150 130
Elastomeric or thermosettings: –Based upon ethylene propylene rubber or similar (EPM or EPDM) –Based upon chemically crosslinked polyethylene –Based upon silicon rubber	85 85 95	250 250 To be submitted
Mineral	95	To be submitted

10.5.2 Exemption from the requirements of 10.5.1 for applications such as radio frequency or digital communication systems, which require the use of particular types of cable, will be subject to special consideration.

10.5.3 Where electric cables are required to be of a 'fire resistant type', they are in addition to be easily distinguishable and comply with the performance requirements of the appropriate part of IEC 60331: *Tests for electric cables under fire conditions – Circuit integrity, when tested with a minimum flame application time of 90 minutes*, as follows:

- IEC 60331-21: *Procedures and requirements – Cables of rated voltage up to and including 0.6/1.0 kV*;
- IEC 60331-23: *Procedures and requirements – Electric data cables*;
- IEC 60331-25: *Procedures and requirements – Optical fibre cables*; or
- IEC 60331-31: *Procedures and requirements – Cables of rated voltage up to and including 0.6/1.0 kV*, where the overall diameter of the cable exceeds 20 mm.

10.5.4 Where electric cables are installed in locations exposed to the weather, in damp and in wet situations, in machinery compartments, refrigerated spaces or exposed to harmful vapours including oil vapour they are to have the conductor insulating materials enclosed in an impervious sheath of material appropriate to the expected ambient conditions.

10.5.5 Where it is required that the construction of electrical cables includes metallic sheaths, armouring or braids are to be provided with an overall impervious sheath or other means to protect the metallic elements against corrosion, see also 10.8.7 and 10.8.8.

10.5.6 Where cables are installed in an area where contamination by oil is likely to occur, the oversheath is to be of an enhanced oil resistance grade.

10.5.7 Where single core electric cables are used in circuits rated in excess of 20 Amps and are armoured the armour is to be of a non-magnetic material.

Electrical Engineering

Part 6, Chapter 2

Section 10

10.5.8 Electric cables are to be constructed such that they are capable of withstanding the mechanical and thermal effects of the maximum short-circuit current which can flow in any part of the circuit in which they are installed, taking into consideration not only the time/current characteristics of the circuit protective device but also the peak value of the prospective short-circuit current. Where electric cables are to be used in circuits with a maximum short-circuit current in excess of 70 kA, evidence is to be submitted for consideration when required demonstrating that the cable construction can withstand the effects of the short-circuit current.

10.5.9 All high voltage electric cables are to be readily identified by suitable marking.

10.6 Conductor size

10.6.1 The maximum continuous load carried by a cable is not to exceed its continuous current rating. It is to be chosen such that the maximum rated conductor temperature for normal operation for the insulation is not exceeded. In assessing the current rating the correction factors in 10.7 may be applied as required.

10.6.2 The cross-sectional area of the conductors is to be sufficient to ensure that, under short-circuit conditions, the maximum rated conductor temperature for short-circuit operation is not exceeded, taking into consideration the time current characteristics of the circuit protective device and the peak value of the prospective short-circuit current.

10.6.3 The cable current ratings given in Tables 2.10.3 and 2.10.4 are based on the maximum rated conductor temperatures given in Table 2.10.2. When cable sizes are selected on the basis of precise evaluation of current rating based upon experimental and calculated data, details are to be submitted for consideration. Alternative short-circuit temperature limits, other than those given in Table 2.10.4, may be applied using the data provided in:

- IEC 60724: *Short-circuit temperature limits of electric cables with rated voltages of 1kV ($U_m=1,2kV$) and 3kV ($U_m=3,6kV$); or*
- IEC 60986: *Short-circuit temperature limits of electric cables with rated voltages from 6kV ($U_m=7,2kV$) and up to 30kV ($U_m=36kV$).*

Alternative short-circuit temperature limits provided in an acceptable and relevant National Standard may also be considered.

Table 2.10.3 Electric cable current ratings, normal operation, based on ambient 45°C

Nominal cross section	Continuous r.m.s current rating, in amperes

240	35	49	110	28	40	89	25	35	79
300	44	62	140	35	50	110	31	44	100

Table 2.10.5 Correction factors

Insulation material	Correction factor for ambient air temperature of °C										
	35	40	45	50	55	60	65	70	75	80	85
PVC, Polyethylene	1,29	1,15	1,00	0,82	–	–	–	–	–	–	–
EPR, XLPE	1,12	1,06	1,00	0,94	0,87	0,79	0,71	0,61	0,50	–	–
Mineral, Silicon rubber	1,10	1,05	1,00	0,95	0,89	0,84	0,77	0,71	0,63	0,55	0,45

10.6.4 The cross-sectional area of the conductors is to be sufficient to ensure that at no point in the installation will the voltage variations stated in 1.7 be exceeded when the conductors are carrying the maximum current under their normal conditions of service.

10.6.5 The size of earth conductors is to comply with 1.11.7.

10.6.6 The cross-sectional area of conductors used in circuits supplying cyclic or non-continuous loads is to be sufficient to ensure that the cables maximum rated conductor temperature for normal operation is not exceeded when the conductors are operating under their normal conditions of service, see 10.7.4.

10.7 Correction factors for cable current rating

10.7.1 The correction factors of 10.7.2 to 10.7.5 provide a guide for general applications in assessing a current rating. A more precise evaluation based upon experimental and calculated data may be submitted for consideration.

10.7.2 Bunching of cables. Where more than six electric cables, which may be expected to operate simultaneously at their full rated capacity, are laid close together in a cable bunch in such a way that there is an absence of free air circulation around them, a correction factor of 0,85 is to be applied. Signal cables may be exempted from this requirement.

10.7.3 Ambient temperature. The current ratings of Table 2.10.3 are based on an ambient temperature of 45°C. For other values of ambient temperature the correction factors shown in Table 2.10.5 are to be applied.

10.7.4 Short time duty. When the load is not continuous i.e. operates for periods of half an hour or one hour and the periods of no load are longer than three times the cable's time constant, T in minutes, the cable's continuous rating may be increased by a duty factor, calculated in accordance with:

$$\text{Duty factor} = \sqrt{\frac{1,12}{1 - e^{-\frac{t_s}{T}}}}$$

When the load is not continuous, is repetitive and has periods of no-load less than three times the cable's time constant, so that the cable has insufficient time to cool down between the applications of load, the cable's continuous rating may be increased by an intermittent factor, calculated in accordance with:

$$\text{Intermittent factor} = \sqrt{\frac{1 - e^{-\frac{t_p}{T}}}{1 - e^{-\frac{t_s}{T}}}}$$

where

- t_p = the intermittent period, in minutes, i.e. the total period of load and no-load before the cycle is repeated
- T = $0,245d^{1,35}$ where d is the overall diameter of the cable, in mm
- t_s = the service time of the load current in minutes

10.7.5 Diversity. Where cables are used to supply two or more final sub-circuits account may be taken of any diversity factors which may apply, see 5.6.

10.8 Installation of electric cables

10.8.1 Electric cable runs are to be as far as practicable fixed in straight lines and in accessible positions.

10.8.2 Bends in fixed electric cable runs are to be in accordance with the cable manufacturer's recommendations. The minimum internal radius of bend for the installation of fixed electric cables is to be chosen according to the construction and size of the cable and is not to be less than the values given in Table 2.10.6.

10.8.3 The installation of electric cables across expansion joints in any structure is to be avoided. Where this is not practicable, a loop of electric cable of length sufficient to accommodate the expansion of the joint is to be provided. The internal radius of the loop is to be at least 12 times the external diameter of the cable.

10.8.4 Electric cables for essential and emergency services are to be arranged, so far as is practicable, to avoid galleys, machinery spaces and other enclosed spaces and areas of high fire risk except as is necessary for the service being supplied. Such cables are also, so far as reasonably practicable, to be routed clear of bulkheads to preclude their being rendered unserviceable by heating of the bulkheads that may be caused by a fire in an adjacent space.

10.8.5 Electric cables having insulating materials with different maximum rated conductor temperatures are to be so installed that the maximum rated conductor temperature for normal operation of each cable is not exceeded.

10.8.6 Electric cables having a protective covering which may damage the covering of other cables are not to be bunched with those other cables.

10.8.7 Cables having a bare metallic screen, braid or armour are to be installed in such a manner that galvanic corrosion by contact with other metals is prevented. Sufficient measures are also to be taken to prevent damage to any bare galvanised coatings during installation.

10.8.8 Consideration is to be given to providing adequate protection for cable oversheaths in areas where cables are likely to be exposed to damaging substances under normal circumstances or areas where the spillage or release of harmful substances is likely.

10.8.9 Electric cables are to be as far as practicable installed remote from sources of heat. Where installation of cables near sources of heat cannot be avoided and where there is consequently a risk of damage to the cables by heat, suitable shields, insulation or other precautions are to be installed between the cables and the heat source. The free air circulation around the cables is not to be impaired.

Table 2.10.6 Minimum internal radii of bends in cables for fixed wiring

Cable construction		Overall diameter of cable	Minimum internal radius of bend (times overall diameter of cable)
Insulation	Outer covering		
Thermoplastic and elastomeric 600/1000 V and below	Metal sheathed Armoured and braided	Any	6D
	Other finishes	≤ 25 mm > 25 mm	4D 6D
Mineral	Hard metal sheathed	Any	6D
Thermoplastic and elastomeric above 600/1000 V – single core – multicore	Any	Any	12D
	Any	Any	9D

10.8.10 Where electric cables are installed in bunches, provision is to be made to limit the propagation of fire. This requirement is considered satisfied when cables of the bunch have been tested in accordance with the requirements of IEC 60332: *Tests on electric cables under fire conditions, Part 3-22, Test for vertical flame spread of vertically-mounted bunched wires or cables – Category A*, and are installed in the same configuration(s) as are used for the test(s). If the cables are not so installed, information is to be submitted to satisfactorily demonstrate that suitable measures have been taken to ensure that an equivalent limit of fire propagation will be achieved for the configurations to be used. Particular attention is to be given to cables in:

- atria or equivalent spaces; and
 - vertical runs in trunks and other restricted spaces.
- In addition, cables that comply with the requirements of IEC 60332-3-22 are also required to meet the requirements of IEC 60332-1-2.

10.8.11 Electric cables are not to be coated or painted with materials which may adversely affect their sheath or their fire performance.

10.8.12 Where electric cables are installed in refrigerated spaces they are not to be covered with thermal insulation but may be placed directly on the face of the refrigeration chamber, provided that precautions are taken to prevent the electric cables being used as casual means of suspension.

10.8.13 All metal coverings of electric cables are to be earthed in accordance with 1.11.

10.8.14 High voltage cables may be installed as follows:

- (a) in the open, (e.g. on carrier plating), when they are to be provided with a continuous metallic sheath or armour which is effectively bonded to earth to reduce danger to personnel. The metallic sheath or armour may be omitted provided that the cable sheathing material has a longitudinal electric resistance high enough to prevent sheath currents which may be hazardous to personnel;
- (b) contained in earthed metallic protective casings when the cables may be as in (a) or the armour or metal sheath may be omitted. In the latter case care is to be taken to ensure that protective casings are electrically continuous and that short lengths of cable are not left unprotected.

10.8.15 High voltage electric cables are not to be run in the open through accommodation spaces.

10.8.16 High voltage electric cables are to be segregated as far as is practicable from electric cables operating at lower voltages.

10.8.17 Electric cables are to be, so far as reasonably practicable, installed remote from sources of mechanical damage. Where necessary the cables are to be protected in accordance with the requirements of 10.9.

10.8.18 Electric cables with the exception of those for portable appliances and those installed in protective casings are to be fixed securely in accordance with the requirements of 10.10.

10.8.19 Where electric cables penetrate bulkheads and decks the requirements of 10.11 are to be complied with.

10.8.20 Where electric cables are installed in protective casings the requirements of 10.12 are to be complied with.

10.8.21 a.c. wiring is to be carried out using multicore cables wherever reasonably practicable. Where it is necessary to install single core electric cables for alternating current circuits in excess of 20 Amps the requirements of 10.13 are to be complied with, see also 10.5.7.

10.9 Mechanical protection of cables

10.9.1 Electric cables exposed to risk of mechanical damage are to be protected by suitable protective casings unless the protective covering (e.g. armour or sheath) is sufficient to withstand the possible cause of damage.

10.9.2 Electric cables installed in spaces where there is exceptional risk of mechanical damage such as holds, storage spaces, cargo spaces, etc., are to be suitably protected by metallic protective casings, even when armoured, unless the ship's structure affords adequate protection.

10.9.3 Non-metallic protective casings and fixings are to be flame retardant in accordance with the requirements of IEC 60092-101.

10.9.4 Metal protective casings are to be efficiently protected against corrosion, and effectively earthed in accordance with 1.11.

10.10 Cable support systems

10.10.1 Electric cables are to be effectively supported and secured, without being damaged, to the ship's structure, either indirectly by a cable support system, or directly by means of clips, saddles or straps to bulkheads etc., see 10.8.4.

10.10.2 Cable support systems, which may be in the form of trays or plates, separate support brackets, hangers or ladder racks, together with their fixings and accessories, are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. Where cable support systems are manufactured of plastics materials, evidence of satisfactory type testing in accordance with an acceptable test procedure is to be submitted for consideration. The cable support system is to be effectively secured to the ship's structure, the spacing of the fixings taking account of the probability of vibration and any heavy external forces, e.g. where located in areas subject to impact by sea-water.

10.10.3 The distances between the points at which the cable is supported (e.g. distances between ladder rungs, support brackets, hangers, etc.) are to be chosen according to the construction of cable (i.e. size and rigidity) and the probability of vibration and are to be generally in accordance with those given in Table 2.10.7.

Electrical Engineering

Part 6, Chapter 2

Section 10

Table 2.10.7 Maximum spacing of supports or fixings for securing cables

External diameter of cable		Non-armoured cables	Armoured cables
exceeding	not exceeding		
mm	mm	mm	mm
–	8	200	250
8	13	250	300
13	20	300	350
20	30	350	400
30	–	400	450

10.10.4 Where the cables are laid on top of their support system, the spacings of fixings may be increased beyond those given in Table 2.10.7, but should take account of the probability of movement and vibration and in general is not to exceed 900 mm. This relaxation is not to be applied where cables can be subjected to heavy external forces, e.g. where they are run on, or above, open deck or in areas subject to impact by sea-water.

10.10.5 Where the cable support system or fixings are manufactured from a material other than metal, suitable supplementary metallic fixings or straps spaced at regular distances are to be provided, such that, in the event of a fire or failure, the cable support system and the cables affixed to it are prevented from falling and causing an injury to personnel and/or an obstruction to any escape route. Alternatively, the cables may be routed away from such areas.

10.10.6 Cable support systems manufactured of plastics materials installed on the open deck are to be protected from degradation caused by exposure to solar radiation.

10.10.7 Single core electric cables are to be firmly fixed, using supports of strength adequate to withstand forces corresponding to the values of the peak prospective short-circuit current.

10.11 Penetration of bulkheads and decks by cables

10.11.1 Where electric cables pass through watertight, fire insulated or gastight bulkheads or decks separating dangerous zones or spaces from non-dangerous zones or spaces, the arrangements are to be such as to ensure the integrity of the bulkhead or deck is not impaired. The arrangements chosen are to ensure that the cables are not adversely affected.

10.11.2 Where cables pass through non-watertight bulkheads or structural steel, the holes are to be bushed with suitable material. If the steel is at least 6 mm thick, adequately rounded edges may be accepted as the equivalent of bushing.

10.11.3 Electric cables passing through decks are to be protected by deck tubes or ducts.

10.11.4 Where cables pass through thermal insulation they are to do so at right angles, in tubes sealed at both ends.

10.12 Installation of electric cables in protective casings

10.12.1 Protective casings are to be mechanically continuous across joints and effectively supported and secured to prevent damage to the electric cables.

10.12.2 When protective casings are secured by means of clips or straps manufactured from a material other than metal the fixings are to be supplemented by suitable metal clips or straps spaced at regular distances each not exceeding 2 m.

10.12.3 Protective casings are to be suitably smooth on the interior and have their ends shaped or bushed in such a manner as not to damage the cables.

10.12.4 The internal radius of bends of protective casings are to be not less than that required for the largest cable installed therein, see 10.8.2.

10.12.5 The space factor (ratio of the sum of the cross sectional areas corresponding to the external diameters of the cables to the internal cross sectional area of the protective casings) is not to exceed 0,4.

10.12.6 Where necessary, ventilation openings are to be provided at the highest and lowest points of protective casings to permit air circulation and to prevent accumulation of water.

10.12.7 Expansion joints are to be provided in protective casings where necessary.

10.12.8 Protective casings containing high voltage electric cables are not to contain other electric cables and are to be clearly identified, defining their function and voltage.

10.13 Single-core electric cables for alternating current

10.13.1 When installed in protective casings, electric cables belonging to the same circuit are to be installed in the same casing, unless the casing is of non-magnetic material.

10.13.2 Cable clips are to include electric cables of all phases of a circuit unless the clips are of non-magnetic material.

10.13.3 Single-core cables of the same circuit are to be in contact with one another, as far as possible. In any event the distance between adjacent electric cables is not to be greater than one cable diameter.

10.13.4 If single-core cables of current rating greater than 250 A are installed near a steel bulkhead, the clearance between the cables and the bulkhead is to be at least 50 mm unless the cables belonging to the same a.c. circuit are installed in trefoil formation.

10.13.5 Magnetic material is not to be used between single core cables of a group. Where cables pass through steel plates, all the conductors of the same circuit are to pass through a plate or gland, so made that there is no magnetic material between the cables, and the clearance between the cables and the magnetic material is not to be less than 75 mm, unless the cables belonging to the same a.c. circuit are installed in trefoil formation.

10.13.6 Electric cables are to be installed such that the induced voltages, and any circulating currents, in the sheath or armour are limited to safe values.

10.14 Electric cable ends

10.14.1 Where screw-clamp or spring-clamp type terminations are used in electrical apparatus for external cable connections (see 1.10.7), cable conductors of the solid or stranded type may be inserted directly into the terminals. Where flexible conductors are used, a suitable termination is to be fitted to the cable conductor to prevent 'whiskering' of the strands.

10.14.2 If compression type conductor terminations are used on the cable ends, they are to be of a size to match the conductor and to be made with a compression type tool with the dies selected to suit the termination and conductor sizes and having a ratchet action to ensure completion of the compression action.

10.14.3 Soldered sockets may be used in conjunction with non corrosive fluxes provided that the maximum conductor temperature at the joint, under short-circuit conditions, does not exceed 160°C.

10.14.4 High voltage cables of the radial field type (i.e. having a conducting layer to control the electric field within the insulation) are to have terminations which provide electrical stress control.

10.14.5 Electric cables having hygroscopic insulation (e.g. mineral insulated) are to have their ends sealed against ingress of moisture.

10.14.6 Cable terminations are to be of such a design and dimensions that the maximum current likely to flow through them will not result in degradation of the contacts or damage to insulation as the result of overheating.

10.14.7 The fixing of conductors in terminals at joints and at tappings is to be capable of withstanding the thermal and mechanical effects of short-circuit currents.

10.15 Joints and branch circuits in cable systems

10.15.1 If a joint is necessary it is to be carried out so that all conductors are adequately secured, insulated and protected from atmospheric action. The flame retardant properties or fire resisting properties of the cable are to be retained, the continuity of metallic sheath, braid or armour is to be maintained and the current carrying capacity of the cable is not to be impaired.

10.15.2 Tappings (branch circuits) are to be made in suitable boxes of such a design that the conductors remain suitably insulated, protected from atmospheric action and fitted with terminals or busbars of dimensions appropriate to the current rating.

10.15.3 Cables of a fire resistant type (see 10.5.3) are to be installed so that they are continuous throughout their length without any joints or tappings.

10.16 Busbar trunking systems (bustrunks)

10.16.1 Where busbar trunking systems are used in place of electric cables, they are to comply with the requirements of 10.16.2 to 10.16.6, in addition to the applicable requirements in Section 7.

10.16.2 The busbar trunking, or enclosure system, is to have a minimum ingress protection of IP54, according to IEC60529: *Degrees of protection provided by enclosures* (IP Code).

10.16.3 The internal and external arrangements of the busbar trunking, or enclosure system, are to ensure that the fire and/or watertight integrity of any structure through which it passes is not impaired.

10.16.4 Where the busbar trunking system is employed for circuits on and below the bulkhead deck, arrangements are to be made to ensure that circuits on other decks are not affected in the event of partial flooding under the normal angles of inclination given in 1.9 for essential electrical equipment.

10.16.5 Supports and accessories are to be robust and are to be of corrosion-resistant material or suitably corrosion inhibited before erection. The support system is to effectively secure the busbar trunking system to the ship's structure.

10.16.6 When accessories are fixed to the busbar system by means of clips or straps manufactured from a material other than metal, the fixings are to be supplemented by suitable metal clips or straps, such that, in the event of a fire or failure, the accessories are prevented from falling and causing injury to personnel and/or an obstruction to any escape route. Alternatively, the busbar system may be routed away from such areas.

■ Section 11 Batteries

11.1 General

11.1.1 The requirements of this Section apply to permanently installed secondary batteries of the vented and valve-regulated sealed type.

11.1.2 A vented battery is one in which the cells have a cover provided with an opening through which the products of electrolysis and evaporation are allowed to escape freely from the cells to the atmosphere.

11.1.3 A valve-regulated sealed battery is one in which the cells are closed but have an arrangement (valve) which allows the escape of gas if the internal pressure exceeds a pre-determined value. The electrolyte cannot normally be replaced.

11.2 Construction

11.2.1 Batteries are to be constructed so as to prevent spilling of the electrolyte due to motion and to minimise the emission of electrolyte spray.

11.3 Location

11.3.1 Vented batteries connected to a charging device with a power output of more than 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be housed in an adequately ventilated compartment assigned to batteries only, or in an adequately ventilated suitable box on open deck.

11.3.2 Vented batteries connected to a charging device with a power output within the range 0,2 kW to 2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, are to be installed in accordance with 11.3.1, or may be installed within a well ventilated machinery or similar space.

11.3.3 Vented batteries connected to a charging device with a power output of less than 0,2 kW, calculated from the maximum obtainable charging current and the nominal voltage of the battery, may be installed in an open position or in a battery box in any suitable space.

11.3.4 Where more than one charging device is installed for any battery or group of batteries in one location, the total power output is to be used to determine the installation requirements of 11.3.1, 11.3.2 or 11.3.3.

11.3.5 Valve-regulated sealed batteries may be located in compartments with standard marine or industrial electrical equipment provided that the ventilation requirements of 11.5.10 and the charging requirements of 11.6.4 and 11.6.5 are complied with. Equipment that may produce arcs, sparks or high temperatures in normal operation is not to be in close proximity to battery vent plugs or pressure relief valve outlets.

11.3.6 Where lead-acid and nickel-cadmium batteries are installed in the same compartment precautions are to be taken, such as the provision of screens, to prevent possible contamination of electrolytes.

11.3.7 Where batteries may be exposed to the risk of mechanical damage or falling objects they are to be suitably protected.

11.3.8 Batteries installed in crew and passenger cabins, together with their associated corridors, are to be of the hermetically sealed type.

11.3.9 A permanent notice prohibiting smoking and the use of naked lights or equipment capable of creating a source of ignition is to be prominently displayed adjacent to the entrances of all compartments containing batteries.

11.3.10 Only electrical equipment necessary for operational reasons and for the provision of lighting is to be installed in compartments provided in compliance with 11.3.1. Such electrical equipment is to be certified for group IIC gases and temperature Class T1 in accordance with IEC 60079: *Electrical apparatus for explosive gas atmospheres*, or an acceptable and relevant National Standard.

11.3.11 A permanent notice is to be prominently displayed adjacent to battery installations advising personnel that replacement batteries are to be of an equivalent performance type. For valve-regulated sealed batteries, the notice is to advise of the requirement for replacement batteries to be suitable with respect to products of electrolysis and evaporation being allowed to escape from cells to the atmosphere, see also 1.4.3.

11.4 Installation

11.4.1 Batteries are to be arranged such that each cell or crate of cells is accessible from the top and at least one side and it is to be ensured that they are suitably secured to move with the ship's motion.

11.4.2 The materials used in the construction of a battery rack or stand are to be resistant to the battery electrolyte or suitably protected by paint or a coating.

11.4.3 Measures are to be taken to minimise the effect of any electrolyte spillage and leakage, for example the use of rubber capping around the top of the cells and the provision of a tray of electrolyte-resistant material below the cells, unless the deck is suitably protected with paint or a coating.

11.4.4 The interiors of all compartments for batteries, including crates, trays, boxes, shelves and other structural parts therein, are to be of an electrolyte-resistant material or suitably protected, for example with paint or a coating.

11.5 Ventilation

11.5.1 Battery compartments and boxes are to be ventilated to avoid accumulation of dangerous concentrations of flammable gas. The ventilation openings are to be of a non-closeable type and a permanent notice is to be prominently displayed adjacent to them, stating:

THIS VENTILATOR OPENING IS NOT TO BE CLOSED
OR BLOCKED AT ANY TIME – EXPLOSIVE GAS.

11.5.2 Ducted natural ventilation may be employed for battery installations connected to a charging device with a power output of 2 kW or less, provided the exhaust duct can be run directly from the top of the compartment or box to the open air above, with no part of the duct more than 45° from the vertical. A suitable opening is also to be provided below the level of the top of the batteries, so as to ensure a free ventilation air flow. The ventilation duct is to have an area not less than 50 cm² for every 1 m³ of battery compartment or box volume.

11.5.3 Where natural ventilation is impracticable or insufficient, mechanical ventilation is to be provided, with the air inlet located near the floor and the exhaust at the top of the compartment.

11.5.4 Mechanical exhaust ventilation complying with 11.5.9 is to be provided for battery installations connected to a charging device with a total maximum power output of more than 2 kW. Also, to minimise the possibility of oxygen enrichment, compartments and spaces containing batteries with boost charging facilities are to be provided with mechanical exhaust ventilation irrespective of the charging device power output.

11.5.5 The ventilation system for battery compartments and boxes, other than boxes located on open deck or in spaces to which 11.3.2, 11.3.3 and 11.3.5 refer, is to be separate from other ventilation systems. The exhaust ducting is to be led to a location in the open air, where any gases can be safely diluted, away from possible sources of ignition and openings into spaces where gases may accumulate.

11.5.6 Fan motors associated with exhaust ducts from battery compartments are to be placed external to the ducts and the compartments.

11.5.7 Ventilating fans for battery compartments are to be so constructed and be of material such as to minimise risk of sparking in the event of the impeller touching the casing. Non-metallic-impellers are to be of an anti-static material.

11.5.8 Battery boxes are to be provided with sufficient ventilation openings located so as to avoid accumulation of flammable gas whilst preventing the entrance of rain or spray.

11.5.9 The ventilation arrangements for all installations of vented type batteries are to be such that the quantity of air expelled is at least equal to:

$$Q = 110In$$

where

n = number of cells in series

I = maximum current delivered by the charging equipment during gas formation, but not less than 25 per cent of the maximum obtainable charging current in amperes

Q = quantity of air expelled in litres/hr.

11.5.10 The ventilation rate for compartments containing valve-regulated sealed batteries may be reduced to 25 per cent of that given in 11.5.9.

11.6 Charging facilities

11.6.1 Charging facilities are to be provided for all secondary batteries such that they may be completely charged from the completely discharged state in a reasonable time having regard to the service requirements.

11.6.2 Suitable means, including an ammeter and a voltmeter, are to be provided for controlling and monitoring charging of batteries, and to protect them against discharge into the charging circuits.

11.6.3 For floating circuits or any other conditions where the load is connected to the battery whilst it is on charge, the maximum battery voltage is not to exceed the safe value for any connected apparatus.

11.6.4 Where valve-regulated sealed batteries are installed, the charging facilities are to incorporate independent means such as overvoltage protection to prevent gas evolution in excess of the manufacturer's design quantity.

11.6.5 Boost charge facilities, where provided, are to be arranged such that they are automatically disconnected should the battery compartment ventilation system fail.

11.7 Recording of batteries for emergency and essential services

11.7.1 A schedule of batteries fitted for use for essential and emergency services is to be compiled and maintained.

11.7.2 Procedures are to be put in place and documented to ensure that, where batteries are replaced, they are of an equivalent performance type, *see also* 1.4.3.

11.7.3 When additions or alterations are proposed to the existing batteries for essential and emergency services, the schedule and replacement procedure documentation are to be updated to reflect the proposed installation and submitted in accordance with 1.4.2.

11.7.4 The schedule and replacement procedure documentation are to be made available to the LR Surveyor on request.

Section 12 Equipment – Heating, lighting and accessories

12.1 Heating and cooking equipment

12.1.1 The construction of heaters is to give a degree of protection according to IEC 60529: *Degrees of protection provided by enclosures (IP Code)*, or an acceptable and relevant National Standard, suitable for the intended location.

12.1.2 Heating elements are to be suitably guarded.

Electrical Engineering

Part 6, Chapter 2

Sections 12 & 13

12.1.3 Heating and cooking equipment is to be installed such that adjacent bulkheads and decks are not subjected to excessive heating.

12.2 Lighting – General

12.2.1 Lampholders are to be constructed of flame retarding non-hygroscopic materials.

12.2.2 Lighting fittings are to be so arranged as to prevent temperature rises which overheat or damage surrounding materials. They must not impair the integrity of fire divisions.

12.3 Incandescent lighting

12.3.1 Tungsten filament lamps and lampholders are to be in accordance with Table 2.12.1.

Table 2.12.1 Lamps and lampholders

Designation	Maximum lamp rating		Maximum lampholder current, A
	Voltage, V	Power, W	
Screw cap lamps			
E40	250	3000	16
E27	250	200	4
E14	250	15	2
E10	24	—	2
Bayonet cap lamps			
B22	250	200	4
B15d	250	15	2
B15s	55	15	2
Tubular fluorescent lamps			
G13	250	80	—
G5	250	13	—

12.3.2 Lampholders of type E40 are to be provided with a means of locking the lamp in the lampholder.

12.4 Fluorescent lighting

12.4.1 Fluorescent lamps and lampholders are to be in accordance with Table 2.12.1.

12.4.2 Fittings, reactors, capacitors and other auxiliaries are not to be mounted on surfaces which are subject to high temperatures. If mounted separately they are additionally to be enclosed in an earthed conductive casing.

12.4.3 Where capacitors of 0.5 microfarads and above are installed, means are to be provided to promptly discharge the capacitors on disconnection of the supply.

12.5 Discharge lighting

12.5.1 Discharge lamps operating in excess of 250 V are only acceptable as fixed fittings. Warning notices calling attention to the voltage are to be permanently displayed at points of access to the lamps and where otherwise necessary.

12.6 Socket outlets and plugs

12.6.1 The temperature rise on the live parts of socket outlet and plugs is not to exceed 30°C. Socket outlets and plugs are to be so constructed that they cannot be readily short-circuited whether the plug is in or out, and so that a pin of the plug cannot be made to earth either pole of the socket outlet.

12.6.2 All socket outlets of current rating in excess of 16 A are to be provided with a switch, and be interlocked such that the plug cannot be inserted or withdrawn when the switch is in the 'on' position.

12.6.3 Where it is necessary to earth the non-current carrying parts of portable or transportable equipment, an effective means of earthing is to be provided at the socket outlet.

12.6.4 On weather decks, galleys, laundries, machinery spaces and all wet situations socket outlets and plugs are to be effectively shielded against rain and spray and are to be provided with means of maintaining this quality after removal of the plug.

12.7 Enclosures

12.7.1 Enclosures for the containing and mounting of electrical accessories are to be of metal, effectively protected against corrosion, or of flame retardant insulating materials.

Section 13 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts

13.1 General

13.1.1 The installation of electrical equipment in spaces and locations in which flammable mixtures are liable to collect, e.g. areas containing flammable gas or vapour and/or combustible dust, is to be minimised as far as is consistent with operational necessity and the provision of lighting, monitoring, alarm or control facilities enhancing the overall safety of the ship.

Electrical Engineering

Part 6, Chapter 2

Section 13

13.1.2 In order to eliminate potential sources of ignition from spaces and locations in which flammable mixtures are liable to collect, in accordance with SOLAS 1974 as amended, Chapter II-1, Regulation 45, such dangerous or hazardous areas are to be identified and electrical equipment within these areas is to be selected and installed in accordance with the requirements of this Section.

13.2 Selection of equipment

13.2.1 When apparatus is to be installed in areas where an explosive gas atmosphere may be present, unless permitted otherwise by 13.2.2, it is to be of a 'safe-type', as listed below, certified or approved by a competent authority for the gases encountered. The construction and type testing is to be in accordance with IEC 60079: *Electrical Equipment for Explosive Gas Atmospheres* or an acceptable and relevant National Standard.

Intrinsically safe	– Ex 'i'
Increased safety	– Ex 'e'
Flameproof	– Ex 'd'
Pressurised enclosure	– Ex 'p'
Powder filled	– Ex 'q'
Encapsulated	– Ex 'm'

13.2.2 Consideration may be given to the use of equipment of the following types:

- (a) equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2;
- (b) simple non-energy-storing apparatus having negligible surface temperature rise in normal operation, such as limit switches, strain gauges, etc, incorporated in intrinsically-safe circuits;
- (c) radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15. Additionally, in the case of transmitter aerials, it is to be shown, by detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m, respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment;
- (d) electrical apparatus with type of protection 'n' or 'N' provided it is in a well ventilated area on open deck and not within 3 m of any flammable gas or vapour outlet.
- (e) electrical apparatus selected in accordance with IEC 60092-502: *Electrical Installations in Ships – Tankers – Special Features*, see 13.9 to 13.11.

13.2.3 Where apparatus is to be installed in areas where combustible dusts may be present in quantities sufficient to create an explosive atmosphere, it is, when practicable, to be of a type certified or approved by a competent authority for the dusts and additionally any explosive gases encountered.

13.2.4 Electrical equipment for use in combustible dust atmospheres is to be so designed and installed as to minimise the accumulation of dust which may interfere with the safe dissipation of heat from the enclosure.

13.2.5 Where equipment certified for combustible dusts is not available, consideration will be given to the use of apparatus complying as a minimum, with the following requirements provided no explosive gases will be present:

- (a) the enclosure is to be at least dust protected (IP5X) having, when type tested, an ingress of fine dust within the enclosure not exceeding 10 g per m³ of free air space, and
- (b) the surface temperature of the apparatus, under the most onerous combination of normal operating conditions, but in the absence of a dust layer, is to be at least 10°C below the auto-ignition temperature of the dusts encountered, or
- (c) the equipment is to be certified intrinsically-safe having a temperature classification ensuring compliance with (b), or
- (d) pressurised and operated in accordance with procedures ensuring, prior to its re-energisation, the absence of dust within the enclosure following loss of pressurisation and consequent shutdown, and having surface temperature complying with (b), or
- (e) simple apparatus included in intrinsically-safe circuits or radio aerials, complying with 13.2.2(b) or (c) respectively.

13.3 Installation of electrical equipment

13.3.1 The method of installation and application of safe-type equipment is to be in accordance with IEC 60079-14, or the national code of practice relevant to the standard to which the equipment has been certified. Any special requirements laid down by the equipment certification documentation are also to be observed. The ambient temperature range for which the apparatus is certified, is to be taken to be minus 20°C to 40°C, unless otherwise stated, and account is to be taken of this when assessing the suitability of the equipment for the auto-ignition temperature of the gases and dusts encountered.

13.3.2 All switches and protective devices from which equipment located in dangerous zones or spaces is supplied are to interrupt all poles or phases and, where practicable are to be located in a non-hazardous zone or space. Such equipment, switches and protective devices are to be suitably labelled for identification purposes.

13.4 Dangerous zones and spaces

13.4.1 Dangerous zones or spaces and sources of hazard for ships intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids, and the requirements for ships carrying vehicles with fuel in their tanks, are defined in 13.9 to 13.12. The following principles are to apply in general, and where any specific arrangement does not fall into any of the categories covered by 13.9 to 13.12.

13.4.2 A dangerous zone or space may arise from the presence of any of the following:

- (a) spaces or tanks containing either:
 - (i) flammable liquid having a flashpoint (closed-cup test), not exceeding 60°C;
 - (ii) flammable liquid having a flashpoint exceeding 60°C, heated or raised by ambient conditions to a temperature within 15°C of its flashpoint;
 - (iii) flammable gas.

- (b) piping systems or equipment containing fluid defined by (a) and having flanged joints or glands or other openings through which leakage of fluid may occur under normal operating conditions;
- (c) spaces containing solids, such as coal or grain, liable to release flammable gas and/or combustible dust;
- (d) piping systems or equipment associated with processes (such as battery charging or electrochlorination) generating flammable gas as a by-product and having openings from which the gas may escape under normal operating conditions;
- (e) piping systems or equivalent containing flammable liquids not defined by (a), having flanged joints, glands or other openings through which leakage of fluid in the form of a mist or fine spray may occur under normal operating conditions.

13.4.3 The following zones or spaces are regarded as dangerous:

- (a) the interiors of those spaces, tanks, piping systems and equipment defined by 13.4.2(a), (b) and (c);
- (b) spaces separated by a single bulkhead or deck from a cargo defined by 13.4.2(a);
- (c) enclosed or semi-enclosed spaces containing pipework or equipment defined by 13.4.2(b) and (d);
- (d) enclosed or semi-enclosed spaces with direct opening into a dangerous space or zone;
- (e) zones within a 3 m radius of ventilation inlets or outlets, hatches or doorways or other openings into dangerous spaces, or within 3 m of the ventilation outlets of spaces regarded by 13.6 as open areas and which contain the pipework or equipment defined by 13.4.2(b); where the hazard results from flammable gas or vapour having a density relative to that of air of more than 0,75, the dangerous zone is considered to extend vertically downward to solid deck, or for a distance of 9m, whichever is the lesser;
- (f) zones within a 3 m radius of flanged joints, or glands or other openings defined by 13.4.2(b); in the case of gas or vapour having a relative density of more than 0,75, the dangerous zone is considered to extend vertically downwards as described under (e);
- (g) zones within a 1,5 m radius of the ventilation outlets of spaces regarded as open areas containing items defined under 13.4.2(d);
- (h) zones within a 1,5 m radius of flanged joints, or glands or other openings defined by 13.4.2(d) and (e);
- (j) zones within a 3 m radius of bunds or barriers intended to contain spillage of liquids defined by 13.4.2(a).

13.5 Semi-enclosed spaces

13.5.1 Semi-enclosed spaces are considered to be spaces limited by decks and/or bulkheads in such a manner that the natural conditions of ventilation are sensibly different from those obtained on open deck.

13.6 Ventilation

13.6.1 Where an enclosed or semi-enclosed space is provided with mechanical ventilation ensuring at least 12 air changes/hour, and leaving no areas of stagnant air, it may be regarded in consideration of dangerous zones as would otherwise be defined by 13.4.3(c) and (d), as an open area.

13.6.2 Where the rate of ventilation air flow, in relation to the maximum rate of release of flammable substances reasonably to be expected under normal conditions, is sufficient to prevent the concentration of flammable substances approaching their lower explosive limit, consideration may be given to regarding as non-dangerous, the space, ventilation and other openings into it, and the zone around the equipment contained within.

13.6.3 An alarm is to be provided on the navigating bridge, engine control room, and where applicable, cargo control room to indicate any loss of the required ventilation capacity.

13.7 Pressurisation

13.7.1 A space having access to a dangerous space or zone as defined under 13.4.3(c) to (j) may be regarded as non-dangerous if fulfilling all the following conditions:

- (a) access is by means of an air-lock, having gastight steel doors, the inner of which as a minimum, is self-closing without any hold-back arrangement;
- (b) it is maintained at an overpressure relative to the external hazardous area by ventilation from a non-dangerous area;
- (c) the relative air pressure within the space is continuously monitored and, so arranged, that in the event of loss of overpressure an alarm is given and the electrical supply to all equipment not of a safe-type is automatically disconnected. Where the shutdown of equipment could introduce a hazard, an alarm may be given, in lieu of shutdown, upon loss of overpressure, and a means of disconnection of non-safe-type electrical equipment, capable of being controlled from a manned station, provided in conjunction with an agreed operational procedure; where the means of disconnection is located within the space then it is to be effected by equipment of a safe-type;
- (d) any electrical equipment required to operate upon loss of overpressure, lighting fittings (see 5.7.3) and equipment within the air-lock, is to be of a safe-type;
- (e) means are to be provided to prevent electrical equipment, other than of a safe-type, being energised until the atmosphere within the space is made safe, by air renewal of at least 10 times the capacity of the space.

13.8 Cable and cable installation

13.8.1 Electric cables are not to be installed in dangerous zones or spaces, except where specifically permitted by 13.9 to 13.11 or when associated with intrinsically-safe circuits.

13.8.2 In addition to the requirements of Section 10, cables for circuits that are not intrinsically-safe, which are located in dangerous zones or spaces, or which may be exposed to cargo oil, oil vapour or gas, are to be either:

- (a) mineral insulated with copper sheath, or
- (b) armoured or braided for earth detection.

13.8.3 Armouring, braiding and other metal coverings of cables installed in dangerous zones or spaces are to be effectively earthed at least at both ends.

13.8.4 Where there is risk of intermittent contact between armour and exposed metalwork, non-metallic impervious sheath is to be applied over metallic armour of cables.

13.8.5 Cables associated with intrinsically-safe circuits are to be used only for such circuits. They are to be physically separated from cables associated with non-intrinsically-safe circuits, e.g. neither installed in the same protective casing nor secured by the same fixing clip.

13.9 Requirements for tankers intended for the carriage in bulk of oil cargoes having a flash point not exceeding 60°C (closed-cup test)

13.9.1 In order to eliminate potential sources of ignition from hazardous areas onboard tankers in accordance with SOLAS 1974 as amended, Chapter II-1, Regulation 45.11, electrical equipment is to be selected and installed in accordance with IEC 60092: *Electrical installations in ships – Part 502: Tankers – Special features*.

13.10 Requirements for ships for the carriage of liquefied gases in bulk

13.10.1 See Chapter 10 of the Rules for Ships for Liquefied Gases.

13.11 Requirements for ships intended for the carriage in bulk of other flammable liquid cargoes

13.11.1 See Chapter 10 of the Rules for Ships for Liquid Chemicals.

13.12 Special requirements for ships with spaces for carrying vehicles with fuel in their tanks, for their own propulsion

13.12.1 **Passenger ships with special category spaces above the bulkhead deck for carrying vehicles:**

- (a) electrical equipment fitted within a height of 45 cm above the vehicle deck, or any platform on which vehicles are carried, or within the exhaust ventilation trunking for the space, is to be of a safe-type;

- (b) electrical equipment situated elsewhere within the space is to have an enclosure of ingress protection rating of at least IP55, if not of a safe-type, see IEC 60529: *Classification of Degrees of Protection Provided by Enclosures*. Smoke and gas detector heads are exempt from this requirement.

13.12.2 **Passenger ships with special category spaces below the bulkhead deck for carrying vehicles:** electrical equipment fitted within the space and within the exhaust ventilation trunking for the space, is to be of a safe-type.

13.12.3 **Passenger ships** with cargo spaces, other than special category spaces, for carrying vehicles:

- (a) electrical equipment within such a cargo space, or within the exhaust ventilation trunking for the space, is to be of a safe-type;
- (b) all electrical circuits terminating in the cargo space are to be provided with multipole linked isolating switches located outside the cargo hold. Provision is to be made for locking in the off position. This does not apply to safety circuits such as those for fire, smoke or gas detection.

13.12.4 **Cargo ships with closed ro-ro cargo spaces for carrying vehicles:**

- (a) except where exempted by (b) electrical equipment fitted within the space and within the exhaust ventilation trunking for the space is to be of a safe-type;
- (b) where the ventilation system required by SOLAS 1974 as amended, Chapter II-2, Regulation 20.3.1.1.1 is arranged to operate continuously and is sufficient to provide at least ten air changes per hour, whenever vehicles are on board, above a height of 45 cm from the vehicle deck, or any platform on which vehicles are carried, electrical equipment having an enclosure of ingress protection rating of at least IP 55 may be accepted as an alternative to that of a safe-type;
- (c) all electrical circuits terminating in the cargo space are to be provided with multipole linked isolating switches located outside the cargo hold. Provision is to be made for locking in the off position. This does not apply to safety circuits such as those for fire, smoke or gas detection.

13.13 Special requirements for ships intended for the carriage of dangerous goods

13.13.1 In order to eliminate potential sources of ignition in enclosed cargo spaces or vehicle spaces in accordance with SOLAS 1974 as amended, Chapter II-2, Regulation 19.3.2, and from associated hazardous areas (see 13.4.2), electrical equipment is to be selected in accordance with 13.13.2 and 13.13.3 and installed in accordance with 13.3 and 13.13.4 to 13.13.7.

13.13.2 Electrical equipment essential for the safety and operation of the ship is to be of a certified safe type selected in accordance with IEC 60092 *Electrical installations in ships – Part 506: Special features – Ships carrying specific dangerous goods and materials hazardous only in bulk*.

13.13.3 In addition to the requirements of IEC 60092-506, pipes such as ventilation and bilge pipes, having ends opening into a hazardous area are to be considered a hazardous area. Enclosed spaces such as pipe tunnels and bilge pump rooms containing such pipes and with equipment and components such as pumps, valves and flanges are to be considered as extended hazardous areas unless protected by overpressure.

13.13.4 Electrical equipment not essential for the safety or operation of the ship and which is not of a certified safe type is to be completely disconnected and protected against unauthorised re-connection. Disconnection is to be made outside the hazardous areas and be effected with isolating links or lockable switches.

13.13.5 Electrical equipment and all cables, including through runs and terminating cables, are to be protected against mechanical damage. Cables are to be either enclosed in screwed heavy gauge steel drawn or seam-welded and galvanised conduit, or protected by electrically continuous metal sheathing or metallic wire armour braid or tape.

13.13.6 Cables joints in cargo spaces are to be avoided where possible. Where joints are unavoidable, they are to be enclosed in metal-clad or impact strength plastic junction boxes of certified safe type (see 13.13.2) or heat-shrink or encapsulated crimp sleeve cable joints.

13.13.7 Cable penetrations of decks and bulkheads are to be sealed against the passage of gas or vapour.

■ Section 14 Navigation and manoeuvring systems

14.1 Steering gear

14.1.1 The requirements of 14.1.2 to 14.1.7 are to be read in conjunction with those in Pt 5, Ch 19.5.

14.1.2 Two exclusive circuits, fed from the main source of electrical power and each having adequate capacity to supply all the motors which may be connected to it simultaneously are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors. One of these circuits may pass through the emergency switchboard, *see also* Pt 5, Ch 19.6.

14.1.3 The main and auxiliary steering gear motors are to be capable of being started from a position on the navigating bridge and also arranged to restart automatically when power is restored after a power failure.

14.1.4 The motor of an associated auxiliary electric or electrohydraulic power unit may be connected to one of the circuits supplying the main steering gear.

14.1.5 Only short-circuit protection is to be provided for each main and auxiliary steering gear motor circuit.

14.1.6 In ships of less than 1600 gross tonnage, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements other than described in 14.1.5 for such a motor primarily intended for other services.

14.1.7 Each main and auxiliary steering gear electric control system which is to be operated from the navigating bridge is to be served with electric power by a separate circuit supplied from the associated steering gear power circuit, from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected. Each separate circuit is to be provided with short-circuit protection only.

14.2 Thruster systems for steering

14.2.1 Where azimuth or rotatable thruster units, used as the sole means of steering, are electrically driven the requirements of Pt 5, Ch 20.5.1 are to be complied with.

14.3 Thruster systems for dynamic positioning

14.3.1 For ships having a **DP** notation the requirements of Pt 7, Ch 4 are to be complied with.

14.4 Thruster systems for manoeuvring

14.4.1 Where a thruster unit is fitted solely for the purpose of manoeuvring, and is electrically driven, its starting and operation is not to cause the loss of any essential services.

14.4.2 In order to ensure that the thruster system is not tripped inadvertently whilst manoeuvring the ship, overload protection in the form of an alarm is to be provided for the electric motor and any associated supply converters, in lieu of tripping.

14.4.3 The thruster unit electric motor is not to be disconnected as part of a load management switching operation.

14.5 Navigation lights

14.5.1 Navigation lights are to be connected separately to a distribution board reserved for this purpose only and accessible to the officer of the watch. This distribution board is to be connected directly or through transformers to the emergency source of electrical power in compliance with, for passenger ships, 3.2.7(b) and 3.2.9(a)(i) or, for cargo ships, 3.3.7(c) and 3.3.9(a).

14.5.2 Each navigation light is to be controlled and protected in each insulated pole by a switch and fuse or circuit-breaker mounted on the distribution board.

14.5.3 Each navigation light is to be provided with an automatic indicator giving audible and/or visual indication of failure of the light. If an audible device alone is fitted, it is to be connected to an independent source of supply, e.g. a battery, with means provided to test this supply. If a visual signal is used connected in series with the navigation light, means are to be provided to prevent extinction of the navigation light due to failure of the signal. The requirements of this paragraph do not apply to tugs, trawlers and similar small vessels.

14.5.4 For navigation lights using light emitting diodes (consisting of multiple light sources) means to ensure that the overall luminous intensity of the navigation light is sufficient are to be provided in addition to the alarm to indicate the complete loss of the navigation light illumination required by 14.5.3. For replacement navigation lights, see 1.4.4.

14.5.5 To satisfy 14.5.4, an audible and visual alarm is to be activated to notify the Officer of the Watch when the luminous intensity of the light reduces below the level required by the IMO Convention on the International Regulations for Preventing Collisions at Sea. Alternative measures to ensure continuing acceptable performance of navigation lights using light emitting diodes may be considered that are in accordance with:

- IMO Res. MSC.253(83), *Performance Standards for Navigation Lights, Navigation Light Controllers and associated Equipment*, and
- EN 14744, *Inland navigation vessels and sea-going vessels – Navigation light*, or a relevant National or International Standard.

Where alternative measures are proposed that require verification by personnel of the luminous intensity of navigation lights using light emitting diodes, details of the inspection implementation in the ship's safety management system and acceptance by the National Administration are to be submitted for consideration.

14.5.6 Provision is to be made on the navigating bridge for the navigation lights to be transferred to an alternative circuit fed from the main source of electrical power.

14.5.7 Any statutory requirements of the country of registration are to be complied with and may be accepted as an alternative to the above.

14.6 Navigational aids

14.6.1 Navigational aids as required by SOLAS are to be fed from the emergency source of electrical power, see also 3.2.7(c)(ii) and 3.3.7(d)(ii).

14.6.2 For ships having a notation **NAV 1** navigational aids are to have an alternative supply fed from the main source of electrical power, independent of the emergency switchboard, with automatic changeover facilities.

Section 15 Electric propulsion

15.1 General

15.1.1 Where the arrangements permit a propulsion motor to be connected to a generating plant having a continuous rating greater than the motor rating, means are to be provided to limit the continuous input to the motor to a value not exceeding the continuous full load torque for which the motor and shafts are approved.

15.1.2 The ventilation and cooling systems for electrical propulsion equipment are to be provided with monitoring devices arranged to operate an alarm if the temperature of the heated cooling medium exceeds a predetermined safe value.

15.1.3 The embedded temperature detectors required by 8.1.9 are to be arranged to operate an alarm if the temperature exceeds a predetermined safe value.

15.2 Power requirements

15.2.1 The propulsion system is to have sufficient power for manoeuvring the ship and for going astern. With the ship travelling at maximum service speed the propulsion equipment is to be capable of stopping and reversing the ship in an agreed time.

15.2.2 The propulsion system is to have adequate torque and power margins for all operating conditions including manoeuvring and rough weather with due regard to propeller and ship characteristics.

15.2.3 The electric power for the propulsion system may be derived from generating sets dedicated to propulsion duty or from a central power generation plant which serves both propulsion and ship service loads.

15.2.4 Where propulsion power is derived from a central, common, power plant the control system is to ensure a safe distribution of power between propulsion and ship services, with tripping of non-essential loads and/or reduction in propulsion power if necessary.

15.2.5 Where a central power generation system is employed the number and rating of generator sets is to be such that with one set out of action the remaining sets are capable of providing all essential and normal ship service loads whilst maintaining an effective level of propulsion power.

15.2.6 Where, in a central power generation system, the electrical power requirements are normally supplied by two or more generating sets operating in parallel, on sudden loss of power from one set, the rating of the remaining set(s) in service is to be sufficient to ensure uninterrupted operation of essential services and an effective level of propulsion power.

15.3 Propulsion control

15.3.1 Propulsion control systems are to be stable throughout their normal operating range and arranged to attenuate any effects of cyclic propeller load fluctuations caused by wave action.

15.3.2 Step-less control of propeller speed, and/or pitch, from zero to full power ahead or astern is to be provided.

15.3.3 The control system is to ensure that there is no dangerous overspeeding of propulsion motors upon loss of load.

15.3.4 Interlocks are to be provided in the control system to ensure that ahead and astern circuits are not energised simultaneously.

15.3.5 Any single fault in either the propulsion machine excitation or power distribution systems is not to result in a total loss of propulsion power.

15.3.6 Control stations for the propulsion system are to satisfy the requirements of Pt 6, Ch 1.

15.3.7 Each control station is to be provided with emergency stops for propulsion motors. The emergency stop is to be independent of the normal control system.

15.3.8 The control system is to limit the propulsion power if the power available from the generator(s) is not sufficient to supply the demand level of propulsion power. In the event of a power limitation, there is to be a visual indication at the control stations.

15.3.9 Local controls are to be provided, independent of any remote or automatic system, to permit effective control of the propulsion equipment.

15.3.10 The propulsion control may be in analogue or digital form, which is to be developed using a systematic design procedure incorporating verification and validation methods to ensure successful implementation of the requirements listed above. A quality plan giving evidence of compliance with this requirement is to be submitted when requested.

15.4 Protection of propulsion system

15.4.1 Provision is to be made for protection against severe overloads, and electrical faults likely to result in damage to plant.

15.4.2 The main propulsion circuits are to be provided with means for detecting earth faults. Where the fault current flowing is liable to cause damage to the electrical equipment there are to be arrangements for interrupting the current.

15.4.3 For the protection of electrical equipment and cables against overvoltages means are to be provided for limiting the induced voltage when field windings, and other inductive circuits are opened. Protective resistors and devices are to be sized to cater for the likely extreme operating conditions.

15.4.4 Where, on stopping or reversing the propeller, regenerated energy is produced by the propulsion motor this is not to cause a dangerous increase of speed in the prime mover or a dangerous overvoltage condition on the supply system. Where a central power generation system is used then the voltage and frequency fluctuations are not to exceed the limits given in 1.7.

15.5 Instruments

15.5.1 The main control station is to be provided with the following instruments:

- (a) a.c. systems:
 - (i) an ammeter for each generator and propulsion motor; voltmeter, wattmeter and frequency meter for each generator and ammeter for each excitation circuit;
 - (ii) a temperature indicator for each generator and propulsion motor, the indicator is to read stator winding and cooling system temperature.
- (b) d.c. systems:
 - a voltmeter and ammeter for each generator and propulsion motor;
 - an ammeter for each excitation circuit.

15.5.2 Each control station is to be provided with instruments to indicate:

- (a) propeller speed;
- (b) direction of rotation for a fixed pitch propeller or pitch position for a controllable pitch propeller; and
- (c) visual indication of power limitation.

Section 16 Fire safety systems

16.1 Fire detection and alarm systems

16.1.1 Fire detection and alarm systems are to be provided with an emergency source of electrical power required by 3.2 or 3.3 and are also to be connected to the main source of electrical power. Separate feeders, reserved solely for this purpose, with automatic changeover facilities located in, or adjacent to, the main fire control panel are to be provided. Failure of any power supply is to operate an audible and visual alarm. See also 1.13 and 1.14.

16.1.2 For machinery spaces the requirements of Ch 1,2.8 are applicable.

16.1.3 Fire detection systems within the accommodation spaces and cabin balconies are, in addition to the requirements of Ch 1,2.8.4, 2.8.6, 2.8.8 and 2.8.10 to 2.8.14, to comply with 16.1.4 to 16.1.15.

16.1.4 The fire control panel is to be located on the navigating bridge or in a central fire control station and may form part of that panel specified in Ch 1,2.8.2. For passenger ships carrying more than 36 passengers, the fire control panel is to be located in the continuously manned central control station.

Electrical Engineering

Part 6, Chapter 2

Section 16

16.1.5 Detectors and manually operated call points are to be grouped into sections. The activation of any detector or manually operated call point is to initiate a visual and audible fire signal at the control panel and indicating units. If the signals have not received attention within two minutes an audible alarm is to be automatically sounded throughout the crew accommodation and service spaces, control stations and machinery spaces of Category A. This alarm sounder system need not be an integral part of the detection system.

16.1.6 In passenger ships, the fixed fire detection and fire alarm system are to be capable of remotely and individually identifying each detector and manually operated call point. On other ships, indicating units are to denote, as a minimum, the section in which a detector or manually operated call point has operated. At least one unit is to be so located that it is easily accessible to responsible members of the crew. One indicating unit is to be located on the navigating bridge if the control panel is located in the central control station.

16.1.7 Clear information is to be displayed on or adjacent to each indicating unit about the spaces covered and the location of the section and, for passenger ships, each detector and manually operated call point.

16.1.8 Where the fire detection system does not include means of remotely identifying each detector individually no section covering more than one deck within accommodation, service spaces and control stations is normally to be permitted except a section which covers an enclosed stairway. The number of enclosed spaces in each section are to be limited to the minimum considered necessary in order to avoid delay in identifying the source of fire. In no case are more than fifty spaces permitted in any section.

16.1.9 In passenger ships, detectors fitted in cabins, when activated, are also to be capable of emitting, or cause to be emitted, an audible alarm within the space where they are located.

16.1.10 A section of fire detectors which covers a control station, a service space or an accommodation space is not to include a machinery space of Category A.

16.1.11 The fire detection system is not to be used for any other purpose, except that closing of fire doors and similar functions may be permitted at the control panel.

16.1.12 A loop circuit of an addressable fire detection system, capable of remotely identifying from either end of the loop each detector served by the circuit, may serve spaces on both sides of the ship and on several decks, but is not to be situated in more than one main vertical or horizontal fire zone, nor is a loop circuit which covers a control station or an accommodation space to include a machinery space of Category A.

16.1.13 A loop circuit of an addressable fire detection system may comprise one or more sections of detectors. Where the loop comprises more than one section, the sections are to be separated by devices which will ensure that if a short-circuit occurs anywhere in the loop, only the affected section of detectors will be isolated from the control panel. No section of detectors is in general to include more than 50 detectors.

16.1.14 A section of detectors of an addressable fire detection system is neither to serve spaces on both sides of the ship nor on more than one deck, except that:

- (a) a section of detectors may serve spaces on more than one deck if those spaces are located in either the fore or aft end of the ship, or they constitute common spaces occupying several decks (i.e. public spaces, enclosed stairways, etc.); or
- (b) in ships of less than 20 m in breadth, a section of detectors may serve spaces on both sides of the ship.

16.1.15 The wiring for each section of detectors in an addressable fire detector system is to be separated as widely as practicable from that of all other sections on the same loop. Where practicable no loop is to pass through a space twice. When this is not practical, such as in large public spaces, the part of the loop which by necessity passes through the space for a second time is to be installed at the maximum possible distance from other parts of the loop.

16.1.16 Where it is intended that detectors be installed in external locations, e.g. cabin balconies, in addition to meeting the requirements for an environmental category suitable for open decks (see Ch 1,2.8.8), they are also to be tested for sun irradiation and ultraviolet exposure with satisfactory results.

16.2 Automatic sprinkler system

16.2.1 Any electrically-driven power pump, provided solely for the purpose of continuing automatically the discharge of water from the sprinklers, is to be brought into action automatically by the pressure drop in the system before the standing fresh water charge in the pressure tank is completely exhausted.

16.2.2 For **passenger ships**, electrically-driven sea-water pumps for automatic sprinkler systems are to be served by not less than two circuits reserved solely for this purpose, one fed from the main source of electrical power and one from the emergency source of electrical power. Such feeders are to be connected to an automatic changeover switch situated near the sprinkler pump and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.

16.2.3 The automatic alarm and detection system is to be fed by exclusive feeders from two sources of electrical power, one of which is to be an emergency source, with automatic changeover facilities located in, or adjacent to, the main alarm and detection panel.

Electrical Engineering

Part 6, Chapter 2

Section 16

16.2.4 Feeders for the sea-water pump and the automatic alarm and detection system are to be arranged so as to avoid galleys, machinery spaces and other enclosed spaces of high fire risk, except in so far as it is necessary to reach the appropriate switch boards. The cables are to be of a fire resistant type where they pass through such high risk areas.

16.3 Fixed water-based local application fire-fighting systems

16.3.1 Where fixed water-based local application fire-fighting system pressure sources are reliant on external power they need only be supplied by the main source of electrical power.

16.3.2 The fire detection, control and alarm systems are to be provided with an emergency source of electrical power required by 3.2 or 3.3 and are also to be connected to the main source of electrical power. Separate feeders, reserved solely for this purpose, with automatic changeover facilities located in, or adjacent to, the main control panel are to be provided.

16.3.3 Failure of any power supply is to operate an audible and visual alarm. See *a/s/o* 1.13 and 1.14.

16.3.4 Means to activate a system are to be located at easily accessible positions inside and outside the protected space. Arrangements inside the space are to be situated such that they will not be cut off by a fire in the protected areas and are suitable for activation in the event of escape. Where it is proposed to install local activation means outside of the protected space, details are to be submitted for consideration.

16.3.5 For the electrical safety of electrical and electronic equipment in areas protected by fixed water-based local application fire-fighting systems and adjacent areas where water may extend, the requirements of 16.3.6 to 16.3.10 apply.

16.3.6 As far as is practicable, electrical and electronic equipment is not to be located within protected areas or adjacent areas. The system pump, its electrical motor and the sea valve if any, may be in a protected space provided that they are outside areas where water or spray may extend.

16.3.7 High voltage equipment and their enclosures are not to be installed in protected areas or adjacent areas. For high voltage generators enclosures which cannot be fully located outside of adjacent areas due to close proximity, a technical justification, including proposed degree of protection ratings that are normally not to be lower than IP54, may be submitted for consideration that demonstrates the overall safety of the installation in the event of system operation.

16.3.8 In addition to the degree of protection requirements of 1.10.1, electrical and electronic equipment enclosures located within protected areas and within adjacent areas are to provide adequate protection in the event of system operation.

16.3.9 To demonstrate compliance with 16.3.8, evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas is to be submitted in accordance with 1.2.9. The evidence is to demonstrate that additional precautions have been taken, where necessary, in respect of:

- (a) satisfying 16.3.6 and 16.3.7;
- (b) personnel protection against electric shock;
- (c) cooling airflow, where necessary, for equipment required to operate during system operation; and
- (d) maintenance requirements for equipment before return to operation following system activation.

Any test evidence submitted is to consider the overall installation, including equipment types, system configuration and nozzles and the potential effects of airflows in the protected space.

16.3.10 The evidence required by 16.3.9 is to demonstrate the safe and effective operation of the overall arrangements in the event of system operation. This evidence is to demonstrate that exposure to system spray and/or water:

- cannot result in loss of essential services (i.e. unintended activation of automatic machinery shut-down due to sensor failure);
- cannot result in loss of availability of emergency services;
- will not affect the continued safe and effective operation of electrical and electronic equipment required to operate during the required period of system operation;
- does not present additional electrical or fire hazards; and
- would require only identified readily replaceable components to be repaired or replaced.

The installation of electrical and electronic equipment required to provide essential or emergency services in enclosures with a degree of protection less than IP44 within areas exposed to direct spray is to be acceptable to LR, and evidence of suitability is to be submitted accordingly.

16.3.11 Fixed water-based local application fire-fighting system electrically-driven pumps may be shared with:

- equivalent automatic sprinkler systems;
- equivalent main machinery space fire-fighting systems; or
- local fire-fighting systems for deep-fat cooking equipment;

provided that the shared use is accepted by the National Administration as complying with applicable statutory regulations and the arrangements comply with the requirements of 16.3.12 to 16.3.14.

16.3.12 Shared electrically-driven sea-water pumps are to be served by not less than two circuits reserved solely for this purpose, one fed from the main source of electrical power and one from the emergency source of electrical power. Such feeders are to be connected to an automatic changeover switch situated near the pumps and the switch is to be normally closed to the feeder from the main source of electrical power. No other switches are permitted in the feeders. The switches on the main and emergency switchboards are to be clearly labelled and normally kept closed.

Electrical Engineering

Part 6, Chapter 2

Section 16

16.3.13 Failure of a component in the power and control system is not to result in a reduction of the total available pump capacity below that required by any of the areas which the system is required to protect. For equivalent automatic sprinkler systems, a failure is not to prevent automatic release or reduce sprinkler pump capacity by more than 50 per cent.

16.3.14 Where fire-fighting systems share fire-fighting pumps, failure of one system is not to prevent activation of the pumps by any other system.

16.4 Fire pumps

16.4.1 When the emergency fire pump is electrically-driven, the power is to be supplied by a source other than that supplying the main fire pumps. This source is to be located outside the machinery spaces containing the main fire pumps and their source of power and drive units.

16.4.2 The cables to the emergency fire pump are not to pass through the machinery spaces containing the main fire pumps and their source of power and drive units. The cables are to be of a fire resistant type where they pass through other high fire risk areas.

16.5 Refrigerated liquid carbon dioxide systems

16.5.1 Where there are electrically driven refrigeration units for carbon dioxide fire-extinguishing systems, one unit is to be supplied by the main source of electrical power and the other unit from the emergency source of electrical power.

16.5.2 Each electrically driven carbon dioxide refrigerating unit is to be arranged for automatic operation in the event of loss of the alternative unit.

16.6 Fire safety stops

16.6.1 In order to limit the fire growth potential in every space of the ship, means for controlling the air supply to the spaces and flammable liquids within the spaces are to be provided.

16.6.2 To control air supply, a means of stopping all forced and induced draught fans, and all ventilation fans serving accommodation spaces, service spaces, control stations and machinery spaces from an easily accessible position outside of the space being served is to be provided. The position is not to be readily cut off in the event of a fire in the spaces served by the fans.

16.6.3 In passenger ships carrying more than 36 passengers, a second means of stopping ventilation fans serving accommodation spaces, service spaces and control stations is to be provided at a position as far apart from the position required by 16.6.2 as is practicable. At both positions, the controls are to be grouped so that all fans can be stopped from either of the two positions.

16.6.4 A second means of stopping ventilation fans serving machinery spaces is to be provided at a position as far apart from the position required by 16.6.2 as is practicable. At both positions the controls are to be grouped so that all fans are operable from either of the two positions. The means for stopping machinery space ventilation fans are to be entirely separate from the means for stopping fans serving all other spaces.

16.6.5 In passenger ships, the means of stopping machinery ventilation fans required by 16.6.2 is to be located at the central control station which is to have safe access from the open deck. The central control station is to be provided with ventilation fan OFF status indications together with a means for restarting the ventilation fans.

16.6.6 In passenger ships carrying more than 36 passengers, exhaust ducts from main laundries are to be fitted with additional remote-control arrangements for shutting off the exhaust fans and supply fans from within the space and for operating fire dampers fitted at the lower end of the duct.

16.6.7 To control flammable liquids, a means of stopping all fuel oil, lubricating oil, hydraulic oil, cargo oil and thermal oil pumps, oil purifiers from outside the spaces being served is to be provided. The position is not to be cut off in the event of a fire.

16.6.8 Means of cutting off power to the galley, in the event of a fire, is to be provided outside the galley exits, at positions which will not readily be rendered inaccessible by such a fire.

16.6.9 Following activation of any fire safety stops, a manual reset is to be provided in order to restart the associated equipment.

16.6.10 Fire safety stop systems are to be designed on the fail safe principle or alternatively the power supplies to, and the circuits of, the fire safety stop systems are to be continuously monitored and an alarm initiated in the event of a fault. Cables are to be of a fire-resistant type, see 10.5.3. See also 5.2.1.

16.7 Fire doors

16.7.1 The electrical power required for the control, indication and alarm circuits of fire doors is to be provided by an emergency source of electrical power as required by 3.2. In passenger ships carrying more than 36 passengers an alternative supply fed from the main source of electrical power, with automatic changeover facilities, is to be provided at the central control station. Failure of any power supply is to operate an audible and visual alarm, see also 1.13 and 1.14.

16.7.2 The control and indication systems for the fire doors are to be designed on the fail-safe principle with the release system having a manual reset.

16.8 Fire dampers

16.8.1 The electrical power required for the control and indication circuits of fire dampers is to be supplied from the emergency source of electrical power.

16.8.2 The control and indication systems for the fire dampers are to be designed on the fail-safe principle with the release system having a manual reset.

16.8.3 In passenger ships carrying more than 36 passengers, fire dampers fitted at the lower end of exhaust ducts from main laundries are to be capable of automatic and remote operation.

16.9 Fire-extinguishing media release

16.9.1 Where it is required that alarms be provided to warn of the release of a fire-extinguishing medium, and these are electrically-operated, they are to be provided with an emergency source of electrical power, as required by 3.2 or 3.3, and also connected to the main source of electrical power, with automatic changeover facilities located in, or adjacent to, the fire-extinguishing media release panel, see also 1.13. Failure of any power supply is to operate an audible and visual alarm, see also 1.13 and 1.14.

16.9.2 The opening of the fire-extinguishing media control cabinet door, or panel, for any purpose, other than for the release of the fire-extinguishing media, is not to cause the loss of any essential services, see 1.5.1.

16.10 Safety centre on passenger ships

16.10.1 Passenger ship safety centres required by SOLAS Ch II/2, Reg. 23 to provide a control station dedicated to assist with the management of emergency situations are to satisfy the requirements of this sub-Section.

16.10.2 The safety centre is to be either a part of the navigation bridge or to be located in a separate adjacent space having direct access to the navigation bridge.

16.10.3 Except where located in the same space, means of communication between the safety centre, the central control station, the navigation bridge, the engine control room, the storage room(s) for fire extinguishing system(s) and fire equipment lockers are to be provided.

16.10.4 The operation, control and monitoring of the following arrangements, where they are required to be installed by the National Administration, is to be additionally available from the safety centre:

- all powered ventilation systems;
- fire doors;
- general emergency alarm system;
- public address system;
- electrically powered escape route lighting or low location lighting for evacuation guidance;
- watertight and semi-watertight doors;
- indicators for bow and inner doors and stern and side shell doors and their closing appliances;

- water ingress detection for bow and inner doors and stern and side shell doors;
- remote surveillance systems for bow and inner doors and stern and side shell doors;
- fire detection and alarm systems;
- fixed water-based local application fire-fighting systems;
- automatic sprinkler systems, or equivalents;
- water-based fixed fire-extinguishing systems for machinery spaces;
- alarm to summon the crew;
- atrium smoke extraction system;
- flooding detection systems; and
- fire pumps and emergency fire pumps.

Operation, control and/or monitoring facilities provided at the safety centre are additional to any dedicated facilities required at other locations by the Rules or the National Administration.

16.10.5 Where arrangements are operated, controlled and/or monitored from the safety centre in accordance with 16.10.4, they are to comply with the relevant requirements of Ch 1,2 in respect of control, alarm and programmable electronic systems.

Section 17

Crew and passenger emergency safety systems

17.1 Emergency lighting

17.1.1 For the purpose of this Section emergency lighting, transitional emergency lighting and supplementary emergency lighting are hereafter referred to under the generic name 'emergency lighting'.

17.1.2 Emergency lighting provided in compliance with Section 3 is to be arranged so that a fire or other casualty in the spaces containing the emergency source of electrical power, associated transforming equipment and the emergency lighting switchboard does not render the main lighting system inoperative.

17.1.3 The level of illumination provided by the emergency lighting is to be adequate to permit safe evacuation in an emergency, having regard to the possible presence of smoke, see 17.4.

17.1.4 The exit(s) from every main compartment occupied by passengers or crew is to be continuously illuminated by an emergency lighting fitting.

17.1.5 Switches are not to be installed in the final sub-circuits to emergency light fittings unless the light fittings are serving normally unmanned spaces (e.g. storage rooms, cold rooms, etc.), or they are normally required to be extinguished for operational reasons (e.g. for night visibility from the navigating bridge). Where switches are fitted they are to be accessible only to ships crew with provision made to ensure that the emergency lighting is energised when such spaces are manned and/or during emergency conditions.

Electrical Engineering

Part 6, Chapter 2

Section 17

17.1.6 Where emergency lighting fittings are connected to dimmers, provision is to be made, upon the loss of the main lighting, to automatically restore them to their normal level of illumination.

17.1.7 Fittings are to be specially marked to indicate that they form part of the emergency lighting system.

17.2 General emergency alarm system

17.2.1 An electrically operated bell or klaxon or other equivalent warning system installed in addition to the ship's whistle or siren, for sounding the general emergency alarm signal is to comply with the *International Life-Saving Appliances (LSA) Code* and with the requirements of this Section, see also 1.13 and 1.14.

17.2.2 The general emergency alarm system is to be provided with an emergency source of electrical power as required by 3.2 or 3.3 and also connected to the main source of electrical power with automatic changeover facilities located in, or adjacent to, the main alarm signal distribution panel. Failure of any power supply is to operate an audible and visual alarm, see also 1.13.

17.2.3 The general emergency alarm distribution system is to be so arranged that a fire or casualty in any one main vertical zone, as defined by SOLAS 1974 as amended Reg II-2/A, 3.32, other than the zone in which the public address control station is located, will not interfere with the distribution in any other such zone.

17.2.4 There are to be segregated cable routes to public rooms, alleyways, stairways, and control stations, so arranged that any single electrical fault, localised fire or casualty will not cause the loss of the facility to sound the general emergency alarm in any public rooms, alleyways, stairways, and control stations, be it at a reduced capacity.

17.2.5 Where the special alarm fitted to summon the crew, operated from the navigation bridge, or fire-control station, forms part of the ship's general alarm system, it is to be capable of being sounded independently of the alarm to the passenger spaces.

17.2.6 The sound pressure levels are to be measured during a practical test and documented, see 20.2.

17.3 Public address system

17.3.1 Public address systems on passenger ships and public address systems used on cargo ships to sound the general emergency alarm or the fire-alarm, are to comply with the *International Life-Saving Appliances (LSA) Code* and the requirements of this Section.

17.3.2 The public address system is to be provided with an emergency source of electrical power as required by 3.2 or 3.3 and also connected to the main source of electrical power with automatic changeover facilities located adjacent to the public address system. Failure of any power supply is to operate an audible and visual alarm, see also 1.13 and 1.14.

17.3.3 The public address system is to have multiple amplifiers having their power supplies so arranged that a single fault will not cause the loss of the facility to broadcast emergency announcements in public rooms, alleyways, stairways and control stations, albeit at a reduced capacity.

17.3.4 The public address distribution system is to be so arranged that a fire or casualty in any one main vertical zone, as defined by SOLAS 1974 as amended Reg II-2/A, 3.32, other than the zone in which the public address control station is located, will not interfere with the distribution in any other such zone.

17.3.5 There are to be at least two cable routes, sufficiently separated throughout their length, to public rooms, alleyways, stairways and control stations so arranged that any single electrical fault, fire or casualty will not cause the loss of the facility to broadcast emergency announcements in any public rooms, alleyways, stairways and control stations, albeit at a reduced capacity.

17.3.6 Amplifiers are to be continuously rated for the maximum power that they are required to deliver into the system for audio and, where alarms are to be sounded through the public address system, for tone signals.

17.3.7 Loudspeakers are to be continuously rated for their proportionate share of amplifier output and protected against short-circuits.

17.3.8 Amplifiers and loudspeakers are to be selected and arranged to prevent feedback and other interference. There are also to be means to automatically override any volume controls, so as to ensure the specified sound pressure levels are met.

17.3.9 Where the public address system is used for sounding the general emergency alarm and the fire-alarm, the following requirements are to be met in addition to those of 17.2:

- (a) The emergency system is given automatic priority over any other system input.
- (b) More than one device is provided for generating the sound signals for the emergency alarms.

17.3.10 Where more than one alarm is to be sounded through the public address system, they are to have recognisably different characteristics and additionally be arranged, so that any single electrical failure which prevents the sounding of any one alarm will not affect the sounding of the remaining alarms.

17.3.11 The sound pressure levels are to be measured during a practical test using speech and, where applicable, tone signals and documented, see 20.2.

17.4 Escape route or low location lighting (LLL)

17.4.1 The escape route or low location lighting (LLL) required by SOLAS 1974 as amended Pt D, Ch II-2, Reg. 13, 3.2.5.1, where satisfied by electric illumination, is to comply with the requirements of this sub-Section.

17.4.2 The LLL system is to be provided with an emergency source of electrical power as required by 3.2 and also be connected to the main source of electrical power, with automatic changeover facilities located adjacent to the control panel, see also 1.14.

17.4.3 The power supply arrangements to the LLL are to be arranged so that a single fault or a fire in any one fire zone or deck does not result in loss of the lighting in any other zone or deck. This requirement may be satisfied by the power supply circuit configuration, use of fire-resistant cables complying with 10.5.3, and/or the provision of suitably located power supply units having integral batteries adequately rated to supply the connected LLL for a minimum period of 60 minutes, see 11.3.8.

17.4.4 The performance and installation of lights and lighting assemblies are to comply with ISO Standard 15370: *Ships and marine technology – Low location lighting on passenger ships*.

■ Section 18 Ship safety systems

18.1 Watertight doors

18.1.1 The electrical power required for power-operated sliding watertight doors is to be separate from any other power circuit and supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the bulkhead deck. The associated control, indication and alarm circuits are to be supplied from the emergency switchboard either directly or by a dedicated distribution board situated above the bulkhead deck and for passenger ships be capable of being automatically supplied by the transitional source of emergency electrical power required by 3.2.8 in the event of failure of either the main or emergency source of electrical power.

18.1.2 For passenger ships, where the sources for opening and closing the watertight doors have electric motors, unless an independent temporary source of stored energy is provided, the electric motors are to be capable of being automatically supplied from the transitional source of emergency electrical power.

18.1.3 A single failure in the power operating or control system of power-operated sliding watertight doors is not to result in a closed door opening or prevent the hand operation of any door.

18.1.4 Availability of the power supply is to be continuously monitored at a point in the electrical circuit adjacent to the door operating equipment. Loss of any such power supply is to activate an audible and visual alarm at the central operating console at the navigating bridge.

18.1.5 Electrical power, control, indication and alarm circuits are to be protected against fault in such a way that a failure in one door circuit will not cause a failure in any other door circuit. Short circuits or other faults in the alarm or indicator circuits of a door are not to result in a loss of power operation of the door. Arrangements are to be such that leakage of water into the electrical equipment located below the bulkhead deck will not cause the door to open.

18.1.6 The enclosures of electrical components necessarily situated below the bulkhead deck are to provide suitable protection against the ingress of water with ratings as defined in IEC 60529: *Degrees of protection provided by enclosures (IP Code)* or an acceptable and relevant National Standard, as follows:

- (a) Electrical motors, associated circuits and control components, protected to IPX7 Standard.
- (b) Door position indicators and associated circuit components protected to IPX8 Standard, where the water pressure testing of the enclosures is to be based on the pressure that may occur at the location of the component during flooding for a period of 36 hours.
- (c) Door movement warning signals, protected to IPX6 Standard.

18.1.7 Watertight door electrical controls including their electric cables are to be kept as close as is practicable to the bulkhead in which the doors are fitted and so arranged that the likelihood of them being involved in any damage which the ship may sustain is minimised.

18.1.8 An audible alarm, distinct from any other alarm in the area, is to sound whenever the door is closed remotely by power and sound for at least five seconds but no more than ten seconds before the door begins to move and is to continue sounding until the door is completely closed. The audible alarm is to be supplemented by an intermittent visual signal at the door in passenger areas and areas where the noise level exceeds 85 dB(A).

18.1.9 Sliding watertight doors on **cargo ships** are to be capable of being remotely closed from the bridge and are also to be operable locally from each side of the bulkhead. Indicators are to be provided at the control position showing whether the doors are open or closed, and an audible alarm is to be provided at the door closure.

18.1.10 On passenger ships, a central operating console is to be fitted on the navigating bridge and is to be provided with a 'master-mode' switch having:

- (a) a 'local control' mode for normal use which is to allow any door to be locally opened and locally closed after use without automatic closure, and;
- (b) a 'doors closed' mode for emergency use which is to allow any door that is opened to be automatically closed whilst still permitting any doors to be locally opened but with automatic reclosure upon release of the local control mechanism.

18.1.11 On passenger ships, the 'master mode' switch is to be arranged to be normally in the 'local control' mode position; be clearly marked as to its emergency function and be Type Approved in accordance with LR's Procedure for Type Approved Products.

18.1.12 On passenger ships, the central operating console at the navigating bridge is to be provided with a diagram showing the location of each door, with visual indicators to show whether each door is open or closed. A red light is to indicate a door is fully open and a green light, a door fully closed. When the door is closed remotely a red light is to indicate the intermediate position by flashing. The indicating circuit is to be independent of the control circuit for each door.

18.1.13 The arrangements are to be such that it is not possible to remotely open any door from the central operating console.

18.2 Stern and side shell doors

18.2.1 A notice is to be displayed at the operating panel stating that the door is to be fully closed, secured and locked preferably before, or immediately the ship leaves the berth and that this operation is to be entered in the ship's log.

18.2.2 Control positions are to be provided with a system of warning indicator lights. The system is to provide positive indication that the door is fully closed, secured and locked. The indication arrangements are to be 'fail-safe' such that in the event of a fault the system cannot incorrectly indicate that the doors are fully closed, secured or locked.

18.2.3 The indication system is to be arranged such that it functions independently of any system for door operation, securing and locking.

18.2.4 The electrical power supply for the indication system is to be independent of any electrical power supply for operating, securing and locking the doors.

18.2.5 The indication system is to be fed from two exclusive circuits, one from the main source of electrical power and one from the emergency source of electrical power with automatic changeover facilities located adjacent to the panel. Loss of either active or standby power supply is to initiate an audible and visual alarm on the navigation bridge.

18.2.6 The indicator panel is to be provided with a lamp test function. It is not to be possible to turn off the indication lights at the panel. Dimming facilities may be provided, but the indications are to remain clearly readable under all operating lighting conditions.

18.2.7 Means are to be provided to prevent unauthorised operation of the doors and associated securing and locking devices.

18.2.8 Detection of door position and securing and locking device status is to be by direct sensing of proximity, contact or equivalent, not inferred from actuator positions. Sensors are to be protected against ice formation, mechanical damage and water ingress to be not less than IPX6 Standard as defined in IEC 60529, or an acceptable and relevant National Standard.

18.2.9 Where a strongback or equivalent independent secondary means of securing an inwardly opening door is required, these need not be monitored by the indication system providing their correct positioning can be easily observed from the control position.

18.2.10 Doors with a clear opening area of 12 m² or greater are to be provided with closing devices operable from a remote control position. Doors which are located partly or totally below the freeboard deck with a clear opening area greater than 6 m² are to be provided with an arrangement for remote control from a position above the freeboard deck. This remote control is to provide centralised control for:

- (a) The closing and opening of the doors.
- (b) Associated securing and locking devices.

18.2.11 The location of the remote control panel is to be such that door operation can be easily observed by the operator or by other suitable means such as closed circuit television. Where remote control is required, television surveillance or other such means may satisfy this requirement.

18.2.12 The additional requirements of 18.2.13 to 18.2.17 apply to doors in the boundaries of special category spaces or ro-ro cargo spaces through which such spaces may be flooded. For cargo ships, where no part of the door is below the uppermost waterline and the area of the door opening is not greater than 6 m², then the requirements of 18.2.13 to 18.2.17 need not be applied.

18.2.13 An indicator panel is to be located on the navigating bridge, providing separate visual indications of the position of each door and the status of their associated securing/locking devices.

18.2.14 The indication system is to be provided with a 'harbour/sea voyage' mode selection function, with means of operation located on or adjacent to the navigating bridge indication panel. The selected mode is to be displayed on all indicator panels. An audible alarm is to be initiated on the navigating bridge if the ship leaves the harbour with any door not fully closed or not fully secured. Where practical, the alarm should be initiated immediately the ship leaves the berth. Audible alarms are to be silenced in the 'harbour' mode. Visual indications are to remain operational in either mode.

18.2.15 An audible and visual alarm is to be given on the navigation bridge in the event of any fault within the indication system.

18.2.16 An audible and visual alarm is to be initiated on the navigation bridge and the engine control room, or an equivalent attended position, in the event of leakage through the doors.

18.2.17 For passenger ships, television surveillance arrangements are to be provided to allow leakage through doors below the freeboard deck to be assessed from the navigation bridge and the engine control room, or equivalent attended position.

Electrical Engineering

Part 6, Chapter 2

Sections 18 & 19

18.3 Bow and inner doors

18.3.1 Bow doors and inner doors, giving access to vehicle decks, and subdivision doors are to be provided with an arrangement for remote control, from a position above the freeboard deck, providing centralised control for:

- (a) the closing and opening of the doors, and
- (b) associated securing and locking devices.

18.3.2 The location of the remote control panel is to be such that door operation can be easily observed by the operator or by other suitable means such as closed circuit television. Where remote control is required, television surveillance or other such means may satisfy this requirement.

18.3.3 A notice is to be displayed at the control position operating panel stating that the bow and inner doors are to be fully closed, secured and locked immediately before the ship leaves the berth and that this operation is to be entered in the ship's log.

18.3.4 Means are to be provided to prevent unauthorised operation of the doors and associated securing and locking devices.

18.3.5 An indicator panel is to be located on the navigating bridge and at each control position, providing separate visual indications of the position of bow and inner doors and the status of their associated securing/locking devices.

18.3.6 The indication arrangements are to be 'fail-safe' such that in the event of a fault the system cannot incorrectly indicate that the doors are fully closed, secured or locked.

18.3.7 Indicator panels are to be provided with a lamp test function. It is not to be possible to turn off the indication lights at the panel. Dimming facilities may be provided, but the indications are to remain clearly readable under all operating lighting conditions.

18.3.8 The indication system is to be provided with a 'harbour/sea voyage' mode selection function, arranged such that an audible alarm is to be initiated on the navigating bridge if the ship leaves the harbour with any door not fully closed or not fully secured. Where practical, the alarm should be initiated immediately the ship leaves the berth. Audible alarms are to be silenced in the 'harbour' mode. Visual indications are to remain operational in either mode.

18.3.9 An audible and visual alarm is to be given on the navigation bridge in the event of any fault within the indication system.

18.3.10 The indication system is to be arranged such that it functions independently of any system for door operation.

18.3.11 The electrical power supply for the indication system is to be independent of any electrical power supply for operating, securing and locking the doors.

18.3.12 The indication system is to be fed from two exclusive circuits, one from the main source of electrical power and one from the emergency source of electrical power with automatic changeover facilities located adjacent to the panel. Loss of either active or standby power supply is to initiate an audible and visual alarm on the navigation bridge.

18.3.13 Detection of door position and securing and locking device status is to be by direct sensing of proximity, contact or equivalent, not inferred from actuator positions. Sensors are to be protected against ice formation, mechanical damage and water ingress to be not less than IPX6 Standard as defined in IEC 60529, or an acceptable and relevant National Standard.

18.3.14 An audible and visual alarm is to be initiated on the navigation bridge and the engine control room, or equivalent attended position, in the event of leakage through the inner door.

18.3.15 Television surveillance arrangements are to be provided that allow the extent of leakage to be readily assessed from the navigation bridge and the engine control room, or equivalent attended position, in the event of leakage through the doors. See also Pt 4, Ch 2, 10.2.

18.3.16 The electrical power supply for surveillance lighting is to be independent of any electrical power supply for operating, securing and locking the doors.

18.4 Subdivision doors on vehicle decks

18.4.1 Where subdivision doors are provided on passenger ship vehicle decks in accordance with Pt 4, Ch 2, 9, the control and monitoring arrangements for these doors are to generally comply with 18.3.

18.5 Bilge pumps

18.5.1 Where the bilge pumps for the holds of open-top container ships are electrically driven one pump is to be supplied from the emergency switchboard, the remaining pumps are to be supplied from the main source of electrical power, independent of the emergency switchboard.

Section 19 Lightning conductors

19.1 General

19.1.1 In order to minimise the risks of damage to the ship and its electrical installation due to lightning, ships having non-metallic masts or topmasts are to be fitted with lightning conductors in accordance with the applicable requirements of IEC 60092-401 *Electrical installations in ships*. Part 401: Installation and test of completed installation or an alternative and relevant National Standard.

Electrical Engineering

Part 6, Chapter 2

Section 20

Section 20 Testing and trials

20.1 Testing

20.1.1 Tests in accordance with 20.1.2 to 20.1.4 are to be satisfactorily carried out on all electrical equipment, complete or in sections, at the manufacturer's premises and a test report issued by the manufacturer.

20.1.2 A high voltage at any frequency between 25 and 100 Hz is to be applied between:

- all current carrying parts connected together and earth;
 - all current carrying parts of opposite polarity or phase.
- For rotating machines the value of test voltage is to be 1000 V plus 2 x rated voltage with a minimum of 2000 V, and for other electrical equipment, it is to be in accordance with Table 2.20.1. Items of equipment included in the assembly for which a test voltage lower than the above is specified may be disconnected during the test and tested separately at the appropriate lower test voltage. The test is to be commenced at a voltage of about one-third the test voltage and is to be increased to full value as rapidly as is consistent with its value being indicated by the measuring instrument. The full test voltage is then to be maintained for 1 minute, and then reduced to one-third full value before switching off. The assembly is considered to have passed the test if no disruptive discharge occurs.

Table 2.20.1 Test voltage

Rated voltage, U_n U_n V	Test voltage a.c. (r.m.s.), V
$U_n \leq 60$	500
$60 < U_n \leq 1000$	$2 \times U_n + 1000$
$1000 < U_n \leq 2500$	6500
$2500 < U_n \leq 3500$	10000
$3500 < U_n \leq 7200$	20000
$7200 < U_n \leq 12000$	28000
$12000 < U_n \leq 15000$	38000

20.1.3 When it is desired to make additional high voltage tests on equipment which has already passed its tests, the voltage of such additional tests is to be 80 per cent of the test voltage the equipment has already passed.

20.1.4 Immediately after the high voltage test, the insulation resistance is to be measured using a direct current insulation tester, between:

- all current carrying parts connected together and earth;
 - all current carrying parts of different polarity or phase.
- The minimum values of test voltage and insulation resistance are given in Table 2.20.2.

Table 2.20.2 Test voltage and minimum insulation

Rated voltage U_n V	Minimum voltage of the tests, V	Minimum insulation resistance, $M\Omega$
$U_n \leq 250$	$2 \times U_n$	1
$250 < U_n \leq 1000$	500	1
$1000 < U_n \leq 7200$	1000	$\frac{U_n}{1000} + 1$
$7200 < U_n \leq 15000$	5000	$\frac{U_n}{1000} + 1$

20.1.5 Tests in accordance with the Standard with which the equipment complies may be accepted as an alternative to the above.

20.2 Trials

20.2.1 Before a new installation, or any alteration or addition to an existing installation, is put into service the applicable trials in 20.2.2 to 20.2.7 are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturer's works and are to be to the Surveyor's satisfaction.

20.2.2 The insulation resistance is to be measured of all circuits and electrical equipment, using a direct current insulation tester, between:

- all current carrying parts connected together and earth and, so far as is reasonably practicable;
 - all current carrying parts of different polarity or phase;
- The minimum values of test voltage and insulation resistance are given in Table 2.20.2. The installation may be subdivided and appliances may be disconnected if initial tests produce results less than these figures.

20.2.3 Tests are to be made to verify the effectiveness of:

- earth continuity conductor;
- the earthing of non-current carrying exposed metal parts of electrical equipment and cables not exempted by 1.11.2;
- bonding for the control of static electricity.

20.2.4 It is to be demonstrated that the Rules have been complied with in respect of:

- satisfactory performance of each generator throughout a run at full rated load;
- temperature of joint, connections, circuit-breakers and fuses;
- the operation of engine governors, synchronising devices, overspeed trips, reverse-current, reverse-power and over-current trips and other safety devices;
- voltage regulation of every generator when full rated load is suddenly thrown off and when starting the largest motor connected to the system;
- satisfactory parallel operation, and kW and KVA load sharing of all generators capable of being operated in parallel at all loads up to normal working load;

- (f) all essential and other important equipment are to be operated under service conditions, though not necessarily at full load or simultaneously, for a sufficient length of time to demonstrate that they are satisfactory;
- (g) propulsion equipment is to be tested under working conditions and operated in the presence of the Surveyors and to their satisfaction. The equipment is to have sufficient power for going astern to secure proper control of the ship in all normal circumstances. In passenger ships the ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum ahead service speed, is to be demonstrated at the sea trial.

20.2.5 Voltage drop is to be measured, where necessary, to verify that this is not in excess of that specified in 1.7.

20.2.6 It is to be demonstrated by practical tests that the Rules have been complied with in respect of fire, crew and passenger emergency and ship safety systems.

20.2.7 On completion of the general emergency alarm system and the public address system tests, the Surveyor is to be provided with two copies of the test schedule, detailing the measured sound pressure levels. Such schedules are to be signed by the Surveyor and the Builder.

20.3 High voltage cables

20.3.1 Before a new high voltage cable installation, or an addition to an existing installation, is put into service a voltage withstand test is to be satisfactorily carried out on each completed cable and its accessories. The test is to be carried out after the insulation resistance test required by 20.2.2 and may use either an a.c. voltage at power frequency or a d.c. voltage.

20.3.2 When an a.c. voltage withstand test is carried out, the voltage is to be not less than the normal operating voltage of the cable and it is to be maintained for a minimum of 24 hours.

20.3.3 When a d.c. voltage withstand test is carried out, the voltage is to be not less than:

- (a) $1,6 (2,5U_o + 2 \text{ kV})$ for cables of rated voltages (U_o) up to and including 3,6 kV, or
- (b) $4,2U_o$ for higher rated voltages

where U_o is the rated power frequency voltage between conductor and earth or metallic screen, for which the cable is designed.

The test voltage is to be maintained for a minimum of 15 minutes. After completion of the test the conductors are to be connected to earth for a sufficient period in order to remove any trapped electric charge. An insulation resistance test in accordance with 20.2.2 is then to be repeated.

20.4 Hazardous areas

20.4.1 All electric equipment located in hazardous areas is to be examined to ensure that it is of a type permitted by the Rules, has been installed in compliance with its certification, and that the integrity of the protection concept has not been impaired.

20.4.2 Alarms and interlocks associated with pressurised equipment and the ventilation of spaces located in hazardous areas are to be tested for correct operation.

■ Section 21 Spare gear

21.1 General

21.1.1 It is recommended that adequate spares, together with the tools necessary for maintenance, or repair, be carried. The spares are to be determined by the Owner according to the design and intended service. The maintenance of the spares is the responsibility of the Owner.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 1

Sections

- 1 **General requirements**
- 2 **Design criteria**
- 3 **Refrigerating machinery and refrigerant storage compartments**
- 4 **Refrigeration plant, pipes, valves and fittings**
- 5 **Refrigerant detection systems**
- 6 **Electrical installation**
- 7 **Instrumentation, control, alarm, safety and monitoring systems**
- 8 **Personnel safety equipment and systems**
- 9 **Refrigerated cargo spaces**
- 10 **Container ships fitted with refrigerating plant to supply cooled air to insulated containers in holds**
- 11 **Acceptance trials**

■ Section 1 General requirements

1.1 Application

1.1.1 The requirements of this Chapter apply to the refrigerated cargo installations of refrigerated cargo ships, refrigerated container ships, fish factory ships, fishing vessels, fruit juice carriers, and the reliquefaction/refrigerating plant of liquefied gas carriers and chemical carriers or tankers, where an **RMC** notation is requested.

1.1.2 Ships with refrigerated cargo installations which are approved, installed and tested in accordance with these requirements will be eligible for the applicable class notation specified in Pt 1, Ch 2.

1.1.3 The requirements for the classification of ships for the carriage of liquefied gas are given in Lloyd's Register's (hereinafter referred to as 'LR') *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases). Where reliquefaction or refrigeration equipment is fitted for cargo temperature and pressure control, the equipment is to comply with the requirements of Sections 2 to 11, as applicable.

1.1.4 The requirements for the refrigeration equipment and systems necessary for provision stores and air conditioning are specified in Pt 7, Ch 17.

1.2 Plans and particulars

1.2.1 The following plans and particulars, as applicable, and any others which may be specially requested for the **refrigerating plant and systems**, are to be submitted in triplicate for approval, before construction is commenced:

- (a) Schematic plans, including full particulars of piping and instrumentations, for:
 - primary and secondary refrigeration systems;
 - air cooler defrosting arrangements;
 - gas reliquefaction systems; and
 - condenser cooling water systems.
- (b) Detailed dimensioned plans and material specifications for:
 - reciprocating compressor crankshaft and crankcase, where exposed to refrigerant pressure;
 - rotary-type compressor rotors and casing;
 - condensers shell and tube and plate type;
 - evaporators shell and tube and plate type;
 - air coolers;
 - arrangement of air cooling pipe grids and construction method;
 - liquid receivers;
 - oil separators; and
 - any other pressure vessels, see Pt 5, Ch 11,6.1.
- (c) General arrangement of refrigerating machinery compartment in elevation and plan, showing location and arrangement of the plant, ventilation details and location of temperature sensors and vapour detectors.
- (d) Details of automatic controls, alarms and safety systems, see Ch 1,1.
- (e) Details of level indicators.
- (f) Where provision is made for the manufacture and/or storage of inert gas in liquid form, details of the storage vessel insulation arrangements and the reliquefaction equipment and piping system are to be submitted.
- (g) Capacity calculations for pressure relief valves and/or bursting discs, and discharge pipe pressure drop calculations, see 4.15.5 to 4.15.21.
- (h) Programme of tests to be conducted on completion of the installation, see Section 11.

1.2.2 The following plans and particulars, as applicable, and any others which may be specially requested for **refrigerated cargo spaces**, are to be submitted in triplicate for approval, before work is commenced:

- (a) Specification of proposed insulation envelope system, including physical, thermal and fire properties.
- (b) General arrangement of insulated refrigerated spaces in elevation and plan.
 - The plans are to be to a scale adequate for the measurement of the external surfaces and the deck and bulkhead edges.
 - Dimensions and spacing of frames, beams and stiffeners, and details of other steel work intruding into the insulation and within the spaces, are to be shown.
 - Oil fuel and liquid cargo tanks adjacent to or below the refrigerated spaces are to be shown, and whether heating arrangements are provided for such tanks are to be indicated.
 - Ventilating and air conditioning trunks, and ducts passing through refrigerated spaces are to be shown.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 1

- The plans are to include a diagram showing the position of the spaces in relation to other parts of the ship if this is not otherwise apparent.
- (c) Plans showing:
 - the thicknesses and methods of attachment of the insulation and linings on all surfaces including girders, hatch coamings and pillars; and
 - details of prefabricated panels and their fixings, vapour barriers, insulated doors and hatch access, bilge and manhole plugs and their frames.
- (d) Methods of attachment of air cooling grids (if fitted) are to be indicated.
- (e) Size and position of refrigerated space pressure equalising devices, where fitted, see 9.2.12 and 9.2.13.
- (f) Arrangements of the drainage system, and sounding and air pipes that pass through the refrigerated spaces.
- (g) Arrangements of air ducts and distribution systems within the refrigerated spaces (including method of cooling spaces within hatch coamings), and air cooler spaces showing location of the coolers and their fans and drive motors.
- (h) Details of temperature indicating, and recording and sensing equipment, and arrangement of sensors within the refrigerated spaces.

1.2.3 Single copies of the following plans and particulars are to be submitted:

- LR Data Sheet for refrigerated cargo installations (LR Form 3905).
- Specification of proposed refrigerating system and auxiliary equipment, including the refrigerating capacities of the compressors, condensers, evaporators and air coolers.
- Heat load calculations at all design operating conditions justifying the refrigerating capacity which is to be installed.

1.3 Materials

1.3.1 Steel plating used in ship construction is to be of an appropriate grade corresponding to the proposed temperature notation, see Pt 3, Ch 2,2.2.

1.3.2 Materials used in the construction of the refrigerating equipment and associated systems are to be generally manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.3.3 Where it is proposed to use materials other than those specified in Rules for Materials, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement with LR.

1.3.4 All materials used in refrigerating equipment and systems are to be suitable for use with the selected refrigerants. This includes joints, sealing materials and lubricants. For example, the following materials and refrigerants are not to be combined:

- Copper with ammonia.
- Magnesium with fluorinated hydrocarbons.
- Zinc with ammonia or fluorinated hydrocarbons.

1.3.5 For ammonia systems, the condensers/evaporators are to be manufactured in titanium or a suitable grade of stainless steel.

1.4 Equipment to be constructed under survey

1.4.1 All major items of equipment are to be surveyed at the manufacturer's works. The workmanship is to be to the Surveyor's satisfaction and the Surveyor is to be satisfied that the components are suitable for the intended purpose and duty. Examples of such units are:

- Crankshafts, crankcases, rotor shafts and casings for all compressors.
- Condensers.
- Evaporators (secondary refrigerant coolers).
- Air coolers.
- Pressure vessels (e.g. liquid receivers, surge drums, suction separators, intercoolers, oil separators).
- Cooling water pumps for condensers.
- Valves and other components intended for installation in pressure piping systems having a maximum working pressure greater than 7 bar.
- Thermal insulating panels (factory made).

1.5 Type approved equipment

1.5.1 Where it is proposed to use components (e.g. compressors, condensers, oil separators) which have valid LR Type Approval or General Approval Certificates, the types and model numbers of the components are to be stated. Plans of components that have been so approved need not be re-submitted.

1.6 Notation and temperature conditions

1.6.1 The class notation assigned will state the minimum temperature or a temperature range approved by the Committee for the installation with the maximum sea temperature stated, e.g. '⌘ Lloyd's RMC to maintain temperature(s) of minus 29°C to plus 14°C with sea temperature plus 32°C maximum'.

1.6.2 For refrigerated installations aboard container ships with approved refrigerating plant and arrangements to supply refrigerated air through ducting to insulated containers, the class notation assigned will additionally specify the maximum number and characteristics of the containers for which the plant is approved, e.g. 'to supply refrigerated air at temperatures of minus 25°C to plus 14°C to 800 certified insulated containers with an average thermal transmittance per container of 27 W/K with sea temperature plus 32°C maximum'.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 1 & 2

1.6.3 For reliquefaction or refrigerating plants aboard liquefied gas carriers, the notation assigned will state the minimum cargo temperature for which the installation is approved, unless otherwise qualified, see LR III.3 of the Rules for Ships for Liquefied Gases.

1.6.4 On application from an Owner, consideration will be given by the Committee to an alternative temperature notation being assigned to that appearing in the *Register Book*.

1.7 Novel arrangements and design

1.7.1 Where the proposed construction of the refrigerating plant or refrigerated spaces or chambers is novel in design or involves the use of unusual material, special tests may be required, and a suitable class notation may be assigned when the Committee considers this necessary.

1.8 Heat balance tests

1.8.1 A heat balance test will be required as prescribed in Section 11 on a classed installation, or one being considered for reclassification, when extensive repairs or alterations have been carried out, or when the Surveyors consider that an amended temperature condition should be assigned.

1.9 Controlled atmosphere (CA) systems

1.9.1 Where it is intended to install a CA system on a vessel intended for classification, the requirements of Pt 7, Ch 1 are to be complied with.

1.9.2 Where a **CA** notation is requested by an Owner, it is a prerequisite that the refrigeration installation be assigned an **RMC** notation.

1.10 Spare gear and refrigerant charge

1.10.1 It is recommended that adequate spares, together with the tools necessary for maintenance, or repair, be carried. The spares are to be determined by the Owner according to the design and intended service. The maintenance of the spares is the responsibility of the Owner.

1.10.2 For systems complying with 2.5.6 sufficient carbon dioxide is to be carried on board to allow the refrigeration system to be fully recharged. In addition, adequate reserve supplies of refrigerant are to be carried for maintenance purposes. The replacement refrigerant is to be stored in containers complying with 3.3.5.

Section 2 Design criteria

2.1 General

2.1.1 The proposed refrigerating plant, insulation and refrigerants are to be suitable for achieving the designed notation temperature. The refrigerating machinery and all components are to operate satisfactorily under the conditions listed in Table 1.3.1 in Pt 5, Ch 1.

2.1.2 The properties of steel materials used in refrigerated holds are to be suitable for the proposed notation temperature.

2.2 Refrigerants and classes of pipes

2.2.1 These Rules are applicable to the primary refrigerants in Table 3.2.1.

2.2.2 Attention is to be given to any statutory requirements, regarding the use of refrigerants, of the National Authority of the country in which the ship is to be registered.

2.2.3 Within the parameters of pressures, temperatures, toxic nature and flammability, the class of pipe to be used with various refrigerants is shown in Table 3.2.1.

2.2.4 Design conditions as applicable to the classes of pipes are defined in Pt 5, Ch 12, 1.5.

2.2.5 The materials of Class I and Class II piping systems are to be manufactured at a works approved by LR and tested in accordance with the appropriate requirements of Rules for Materials. Particular attention is drawn to Ch 6, 4 of the Rules for Materials, where testing requirements for pipes used for low temperature service are given.

2.2.6 The materials of Class III piping system are to be manufactured and tested in accordance with the requirements of acceptable National Specifications. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of materials.

2.2.7 Particulars of refrigerating systems using refrigerants other than those listed will be given special consideration.

2.3 Refrigeration units

2.3.1 A refrigerating unit is considered to comprise a compressor, its driving motor and one condenser. Where a secondary refrigerant, such as brine, is employed, the unit is also to include an evaporator (secondary refrigerant cooler) and a brine pump.

2.3.2 Two or more compressors driven by a single motor, or having only one condenser or evaporator (secondary refrigerant cooler) are to be regarded as one unit.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 2

Table 3.2.1 Primary refrigerants and their class of pipe

Refrigerant	Type	Composition	Class I	Class of Pipe Class II	Class III
R-717 (Ammonia)	NH ₃	—	✓	—	—
R-22	HCFC	—	—	✓	—
R-290 (Propane)	HC	—	—	✓	—
R-600a (Isobutane)	HC	—	—	✓	—
R-134a	HFC	—	—	—	✓
R-407C	Blend	R-32, R-125, R-134a	—	✓	—
R-410A	Blend	R-32, R-125	—	✓	—
R-507A	Blend	R-125, R-143a	—	✓	—
R-404A	Blend	R-134a, R-125, R-143a	—	✓	—
R-744 (Carbon Dioxide)	CO ₂	—		See 2.5.6	

NOTES

1. HCFC – Hydrochlorofluorocarbon.
2. HFC – Hydrofluorocarbon.s
3. HC – Hydrocarbon.
4. In view of increasing world-wide restrictive legislation and phasing out of the refrigerant R-22, it is recommended that this refrigerant should not be used in any new installation.
5. Although ozone depleting and global warming potentials are not included in these Rules for Classification, these effects are important and need to be considered when selecting the refrigerant for a particular application.

2.3.3 The refrigerating units of a classed cargo installation are to be completely independent of any refrigerating machinery associated with air conditioning plant, or any domestic refrigerated installation, or any process plant, unless full details of any proposal have been submitted and approved.

2.4 Refrigeration capacity

2.4.1 The refrigeration capacity provided is to be sufficient to maintain the temperatures specified in the class notation when operating 24 hours per day with one unit on standby. The plant is to be able to cool down a complete cargo to its carrying temperature within the time specified by the manufacturer. The standby unit may be considered as an operating unit during the cooling down period of a non-precooled cargo. In order to compensate for deterioration of machinery and insulation over the life of the installation, the equipment is to be designed to have at least five per cent excess capacity over that required for maximum design output.

2.4.2 The proposals of both machinery and insulating contractors will be evaluated by LR in determining the theoretical capabilities of the equipment to maintain the duty temperatures. LR will advise the contractors after appraisal of the specification and plans if it is considered that additional refrigeration or insulating effect is required, but the temperature assigned on completion of the capacity heat balance test will be determined from the actual results of the test.

2.4.3 Where the units are not connected in common to all refrigerated chambers, the equipment serving each group of chambers is to comply with 2.4.1.

2.4.4 In the case of installations having a large number of small units arranged to serve individual chambers or groups of chambers, the question of standby capacity will be specially considered.

2.4.5 Where only two refrigerating units are fitted, the working parts are to be interchangeable.

2.4.6 Where a refrigerating plant is provided for sub-cooling the liquid refrigerant of other units, but is not arranged for cooling the cargo chambers independently, it will not be regarded as a unit.

2.5 Design pressures

2.5.1 The design pressure of the system is to be regarded as equal to its maximum working pressure.

2.5.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No relief valve is to be set to a pressure higher than the maximum working pressure.

2.5.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure system.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 2 & 3

2.5.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be $1,11 \times P_b$, where P_b is an allowance for the compressor high pressure cut-out. P_b is to be at least equal to $1,11 \times P_a$, where P_a is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure at 46°C.

2.5.5 Design pressures (bar g) applicable to refrigerants are to be not less than the values given in Table 3.2.2 when condensers are sea-water cooled. The design pressure for other refrigerants and condensing arrangements is to be agreed with LR.

Table 3.2.2 Pressure limits

Refrigerant	Pressure (bar g)	
	High	Low
R-717	21,2	17,2
R-22	20,6	16,7
R-290	18,1	14,7
R-600a	6,4	5,2
R-134a	13,4	10,9
R-470C	23,5	19,0
R-410A	34,5	28,0
R-507A	25,3	20,5
R-404A	24,8	20,1
R-744	See 2.5.6	

2.5.6 Due to the low critical temperature of carbon dioxide it is inappropriate to determine the design pressure in accordance with 2.5.3. The proposed design pressure for a carbon dioxide system is to be stated, taking account of the maximum working pressure and the maximum pressure at rest conditions. Where the maximum pressure at rest condition is maintained by the fitting of a supplementary refrigeration unit, condensing the vapour in a holding vessel, supporting calculation is to be provided to show that this can be undertaken with a local ambient temperature of 45°C. The holding vessel is to be thermally insulated to prevent the operation of the relief devices within a 24 hour period after stopping the supplementary refrigeration unit at an ambient temperature of 45°C and an initial pressure equal to the starting pressure of the refrigeration unit.

2.5.7 Where a carbon dioxide system is designed for hot gas defrosting, due regard is to be given to the possibility of a higher pressure being imposed on the low pressure system. The design pressure for this section of the system shall be 10 per cent above the maximum pressure experienced during defrosting.

2.6 Insulation

2.6.1 Properties of materials used for thermal insulation are to be verified against known standards for the following parameters, as applicable, to ensure that they are adequate for the intended service. The following test results are to be made available to LR for approval:

- Closed cell content.
- Density.
- Mechanical properties.
- Thermal expansion.
- Abrasion.
- Cohesion.
- Thermal conductivity.
- Resistance to fire and flame spread.
- Ageing.
- Bonding (adhesive and cohesive strength).

2.6.2 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted for approval.

2.6.3 Where applicable, having regard to their location and environmental conditions, insulation materials are to be:

- suitably resistant to fire;
- suitably resistant to the spreading of flame;
- adequately protected against penetration of water vapour; and
- adequately protected against mechanical damage.

Section 3 Refrigerating machinery and refrigerant storage compartments

3.1 General

3.1.1 Refrigerating machinery is to be located in a well ventilated compartment. In general, the arrangements are to be such that all components of the refrigerating machinery can be readily opened up for inspection or replacement. Space is to be provided for the withdrawal and renewal of the tubes in 'shell-and-tube' type evaporators (brine coolers) and condensers. Proposals for alternative arrangements are to be submitted for consideration. See 3.2 for refrigerating machinery using ammonia.

3.1.2 Refrigerating machinery using toxic and/or flammable refrigerants is to be located outside the main machinery space in a separate gastight compartment.

3.1.3 Where the refrigerating machinery is located in a separate gastight compartment, outside the main machinery space, this compartment is to be equipped with effective mechanical ventilation to provide 30 air changes per hour based upon the total volume of the space. The mechanical ventilation is to have two main controls, one of which is to be operable from a place outside the compartment.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 3

3.1.4 Refrigerating machinery using non-toxic and non-flammable refrigerants will not, in general, be required to be located in a separate compartment outside the main machinery space.

3.1.5 Openings for pipes, electrical cables and other fittings in the bulkheads and deck are to be fitted with gastight seals.

3.1.6 Ammonia piping is not to pass through accommodation spaces.

3.2 Arrangements for compartments housing machinery using ammonia

3.2.1 Where ammonia refrigerant is used, the refrigerating machinery shall be installed in a dedicated gastight compartment. See also 3.2.9.

3.2.2 The compartment containing ammonia refrigerating machinery and any access ways are to be provided with independent mechanical ventilation capable of:

- removing the heat generated by the equipment installed in the compartment;
- maintaining the atmosphere in the compartment at acceptable vapour threshold levels under normal operating conditions; and
- disposing of ammonia vapour safely and quickly in the event of a major leakage.

3.2.3 The ventilation system is to be of the negative pressure type where abnormal stoppages of the extraction fans activate an audible and visual alarm.

3.2.4 Compartments containing ammonia refrigerating machinery, including process vessels, are to be provided with:

- a negative ventilation system, independent of ventilation systems serving other spaces, having a capacity of not less than 30 air changes per hour based upon the total volume of the space. Other suitable arrangements which ensure an equivalent effectiveness may be considered;
- fresh air inlets, located at a low level in the machinery compartment and arranged so as to provide a supply of fresh air and to minimise the possibility of re-cycling the exhaust air from the outlet;
- exhaust outlets, located at a high level and arranged so as to promote good air distribution throughout the compartment;
- a fixed ammonia detector system with alarms inside and outside the compartment;
- water screens above all access doors, operable manually from outside the compartment in all ambient conditions;
- an independent bilge system;
- where the charge is greater than 50 kg, emergency body shower and eye wash facilities shall be installed locally outside the compartment. The water for the shower is to be thermostatically controlled so as to avoid low temperature shock.

3.2.5 Compartments are to have at least two access doors, opening outwards, one of which is to be an emergency exit giving direct access to the open deck. The doors are to be fitted with an easily operated opening mechanism to facilitate rapid escape in an emergency. In the case of small compartments where more than one door would be impractical, the emergency exit only is to be provided.

3.2.6 At least two sets of self-contained breathing apparatus and protective clothing are to be provided, readily available in the vicinity of the compartment but external to the area of risk. See 8.1.4.

3.2.7 The location of the exhaust duct, from the compartment or area, is to be free from obstruction and be such as not to cause danger. Where practicable, they are to be 10 m, in the horizontal direction from other ventilation intakes and openings to accommodation and other enclosed areas, and at least 2 m above the surrounding deck.

3.2.8 Ventilation fans are not to produce a source of vapour ignition in either the ventilated compartment/area or ventilation system. Ventilation fans and fan ducts, in way of fans only, are to be of non-sparking construction.

3.2.9 In the case of ammonia plants on fishing ships under 55 m overall length, or ammonia plants with a charge of ammonia not greater than 25 kg, the refrigerating machinery may be located in the main machinery space provided it complies with the following requirements:

- The entrance to the machinery space is properly illuminated and marked and has warning signs permanently posted.
- The area where the ammonia machinery is installed is served by a hood with a negative ventilation system, so as not to permit any leakage of ammonia dissipating into other areas.
- A water spray system is provided for the area.
- Coamings, of not less than 150 mm in height, are installed around the ammonia machinery area.
- A fixed ammonia detector system with alarms inside and outside the main machinery space is provided.
- Means are provided for stopping the ammonia compressor prime movers from a position outside the machinery space.
- At least two sets of self-contained breathing apparatus and protective clothing are to be provided readily available in the vicinity of the compartment but external to the area of risk. See 8.1.4.
- Air intakes of other machinery are located away from the ammonia machinery area as far as is practicable.

3.3 Gas storage compartments

3.3.1 Portable steel cylinders containing reserve supplies of refrigerant are to be stored in a well ventilated compartment reserved solely for this purpose.

3.3.2 The compartment is to be provided with a mechanical ventilation system providing 10 air changes per hour and is to have at least one door opening outwards giving direct access to open deck.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 3 & 4

3.3.3 Bulk storage tanks holding more than 150 kg of replacement carbon dioxide are to be located in a separate compartment. The compartment is to be provided with a mechanical ventilation system having a minimum capacity of 6 air changes per hour. The ventilation system exhaust ducting is to remove air from the base of the compartment. The compartment is to be fitted with a gas tight access door opening outward.

3.3.4 The compartment is to be provided with a refrigerant vapour detection system.

3.3.5 The compartment is to be provided with suitable water drainage arrangements not connected with the main machinery spaces.

3.3.6 Steel storage cylinders are to be of an approved type, supplied by the refrigerant manufacturer and are to be filled to a level suitable for an ambient temperature of plus 46°C.

3.3.7 The compartment is to be provided with racks to facilitate secure stowage of the cylinders.

3.4 Compartments housing carbon dioxide containing equipment

3.4.1 Self closing gas tight access doors are to be provided between each compartment and the dedicated escape routes. See 5.1.5.

3.4.2 In compartments which are normally occupied and where the volume of ventilation required by 3.1.3 is not desirable, such as production areas on fishing vessels, a negative pressure ventilation system, capable of 10 air changes per hour, is required to be fitted. This ventilation system is to be automatically activated when, in the event of a leak the concentration of carbon dioxide reaches a predetermined level but in no case higher than the threshold limit value of 5,000 ppm.

4.1.3 Where ball or roller bearings are incorporated, they are to have a minimum life expectancy of 25 000 running hours, for the application in question.

4.1.4 A check valve is to be fitted to each compressor discharge.

4.1.5 Where off-loading devices are incorporated, arrangements are to be provided which indicate the extent of the off-loading being effected.

4.1.6 A pressure relief valve and/or safety disc is to be fitted between each compressor and its gas delivery stop valve in accordance with 4.15.5 and 4.15.6.

4.1.7 Stop valves are to be provided on compressor suctions and discharges.

4.1.8 Suction strainers and lubricating oil filters are to be provided and so arranged that they are easily accessible for cleaning or renewal of the filter elements, without substantial loss of refrigerant or lubricating oil.

4.1.9 The correct direction of rotation is to be permanently indicated.

4.1.10 Where any hermetic or semi-hermetic compressor has the electric motor cooled by the circulating refrigerant, the following arrangements are to be provided:

- (a) Refrigeration circuits are to contain no more than one hermetic or semi-hermetic compressor.
- (b) Every compressor motor is to be fitted with a thermal cut-out device to protect the motor against overheating.
- (c) In each refrigeration circuit containing a hermetic or semi-hermetic compressor, suitable arrangements shall be provided to remove debris and contaminants resulting from a motor failure. See 4.16.1.
- (d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of Pt 5, Ch 11 and Ch 17 as applicable. Plans are to be submitted for consideration as required by Pt 5, Ch 11, 1.6.

Section 4 Refrigeration plant, pipes, valves and fittings

4.1 General requirements for refrigerating compressors

4.1.1 New compressor types or developments of existing types are to be subjected to an agreed programme of type testing to complement the design appraisal and review of documentation.

4.1.2 Where it is proposed to treat the bearing surfaces either by local hardening or by chromium plating, then these processes are to be confined to the bearing area and not extended to the fillets. Particulars of the process are to be submitted.

4.2 Reciprocating compressors

4.2.1 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:

- (a) Carbon and carbon-manganese steel castings – 400 to 550 N/mm².
- (b) Carbon and carbon-manganese steel forgings (normalised and tempered) – 400 to 600 N/mm².
- (c) Carbon and carbon-manganese steel forgings (quenched and tempered) – not exceeding 700 N/mm².
- (d) Alloy steel castings – not exceeding 700 N/mm².
- (e) Alloy steel forgings – not exceeding 1000 N/mm².
- (f) Spheroidal or nodular graphite iron castings – 370 to 800 N/mm².

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 4

- (g) Grey iron castings –
not less than 300 N/mm².

4.2.2 Where it is proposed to use materials outside the ranges specified in 4.2.1, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

4.2.3 Materials for components of reciprocating compressors such as crankshafts, pistons, piston rods, crank cases, etc., are to be produced at a works approved by LR and in general to be tested in accordance with the Rules for Materials.

4.2.4 A fully documented fatigue strength analysis is to be submitted indicating a factor of safety of 1,5 at the design loads based on a suitable fatigue strength criteria. Alternatively, the requirements of 4.2.5 to 4.2.9 may be used.

4.2.5 The diameter, d , of a compressor crankshaft using one of the refrigerants detailed in 2.5, is to be not less than that determined by the following formula, when all cranks are located between two main bearings:

$$d = V_c \left(\frac{D^2 p Z}{78,5} \left(\frac{S}{16} + \frac{ab}{a+b} \right) \right)^{1/3} \text{ mm}$$

where

a = distance between inner edge of one main bearing and the centreline of the crankpin nearest the centre of the span, in mm

b = distance from the centreline of the same crankpin to the inner edge of the adjacent main bearing, in mm

$a + b$ = span between inner edges of main bearings, in mm

d_p = proposed minimum diameter of crankshaft, in mm

p = design pressure, in bar g, as defined in 2.5

D = diameter of cylinder, in mm

S = length of stroke, in mm

V_c = 1,0 for shafts having one cylinder per crank, or

= 1,05 for 90°

= 1,18 for 60°

= 1,25 for 45°

} between adjacent
cylinders on the
same crankpin

for the shaft and cylinder arrangements as detailed in Table 3.4.1

$$Z = \frac{560}{\sigma_u + 160} \text{ for steel}$$

$$Z = \frac{700}{\sigma_u + 260 - 0,059d_p} \text{ for spheroidal or nodular graphite cast iron}$$

$$Z = \frac{700}{\sigma_u + 260 - 0,069d_p} \text{ for grey cast iron}$$

σ_u = specified minimum tensile strength of crankshaft material, in N/mm².

4.2.6 Where the shaft is supported additionally by a centre bearing, the diameter is to be evaluated from the half shaft between the inner edges of the centre and outer main bearings. The diameter so found for the half shaft is to be increased by six per cent for the full length shaft diameter.

Table 3.4.1 Angle between cylinders

Number of crankpins	Number of cylinders per crank	Angle between cylinders, in degrees		
1 or 2	2	45	60	90
3	2	45	60	—
4	2	45	60	—
1	3	45	60	90
2	3	45	60	—
3	3	45	—	—
1	4	45	60	—
2	4	45	—	—

4.2.7 The dimensions of crankwebs are to be such that Bt^2 is to be not less than given by the following formulae:

$0,4d^3$, for the web adjacent to the bearing

$0,75d^3$, for intermediate webs

where

B = breadth of web, in mm

d = minimum diameter of crankshaft as required by 4.2.5, in mm

t = axial thickness of web which is to be not less than $0,45d$ for the web adjacent to the bearing, or $0,60d$ for intermediate webs, in mm.

4.2.8 Fillets at the junction of crankwebs with crankpins or journals are to be machined to a radius not less than $0,05d$. Smaller fillets, but of a radius not less than $0,025d$, may be used provided the diameter of the crankpin or journal is not less than cd ,

where

$$c = 1,1 - 2 \frac{r}{d} \text{ but to be taken as not less than } 1,0$$

d = minimum diameter of crankshaft as required by 4.2.5, in mm

r = fillet radius, in mm.

4.2.9 Fillets and oil holes are to be rounded to an even contour and smooth finish.

4.2.10 An oil level sight glass is to be fitted to the crankcase.

4.2.11 Compressors with cylinder bores in excess of 50 mm diameter are to be provided with arrangements to relieve high cylinder pressures such as would result from 'hydraulic lock' (i.e. liquid refrigerant in the cylinders). Alternatively the provision of positive means to prevent liquid refrigerant reaching the compressor may be accepted.

4.2.12 The crankcases of trunk piston compressors are to be designed to withstand a pressure equal to the maximum working pressure of the system. The crankcases of compressors of the crosshead type which are substantially isolated from the refrigerant circuit may be designed for lower pressures but are to be provided with relief valves adjusted to lift at a pressure not exceeding the design pressure, and discharging to a safe place.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 4

4.2.13 A crankcase heater, arranged to be energised when the compressor is stopped, is to be provided.

4.3 Screw compressors

4.3.1 For screw-type compressors, the materials of the rotors and casings are to be produced, and the manufacture is to be carried out, at a works approved by LR, and in general, they are to be tested in accordance with the Rules for general machinery forgings.

4.3.2 The rotor casing is to be designed for the maximum pressure to which it may be subjected, see 2.5.

4.3.3 Where gearing is fitted to increase the rotor speed and also to locate the rotors, the gearing is to comply with Pt 5, Ch 5. The manufacturer's maximum allowable tolerances for clearances and backlash between mating rotors are to be stated.

4.4 Pressure vessels and heat exchangers

4.4.1 The term 'pressure vessel' will normally apply to receivers and heat exchangers, and does not include any of the following:

- Compressors.
- Liquid refrigerant pumps.
- Pipes and their fittings.

The use of plate heat exchangers will be specially considered on submission of plans, and special tests may be required.

4.4.2 Fusion welded steel pressure vessels exposed to the pressure of the refrigerants are to be constructed in accordance with the requirements of Pt 5, Ch 11 and Ch 17. Plans are to be submitted for consideration if required by Pt 5, Ch 11,1.6.

4.4.3 Where ammonia is the refrigerant, the pressure vessels are to be constructed to at least Class 2/1 requirements.

4.4.4 Pressure vessels for the containment of primary refrigerants for use in conventional refrigeration circuits where the pressure/saturation temperature relationship applies are not required to be low temperature impact tested unless the design temperature is lower than minus 40°C.

4.4.5 Pressure vessels are to be thermally insulated to an extent which will minimise condensation of moisture from the surrounding atmosphere. The insulation is to be provided with an efficient vapour barrier and adequately protected from mechanical damage. Prior to applying the insulation, the steel surfaces are to be suitably protected against corrosion.

4.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated is to be protected with overpressure relief devices, see 4.15.

4.5 Condensers, oil coolers and evaporators

4.5.1 In order to minimise the risk of corrosion, where the refrigerant is ammonia, the material interface between the primary refrigerant and cooling water or secondary refrigerant is to be of a suitable grade of stainless steel. Carbon-manganese steel with a suitable inhibitor would also be acceptable.

4.5.2 Space is to be provided for the withdrawal and replacement of condenser and evaporator tubes, see 3.1.1.

4.5.3 Where ammonia is used as the refrigerant, the refrigerating plant is to comply with the following additional requirements:

- (a) Automatic air purgers are to be provided, with their discharges being led through water before venting to atmosphere.
- (b) The cooling water returns from sea-water cooled condensers are not to be led into the main machinery spaces.
- (c) Fresh water condenser cooling systems are to be provided with pH meters to activate audible and visual alarms in the event of an ammonia leak.

4.6 Liquid receivers

4.6.1 Primary refrigerating systems are to be provided with liquid receivers with sufficient capacity to hold the complete refrigerant charge to prevent emission of the refrigerant to the atmosphere during servicing or repairs.

4.6.2 Alternatively, in systems using a secondary refrigerant, with a number of units, smaller receivers may be used provided the system includes a common storage receiver with sufficient capacity to hold at least the primary refrigerant charge from two units. The common receiver is to be provided with the necessary crossover connections to facilitate transfer of refrigerant to and from each unit in the system.

4.7 Oil separators

4.7.1 Oil separators are to be provided at compressor discharges and are to be fitted with a control arrangement to enable the separated oil to be returned to the compressor crankcase. Wire gauze used in separators is to be sufficiently robust and well supported.

4.8 Air coolers and cooling grids

4.8.1 Refrigerated spaces may be cooled by air coolers or cooling grids on the ceiling, bulkheads and sides. In order to minimise the dehydration of the cargo and the frosting of the air coolers or cooling grids, the installation is to be designed to maintain the required notation temperatures with a minimum of difference between the refrigerant and space temperatures.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 4

4.8.2 Individual spaces are to have a minimum of two independent air coolers, each comprising one or more fans and one or more refrigerant circuits in a single casing and with isolating valves. Alternatively, multiple circuits each with their own fan(s), in a single cooler casing may each be regarded as a separate cooler, provided stop valves are fitted so that each circuit may be isolated.

4.8.3 For refrigerated spaces having a net volume of 300 m³ or less, a single cooler with one circuit will be accepted.

4.8.4 The refrigeration capacity of the air cooler arrangement is to be such that the notation temperature conditions can be maintained with any one independent cooler or circuit out of action. The capacities of the fans are also to be such that they can maintain the required air flow rates (see also 9.4) and uniform air temperature throughout the refrigerated spaces, when part or fully loaded with cargo, with any one cooler or fan out of action.

4.8.5 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.

4.8.6 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. Provision is to be made for the prevention of freezing of the condensate.

4.8.7 Air coolers are to be located such that when the refrigerated spaces are loaded with cargo, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.

4.8.8 The cooling grids in each refrigerated space are to be arranged in not less than two sections, and each section is to be fitted with valves so that it can be shut off. The notation temperature conditions are to be capable of being maintained with any one section isolated. For spaces having a net volume of 300 m³ or less, a single section will be acceptable.

4.8.9 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

4.9 Refrigerant pumps

4.9.1 Pumped primary and/or secondary refrigerant systems are to have a minimum of two pumps. Each pump is to be capable of operating on all cargo chambers and maintaining full duty with any one pump out of operation.

4.9.2 Primary and, where appropriate, secondary refrigerant pumps are to be provided with pressure relief valves, see 4.15.13.

4.10 Condenser cooling water pumps

4.10.1 At least two separate condenser cooling water pumps are to be installed. One of the pumps may be considered as a standby pump and may be used for other purposes, provided that it is of adequate capacity and its use on other services does not interfere with the supply of cooling water to the condensers.

4.10.2 Not less than two sea inlets are to be provided supplying sea-water to the pumps for condenser cooling. It is recommended that one of the sea inlets be provided on the port side and the other on the starboard side. The sea inlets are to be fitted in accordance with Pt 5, Ch 13.2.6.

4.10.3 The cooling water pumps and sea inlets are to be suitably valved and cross-connected with each condenser.

4.10.4 Suitable spring-loaded safety valves are to be provided in each cooling water circuit, see 4.15.13.

4.11 Piping systems

4.11.1 All piping, valves and fittings are to be suitable for the maximum pressure to which the system can be subjected and are to comply with the requirements of Pt 5, Ch 12.

4.11.2 Pipework for ammonia (R-717) is to comply with Class I requirements.

4.11.3 In addition to visual examination of pipe welds, non-destructive examination of pipe welds is to be carried out in accordance with the requirements of Chapter 13 of the Rules for Materials to the satisfaction of the Surveyors.

4.11.4 All steel pipework on the low temperature part of the system is to be protected against external corrosion. Protective coatings are to be removed from pipe surfaces to a distance of not less than 50 mm either side of the joint weld preparations prior to welding. On completion of welding and testing a protective coating is to be applied.

4.11.5 Where brine is the secondary refrigerant, piping and tanks should not be galvanised on the brine side. If any parts of the brine system have been galvanised, the brine cooling and return tanks are to be provided with a ventilating pipe or pipes led to the atmosphere in a location where no damage will arise from the gas discharged. The ventilation pipes are to be fitted with wire gauze diaphragms which can be readily renewed.

4.11.6 Copper piping is to be manufactured in accordance with Pt 5, Ch 12.3 except in the case of small air coolers having finned pipes of sizes not greater than 19 mm outside diameter, and which have been fabricated under workshop conditions. The finned pipes may have a minimum wall thickness of 0,5 mm when used with R-22 and R-134a refrigerants.

4.11.7 Where the use of plastics pipe is proposed in a secondary refrigerant system (e.g. brine), it is to be in accordance with Pt 5, Ch 12.5.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 4

4.11.8 Pipelines are to have ample provision for expansion and contraction in service conditions. In general, expansion bends are to be used for this purpose. However, the use of metallic expansion bellows will be accepted provided test data is produced showing satisfactory strength and fatigue properties under the appropriate conditions.

4.11.9 All pipelines are to be fully supported and secured so as to prevent vibration. Flexible hoses may be used, where necessary, to prevent transmission of vibration provided the documentation in 4.11.8 is provided. Flexible hoses are to be of a type which has been approved by LR, see Pt 5, Ch 12.6.

4.11.10 Pipework, which may contain low temperature refrigerant, except within secondary refrigerant cooler rooms, is to be thermally insulated to an extent which will minimise condensation of moisture. Insulation in pre-formed sections is recommended. If *in situ* foamed insulation is employed, pre-production testing on site is to be carried out to the satisfaction of the Surveyor, using a 'mock-up' representative of the system to be employed.

4.11.11 All pipe insulation is to be provided with an efficient vapour barrier, care being taken to ensure that it is not interrupted in way of supports, valves, etc. Also adequate protection of insulation surfaces from mechanical damage is to be provided.

4.11.12 Where refrigerating piping is embedded in the cargo chamber insulation, the locations of the pipe joints are to be marked on the outside of the insulation lining.

4.12 Joints

4.12.1 Butt welded pipe joints are to be employed as far as practicable. Socket welded pipe joints are acceptable up to 25 mm diameter. Flanged or other joints are to be kept to a minimum and, in general, are to be restricted to connections with items of machinery or components which may have to be removed for maintenance purposes. Connections to valves are normally to be welded unless they are of a type, or in a position, which precludes *in situ* maintenance.

4.12.2 Pipe connections to fittings (e.g. gauge lines, level controls) which are likely to be subjected to heavy corrosion, are to be of heavy gauge construction, or be made from suitable corrosion resistant materials.

4.13 Liquid level indicators

4.13.1 Where liquid level indicators of the 'see-through' variety are used they are to be of the flat plate type incorporating glass (or equivalent material) of heat resistant grade.

4.13.2 All level indicators are to be provided with automatic shut-off devices and isolating valves. Plate-type sight glasses which form an integral part of the component in which they are mounted (e.g. compressor crankcases, pressure vessels) are exempt from this requirement.

4.13.3 All level indicators are to be suitable for the system maximum working pressure and tested accordingly.

4.14 Automatic expansion valves

4.14.1 Refrigerating systems with automatic expansion valves are also to be provided with efficient hand expansion valves and the arrangement is to be such that the automatic expansion valves can be by-passed and isolated.

4.14.2 As an alternative, duplicate automatic expansion valves may be fitted, each valve to be capable of the required duty and operable with the other out of action.

4.15 Overpressure protection devices

4.15.1 Refrigeration systems are to be provided with relief devices, but it is important to avoid circumstances which would bring about an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that pressure due to fire conditions will be safely relieved.

4.15.2 Pressure relief devices are to be mounted in such a way that it is not possible to isolate them from the part of the system which they are protecting except that, where duplicated, a changeover valve may be fitted which will allow either device to be isolated for maintenance purposes without it being possible to shut off the other device at the same time.

4.15.3 Relief discharge is to be led to a safe place above deck away from personnel accesses and air intakes. Discharge piping should be designed to preclude ingress of water, dirt or debris which may cause the equipment to malfunction.

4.15.4 For ammonia systems, discharge from relief valves is to be led through water before venting to the atmosphere. Vapour detectors are to be provided in the discharge pipes to activate audible and visual alarms in the event of a leakage of ammonia.

4.15.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The flow capacity of the valve or disc is to exceed the full load compressor capacity on the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

4.15.6 Compressors protected by bursting discs are to be provided with automatic shutdown in the event of high discharge temperatures.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 4

4.15.7 Each compressor is to be provided with automatic shutdown in the event of high discharge pressure. For refrigeration systems where the maximum working pressure is less than or equal to 40 bar g the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,9 of the maximum working pressure. For refrigeration systems where the maximum working pressure is greater than 40 bar g the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,95 of the maximum working pressure.

4.15.8 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of stop or automatic control or check valves is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device.

4.15.9 Pressure vessels which are interconnected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any vessel.

4.15.10 Omission of one of the specified relief devices and the changeover device, as required by 4.15.8, will be allowed where:

- vessels are of less than 300 litres internal gross volume; or
- vessels discharge into the low pressure side by means of a relief valve.; or
- vessels operating using only cargo gas and, which can be independently isolated and gas freed during normal cargo operations provided that a shelf spare is carried.

4.15.11 Sections of systems and components which could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.

4.15.12 Refrigerant pumps are to be provided with pressure relief valves on the discharge side, which may relieve to the suction side, or to another suitable location.

4.15.13 Suitable spring-loaded safety valves are to be provided on the cooling liquid side of condensers and the brine side of evaporators where the pressure from any pump or expansion of the liquid in the circuit could exceed the design pressure of the system or any component forming part of the cooling system.

4.15.14 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system, as defined in 2.5.

4.15.15 When satisfactorily adjusted, relief valves are to be protected against tampering or interference by a wire with a lead seal or similar arrangement.

4.15.16 Valves which are arranged to discharge to the low pressure side of the system are to be substantially independent of back pressure and are to be of a type which has been approved by LR.

4.15.17 The minimum required discharge capacity related to air of the pressure relief device for each pressure vessel is to be determined as follows:

$$C = D L f$$

where

- C = minimum required discharge capacity related to air of each relief device, in kg/s
 D = outside diameter of the vessel, in metres
 L = length of the vessel, in metres
 f = factor which is dependent on the refrigerant:
- | | |
|---|--------|
| R-717 (Ammonia) | 0,041 |
| R-22, R-134a, R-407C | 0,131 |
| R290 (Propane), R-600a (Isobutane) | 0,082 |
| R-410A, R-404A, R-507A | 0,203 |
| R-744 (Carbon dioxide) | |
| (when used on the low side of a cascade system) | 0,082. |

4.15.18 The rated discharge capacity of the pressure relief valves expressed in kg/s of air may also be determined in accordance with an appropriate recognised National or International Standard such as *ISO 5149 Mechanical Refrigeration Systems used for Cooling and Heating – Safety Requirements*.

4.15.19 The rated discharge capacity of a bursting disc discharging to atmosphere under critical flow conditions is to be determined by the following formula:

$$d = 857,5 \sqrt{\frac{C}{P}} \text{ mm}$$

where

- d = minimum diameter of free aperture of bursting disc, in mm
 C = minimum required air equivalent discharge capacity, in kg/s, see 4.15.17
 P = 1,1 x maximum working pressure, see 2.5.

4.15.20 The bore of the discharge pipe shall be at least the same bore as the relieving device outlet. The size of a common discharge line serving two or more pressure relieving devices which may discharge simultaneously shall be based on the sum of their outlet areas. Where discharge lines are long or where the outlets of two or more pressure relieving devices are connected into a common line, the discharge piping shall be sized such that the back pressure at full relief rate does not exceed 10 per cent of the relief valve set pressure.

4.15.21 Due account is to be taken of the reaction force on a relief valve or on discharge piping during discharge and adequate support provided.

4.15.22 As carbon dioxide can form a solid powder at atmospheric pressure, there is a possibility that relief devices will choke if vented directly to atmosphere. The method used to guard against the formation of powder is to be submitted for consideration.

4.15.23 In carbon dioxide systems, overpressure protection is to be fitted to pipelines or components which can be isolated in a liquid full condition. Pressure relief devices are to be arranged such as to vent vapour at all times.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 4

4.15.24 In cascade systems where carbon dioxide is used in combination with ammonia, the effects of carbon dioxide leaking into the ammonia side are to be considered. It may be desirable to design the ammonia system to either withstand the design pressure on the carbon dioxide side or have relief arrangements to safely deal with the additional vapour produced if a leak occurs.

4.16 Filters, driers and moisture indicators

4.16.1 Suitable filters are to be provided in the refrigerant gas lines to compressors and in the liquid lines to refrigerant flow controls. Wire gauze used in filters is to be sufficiently robust and well-supported. A filter may be combined with the oil separator required by 4.7.1. Stop valves are to be provided to allow for servicing of filters. After first commissioning of the system, the filters should be examined to confirm that elements remain intact and not collapsed.

4.16.2 Refrigerant filters, driers and moisture indicators are to be fitted in halocarbon refrigerant systems, and the arrangement is to be such that filters and driers can be bypassed, isolated and opened up without interrupting plant operations.

4.17 Purging devices

4.17.1 Where the operating pressure of the low pressure system may be below atmospheric, a purging device is to be provided, the discharge from which is to be led to a safe place above deck.

4.18 Piping in way of refrigerated spaces

4.18.1 All sounding pipes, whether for compartments or tanks, which pass through refrigerated spaces or the insulation thereof, in which the temperatures contemplated are 0°C or below, are to be not less than 65 mm bore. The pipework is to be in accordance with the requirements of Pt 5, Ch 12 and Pt 5, Ch 13,2.9.

4.18.2 Sounding pipes to oil compartments are not to terminate within refrigerated spaces or in their air cooler spaces, nor are these pipes to terminate in enclosed spaces from which access is provided to refrigerated spaces or their air cooler spaces.

4.18.3 All pipes, including scupper pipes, air pipes and sounding pipes that pass through refrigerated spaces are to be insulated.

4.18.4 Where the pipes referred to in 4.18.3 pass through chambers intended for temperatures of 0°C or below, they are also to be insulated from the steel structure, except in positions where the temperature of the structure is mainly controlled by the external temperature and will normally be above freezing point. Pipes passing through a deck plate within the ship side insulation, where the deck is fully insulated below and has an insulation ribband on top, are to be attached to the deck plating. In the case of pipes adjacent to the shell plating, metallic contact between the pipes and

the shell plating or frames is to be avoided so far as practicable.

4.18.5 The air refreshing pipes to and from refrigerated spaces need not, however, be insulated from the steelwork.

4.19 Drainage from refrigerated spaces

4.19.1 Provision is to be made for the continuous drainage of the inside of all refrigerated spaces and cooler trays. The pipework is to be in accordance with the requirements of Pt 5, Ch 12 and Pt 5, Ch 13,3.2.

4.19.2 All drain pipes from the refrigerated spaces and cooler trays are to be fitted with liquid sealed traps, which are to be of adequate depth and readily accessible for cleaning and refilling with brine. The pipes from lower spaces situated on the tank tops are also to be fitted with bilge non-return valves.

4.19.3 Where drains from separate refrigerated spaces join a common main, the branch pipes are each to be provided with a liquid sealed trap.

4.19.4 Sluices, scuppers or drain pipes which would permit drainage from compartments outside the refrigerated spaces into the bilges of the latter, are not to be fitted.

4.19.5 Screwed plugs or other means for blanking off scuppers, draining chambers and cooler trays are not to be fitted. If, however, it is specially desired to provide means for temporarily closing these scuppers, they may be fitted with shut-off valves.

4.20 Corrosion protection of metal fixtures

4.20.1 All steel bolts, nuts, hangers, brackets and fixtures which support or secure cooling appliances, piping insulation, meat rails, linings and prefabricated insulated panels, etc., are to be suitably protected against corrosion.

4.21 Pressure testing at manufacturers' works

4.21.1 Components intended for use with a primary refrigerant are to be subject to strength and leak pressure tests as detailed in Table 3.4.2.

Table 3.4.2 Test pressure

Component	Test pressure, bar g	
	Strength test	Leakage test
1. Pressure vessels	See Pt 5, Ch 11	1,0p
2. Compressor cylinders/ crankcase/casing	1,5p	1,0p
3. Valves and fittings	2,0p	1,0p
4. Pressure piping, fabricated headers, air coolers, etc.	1,5p	1,0p
NOTE p is the design pressure as defined in 2.5.		

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 4, 5 & 6

4.21.2 Component strength pressure tests are to be hydraulic or where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.

4.21.3 Component leakage pressure tests are to be carried out only after completion of satisfactory strength pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.

4.21.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure, but in no case less than 3,5 bar g.

4.22 Pressure test after installation on board ship

4.22.1 For primary refrigerant piping welded in place, strength pressure tests of the welds are to be carried out at a test pressure of 1,5*p*. This will normally take the form of a pneumatic test since hydraulic testing media such as water are not acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.

4.22.2 Pneumatic pressure tests are to be carried out using a suitable inert gas. All pneumatic tests are potentially dangerous and due precautions are to be observed.

4.22.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by 4.22.2 may be omitted provided non-destructive tests by ultrasonic or radiographic methods are carried out with satisfactory results on the entire circumference of all butt welds not tested in accordance with 4.11.3. Where ultrasonic tests have been carried out, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have a prejudicial effect on the service performance of the piping.

4.22.4 After completion of the test required by 4.22.1, 4.22.2 or 4.22.3, a leak pressure test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the Surveyor.

4.22.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure, but in no case less than 3,5 bar g.

5.1.2 The alarm system is to comply with the requirements of Chapter 1 and, as a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and a high-level concentration corresponding to the refrigerant's safe occupational level.

5.1.3 Detection equipment is to be so designed that it may be readily tested and calibrated, and failure of the equipment is to initiate an alarm.

5.1.4 The location of the detectors is to be determined relative to the layouts of the individual compartments and machinery spaces and are to be indicated on the plan submission.

5.1.5 For carbon dioxide systems, spaces such as machinery rooms, storage compartments, production areas on fishing vessels and valve stations, where leakage may occur, are to be fitted with detectors. Welded pipelines passing through passageways or access ducts are not considered possible leakage areas.

5.1.6 Audible and visual alarms are to be activated, located both inside and outside the affected space. The alarms are to be readily identifiable and be visible and audible in all locations within the space housing the refrigeration equipment.

5.2 Ammonia vapour detection and alarm equipment

5.2.1 A fixed detector system for ammonia is to comply with the requirements contained in 5.1.2.

5.2.2 The location of the detectors is to be determined relative to the layouts of the individual spaces and are to be indicated on the plan submission required by 1.2.

5.2.3 Ammonia vapour detectors are to be provided in the refrigeration machinery compartment, associated access ways, the exhaust ducts, the ammonia store room and the discharge pipes from pressure relief valves.

5.2.4 Sufficient detectors are to be provided to monitor the total areas of the above spaces.

5.2.5 For vapour detection in relief valve discharge pipes, see 4.15.4.

5.2.6 Details of the refrigerant detector set points and operational philosophy are to be submitted for consideration.

Section 5 Refrigerant detection systems

5.1 General

5.1.1 A fixed refrigerant detection system is to be provided in the refrigerating machinery compartment or space, the discharge pipes from pressure relief valves, ventilation outlet ducts, and the cargo chambers, where appropriate.

Section 6 Electrical installation

6.1 General

6.1.1 Where the refrigerating machinery is to be electrically driven, the requirements of Ch 2,2 are to be complied with, as applicable.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 6 & 7

6.1.2 The generating capacity available for the refrigerated installation is to be sufficient to supply power to the installation during cooling down of a complete cargo to, and maintenance of, the notation temperature conditions in all refrigerated spaces at the Rule maximum ambient and sea-water temperatures.

6.1.3 Electrical equipment is not to be installed in spaces in which ammonia refrigerant is used or stored unless it is essential for operational purposes. Where electrical equipment is installed in such spaces the requirements of 6.2 are to be complied with.

6.2 Electrical equipment for use in explosive gas atmospheres

6.2.1 Lighting fittings are to be of a certified safe-type and be arranged on at least two independent final branch circuits. Switches and protective devices are to interrupt all lines or phases and are to be located outside the space.

6.2.2 Where electric motors driving ventilation fans are located within the spaces, within ventilation ducts, or within three metres of ventilation openings, they are to be of a certified safe-type.

6.2.3 Monitoring control and alarm systems which are required to operate under conditions of ammonia leakage are to be of a certified safe-type.

6.2.4 Electrical equipment which is not of a certified safe-type is to de-energize automatically if the ammonia concentration within the space exceeds 1,0 per cent by volume.

Section 7 Instrumentation, control, alarm, safety and monitoring systems

7.1 Instrumentation

7.1.1 All compressors are to be provided with the following instrumentation and automatic shutdowns:

- Indication of suction pressure (saturated temperature), including intermediate stage, when applicable.
- Indication of discharge pressure (saturated temperature), including intermediate stage, when applicable.
- Indication of lubricating oil pressure.
- Indication of cumulative running hours (screw compressors).
- Automatic shutdown in the event of low lubricating oil pressure.
- Automatic shutdown in the event of high discharge pressure, see also 4.15.7.
- Automatic shutdown in the event of low suction pressure.

7.1.2 The automatic safety equipment is to be designed to fail safe and the arrangements are to be such that the compressors can be operated manually with the equipment out of action, in accordance with the relevant requirements of Chapter 1.

7.1.3 For installations greater than 25 kW the following instrumentation, additional to that required by 7.1.1, is to be provided:

- Indication of lubricating oil temperature.
- Indication of cooling water outlet temperature.
- Indication of cumulative running hours (reciprocating compressors).
- Indication of suction and discharge temperatures.

7.2 Control, alarm and safety systems

7.2.1 Where the refrigerating system is fitted with automatic or remote controls, so that under normal operating conditions no manual intervention by the operators is required, it is to be provided with the alarms required by 7.2.2 and 7.2.3 in accordance with the relevant requirements of Chapter 1.

7.2.2 Alarms are to be initiated in the event of the following compressor fault conditions:

- High discharge pressure.
- Low suction pressure.
- Low oil pressure.
- High discharge temperature.
- High oil temperature.
- Motor shutdown.

7.2.3 Alarms are also to be initiated in the event of the following fault conditions:

- Failure of condenser cooling water pumps.
- High condenser cooling water outlet temperature.
- Failure of air cooler fans.
- High and low refrigerated air delivery temperatures.
- High secondary refrigerant temperatures.
- Failure of secondary refrigerant pump.
- Failure of air refreshing fans.
- Low level in secondary refrigerant header tank.

7.3 Temperature monitoring and recording

7.3.1 Temperature sensors are to be of a type which has been approved by LR. The number of sensors and their locations are to be such as to give a true measurement of the temperatures within the refrigerated spaces and of the cooler delivery and return air temperatures.

7.3.2 At least one automatic recorder is to be provided for the remote monitoring and continuous recording of air temperatures within the refrigerated spaces, and delivery and return air temperatures of individual air coolers. Where only one recorder is installed, at least one sensor in each refrigerated space or in its air distribution system is to be connected to a separate remote temperature indicating instrument.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 7 & 8

7.3.3 Where the equipment controlling the temperature of the air delivered from the air coolers is equipped with a temperature indicator, this indicator will be given consideration as a standby instrument.

7.3.4 In the case of freezer fishing vessels, where the catch is frozen on board and stored in a refrigerated space, thermometer(s) hung within each space(s) will be accepted as the standby temperature indicator, provided the space is accessible at all times.

7.3.5 Automatic temperature recorders and temperature indicators are to be of a type which has been approved by LR and, where appropriate, are to be in accordance with the requirements of Chapter 1. Approval will be granted on the basis of compliance with 7.3.6 and 7.3.7, together with satisfactory environmental testing in accordance with the requirements of LR's Type Approval System. This is to include low temperature testing at the class notation minimum temperatures for any components which may be installed in environments subject to temperatures below ambient.

7.3.6 All temperature instrumentation is to be accurate to within $\pm 0,15^{\circ}\text{C}$ of the true temperature in the range minus 3°C to plus 15°C , and to $\pm 0,3^{\circ}\text{C}$ in other parts of the range and is to register to 0,1 of a degree Celsius.

7.3.7 Where the installation is intended for the carriage of frozen cargo only, the readings need only be accurate to within $\pm 0,5^{\circ}\text{C}$ of the true temperature, throughout the range.

7.3.8 A spirit-in-glass thermometer is to be carried on board for checking purposes, which is to be calibrated to a recognised National Standard.

7.3.9 Thermometer tubes with their flanges and covers are to be insulated from the deck plating, and on weather decks they are to be so arranged that water will not run down the tubes when temperatures are being taken.

7.3.10 The inside diameter of thermometer tubes is to be not less than 50 mm, and the tubes are not to be in contact with cold decks.

7.3.11 Where thermometer tubes pass through compartments other than those which they serve, they are to be efficiently insulated.

8.1.2 Access ways to the refrigerated space are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.

8.1.3 Access ways and air cooler spaces are to be provided with an independent lighting system in accordance with the requirements of Ch 2,5.7.2 and Ch 2,5.7.4, with the means of locking the switches in the 'on' position.

8.1.4 Where ammonia is used in refrigerating systems, the following items of safety equipment are to be provided as a minimum, and positioned in accessible protected storage (e.g. locked glass fronted cabinets) located outside the machinery compartment:

- Two sets of ammonia protective clothing (including helmet, boots and gloves).
- Two portable battery powered hand lamps (to be of certified safe-type).
- Two sets of self-contained breathing apparatus (compressed air).
- Two full face mask respirators.
- Two fire-resistant life-lines.
- Two firemen's axes.
- Two heavy duty adjustable spanners.
- Two wheel wrenches.
- Irrigation facilities or eye wash bottles containing an eye wash solution, distilled water or non-carbonated mineral water.
- Hand or foot-operated douches providing a copious supply of clean water, located outside the compartment's doors. See 3.2.4.

8.2 Personnel warning systems

8.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.

8.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the Surveyors must indicate their well-being by accepting the warning.

8.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.

8.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.

8.2.5 In the event that the crew member(s) fail(s) to respond and accept the warning within an agreed specified time, the system is to immediately initiate an alarm on the bridge and in the engineers' accommodation. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.

8.2.6 The system is to comply with the relevant requirements of Chapter 1.

Section 8

Personnel safety equipment and systems

8.1 Personnel safety equipment

8.1.1 Access doors and hatches to the refrigerated spaces and air cooler spaces are to be provided with an external locking arrangement.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 9

■ Section 9 Refrigerated cargo spaces

9.1 Airtightness of refrigerated spaces

9.1.1 The envelopes of individual refrigerated spaces, enclosing each temperature zone, are to be sufficiently airtight to prevent infiltration of water vapour and cross-contaminating odours. Each envelope is to be hose-tested for tightness before the insulation is installed. Alternative proposals to test with gas or air under pressure will be considered.

9.1.2 Hatch closing appliances, access doors, side loading doors, bilge and manhole plugs forming part of an insulated envelope are to be made airtight and, where exposed to ambient conditions, are to be provided with a double seal.

9.1.3 Ventilators, ducts or pipes passing through refrigerated spaces to other compartments are to be made airtight and efficiently insulated. Particular attention is to be given to insulation linings forming surfaces of air ducts. Ventilators to refrigerated spaces, if fitted, are to be provided with airtight closing appliances.

9.1.4 Refrigeration pipes passing through bulkheads or decks of refrigerated chambers or spaces are not to be in direct contact with the steelwork. The temperature of the ship's steelwork close to low temperature refrigeration piping must not be lower than that acceptable for the steel grade, see also Pt 3, Ch 2.2.2. The airtightness of the bulkheads and decks is to be maintained and, where the pipes pass through watertight decks and bulkheads, the fittings and packing of the glands are to be both fire resisting and watertight.

9.2 Insulation systems

9.2.1 Steelwork and fittings are to be clean and dry, and suitably coated to prevent corrosion, before insulation is applied.

9.2.2 *In situ* insulation and insulating panels are to be of a type that has been approved by LR and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the *Procedure for LR Type Approval System* will be supplied on application. Prefabricated panels, with an organic foam core and metal or similar cladding both sides, are also to be manufactured under survey at a works approved by LR. Organic foam materials are to be certified as self-extinguishing. All materials are to be free from odour likely to cause taint.

9.2.3 The thickness of insulation over all surfaces and the manner in which it is supported are to be in accordance with the approved specification and plan.

9.2.4 The insulation is to be efficiently packed and, where it is of slab form, the joints are to be butted closely together and staggered. Where it is intended to use a foamed *in situ* type of insulation, full details of the process are to be submitted for approval before the work commences and pre-production testing on site is to be carried out to the satisfaction of the Surveyor, using a 'mock-up' representative of the system to be employed. Prefabricated panels are to be of a design such that, when erected, continuity of the insulation envelope is maintained without any gaps. Gaps between panels or insulation slabs are to be filled with insulating material to the satisfaction of the Surveyor.

9.2.5 The inner surfaces of insulation envelopes are to be clad with a suitable lining, such as marine grade aluminium or plywood, or equivalent material which is:

- impermeable;
- able to withstand wear and tear and the flexing of the ship's structure without fracture at the notation temperatures;
- non-corrosive, non-rotting; and
- free from odour likely to cause taint.

Where prefabricated panels are employed the outer surfaces are also to be clad with a suitable lining.

9.2.6 Insulation linings are to be constructed and fitted so that they are airtight and provide an effective vapour barrier. The means of joining prefabricated panels are to have sufficient mechanical strength to maintain a vapour barrier on the inner and outer faces. All joints, including corner, deck, deckhead and tank top intersections are to be sealed with a suitable flexible, water vapour resistant sealant or gasket. Special care is necessary where air ducts are embedded in the insulation, and where refrigeration pipes, air refreshing ducts, fan supports, fixtures, etc., protrude through the linings.

9.2.7 Hatch covers and plugs, access doors, manhole plugs, bilge limbers and plugs forming part of the insulated envelope are to be constructed of, or covered with, a suitable lining material.

9.2.8 Insulation linings and air screens, together with supports, are to be strong enough to withstand the loads imposed by either refrigerated or general cargo.

9.2.9 Successive coatings impervious to oil are to be applied before insulating the exposed plating of tank tops and bulkheads protecting tanks containing oil. The total thickness of the required coating will depend on the construction of the tank, the composition of the coating used and the method of application.

9.2.10 If the cargo to be loaded on the tank top insulation could cause damage to the lining, then additional protection is to be provided in way of the hatch and 0,6 m beyond. The protection may be of either a permanent or temporary nature.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 9 & 10

9.2.11 Where the insulation is to support fork lift trucks, the strength of the lining and its supports is to be demonstrated. A sample of the insulation, approximately 4 m x 4 m, is to be prepared and tested by a fully loaded fork lift truck with a gross weight of 6,5 tons on one axle with a wheel pitch of 1450 mm, having single wheeled pneumatic tyres. The truck is to be driven and manoeuvred over the sample to the satisfaction of the Surveyors.

9.2.12 Prefabricated panel systems are to be fitted with suitable pressure equalising devices to prevent damage which may be caused by under or over pressure resulting from the defrosting of coolers, rapid changes in pressure on the inner and outer faces of the panels or rapid cooling of the chamber.

9.2.13 The pressure equalising devices are to be so designed as to allow the passage of air in either direction, but remain effectively closed until the pressure differential reaches a value of 10 mm water column. Heating is to be provided to protect the mechanism from freezing.

9.3 Access plugs and panels

9.3.1 Insulated plugs are to be provided in the insulation where required for easy access to the bilges, bilge suction strum boxes, cooler and chamber drains and tank manhole lids. Removable panels are to be provided for access to tank air and sounding pipes and drains.

9.3.2 Tank top insulation in way of manholes and bilge hats is to be provided with a liquid-tight steel coaming to prevent seepage into the insulation.

9.3.3 Manholes are not permitted in the bulkheads of fuel oil tanks which form part of the cargo space envelope.

9.4 Air circulation and distribution

9.4.1 When frozen cargo is carried, provision is to be made for the adequate circulation of air between the frozen cargo and all the insulation lining surfaces.

9.4.2 When cooled cargo is carried, of a type which may generate heat or emit gas, provision is to be made for the adequate circulation of air through all the stow.

9.4.3 There is to be adequate air flow between cargo and cooling grids, where fitted.

9.4.4 The air distribution arrangements are to be such that the required circulation rate and uniform distribution can be achieved when the space is part or fully loaded with cargo. The arrangement is also to be capable of maintaining uniform air temperature throughout the space with any one fan, or air cooler, or cooling grid circuit out of action, see 4.8.

9.5 Air refreshing arrangements

9.5.1 Where spaces are intended for the carriage of refrigerated cargoes requiring controlled ventilation, means are to be provided for air refreshing. The positions of the air inlets are to be carefully selected to minimise the possibility of contaminated air entering the spaces. Chambers or spaces are to be provided with separate inlet and discharge vents. Each vent is to have a positive airtight valve capable of closing onto a seat. It is recommended that a distance of at least 3 m is maintained between inlet and exhaust vents.

9.6 Heating arrangements for fruit cargoes

9.6.1 Where the class notation includes the symbol ‡ for the carriage of fruit cargoes, facilities for heating the refrigerated spaces are to be provided to maintain the carrying temperatures when the temperatures outside the spaces are lower.

Section 10 Container ships fitted with refrigerating plant to supply cooled air to insulated containers in holds

10.1 General

10.1.1 Classed installations designed to supply refrigerated air to insulated 'porthole' containers in holds aboard container ships are to comply with the requirements of Sections 1 to 9 and 11, so far as they are applicable, and the special requirements of this Section.

10.1.2 The classed refrigerating installation is to include the refrigerating machinery, air coolers, supply and return air ducting, and the flexible couplings between containers and the duct system. Where the arrangements are such that cell air conditioning is essential to the carriage of the containers, the air conditioning equipment and (if fitted) the insulation of the hold, deckheads, sides and tank tops are to be included in the classification.

10.2 Additional information and plans

10.2.1 In addition to those requirements detailed in Section 1 which are also applicable to refrigerated container ships, the following information is to be submitted before the work commences:

- Details of air coolers.
- Details of the design of ducting proposed, including joints, connections, insulation, vapour sealing and linings.
- Details of cell air conditioning arrangements and components.
- Details of couplings between ducting and containers, including operating arrangements.

Refrigerated Cargo Installations

Part 6, Chapter 3

Sections 10 & 11

10.3 Air coolers

10.3.1 Air ducts supplying more than ten standard 20 ft containers or five standard 40 ft containers are to have a single air cooler with multiple circuits or two independent coolers. The individual circuits or coolers are to be provided with stop valves so that each circuit or cooler may be readily isolated.

10.3.2 The refrigeration capacity of the air cooler arrangement is to be such that the temperature conditions can be maintained with any one circuit or independent cooler out of action.

10.3.3 For air ducts supplying ten standard 20 ft containers or five standard 40 ft containers or less, a single cooler with one circuit will be acceptable.

10.4 Air duct systems

10.4.1 The air ducts, together with all branches and couplings, supplying refrigerated air to insulated containers in holds, are to be made airtight. For design purposes, however, an air leakage rate of 0,5 per cent of total volume flow at the design pressure for each duct is to be taken.

10.4.2 Where air ducting is insulated on the internal surfaces, provision is to be made to prevent retention of odour which may taint subsequent cargo.

10.4.3 Couplings are to be of a type that has been approved by LR. Prototypes are to be tested under all operating conditions, witnessed by the Surveyors, to demonstrate that they extend, retract and separate satisfactorily from a 'container end wall' at the minimum temperature condition. When operated by means of air pressure they are to be supplied with air sufficiently dry to avoid ice formation. The air supply lines are to be strength pressure tested to 1,5 x design pressure.

10.5 Duct air leakage and distribution tests

10.5.1 Air leakage tests on at least 10 per cent of ducting, selected at random, are to be carried out to the satisfaction of the Surveyors before the insulation is applied. The Surveyors may require further testing to demonstrate airtightness of ducting. The air leakage from each duct will depend on several factors and, while complete airtightness should be the objective, the air leakage rate for design purposes is not to exceed 0,5 per cent of total volume flow at the design pressure of 250 Pa.

10.5.2 In the case of prefabricated ducts, the prototype is to be subjected to air distribution, heat leakage and air leakage tests. Each production duct is to be tested for air leakage and is not to exceed the prototype test results by more than five per cent. Additionally, one duct in 50 or part thereof is to be tested for heat leakage and the results are not to exceed the prototype test results by more than 10 per cent.

10.5.3 In all cases when prefabricated sections are assembled on board, the tests as detailed in 10.5.2, are to be carried out aboard the ship.

10.5.4 On application from the Owner, the air leakage tests on air ducts installed aboard the ship, as detailed in 10.5.1 to 10.5.3, may be omitted provided that:

- the installation is designed with at least 20 per cent surplus refrigerating capacity, or
- assignment of a temperature notation for the installation be deferred until verified by a thermal balance test to the Surveyor's satisfaction.

10.5.5 All ducts are to be tested for air distribution to the containers, at the manufacturer's works, by measuring the flow of air from the supply couplings while the fan is operated at full speed against the designed pressure. The air flow at each coupling is to meet the specified figure within ± 5 per cent.

10.5.6 Systems comprising rigid prefabricated ducts complete with coolers and fans are to be tested for air distribution at the place of manufacture. The remaining tests are to be carried out aboard the ship.

10.6 Cell air conditioning arrangements

10.6.1 The cell air conditioning equipment and ducting, and/or insulation of the holds, deckheads, sides and tank tops, is to be such as to maintain a uniform temperature throughout the cell and to ensure the ship's steelwork is maintained above the minimum temperature acceptable for the steel grade, see also Pt 3, Ch 2,2.2.

Section 11 Acceptance trials

11.1 Tests after completion

11.1.1 On completion of construction, the acceptance tests prescribed in 11.3.1 are to be carried out to verify the correct functioning of the installation and its ability to maintain the lowest notation temperature conditions required for the assignment of the intended class notation. The proposed test schedules, which should include methods of testing and test facilities provided, are to be submitted for approval before these acceptance tests are started.

11.2 Thermographic survey

11.2.1 The insulated envelope of refrigerated cargo ships and, where applicable, fish factory ships, fishing vessels, fruit juice carriers and container ships is to be scanned using a thermal imaging camera. The main purpose of carrying out the infra-red scan is to verify the efficiency of the insulation system.

Refrigerated Cargo Installations

Part 6, Chapter 3

Section 11

11.2.2 During the course of, or prior to, the acceptance trials all inner insulated surfaces, including tank tops, bulkheads, 'tween decks, insulated hatches, coamings and weather decks are to be subject to an infra-red scan.

11.2.3 Where internal obstructions preclude an internal scan, it is to be carried out externally.

11.2.4 The scan is to be conducted with the 'tween deck and main holds in total darkness and with air coolers/cooling grids isolated and all heat sources disconnected. The temperature difference, cargo hold to ambient air or sea-water temperature, is to be 15 K or more.

11.2.5 Any deficiencies or abnormalities revealed are to be investigated and repaired to the extent considered necessary by the Surveyor.

11.3 Acceptance tests

11.3.1 The acceptance tests (see also 11.3.2 and 11.3.3) are to comprise the following:

- (a) Verification of control, alarm, safety and refrigerant detection systems.
- (b) Test simulating failure of selected components such as compressors, fans and pumps, to verify correct functioning of alarm and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control, monitoring and recording instrumentation.
- (d) Verification of air cooler fan outputs running at maximum speed, and air circulation rates and distribution arrangements in individual refrigerated spaces or chambers. The latter is to be undertaken firstly with all coolers in operation and secondly with any one cooler or fan out of action.
- (e) Verification of air refreshing and heating arrangements.
- (f) Verification of personnel safety devices and warning systems in refrigerated spaces.
- (g) Refrigeration and thermal balance tests to demonstrate the capability of the combined refrigerating plant and insulation envelope to maintain the lowest notation temperature to be assigned.
- (h) Refrigeration tests for refrigerated container ships carrying 'porthole' type insulated containers. If the prescribed thermal balance tests cannot be carried out due to the number of insulated containers available in the shipyard being inadequate, then, alternatively, the following separate tests will be accepted:
 - (i) Compressor capacity test.
 - (ii) Duct heat leakage test on at least 20 per cent of the insulated ducting selected at random.
 - (iii) Cell heat leakage test.
- (j) Thermographic scan to be carried out as required by 11.2.

11.3.2 Where a number of identical installations are constructed for the same Owner and by the same shipyard, the refrigeration and thermal balance tests required in 11.3.1(g), need only be carried out on two of the series, provided the results are satisfactory.

11.3.3 Where the cells of 'porthole' type insulated containers are not insulated, a heat leakage test will be required on the first ship of the series only.

11.4 Sea trials

11.4.1 Where the class notation includes the symbol ‡ for the carriage of fruit, or the symbol ‡ is to be assigned to a fishing vessel the following records are to be kept during the first loaded voyage:

(a) Refrigerated cargo or container ships:

Refrigerating machinery logs and temperature records for the refrigerated cargo spaces or containers, demonstrating the installation's capability to cool down the full cargo of fruit and maintain the notation temperature conditions.

(b) Fishing vessels:

Refrigerating machinery and freezing equipment logs and temperature records for the refrigerated cargo spaces, demonstrating the installation's capability to freeze the catch and maintain the notation temperature conditions.

11.5 Reporting of tests

11.5.1 On completion of the tests prescribed in 11.1, two copies of the test schedule for the refrigerated cargo installation, giving details of all recorded data and thermal heat balance results, signed by the Surveyor and Builder are to be provided. One copy is to be placed on board the ship and the other submitted to LR.

11.5.2 At the end of the first loaded voyage a copy of the logs and temperature records requested in 11.4.1(a) and (b), as applicable, signed by the ship's Chief Engineer, are to be submitted to LR.

Fire Protection, Detection and Extinction Requirements

Part 6, Chapter 4

Sections 1 & 2

Section

1 General

2 Fire detection, protection and extinction

■ Section 1 General

1.1 Application

1.1.1 Cargo ships of 500 gross tons or more, all passenger ships and gas and chemical tankers on international voyages, where provision is made within International Conventions are to be provided with the fire safety measures required by the *International Convention for the Safety of Life at Sea*, 1974, as amended (SOLAS 74). Fishing vessels of 45 m freeboard length and over are to be provided with the fire safety measures required by the Torremolinos Protocol of 1993 relating to the *Torremolinos International Convention for the Safety of Fishing Vessels*, 1977 (Torremolinos Protocol).

1.1.2 Cargo ships of 500 gross tons or more, all passenger ships, and gas and chemical tankers, employed on national voyages are to comply with the fire safety measures prescribed and approved by the Government of the flag state.

1.1.3 It is the responsibility of the Government of the flag state to give effect to the fire protection, detection and extinction requirements of 1.1.1 and 1.1.2. However Lloyd's Register (hereinafter referred to as 'LR') will undertake to do this in cases where:

- (a) contracting Governments have authorised LR to apply the requirements of SOLAS 74 or the Torremolinos Protocol and issue the appropriate certification on their behalf; or
 - (b) the Government of the flag state is not a signatory to SOLAS 74 or the Torremolinos Protocol; or
 - (c) the ship or fishing vessel is to be classed for restricted or special service in national waters for which the Government of the flag state has no national requirements. In such cases, LR will apply the fire safety measures required by SOLAS 74 or the Torremolinos Protocol, as appropriate.
- However, due consideration will be given to arrangements deemed to provide an equivalent level of fire safety, taking due cognisance of the circumstances of the restricted or special service.

1.1.4 Section 2 of this Chapter, which is within the spirit of the International Convention and Protocol requirements for ships of Convention size, is applicable to cargo ships of less than 500 gross tons (where not covered by International Conventions), fishing vessels of 12 m registered length and over but less than 45 m freeboard length, and ships not fitted with propelling machinery.

1.1.5 Consideration will be given to the acceptance of fire safety measures prescribed and approved by the Government of the flag state in lieu of 1.1.4.

1.1.6 Special consideration, consistent with the fire hazard involved, will be given to construction or arrangement features not covered by this Chapter.

1.1.7 Cargo ships of less than 500 gross tons intended for the carriage of dangerous goods are to comply with SOLAS 1974 as amended II-2/G.19.

■ Section 2 Fire detection, protection and extinction

2.1 General provisions

2.1.1 The provisions of these requirements, are intended to apply to new and, as far as reasonable and practicable, or as found necessary by the relevant Administration, to existing cargo ships of less than 500 gt.

2.1.2 It should be remembered that the *International Codes for the Construction and Equipment of Ships carrying Dangerous Chemicals in Bulk and Liquefied Gases in Bulk* are applicable to such ships regardless of size including those of less than 500 gt.

2.2 Definitions

2.2.1 The terms, used in these requirements are as defined in SOLAS 1974 (as amended).

2.2.2 The term Gross Tonnage (gt) is as defined in IMO Resolutions A.493 (XII), calculated in accordance with the 1969 Tonnage Convention and the interim scheme applicable to ships with keels laid up to 18 July 1994 in accordance with IMO Resolution A.494 (XII).

2.2.3 Service area definitions

- (a) 'Unrestricted service' means a ship engaged on international voyages.
- (b) 'Restricted service' is broken down into two broad categories: (a) ships operating coastal or specified operating areas (b) ships operating within protected or extended protected waters.

- (i) **Specified coastal service.** Service along a coast, the geographical limits of which are to be defined and for a distance out to sea generally not exceeding 20 nautical miles, unless some other distance is specified for 'coastal service' by the Administration with which the ship is registered, or by the Administration of the coast off which it is operating. A typical example might be 'Indonesian coastal service'.

Specified operating or service areas may be service between two or more ports or other geographical features, or service within a defined geographical area such as 'Red Sea Service', 'Piraeus to Thessaloniki and Islands within the Aegean Sea'.

- (ii) **Protected water service.** Service in sheltered water adjacent to sand banks, reefs, breakwaters to other coastal features, and in sheltered water between islands.

Extended protected water service. Service in protected waters and also short distances (generally less than 15 nautical miles) beyond protected waters in 'reasonable weather'.

2.3 Surveys and maintenance

2.3.1 The hull, machinery and all equipment required for safety aspects of every ship should be constructed and installed so as to be capable of being regularly maintained to ensure that they are at all times, in all respects, satisfactory for the ship's intended service.

2.3.2 A competent authority should arrange for appropriate surveys of the required equipment relating to fire safety aspects during construction and, at regular intervals after completion, generally as prescribed within Chapter I of SOLAS 1974 (as amended). Such surveys should be carried out by the Society classing the ship or the Flag State.

2.3.3 The condition of the structural fire protection and fire safety related equipment shall be maintained to conform with the provisions of the requirements to ensure that the ship in these respects, will remain fit to proceed to sea without danger to the ship or persons on board. The hull structure and machinery do not form part of these requirements but should be similarly surveyed and maintained.

2.4 Requirements

2.4.1 Table 4.2.1 details the various minimum fire protection, detection and extinction arrangements that are required depending on the vessel's intended service area.

Fire Protection, Detection and Extinction Requirements**Part 6, Chapter 4**

Section 2

Table 4.2.1 General fire detection, protection and extinction requirements

Fire-fighting	Unrestricted	Restricted	Protected
1. FIRE PUMPS Ships greater than 150 gt Independently driven power pumps Power pumps Hand pumps Ships less than 150 gt Independently driven power pumps Power pumps Hand pumps	 1 1 — — 1 1	 1 1 — — 1 1	 1 — 1 — 1 —
2. FIRE HYDRANTS Sufficient number and so located that at least one powerful water jet can reach any normally accessible part of ship	X	X	X

Controlled Atmosphere Systems

Part 7, Chapter 1

Sections 1 & 2

Section

- 1 **General requirements**
- 2 **Plans and documentation**
- 3 **CA zones and adjacent spaces**
- 4 **Gas systems**
- 5 **Relative humidity (RH)**
- 6 **Electrical installation**
- 7 **Control instrumentation and alarms**
- 8 **Safety requirements**
- 9 **Inspection and testing on completion**

■ Section 1 General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to refrigerated cargo ships where a Controlled Atmosphere (CA) notation is requested.

1.1.2 The requirements are additional to the classification requirements for refrigerated cargo installations contained in Pt 6, Ch 3.

1.1.3 Ships provided with CA systems which are approved, installed and tested in accordance with the following requirements will be eligible for the applicable class notation specified in Pt 1, Ch 2,2.5.2.

1.1.4 An example of a typical class notation on a refrigeration installation classed with Lloyd's Register (hereinafter referred to as 'LR'), fitted with a CA system built under Special Survey, would be:

⊗ **Lloyd's RMC** to maintain a temperature -29°C to $+14^{\circ}\text{C}$ with sea temperature 35°C maximum.

⊗ **CA (1–12% O₂, 0–25% CO₂) RH**

1.2 Novel arrangements and design

1.2.1 Where the proposed construction of the CA system, or CA zones, is novel in design, or involves the use of unusual materials or equivalent arrangements to those specified in the following sections, special tests may be required, and a suitable descriptive note may be assigned.

1.3 Definitions

1.3.1 **CA zone** means one or more cargo chambers enclosed in an air-tight envelope.

1.3.2 **Gas** means a suitable gaseous mixture to retard the metabolic process of fresh products.

1.3.3 **Gas system** means a system which controls the levels of oxygen and/or carbon dioxide.

1.3.4 **Adjacent space** means an enclosed space adjoining a CA zone separated by watertight bulkheads or decks penetrated by pipes, cables, ducts, doors, 'tween deck, etc.

■ Section 2 Plans and documentation

2.1 Plans of CA zones and adjacent spaces

2.1.1 The following plans and particulars of the CA zones and adjacent spaces are to be submitted in triplicate for approval before construction is commenced:

- (a) Capacity plan.
- (b) Location and installation of CA equipment.
- (c) Arrangement of CA zones in elevation and plan view.
- (d) Access arrangement.
- (e) Arrangement and use of spaces adjacent to CA zones.
- (f) Details of securing weather deck and 'tween deck hatch lids.
- (g) Details of securing gratings in way of hatch lids.
- (h) Details of weather deck and access hatch seals.
- (i) Door seals, scuppers, pipes, cables and ducts penetrating the decks, bulkheads, etc., together with proposed design conditions in the CA zones.
- (k) Specified leakage rate and proposals for its measurement.
- (l) Location of sampling points for CA gas and/or sensors in the CA zones and adjacent spaces.
- (m) Details of the gas supply piping system.
- (n) Details of gas freeing arrangements, including fans, valves, ducts and any interlocks.
- (o) Details of pressure/vacuum valves for protecting devices in CA zones, location of outlets from P/V valves and capacity calculations.
- (p) Details of security locks provided on entry to the hatch and manhole covers, and doors leading to CA zones and adjacent spaces.
- (q) Arrangements of ventilation systems for the gas generator compartment and other adjacent spaces adjoining CA zones.

Controlled Atmosphere Systems

Part 7, Chapter 1

Sections 2 & 3

2.2 Gas supply system

2.2.1 The following plans and particulars of the gas supply system, etc., are to be submitted in triplicate for approval, before construction is commenced:

- (a) Schematic arrangements of the proposed gas supply systems and, where applicable, details of compressors, pressure vessels, membranes, storage tanks, gas cylinders, control and relief valves and safety arrangements, including pressure set points of alarm and safety devices.
- (b) Capacities of gas supply systems at different oxygen and carbon dioxide levels, if applicable.

2.3 Humidifiers

2.3.1 Where applicable, the following plans and particulars of the humidification system, etc., are to be submitted in triplicate for approval, before construction is commenced:

- (a) Specification and capacity of the system.
- (b) Principles of operation and control of relative humidities under different operating conditions.
- (c) Details of proposed equipment, nozzles, pads, heaters, pumps, steam generator, compressors, water tanks, etc.
- (d) Layouts of the equipment and the positioning of sensors and controls.

2.4 Control equipment

2.4.1 The following plans and details of the control, alarm and safety systems for CA zones, gas supply compartment and other adjacent spaces, are to be submitted in triplicate before construction is commenced:

- (a) Line diagrams of all control circuits.
- (b) List of monitored, control and alarm points.
- (c) Details of computer systems, if fitted.
- (d) Location of control panels and consoles.
- (e) Controls of all valves and dampers fitted to CA zones.
- (f) Details of oxygen and carbon dioxide analysers and arrangements for calibration.
- (g) Relative humidity (RH) sensors and details of calibration.
- (h) Details of alarm system, including location of central control panel and audible and visual warning devices.

2.5 Electrical

2.5.1 In addition to the applicable requirements of Pt 6, Ch 2, 1.2, the following information and plans specific to the installed CA system are to be submitted in triplicate for approval, before construction is commenced:

- (a) Main power supply arrangement to the CA system.
- (b) Single-line diagram of the CA system which is to include rating of electrical machines, insulation type, size and current loading of cables and make, type and rating of protective devices.
- (c) A schedule of normal operating loads of CA system, estimated for the different operating conditions expected.

2.6 Testing

2.6.1 Details of the testing programme are to be submitted, including instrumentation to be used with range and calibration.

Section 3 CA zones and adjacent spaces

3.1 Air-tightness of CA zones

3.1.1 The CA zones are to be made air-tight in accordance with the requirements in 9.3. Particular attention is to be paid to sealing of hatches, plugs and access doors in each CA zone. Double seals are to be fitted to each opening.

3.1.2 Openings for pipes, ducts, cables, sensors, sampling lines and other fittings passing through the decks and bulkheads are to be suitably sealed and made air-tight.

3.1.3 The liquid sealed traps from bilges and drains from the cooler trays are to be deep enough to withstand, when filled with liquid which will not evaporate or freeze, the design pressure in each CA zone when taking account of the ship's motion.

3.1.4 Air refreshing inlets and outlets are to be provided with isolating arrangements.

3.2 CA zone protection

3.2.1 Means are to be provided to protect CA zones against the effect of overpressure or vacuum.

3.2.2 At least two P/V valves are to be fitted in each CA zone. They are to be set for the design conditions of the CA zone.

3.2.3 Consideration will be given to the use of a single valve in combination with other suitable means of overpressure or vacuum protection.

3.2.4 The proposed P/V valves for each zone are to be of adequate size to release any excess pressure and to relieve the vacuum at maximum cooling rate.

3.2.5 P/V valve discharges are to be located at least 2 m above deck and 10 m away from any ventilation inlets. Discharge piping is to be arranged to preclude ingress of water, dirt or debris which may cause the equipment to malfunction.

3.2.6 Pressure sensors are to be installed in locations necessary to monitor pressure of all CA zones. Pressure sensors are to be installed away from fans, air inlets and outlets.

Controlled Atmosphere Systems

Part 7, Chapter 1

Sections 3 & 4

3.3 Gas freeing of CA zones

3.3.1 The arrangements for gas freeing of CA zones are to be capable of purging all parts of the zone to ensure a safe atmosphere.

3.3.2 Cargo air cooling fans and the air refreshing arrangements may be used for gas freeing operations.

3.3.3 Gas freeing outlets are to be led to a safe place in the atmosphere 2 m above the deck, away from accommodation spaces and intakes of the fans for accommodation.

3.4 Ventilation of adjacent spaces

3.4.1 Deckhouses and other adjacent spaces which require to be entered regularly are to be fitted with a positive pressure type mechanical ventilation system with a capacity of at least 10 air changes per hour capable of being controlled from outside these spaces.

3.4.2 Adjacent spaces not normally entered are to be provided with a mechanical ventilation system which can be permanent or portable to gas free the space prior to entry.

3.4.3 Ventilation inlets are to be arranged so as to minimise recycling any gas and are to be at least 10 m in the horizontal direction away from the ventilation outlets.

Section 4 Gas systems

4.1 General

4.1.1 Means are to be provided to achieve and maintain the required oxygen and/or carbon dioxide levels in the CA zones. This may be accomplished by the use of stored gas, portable or fixed gas generating equipment or other equivalent arrangements. The arrangements are to be such that a single failure will not cause a complete loss of gas supply to the CA zones.

4.1.2 The gas system is to have sufficient capacity to make good any gas loss from the CA zones and to maintain a positive pressure in all CA zones.

4.1.3 The gas system is also to be able to:

- Deliver gas at 125 per cent of the specified flow rate with two compressors operating.
- Maintain the specified gas levels in all CA zones when operating 24 hours per day with one unit on stand-by.

4.1.4 Air intakes are to be located to ensure that contaminated air is not drawn into the compressors.

4.1.5 Where it is intended to supply gas by means of stored gas bottles, the arrangements are to be such that depleted bottles may be readily and safely disconnected and charged bottles readily connected.

4.2 Location

4.2.1 Fixed gas generating equipment, gas bottles or portable gas generators are to be located in a compartment reserved solely for their use. Such compartments are to be separated by a gastight bulkhead and/or deck from accommodation, service and control station spaces. Access to such compartments is to be only from the open deck.

4.2.2 Gas piping systems are not to be led through accommodation, service and machinery spaces or control stations.

4.3 Gas supply

4.3.1 The gas systems are to be designed so that the pressure which they can exert on any CA zone will not exceed the design pressure of the zone.

4.3.2 During initial operation, arrangements are to be made to vent the gas outlets from each generator to the atmosphere. All vents from gas generators are to be led to a safe location on the open deck.

4.3.3 Where gas generators use positive displacement compressors, a pressure relief device is to be provided to prevent excess pressure being developed on the discharge side of the compressor.

4.3.4 Suitable arrangements are to be provided to enable the supply main to be connected to an external supply.

4.3.5 Where it is intended that gas systems are to be operated unattended, the required CA zone environment is to be automatically controlled.

4.3.6 Means of controlling inadvertent release of nitrogen into CA zones, such as locked valves, are to be provided.

4.4 Gas supply compartment ventilation and alarm

4.4.1 The gas supply compartment is to be fitted with a mechanical extraction ventilation system providing a rate of at least 20 air changes per hour based on the total empty volume of the compartment.

4.4.2 Ventilation ducts from the gas generator/supply compartment are not to be led through accommodation, service and machinery spaces or control stations.

4.4.3 The air outlet duct is to be led to a safe place on the open deck.

4.4.4 The gas supply compartment is to be provided with a low oxygen alarm system.

Controlled Atmosphere Systems

Part 7, Chapter 1

Sections 5, 6 & 7

■ Section 5 Relative humidity (RH)

5.1 Humidification

5.1.1 Where a humidification system is fitted, the following requirements are to be complied with:

- (a) The supply of fresh water for humidification is to be such as to minimise the risk of corrosion and contamination of the cargo.
- (b) To prevent damage or blockage in the humidification system caused by water freezing, the air, steam or water pipelines in the cargo chambers are to be installed to facilitate ease of drainage and are to be provided with suitable heating arrangements.

■ Section 6 Electrical installation

6.1 General

6.1.1 In addition to the requirements of Pt 6, Ch 2, the following requirements are to be complied with:

- (a) The electrical power for the CA plant is to be provided from a separate feeder circuit from the main switch-board.
- (b) Under sea-going conditions, the number and rating of service generators are to be sufficient to supply the cargo refrigeration machinery and CA equipment in addition to the ship's essential services, when any one generating set is out of action.

■ Section 7 Control instrumentation and alarms

7.1 General

7.1.1 An alarm system for monitoring the atmosphere in CA zones is to be installed which may be integral with the machinery space alarm system as required by Pt 6, Ch 1,2,3.

7.1.2 Where alarms are displayed as group alarms in the main machinery space alarm system, provision is to be made to identify individual alarms at the refrigerated cargo control station.

7.1.3 The pressure in each CA zone is to be monitored and an alarm initiated when the pressure is too high or too low.

7.1.4 Where the **RH** notation is to be assigned, humidity sensors are to be installed in each of the CA zones and are to initiate an alarm when the relative humidity (RH) falls below or exceeds the predetermined set values.

7.1.5 Gas sensors or analysers are to be provided to monitor gas content in CA zones, see 7.3 and 7.4.

7.1.6 Gas analysers and sensors are to be calibrated automatically once in every 24 hours. An alarm is to be initiated if accuracy is outside tolerance limits.

7.1.7 Direct readout of the gas quality within any CA zone is to be available to the operating staff on demand.

7.1.8 At least one automatic recorder is to be provided for the remote monitoring and recording of O₂ and CO₂ levels in each CA zone.

7.1.9 Alarms are to be initiated in the event of O₂ or CO₂ levels in each CA zone falling below or exceeding the predetermined set values.

7.2 Gas systems

7.2.1 Where air compressors are to be used for gas production, alarms are to be initiated for the following conditions:

- High lubricating oil temperature.
- High differential pressure across the filters.
- Electric supply failure.

The compressors are to shutdown automatically in the event of:

- High discharge air temperature.
- High discharge air pressure.
- Low lubricating oil pressure.
- High pressure in CA zone.

7.2.2 Instrumentation is to be fitted for indicating continuously:

- (a) Gas pressure.
- (b) Gas temperature.
- (c) Gas content.
- (d) Gas flow.

7.3 Gas analysers and sampling

7.3.1 Where analysers are fitted, at least two analysers for oxygen and carbon dioxide having a tolerance of $\pm 0,1$ per cent by volume are to be provided to determine the content of the circulated gas within the CA zones.

7.3.2 Two separate sampling points are to be located in each CA zone and one sampling point in each of the adjacent spaces. The arrangements are to be such as to prevent water condensing and freezing in the sampling lines under normal operating conditions. Filters are to be provided at the inlet to sampling point lines.

7.3.3 Arrangements of the gas sampling points are to be such as to facilitate representative sampling of the gas in the space.

7.3.4 Where gas is extracted from the CA zones via a sampling tube to analysers outside the space, the sample gas is to be discharged safely to the open deck.

Controlled Atmosphere Systems

Part 7, Chapter 1

Sections 7, 8 & 9

7.3.5 Provision is to be made for gas sampling by means of portable equipment as required by 9.6.3.

7.3.6 The sampling frequency is to be at least once per hour.

7.4 Gas sensors

7.4.1 Where sensors are fitted, at least two sensors for each of O₂ and CO₂, having a tolerance of ±0,1 per cent are to be installed in each CA zone to monitor gas levels.

7.4.2 Gas sensors may be used for indication and alarm.

Section 8 Safety requirements

8.1 Personnel safety

8.1.1 CA zones are to be clearly labelled with 'Caution' and 'Danger' signs to alert personnel.

8.1.2 Entry hatch and manhole covers, doors leading to the CA zones and adjacent spaces are to be fitted with acceptable security-type locks and alarms activated when covers and doors are opened. The alarms are to be placed in a manned location.

8.1.3 All doors and access hatches to CA zones which may be under pressure are to open outwards and are to be fitted with secondary catches to prevent injury or damage during opening.

8.1.4 At least two portable oxygen sensors are to be provided to sample the oxygen level in all CA zones and adjacent spaces.

8.1.5 A means of communication is to be provided between CA zones and an attended location on deck.

8.1.6 Medical first aid equipment, including at least one set of oxygen resuscitation equipment, is to be provided on board.

Section 9 Inspection and testing on completion

9.1 General

9.1.1 CA system trials are to be witnessed on board by the LR Surveyor, before the system is put into service and before a certificate is issued. These trials are in addition to any tests which may have been carried out at the manufacturer's works.

9.1.2 An Operating and Safety Manual for the guidance of the ship's staff is to be provided, covering the following topics:

- Principal information on the use of CA.
- Complete description of the CA installation on board.
- Hazards of low oxygen atmospheres and consequential effects on human life.
- Countermeasures when exposed to low oxygen atmospheres.
- Instructions for operation, maintenance and calibration of all gas detectors.
- Instructions for use of portable oxygen analysers with alarm for personal protection.
- Prohibition of entry to spaces under CA.
- Loading instructions prior to injection of gas.
- Procedure for checking security of CA zones, doors and access hatches prior to injection of gas.
- Gas freeing procedure for all CA zones.
- Procedure for checking atmosphere of CA zones before entry.

9.2 Gas supply and sampling systems

9.2.1 The gas supply main and branches are to be pressure and leak tested. The test pressures are to be 1,5 and 1,0 times the design pressure respectively.

9.2.2 All gas sampling lines are to be leak tested using a vacuum or overpressure method.

9.3 Air-tightness of CA zones

9.3.1 Air-tightness of each CA zone is to be tested and the results entered on the certificate. The measured leakage rate of each zone is to be compared with the specified value.

9.3.2 Either a constant pressure method or a pressure decay method is to be used to determine the degree of air-tightness.

9.3.3 If the constant pressure method is used, the test is to be carried out at the design pressure of the CA zones.

9.3.4 If the pressure decay method is used, the time for the pressure to drop from 350 Pa to 150 Pa is to be measured and the leakage is to be calculated using the following formula:

$$A.L. = \frac{7,095 \times V}{t}$$

where

- A.L. = air leakage, in m³/h
 V = volume of zone, in m³
 t = time, in seconds

7,095 = constant for 200 Pa pressure decay.

During this test, adjacent zones are to be kept at atmospheric pressure.

Controlled Atmosphere Systems

Part 7, Chapter 1

Section 9

9.4 Gas system performance

9.4.1 Capability of the gas system to supply the gas at the specified flow rate and condition is to be verified by tests.

9.4.2 If the notation conditions cannot be verified during testing, assignment of the notation is to be deferred until log book entries confirm the achievement of the specified conditions in every CA zone during a loaded passage.

9.5 Gas freeing

9.5.1 The gas freeing arrangements are to be tested to demonstrate that they are effective.

9.6 Safety, alarms and instrumentation

9.6.1 The control, alarm and safety systems are to be tested to demonstrate overall satisfactory performance of the control engineering installation. Testing is also to take account of the electrical power supply arrangements, see *also* Pt 6, Ch 1,2,3.

9.6.2 Locking arrangements of all CA zones and adjacent spaces where gas may accumulate, provision of warning notices at all entrances to such spaces, communication arrangements and operation of alarms, controls, etc., are to be examined.

9.6.3 The provision of portable gas detectors and personnel oxygen monitors are to be verified by the LR Surveyor. Suitable calibrated instruments for measuring the levels of O₂, CO₂ and humidity, gas pressure and gas flow to the CA zones, are to be provided for testing. Their accuracy is to be verified.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Section 1

Section

- 1 **Introduction**
- 2 **Class notations**
- 3 **Plans and particulars**
- 4 **Materials**
- 5 **Process plant characteristics**
- 6 **Hull construction**
- 7 **Mechanical equipment for the process plant**
- 8 **Boilers and other pressure vessels for the process plant**
- 9 **Pumping and piping systems for the process plant**
- 10 **Firing arrangements of steam boilers, fired pressure vessels, heaters, reformers, etc.**
- 11 **Electrical equipment for the process plant**
- 12 **Control engineering for the process plant**
- 13 **Plant blow-down systems**
- 14 **Plant flare gas systems**
- 15 **Supply and discharge arrangements for feedstock and product**
- 16 **Ventilation of the process plant and other spaces associated with the process plant operation**
- 17 **Gas detection**
- 18 **Fire protection, detection and extinction**

- 2 Ships which can navigate at sea, but whose plants are intended to be operated only while the ships are in harbour or similarly protected waters.
- 3 Specialised ships, including pontoons, barges and similar structures which are designed as sea transportation vehicles to carry non-operative process plants, but which are specially constructed to be fully supported by the sea bed when the plants are operative.

1.1.2 Each category in 1.1.1 may include provision for the storage of the products used in the process or processes concerned.

1.2 General

1.2.1 The Rules are framed on the understanding that ships will not be operated in environmental conditions more severe than those agreed for the design basis and approval, without the prior agreement of Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 Except as indicated in this Chapter, the hull, propulsion machinery, auxiliary machinery, equipment for essential services of the ship, electrical installations and control engineering systems are to comply with the relevant Sections of Parts 3, 4, 5 and 6, the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals) and the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases), where applicable. Hulls made of reinforced or prestressed concrete will be specially considered.

1.2.3 The additional hull structural requirements for Category 3 ships to enable them to be satisfactorily grounded on prepared foundations will be specially considered. Full details of the intended foundations and the local conditions at the site are to be submitted for use in assessing the hull structural capability, etc.

1.2.4 Where the process plant is intended to operate in close proximity to bulk storage of feedstocks and/or products, further consideration may be necessary in addition to that contained in this Chapter, particularly with regard to the provision of effective separation, methods of storage, loading and discharging arrangements.

1.2.5 For ships of all categories in 1.1.1 except Category 1A, provision is to be made for purging, gas freeing, inerting or otherwise rendering safe the plant and process storage facilities before the ship proceeds to sea or changes location. The provisions to be adopted, if any, when a ship of Category 1A enters harbour will be specially considered.

1.2.6 In addition to the requirements for periodical surveys, a general examination of the ship, machinery and process plant is to be carried out by LR's Surveyors before and after a ship, of any category other than 1A, changes location. Every precaution is to be taken to ensure safety during such examination.

Section 1 Introduction

1.1 Scope

1.1.1 This Chapter is intended for the classification of self-propelled or non-self-propelled ships with specialised structures which have plant installed on board for the processing of chemicals, liquefied gases and related products, and which fall into one of the following environmental categories:

- 1A Ships which have plants operable while navigating at sea.
- 1B Ships which have plants operable at sea, but only while the ship is attached to an offshore mooring facility.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 1 & 2

1.2.7 Requirements additional to those of this Chapter may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the process plant is intended to operate.

1.3 Classification of ship

1.3.1 A ship built in accordance with the requirements of this Chapter, or in accordance with requirements equivalent thereto, will be assigned an appropriate class in the *Register Book*, as indicated in Section 2, and will continue to be classed so long as it is found, upon examination at the prescribed surveys, to be maintained in a safe and efficient condition, see also 1.4.6.

1.3.2 For each category described in 1.1.1, classification covers the hull, containment systems for stored products, propulsion machinery, auxiliary machinery used for essential services, and equipment necessary to maintain a suitable environment within which the plant may safely operate.

1.3.3 In general, classification will not be extended to the process plant itself, and the classification requirements do not relate to the specialised machinery, equipment and associated piping, etc., which is solely concerned with the production operations, except where the design and/or arrangements of such equipment and piping may affect the safety of the vessel.

1.3.4 When the reliquefaction plant is installed, and the plant and equipment are in accordance with the requirements of the Rules for Ships for Liquefied Gases, consideration will be given to classing the plant in accordance with Pt 1, Ch 2,2.5.

1.4 Certification of process plant

1.4.1 Process plant will be required to be certified by LR, and a note to the effect that this has been carried out will be appended to the class notation in the *Register Book*.

1.4.2 The certificate will include a brief description of the process plant, indicating the chemical(s) processed and the end products.

1.4.3 The certificate of the plant will cease to be valid if a significant alteration is made to the plant or the arrangements on board without the written approval of LR. This provision does not exclude the direct replacement of any item by a substitute part which has been approved and tested by LR.

1.4.4 The process plant will be required to be surveyed by LR's Surveyors at intervals to be prescribed by the Committee, dependent on the process involved.

1.4.5 The class notation for the ship will, in general, state that the process plant is not classed but certificated by LR and periodically surveyed by LR's Surveyors.

1.4.6 The maintenance of the class of the ship while the plant is in operation will be dependent upon a valid certificate and the plant being found, upon examination at the prescribed surveys, to be maintained in a safe and efficient condition.

1.4.7 The plant certificate is not to be taken as a recommendation for, or an approval of, the process or processes.

Section 2 Class notations

2.1 Ship notations

2.1.1 Ships of Category 1A, which have chemical process plants designed to operate while the ship is navigating at sea, will be eligible to be classed '100A1 Chemical Process Factory', see also 1.4.5.

2.1.2 Ships of Category 1B, which have chemical plants designed for operation at sea while the ship is specially moored, anchored or otherwise linked to the shore, sea bed or other stationary vessel or structure, will be eligible to be classed '100A1(T) moored (oil, ammonia, etc.) processing (tanker, barge, etc.) for service at . . .', see also 1.4.5.

2.1.3 Ships of Category 2, which have chemical plants installed and designed for operation while the ship is in harbour, will be eligible to be classed '100A(T) chemical process plant installed – for operation only when moored in harbour', see also 1.4.5.

2.1.4 Specialised ships of Category 3 which have chemical plants designed to operate only while the ship is fully supported on the sea bed, will be eligible to be classed 'A chemical process plant pontoon/platform – to be operated only when grounded on prepared foundations at...', see also 1.4.5.

2.2 Additional notations

2.2.1 A special chemical cargoes notation may be assigned to ships where raw materials or products are stored or retained on board in bulk.

2.2.2 The Committee may append details of process, product storage, safety or other particulars to the notation as it considers necessary.

2.2.3 Ships of Category 1B or 2 which have process plants installed solely for the purposes of the physical liquefaction of impure feedstock gases at low temperatures and the storage of the purified liquefied gases (where the chemical treatment of the impurities is an incidental process) will be assigned additional notations to those stated in 2.1.2 or 2.1.3, such as 'for liquefaction and storage of methane, etc., in independent tanks Type B, etc. – maximum pressure – minimum temperature'.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 2 & 3

2.3 Special mooring and linking arrangements

2.3.1 Where the process plant is operable only when the ship is specially moored, anchored or otherwise linked to the shore, sea bed or other stationary vessel, and the equipment and/or other linking arrangements and components have been approved by the Committee as suitable and sufficient for the intended service, an equipment character, T, will be assigned in addition, or as an alternative, to the equipment character, 1, as appropriate.

2.3.2 For the purpose of the Rules, the word 'linked' is to be taken to include spuds, retractable legs, floating or submerged pipelines connecting directly to the ship, ship to shore electrical connections, etc., which restrain the ship in its operating position, or which require such restraint to be applied and the failure of which could hazard the ship.

Section 3 Plans and particulars

3.1 General

3.1.1 Before the work is commenced, plans in triplicate, together with the relevant information as detailed in this Section, are to be submitted for consideration. Any subsequent modifications are subject to approval before being put into operation.

3.1.2 Any alterations to basic design, construction, materials, manufacturing procedure, equipment, fittings or arrangements of the process are to be re-submitted for approval.

3.1.3 For Category 1 ships, the plant is to be capable of sustaining an emergency condition at full operating temperatures and pressures with the hull statically listed to an angle of $22\frac{1}{2}^\circ$ and statically trimmed to an angle of 10° beyond the maximum normal operating trim. These angles may be modified by the Committee in particular cases as it considers necessary. The stress calculations for the plant and the supporting structure are to take account of this condition. Wind loads need not be considered to be acting during this emergency condition.

3.1.4 For Category 2 ships, the plant is to be capable of sustaining an emergency condition at full operating temperatures and pressures with the hull statically listed to an angle of 15° and statically trimmed to an angle of 5° beyond the maximum normal operating trim. These angles may be modified by the Committee in particular cases as it considers necessary. The stress calculations for the plant and the supporting structure are to take account of this condition. Wind loads need not be considered to be acting during this emergency condition.

3.2 Hull construction

3.2.1 For all categories of ship, the plans and information detailed in 3.2.2 to 3.2.6 are to be submitted, in addition to those required by Pt 3, Ch 1.5, Chapter IV of the Rules for Ships for Liquid Chemicals or Chapter IV of the Rules for Ships for Liquefied Gases, as applicable.

3.2.2 Plans showing the general arrangement of the ship are to be submitted, giving the location of the following:

- Hatches and other openings to enclosed plant spaces and adjacent cofferdams.
- Doors, hatches, ventilation and other openings to crew accommodation, stations essential for operation at sea, control stations, store rooms and workshops.
- Coated tanks or tanks constructed of special material.
- Additional structure associated with the plant above the deck.
- Proposed grouping of areas within the plant for segregation purposes.

3.2.3 Plans for mooring, anchoring and linking, as applicable, together with relevant wind and sea data are to be submitted for information.

3.2.4 Plans outlining the containment arrangements in the event of an accident, together with all relevant information, are to be submitted.

3.2.5 Particulars of the marine environment and safety arrangements associated with the process plant are to be submitted, including:

- Arrangements for preventing the ingress of water into the ship or structure where the process plant and equipment protrude through the weather deck.
- Proposed emergency flooding procedures and their control.

3.2.6 Particulars of the proposed storage arrangements of hazardous and/or toxic substances, feedstocks and products in bulk, on the ship or structure, are to be submitted.

3.3 Process plant

3.3.1 A description of the expected method of operation of the process plant and a diagram showing the process flow are to be submitted.

3.3.2 General arrangement plans of the process plant showing the hazardous and safe zones and spaces are to be submitted, indicating the following:

- Spaces where toxic gases or vapours may accumulate.
- Spaces where flammable gases or vapours may accumulate.
- Areas maintained at an over-pressure to prevent the ingress of such gases or vapours.

3.3.3 Details of the flammability, toxicity, corrosivity and reactivity of the substances entering, being processed and leaving, or stored in, each compartment, together with details of any exothermic and hazardous reactions particularly with regard to sea-water and other materials normally found in the marine environment, are to be submitted.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Section 3

3.3.4 Plans of the layout of the process plant indicating the hatches and other openings to enclosed plant spaces and cofferdams are to be submitted.

3.3.5 Details and arrangements of the blow-down systems, including quantities of materials and the capacity and working pressure of the containers installed for the reception of the materials to be blown down, are to be submitted.

3.3.6 Proposals for de-watering blow-down tanks in which hot oils and/or chemicals are discharged are to be submitted.

3.3.7 Proposals for the purging, gas freeing, inerting or otherwise rendering safe of the process plant and storage facilities are to be submitted.

3.3.8 Particulars of the arrangements for protecting the process plant systems and vessels against temperature, over-pressure and vacuum are to be submitted.

3.3.9 Proposals for the disposal of hazardous or toxic gases and liquid effluents during normal plant operation, including any proposed flare systems, are to be submitted.

3.3.10 Particulars of the proposals for isolating the ship or structure from the shore installation and/or lightering ships or vessels, where applicable, and from the supply of fuel to boilers, etc., in the process plant and the return flow of chemicals or process effluent, are to be submitted, including:

- Feedstock supply and product discharge, with details of the arrangements showing the location of shut-off valves and of the control and indicating stations.
- The process plant parameters and analysis of transient conditions under which emergency shutdown will be initiated and the time estimated to obtain a safe environment.
- The proposed emergency procedures for controlled shutdown of the process plant, i.e. depressurising, inerting, etc., and the arrangements for the continued operation of the essential services necessary to allow for such controlled shutdown under the emergency conditions of 3.1.3 or 3.1.4, as applicable.

3.3.11 Plans for the ventilation of process plant compartments are to be submitted, together with the following information:

- Location of hazardous and safe zones and spaces.
- Location of all possible sources of ignition.
- Location of air inlets and outlets.
- Number of complete air changes per hour.
- Estimated maximum and minimum ambient temperatures for the regions in which the plant is to operate.
- Expected heat loss of the process plant to the compartment environment.

3.3.12 Particulars of any dust or gas explosion hazard in the enclosed compartments of the process plant are to be submitted.

3.3.13 Proposals for the decontamination of the process plant compartments are to be submitted.

3.3.14 Proposals for the detection of vapour or gas and of oxygen deficiency in the process plant compartments are to be submitted.

3.4 Mechanical equipment associated with the process plant

3.4.1 A list of mechanical equipment associated with the process plant, with the exception of any boilers and other pressure vessels, to be installed in the ship or structure is to be submitted.

3.4.2 Details of safety and relief devices and their discharge arrangements are to be submitted.

3.4.3 When required, in order to facilitate inspection, plans showing the materials of construction, working pressures and temperatures, maximum power and revolutions per minute, as applicable, are to be submitted before the work is commenced.

3.4.4 Calculations of the torsional vibration characteristics of the shafting systems, where applicable, are to be submitted in accordance with the requirements of Pt 5, Ch 8.

3.5 Boilers and other pressure vessels associated with the process plant

3.5.1 Plans of the boilers and other pressure vessels, including the proposals for the support of the vessels, are to be submitted.

3.5.2 Details of the safety and relief devices and their discharge arrangements are to be submitted.

3.5.3 Stress calculations are to be submitted, taking into account the ship linear and angular accelerations, roll and pitch amplitudes, ship flexure and wind loads appropriate to any condition which may normally arise at sea. Where applicable, calculations for the emergency condition in 3.1.3 or 3.1.4 are to be submitted. Due consideration is to be given to the effects of thermal expansion and contraction on the support points of the vessels.

3.5.4 Outline plans of all types of fired equipment, ventilation arrangements with projected casing temperatures, uptake arrangements, gas and/or oil fuel burning arrangements and controls are to be submitted.

3.6 Pumping and piping systems associated with the process plant

3.6.1 Plans of the process plant piping systems, showing the materials of construction, scantlings, support and expansion arrangements, together with the calculations, are to be submitted for consideration.

3.6.2 The following diagrammatic plans for systems associated with the process plant are to be submitted, in addition to those required by Pt 5, Ch 13 and Ch 15 or Chapter V of the Rules for Ships for Liquefied Gases, as applicable:

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 3 & 4

- The Shipbuilder's plan of the general pumping arrangements, including air and sounding pipes and any cross flooding pipes and fittings.
- Pumping arrangements at the fore and aft ends, drainage of cofferdams and process spaces.
- Bilge, ballast and oil fuel pumping arrangements in the process plant machinery space, including the capacities of the pumps on bilge service.
- Arrangement of oil fuel pipes and fittings at settling and service tanks.
- Arrangement of gas and/or oil fuel piping in connection with gas and/or oil burning arrangements.
- Oil fuel overflow systems, where fitted.
- Arrangement of boiler feed system.
- Arrangement of compressed air systems for the process plant.
- Arrangements of lubricating oil and cooling water systems, oil fuel settling, service and other oil tanks not forming part of the ship's structure.

3.6.3 Plans showing the arrangement and dimensions of main steam pipes, with details of flanges, bolts and weld attachments and particulars of the materials of the pipes, flanges, bolts and welding consumables, are to be submitted for consideration.

3.6.4 Details of the safety and relief devices and their discharge arrangements are to be submitted.

3.7 Electrical equipment for the process plant

3.7.1 Details of the electrical system(s) are to be submitted, including the following:

- A statement quoting the standard or Code of Practice in accordance with which the installation has been designed.
- A statement quoting the standard of design and/or manufacture of electrical equipment, e.g. BS, NEMA, VDE, etc.,
- A schedule of the normal operational loads on the system, estimated for the different operating conditions expected.
- Expected range of ambient temperature.

3.7.2 The following line diagram plans and particulars are to be submitted:

- General arrangement plan of the process plant showing the location of the major items of electrical equipment.
- Line diagram of the installation(s) indicating the rating of the various items of rotating machinery, converters, transformers and protective devices, together with the types and sizes of cables and the makes and types of protective devices.
- Arrangement plans and circuit diagrams of the switchboards.
- Calculations of short-circuit currents at the main switchboards, sub-switchboards and the secondary side of transformers.
- General arrangement plan of the process plant showing the location of electrical equipment in hazardous zones, together with the Code of Practice on which they are based.

- A schedule of safe-type electrical equipment located in hazardous zones, giving details of the type of equipment employed, the certifying authority and the certificate number.

3.7.3 Written confirmation and Works' Test Certificates that all items of electrical equipment comply with the relevant standard or Code of Practice are to be supplied.

3.8 Control equipment for the process plant

3.8.1 Details of the control system(s) are to be submitted, together with the following line diagrams and particulars:

- Line diagrams of any control system(s) fitted.
- General arrangement plan of the process plant showing the locations of items of control equipment and the locations of hazardous zones.
- Schedule of the parameters which are monitored and controlled, including alarms and shutdown devices.

3.9 Fire protection, detection and extinction

3.9.1 Plans of fire protection, detection and extinction arrangements, together with details of the fire and explosion hazards involved, are to be submitted.

Section 4 Materials

4.1 General

4.1.1 The materials used in the construction are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) and of Chapter 6 of the Rules for Ships for Liquefied Gases, as applicable. Materials for which provision is not made in those requirements may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

4.1.2 Materials of construction are to be suitable for the intended service, having regard to the substances, process and temperatures involved. For materials unsuitable for use with certain chemicals, and for the protection of materials, see Chapter 6 of the Rules for Ships for Liquid Chemicals.

4.1.3 Details of the materials proposed for all types of construction are to be submitted for approval.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 5 & 6

Section 5 Process plant characteristics

5.1 Design

5.1.1 The design and arrangements are to comply with the requirements of this Chapter and with relevant statutory regulations of the National Authority of the country in which the ship or structure is registered and/or in which it is to operate.

5.1.2 The process plant is to be designed for normal operation in accordance with recognised and agreed codes suitably modified to take into account the ship-borne environment in all its aspects. Except for emergency conditions, as detailed in 3.1.3 or 3.1.4, the total stress in any component of the plant is not to exceed the code value at the temperature concerned, unless expressly agreed otherwise by LR, whether the plant is operative or non-operative, when subjected to any possible combination of the following loads:

- (a) Static and dynamic loads due to wave-induced ship motions.
- (b) Loads resulting from hull flexural effects at the plant support points.
- (c) Direct wind loads.
- (d) Normal process weights and pressures.
- (e) Thermal loads.

5.1.3 For the emergency conditions in 3.1.3 or 3.1.4, the stress levels are to be agreed with LR.

5.2 Separation from ship machinery

5.2.1 Where, during operation, process plant spaces contain or are likely to contain hazardous and/or toxic substances, they are to be kept separate and distinct from the main propulsion and auxiliary machinery and essential ship services, and also the power generating machinery for the process plant.

5.2.2 Notwithstanding the requirements of 5.2.1, this does not exclude the use of the ship's main, auxiliary and/or essential services, for process plant operation in suitable cases. Where, for reason of hazard, essential ship services have to be duplicated within the process plant space, they are to comply with the requirements of Section 9 and Parts 5 and 6, as applicable.

Section 6 Hull construction

6.1 General

6.1.1 The hull structure is to comply with the relevant requirements of Parts 3 and 4, except as stated otherwise in this Section. The containment of liquefied gas products is to comply with Chapter 4 of the Rules for Ships for Liquefied Gases.

6.1.2 All chemical product and effluent tank structures and their location relative to the ship's hull are to comply with the Rules for Ships for Liquefied Gases, or with the Rules for Ships for Liquid Chemicals, as applicable. Where necessary, the probable temperature variations during operations and the thermal stress considerations are to be stated.

6.1.3 Materials for the hull structures subjected to low temperature are to comply with Pt 3, Ch 2.2.2 relating to refrigerated spaces and adjacent structures, or with Chapter 6 of the Rules for Ships for Liquefied Gases, as applicable.

6.1.4 Subdivision and damage stability are not covered by these Rules. However, attention must be given to any relevant statutory regulations of the National Authority of the country in which the ship is to be registered or in which the plant is to be operated.

6.2 Location of accommodation, service and control spaces

6.2.1 All accommodation and other compartments not directly essential to the operation of the plant are to be arranged well clear of plant spaces, and feedstock and product tanks.

6.2.2 Service and control stations essential to the operation of the plant must be made 'gas-safe' in accordance with internationally accepted codes and standards, and should, wherever possible, be so located that access thereto is from a defined safe space. If such location is not possible, the station is to be specially ventilated.

6.3 Integrity of gastightness between compartments

6.3.1 Where integrity of gastightness is required between compartments containing the plant, this is to be maintained in way of pipe tunnels or duct keels where these traverse such compartments.

6.4 Cofferdams

6.4.1 Cofferdams are to be sited as required by the Rules for Ships for Liquefied Gases, or by the Rules for Ships for Liquid Chemicals, as applicable, segregating any spaces in which raw materials or products are stored or retained in bulk.

6.4.2 Cofferdams are to be arranged around independent tanks containing chemical products or effluents where these are separate from the ship structure, but permanently connected thereto. Such cofferdams are to be mechanically ventilated using portable or permanent systems as required by Chapter 12 of the Rules for Ships for Liquid Chemicals, and are to be of sufficient size to allow effective inspection of all the tank and ship structure in way.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Section 6

6.5 Access and openings to spaces

6.5.1 Access openings, windows, side scuttles and ventilation openings to accommodation, service and control stations essential for the operation of the ship, and similar safe spaces are to be located and arranged, as required by the Rules for Ships for Liquefied Gases, or by the Rules for Ships for Liquid Chemicals, as applicable.

6.5.2 Arrangements are to be made to provide easy access to, or escape from, plant working spaces. In general, ladders are not to be arranged vertically, and intermediate platforms are to be fitted at vertical intervals of about 6 m. Ladders and platforms are to have guard rails and permanent provision made for attaching hoists for use in emergencies. The arrangements for the emergency hoists are to allow a clear, unobstructed lift to the outside deck.

6.5.3 Two separate means of access from the open deck are generally to be provided to the cofferdams required by 6.4.1.

6.6 Longitudinal strength

6.6.1 Longitudinal strength calculations are to be made in accordance with Pt 3, Ch 4 for the following conditions, and the Loading Manual required by Pt 3, Ch 4.8 is to include this information:

(a) **Sea-going conditions:**

These conditions are to take account of the weights and disposition of all ballast, plant items including any working fluids, other substances, spare gear, etc., and any special support bracing where thermal effects are considered, which will be on board during any sea-going condition of the plant appropriate to the category of ship.

(b) **Harbour condition:**

This condition is to take account of the weights and disposition of all ballast and plant items, including all working and other substances (in all intended stowage dispositions) and spare gear which will be on board during operation of the plant in harbour.

6.7 Plant support structure

6.7.1 Decks and other structure supporting the plant are, in general, to comply with the requirements of Part 3. Such structure can, however, be considered on the basis of an agreed uniformly distributed loading in association with local loads at plant support points, provided that adequate transverse strength of the ship is maintained.

6.7.2 Where the nature and dispositions of heavy plant items are such that forces on the ship and support structure due to ship motions are significant (whether underway with or without working fluids, or moored with working fluids), calculations of the loading and the structural response are to be submitted. In this respect, the guidance formulae for accelerations as given in the Rules for Ships for Liquefied Gases can be used where appropriate. Details of the mass distribution and support points of the plant items are to be submitted in all cases.

6.7.3 Where model tests or reliable direct calculation procedures are used to estimate wave-induced responses and which may indicate accelerations and motion amplitudes differing from those arising from the application of the Rules, such values will be taken into account in the approval of support structure.

6.7.4 If the vessel is intended for limited service at sea (e.g. a 'once only' voyage from port of build to service location), a reduction in the Rule accelerations and motion amplitudes may be permitted. In order to apply such a reduction, details of the intended service limitation should be submitted.

6.8 Loading due to wave-induced motions

6.8.1 In cases where the mass distribution of large columnar plant items is such that the centre of action of the dynamic force differs significantly from the centre of gravity of the item, due account of this is to be taken in the calculation of the forces and moments at the support positions.

6.9 Additional loads

6.9.1 The structure supporting the plant is also to be capable of withstanding forces arising from the following:

- (a) Wind loads (in all conditions of service and all categories of ships).
- (b) The angle of static heel arising from the emergency condition referred to in 3.1.3 or 3.1.4, as applicable.
- (c) For a Category 1A ship, a collision force acting on the tank corresponding to one-half of the weight of the item with or without working fluids, as appropriate, to the approved sea-going conditions from forward and one-quarter of the weight of the item from aft.
- (d) For all other categories of ship, a collision force from any horizontal direction of one-fifth of the weight of the item.

6.9.2 Wind loading, which is to be applied to the plant items and supporting structure protruding above the weather deck, should be considered to act simultaneously with wave-induced loading. Loadings 6.9.1(b), (c) and (d) need not be combined with wind loads or wave-induced loads.

6.10 Allowable stresses in support structure

6.10.1 The following stress levels are applicable in conjunction with the loading on the support structure:

- (a) Support members above or below the weather deck which are not subject to main hull girder loading:

direct stress:

$$\sigma_a + \sigma_b = 0,6\sigma_y$$

shear stress:

$$\tau = 0,6\tau_y \text{ or } 0,35\sigma_y \text{ whichever is the smaller combined stress:}$$

$$\sigma_c = 0,75\sigma_y = \sqrt{(\sigma_a + \sigma_b)^2 + 3\tau^2}$$

where

$\sigma_a + \sigma_b$ = the algebraic sum of the axial and bending stresses at the point under consideration

σ_y = specified minimum tensile yield stress or 0,2 per cent proof stress at room temperature

τ_y = shear yield stress.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 6 & 7

- (b) Support members directly connected to hull structure and subject to transference of loading therefrom:
- the maximum allowable direct, shear and combined stresses as defined in (a), but with member local loading increased by a factor of 1,30, or
 - when the stresses in such structure are determined using methods which satisfactorily take into account any ship deflection and load transference in way of supports, no load factor need be applied.
- (c) Primary members forming an integral ship structural and plant support system:
- in general, the allowable stresses in such a system will be especially considered on the basis of the degree of refinement employed in the load prediction, structural response and stress analysis methods. Structural response calculations should include the interaction effects of the hull and plant item.

6.10.2 In general, all seatings, platform decks, girders and pillars supporting plant items are to be arranged to align with the main hull structure, which is to be suitably reinforced, where necessary, to carry the appropriate loads. Attention should be paid to the capability of the support structure to withstand buckling.

6.11 Integrity of weather deck

6.11.1 The integrity of the weather deck is to be maintained. Where items of plant equipment penetrate the weather deck and are intended to constitute the structural barrier to prevent the ingress of water to spaces below the freeboard deck, their structural strength is to be equivalent to the Rule requirements for this purpose. Otherwise, such items are to be enclosed in superstructures or deckhouses fully complying with the Rules. Full details are to be submitted for approval.

6.12 Equipment

6.12.1 Anchors and chain cables for ships navigating at sea are to comply with the requirements of Pt 3, Ch 13,7. Special consideration will be given to the equipment required for ships of Categories 1B and 2.

6.13 Gangways and freeing arrangements

6.13.1 Gangways are to be sufficient to provide proper access to all areas necessary for ship safety while the ship is operational and while it is at sea, and are to be to the Surveyor's satisfaction.

6.13.2 Freeing ports are to be fitted in accordance with the requirements of Pt 3, Ch 8,5.3.

Section 7 Mechanical equipment for the process plant

7.1 General

7.1.1 The requirements of this Section are applicable to all types of mechanical equipment associated with the process plant, with the exception of boilers and other pressure vessels.

7.1.2 The mechanical plant and equipment are to be designed and constructed in accordance with the relevant Sections of Part 5 and Pt 6, Ch 3, as applicable, and/or with agreed codes and specifications, suitably modified where necessary to suit shipboard conditions. The design is to be capable of accommodating the forces and moments stated in 6.7, 6.8 and 6.9, as applicable, generated at the support points.

7.2 Safety precautions

7.2.1 Oil engines, air compressors and associated air starting piping, concerned with supplying services not essential to the safety of the vessel or structure, are to comply with the requirements of Pt 5, Ch 2, where applicable.

7.2.2 Air intakes for internal combustion engines are to be led from a safe space. Where internal combustion engines, other than gas turbines, are used in association with plant processing flammable substances, the air intakes are to be fitted with an automatic device to prevent overspeeding in the event of accidental ingestion of flammable gases and/or vapours.

7.2.3 Exhaust pipes from internal combustion engines are to be led well clear of hazardous areas and, where such engines are used in association with plant processing flammable substances, are to be fitted with efficient spark arresters.

7.2.4 In general, air compressors are not to be installed in hazardous areas. Where this is not practicable, alternative arrangements may be accepted, provided that the air inlets are trunked or ducted from a safe space and that such trunking/ducting is fitted with gas detectors arranged to give audible and visible alarms and to shutdown the compressor in the event of flammable and/or toxic gas or vapour entering the air inlets.

7.2.5 The gas detectors are to be capable of continuously sampling the air supply and are to be so arranged as to prevent cross-communication between hazardous and safe spaces, such as control rooms, etc.

7.3 Inspection and installation

7.3.1 The scope of the inspection to be carried out at the manufacturers' works by the Surveyors is to be agreed before the work is commenced.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 7, 8 & 9

7.3.2 The mechanical plant and equipment are to be installed to the Surveyor's satisfaction. Proposals to site internal combustion engines in hazardous areas will be the subject of special consideration.

■ Section 8 Boilers and other pressure vessels for the process plant

8.1 General

8.1.1 The requirements of this Section are applicable to fired and unfired pressure vessels associated with the process plant.

8.1.2 The pressure vessels are to be made in accordance with the requirements of the relevant Sections of Pt 5, Ch 10 or Ch 11, as applicable, or with agreed codes and specifications normally used for similar plant in land installations suitably modified and/or adapted for the marine environment. The design is to be capable of accommodating the forces and moments stated in 6.7, 6.8 and 6.9, as applicable, generated at the support points.

8.1.3 Stress calculations are to take account of the emergency conditions in 3.1.3 or 3.1.4, as applicable, in addition to the normal operational loadings. Due consideration is to be given to the effects of thermal expansion and contraction on the support points of the vessels.

8.2 Construction and installation

8.2.1 The pressure vessels are to be constructed, installed and tested to the Surveyor's satisfaction.

8.2.2 Suitable access is to be provided to the vessels for inspection, including checks on the operation of mountings, fittings, controls and pressure relief devices.

8.3 Safety devices

8.3.1 Where necessary, a test rig is to be supplied to enable the pressure setting of the safety and relief devices to be checked.

8.3.2 Where required, an additional pressure relieving device, with sufficient capacity (a) to prevent pressure vessels becoming liquid-full during fire engulfment and/or (b) to discharge vapours generated under fire exposure, is to be fitted in accordance with the relevant Rules for Ships for Liquefied Gases.

8.3.3 The arrangement of safety and relief discharges is to be such that there is no possibility of hazardous reaction between the substances involved.

8.3.4 Where provision is made for the isolation of safety relief devices from vessels and/or systems for maintenance purposes, not less than two such safety devices are to be fitted.

8.3.5 The isolating or blocking valves are to be so arranged that at least one safety relief device will remain in communication with the vessel or system under all conditions.

■ Section 9 Pumping and piping systems for the process plant

9.1 General

9.1.1 Arrangements are to be made in the process plant spaces, in order that substances which are flammable, toxic or are likely to present a hazard due to reaction when mixed are kept separate.

9.2 Process plant piping systems

9.2.1 Process plant piping systems are to be designed and constructed in accordance with agreed codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted where necessary to suit the marine environment.

9.2.2 Sections of piping which may contain hazardous liquids or gases and which can be isolated are to be suitably protected, see 8.3.2.

9.3 Lubricating oil and oil fuel piping

9.3.1 Lubricating oil and oil fuel pipes, fittings, associated equipment, oil fuel burning arrangements and their materials of construction are to comply with the requirements of Pt 5, Ch 14, where applicable.

9.4 Gas fuel supply systems

9.4.1 The gas fuel supply systems are to comply with the requirements of the relevant Sections of the Rules for Ships for Liquefied Gases, where applicable.

9.4.2 Provision to shut off the gas is to be made in the gas firing supply lines immediately before the lines enter the compartment in which the equipment is installed. The shut-off arrangements are to be of the double block and vent type, and are to be operable at the equipment or the equipment control position and at a position in a safe area remote from the equipment.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 9 & 10

9.5 Air and sounding pipes

9.5.1 Details of air and sounding pipes to tanks containing chemical products are to be submitted for approval.

9.6 Bilge and effluent arrangements

9.6.1 The arrangements for the storage on board ship, and the disposal of bilge and effluent from the process plant spaces, are to be submitted for consideration, and due recognition is to be given to the requirements of the appropriate National Authority.

9.6.2 Bilge and effluent pumping and piping systems in the process plant spaces are to be constructed of material suitable for the substances processed or produced or any combination of the substances which might result from accidental admixture.

9.6.3 Arrangements are to be provided for the control of the bilge and effluent pumping and piping system installed in the process plant spaces from within these spaces and also from a position outside the spaces.

9.6.4 The bilge and effluent pumping and piping systems handling hazardous materials should, wherever possible, be installed in the space associated with the particular hazard. Spaces containing pumps and piping systems that take their suction from a hazardous space may also be considered as hazardous spaces where a pipeline is not of an all-welded construction without flanges, valve glands and bolted connections, etc., and the pumps are not totally enclosed.

9.6.5 Where, during operation, process plant spaces contain or are likely to contain hazardous and/or toxic substances, they are to be kept separate and distinct from the ship's main bilge pumping and piping system. This does not, however, preclude the use of the ship's main bilge system when the process plant is shutdown, gas freed or otherwise made safe.

9.6.6 Pumping and piping systems for the ship services and process plant are to be constructed and installed to the Surveyor's satisfaction.

Section 10 Firing arrangements of steam boilers, fired pressure vessels, heaters, reformers, etc.

10.1 General

10.1.1 The requirements of this Section are applicable to all types of fired equipment associated with the process plant. The equipment is to be constructed, installed and tested to the Surveyor's satisfaction.

10.2 Design and construction

10.2.1 Details of the design and construction of the fuel gas burning equipment for steam boilers, oil and gas heater furnaces, reformers, etc., are to be in accordance with the Rules for Ships for Liquefied Gases, or with agreed codes and specifications normally used for similar plants in land installations, suitably modified and/or adapted for the marine environment. Ignition of the burners is to be by means of permanently installed igniters, or properly located and interlocked pilot burners and main burners arranged for sequential ignition.

10.2.2 Gas or gas/air mixtures having relative densities compared with that of air at the same temperature greater than one are not to be used as fuels for fired pressure vessels situated below deck. Proposals to burn such mixtures above deck will be specially considered in each case.

10.2.3 Proposals for the furnace purging arrangements prior to ignition of the burners are to be submitted. Such arrangements are to ensure that any accidental leakage of product liquid or gas into the furnace, from a liquid or gas heating element, or from the accidental ingestion of flammable gases and/or vapours, does not result in hazardous conditions.

10.2.4 Compartments containing fired pressure vessels, heaters, reformers, etc., for heating or processing hazardous substances are to be so arranged that the compartment in which the fired equipment is installed is maintained at a higher pressure than the combustion chamber of the equipment. For this purpose, induced draught fans or a closed stokehold system of forced draught may be employed. Alternatively, the fired equipment may be enclosed in a pressurised air casing.

10.2.5 The fired equipment is to be suitably lagged. The clearance spaces between the fired equipment and any tanks containing oil are to be not less than 760 mm. The compartments in which the fired equipment is installed are to be provided with an efficient ventilating system.

10.2.6 Smoke box and header box doors of fired equipment are to be well-fitting and shielded, and the uptake joints made gastight. Where it is proposed to install dampers in the uptake gas passages of fired equipment, the details are to be submitted. Dampers are to be provided with a suitable device whereby they may be securely locked in the fully open position.

10.2.7 Each item of fired equipment is to have a separate uptake to the top of the stack casing. Where it is proposed to install process fired equipment with separately fixed furnaces converging into a convection section common to two or more furnaces and/or a secondary radiant section at the confluence of the fired furnace uptake to the convection section, the proposed arrangements, together with the details of the furnace purging and combustion controls, are to be submitted.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 11 to 14

■ Section 11

Electrical equipment for the process plant

11.1 Design of installation

11.1.1 Installations are to be designed in accordance with Pt 6, Ch 2, or with a recognised National or International Standard or Code of Practice.

11.1.2 Attention must be given to any relevant statutory regulations of the National Authority of the country in which the ship is to be registered or in which the process plant is to be operated.

11.2 Equipment suitability for environment

11.2.1 Electrical equipment is to be constructed so that it is suitable for use in the environmental conditions envisaged, e.g. in areas of high ambient temperature, derating may be necessary.

11.3 Hazardous zones

11.3.1 Where flammable gases and vapours are involved, the defining of hazardous zones is to be in accordance with a National or International Standard or Code of Practice.

11.4 Certified safe-type equipment

11.4.1 Where safe-type equipment is permitted in hazardous zones, e.g.:

- Intrinsically-safe (symbol i),
- Flameproof (symbol d),
- Increased safety (symbol e),
- Pressurised enclosure (symbol p),

such equipment is to be certified for the gases and vapours involved. The construction and type testing are to be in accordance with IEC 60079: *Electrical Apparatus for Explosive Gas Atmospheres*, or an equivalent National Standard.

11.5 Survey and testing

11.5.1 All electrical equipment is to be installed and tested to the Surveyor's satisfaction.

■ Section 12

Control engineering for the process plant

12.1 Design of installation

12.1.1 Normal good engineering practice and standards are to be employed in any control system(s) fitted.

12.1.2 Due to the wide variety of types of process plant, it is not possible to lay down precise details of control scheme(s), since any control scheme is affected by the nature of, and the operating procedures of, the process plant. A description of the expected method of operation of the process plant is to be submitted.

12.2 Equipment

12.2.1 Control equipment is to be compatible with the materials involved in the plant process.

12.2.2 Where flammable gases or vapours are involved, control equipment located in hazardous zones is to be of certified safe-type.

12.3 Survey and testing

12.3.1 Control system(s) are to be installed and tested to the Surveyor's satisfaction.

■ Section 13

Plant blow-down systems

13.1 General

13.1.1 Where a liquid blow-down system is provided in the process plant, the design and installation are to make adequate provision for the effects of back pressure in the system and vapour flash off when the pressures of liquids in the blow-down system are reduced.

13.1.2 Substances which will react with each other are to be provided with separate systems.

■ Section 14

Plant flare gas systems

14.1 General

14.1.1 Details of any flare gas stack system and proposals for installation on board the ships, including safety arrangements, are to be submitted for consideration.

14.1.2 The protection zone around the nozzle of the flare gas stack is dependent upon the limiting radiation intensity under all conditions and, also, whether suitable radiation screens are provided. The flare gas stack is to be located so that the nozzle is situated not less than the radius of the protection zone or 50 m, whichever is the greater, from equipment and manned stations, etc.

14.1.3 The arrangements are to ensure that combustion of the flare gas is complete and safe at all times.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 15 & 16

Section 15 Supply and discharge arrangements for feedstock and product

15.1 General

15.1.1 Arrangements are to be made to isolate the ship from the supply of feedstock for processing, the supply of oil fuel or gas to boilers, heaters, etc., and the return flow of product, chemicals or process effluent, blow-down or flare gas, etc.

15.1.2 The arrangements are to provide for valves installed at the shore connection, where applicable, and on board ship which are to be operable from shut-off control and indicating stations on the ship, on the shore, and at the valves.

15.2 Emergency procedures

15.2.1 Detailed instructions of the emergency shutdown and evacuation procedure are to be posted in a prominent position at the ship and shore control stations, where applicable.

16.2.3 The number and capacity of fans are to be such that the minimum ventilation capacity required in each compartment is maintained at all times, with one unit out of service. If internal combustion engines are proposed, their fuel supply is to be kept separate from any other system. Electric motors are to be supplied by two alternative circuits, each of which is capable of supplying all the motors which are normally connected to that circuit and which are operated simultaneously.

16.2.4 The mechanical ventilation system is to be capable of being controlled from a position outside the compartment being ventilated.

16.2.5 Reduction of ventilation capacity below the required level should be indicated in the compartment and also in the control room by an audible and visible alarm.

16.2.6 The parts of the rotating body and of the casing of each fan situated in a hazardous space are to be made of recognised spark-proof materials. If non-metallic materials are used, they are to have anti-static properties.

16.2.7 Ventilation trunking or ducting is to be suitably coated or painted, or made from material suitable for the substances processed or produced, or any combination of the substances which might result from accidental admixture.

Section 16 Ventilation of the process plant and other spaces associated with the process plant operation

16.1 General

16.1.1 An efficient means of ventilation is to be provided for all enclosed compartments associated with the operation of the process plant.

16.1.2 The capacity of the ventilation systems is to comply with the requirements of Pt 5, Ch 15,1.7 or the Rules for Ships for Liquefied Gases, or Chapter 12 of the Rules for Ships for Liquid Chemicals, where applicable, or to an acceptable Code of Practice suitably modified and/or adapted where necessary to suit the marine environment. It is to be related to the hazard and/or environmental consideration of manned spaces during normal operation, and take into account additional requirements which may be necessary during start-up procedures.

16.2 Design and construction

16.2.1 Hazardous compartments where flammable and/or toxic substances are being processed or produced are to be arranged for underpressure ventilation, except as stated in 10.2.4.

16.2.2 Safe compartments, including control rooms, are to be arranged for overpressure ventilation.

16.3 Air inlets and discharges

16.3.1 The air inlets for the ventilation systems are to be located in a designated safe area.

16.3.2 The air inlets and discharges of the ventilation system are to be so situated that recirculation of the vented vapours does not occur.

16.3.3 The discharges from ventilation systems which may contain vapours that present a hazard due to reaction with each other are to be effectively segregated.

16.3.4 The discharges from ventilation systems which may contain hazardous vapours are to be located not less than 10 m from the nearest air intake or opening to accommodation, service and control station spaces or other safe spaces, and from all possible sources of ignition.

16.3.5 Air intakes and openings into the accommodation spaces and all service and control station spaces are to be fitted with closing devices. For toxic gases, these devices are to be operable from inside the space.

16.3.6 Where it is impracticable to locate a plant service or control station so that any access thereto is from a safe space, the service or control station is to be maintained at an overpressure of not less than 5 mm water gauge above the surrounding spaces. Details of the arrangements to ensure that this pressure differential is maintained are to be submitted.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Sections 16, 17 & 18

16.3.7 Airlocks for intercompartmental access doors and emergency escape trunks are to have separate ventilation systems so arranged that an overpressure of 5 mm water gauge is maintained above the adjacent compartments. Details of the arrangements to ensure that this pressure differential is maintained are to be submitted.

16.4 Installation and inspection

16.4.1 The ventilation systems are to be installed to the Surveyor's satisfaction.

16.4.2 The Surveyors are to be satisfied that the ventilation system is capable of maintaining a safe environment during process plant operation. This may require monitoring over an extended period to prove its effectiveness.

Section 17 Gas detection

17.1 General

17.1.1 An efficient gas detection system, suitable for the gases and/or vapours being processed or produced, and for the measurement of oxygen levels in the process plant compartments, is to be provided. Gas detector systems are also to comply with the requirements of Section 17 or of Chapter 13 of the Rules for Ships for Liquefied Gases, where applicable.

17.2 Design and construction

17.2.1 The equipment is to consist of a permanently fixed installation and at least two sets of portable equipment suitable for the process or products involved.

17.2.2 The position and number of fixed sampling points should be determined with due regard to the density of the gases and/or vapours of the substances processed or produced, and the dilution resulting from compartment ventilation. In each case, a sufficient number of sampling points are to be provided to give efficient selective sequential sampling to maintain a safe environment.

17.2.3 Unmanned or closed compartments, such as cofferdams, etc., associated with plant processing or producing flammable or toxic substances, are to have permanently installed sampling points suitable for use with portable detection equipment to be used before entry of the spaces by personnel and thereafter continuously while occupied by them.

17.2.4 Arrangements of the sampling point pipe runs are to be such that there is no possibility of hazardous gases and/or vapours entering a safe space. Common sampling lines to the detection equipment are not to be fitted.

17.2.5 The permanently installed gas detection system is to give audible and visible alarm, both in the control station and within the compartment, during hazardous conditions.

17.2.6 Except where continuous sampling is required (i.e. as in 7.2.5), the gas detection equipment should be capable of sampling and analysing from each sampling point at agreed intervals, which are in no case to exceed 30 minutes.

17.2.7 The gas detection equipment is to be designed so that it may be readily and regularly tested and calibrated. Suitable equipment and span gas is to be provided for this purpose. In addition, regular checking procedures with portable equipment are to be provided, particularly for closed or unmanned spaces during process plant operation.

17.2.8 Where equipment for detecting the specific flammable, toxic or asphyxiate substances which may be present in process plant spaces cannot be provided, full details are to be submitted, including personnel protection requirements and arrangements for decontaminating such spaces if necessary.

17.3 Installation

17.3.1 The gas detection system is to be installed to the Surveyor's satisfaction.

Section 18 Fire protection, detection and extinction

18.1 General

18.1.1 The requirements of SOLAS Chapter II-2 and the Rules for Ships for Liquefied Gases are to be complied with, so far as they are applicable. Additional protection, consistent with the fire hazard involved, may be required for process plant control stations, and accommodation spaces. For the position of accommodation spaces relative to the process plant, see 6.2.

18.1.2 Where the design of the process plant is such that it may be operated only while the vessel or floating structure is specially moored, anchored or otherwise linked close to the shore, consideration will be given to a shore-based fire-fighting facility, taking account of the particular hazards involved.

18.2 Design arrangements

18.2.1 Arrangements are to be made in enclosed process plant spaces to prevent contact of dangerously interreactive substances and of flammable materials with sources of ignition. In general, compartments containing process plant are not to exceed 40 m in length, and the boundary bulkheads are to be 'A' Class divisions.

Ships with Installed Process Plant for Chemicals, Liquefied Gases and Related Products

Part 7, Chapter 2

Section 18

18.2.2 Where, during operation, process plant spaces or adjacent hazardous zones contain or are likely to contain flammable and/or explosive mixtures, special consideration is to be given to the exclusion of all possible sources of ignition.

18.2.3 All heated surfaces, e.g. exhaust pipes, boiler uptakes and steam pipes, are to be effectively lagged or cooled, so that the maximum temperature, °C, of the surfaces is, in general, not to exceed 70 per cent of the auto-ignition temperature, °C, of any substances which may be present in the compartment. In no case is the difference in these temperatures to be less than 50°C.

18.2.4 Compartments where a fire hazard exists and which are not continuously manned are to be provided with an approved fire detection system which shall give visible and audible warning of the location of the fire in the control station and, for plant operating at sea (Category 1A), at the navigating bridge control position.

18.2.5 The fire main is to be so arranged, and hoses and nozzles provided, that any part of the compartments or structure associated with the process plant can be reached with two powerful jets of water, one of which shall be produced by a single length of hose. The hoses are to be provided with dual-purpose nozzles capable of producing a jet or a spray. Special consideration will be given to an exemption from this requirement in respect of compartments where the use of water would in itself constitute a hazard.

18.2.6 Each compartment where the fire hazard so demands is to be provided with an approved fixed fire-extinguishing system capable of extinguishing fires involving the materials present. Operation of such a system at its required output is not to prevent the simultaneous use of the required jets of water from the fire main. Where carbon dioxide systems and Halon systems are fitted, due consideration should be given to the danger of static electricity.

18.2.7 An adequate number of portable fire extinguishers are to be provided in each compartment where a fire hazard exists. The number of such extinguishers will be decided in relation to the nature of the hazard and the layout of the compartment, but shall not be less than two, one of which is to be positioned near the entrance. The extinguishing medium is to be considered in relation to the nature of the hazard involved.

18.2.8 Means are to be provided for stopping all fans and, where practicable, closing all openings which might admit air to the compartment. Such means should be capable of being operated from a position outside the compartment and not likely to be rendered inaccessible by a fire in the compartment.

18.2.9 Means are to be provided for stopping the supply of combustible materials to the compartment in the event of fire.

18.2.10 The provision of additional fireman's outfits, each complying with the requirements of SOLAS Reg. II-2/A, 17, and the necessity for protective clothing, will be specially considered in relation to the layout of the process plant and the hazards involved.

Fire-fighting Ships

Part 7, Chapter 3

Section 1

Section

- 1 **General**
- 2 **Construction**
- 3 **Fire-extinguishing**
- 4 **Fire protection**
- 5 **Lighting**

Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships intended for fire-fighting operations and are additional to those applicable in other Parts.

1.1.2 A ship provided with fire protection and fire-fighting equipment in accordance with these Rules will be eligible for an appropriate class notation which will be recorded in the *Register Book*.

1.1.3 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the fire-fighting ship is intended to operate.

1.2 Classification and class notations

1.2.1 The class notations which may be assigned are:

- 'Fire-fighting ship 1 (total monitor discharge capacity in brackets)',
- 'Fire-fighting ship 2 (total monitor discharge capacity in brackets)',
- 'Fire-fighting ship 3 (total monitor discharge capacity in brackets)',
- 'Fire-fighting ship 1 (total monitor discharge capacity in brackets) with water spray',
- 'Fire-fighting ship 2 (total monitor discharge capacity in brackets) with water spray',
- 'Fire-fighting ship 3 (total monitor discharge capacity in brackets) with water spray'.

1.2.2 The notation **Fire-fighting ship 1**, **Fire-fighting ship 2** or **Fire-fighting ship 3** signifies that a ship complies with these Rules and is provided with the appropriate fire-fighting equipment described in Table 3.1.1, with the total discharge capacity of monitors in m³/h shown in brackets.

1.2.3 The addition of the words 'with water spray' to the notations referred to in 1.2.1 signifies that a ship is provided with a water spray system, which will provide an effective cooling spray of water over the vertical surfaces of the ship to enable it to approach a burning installation for fire-fighting purposes. The requirements for such a system are set out in 4.2.

Table 3.1.1 Fire-fighting equipment

Equipment	Fire-fighting ship		
	1	2	3
Minimum total pump capacity, m ³ /h	2400	7200	10 000
Minimum number of water monitors	2	3	4
Minimum discharge rate per monitor, m ³ /h	1200	1800	1800
Minimum height of trajectory of jets of monitors above sea level, metres	45	70	70
Minimum range of monitor jets, m	120	150	150
Minimum fuel capacity for monitors, hours	24	96	96
Number of hose connections each side of ship	4	8	8
Number of fireman's outfits	4	8	8

1.3 Surveys

1.3.1 The arrangements and equipment referred to in this Chapter are to be examined and tested under working conditions on completion of the installation and, subsequently, annually.

1.4 Submission of plans

1.4.1 The following plans and information are to be submitted:

- A general arrangement showing the disposition of all fire-fighting equipment required by this Chapter.
- Details of major items of fire-fighting equipment, such as pumps and monitors, including their capacity, range and trajectory of delivery.
- A general arrangement plan showing the disposition of fire divisions and their class.
- Detailed plans of the fire divisions and, where applicable, copies of the certificates of approval for the insulating materials proposed.
- A plan of the construction of the fire doors.
- Plans showing the layout and capacity of the water spray system. Where alternative arrangements to those specified in 4.2 are proposed, evidence is to be submitted to satisfactorily demonstrate that an equivalent level of protection from radiated heat is provided, including details of the environmental conditions in which the ship is intended to operate, see 4.2.1.
- A plan of the seating arrangements for the water monitors.
- Particulars of the means of keeping the ship in position during fire-fighting operations.
- A plan showing the fire pumps, the fire water main, the hydrants, hoses and hose nozzles and the monitors, together with particulars of their delivery capability.
- Details of the fireman's outfits provided.
- Plans of any other fire-fighting systems provided.

Fire-fighting Ships

Part 7, Chapter 3

Sections 1, 2 & 3

1.5 Definitions

1.5.1 'A-60 standard' means a fire-resisting construction of steel or other equivalent material, which is suitably stiffened and so constructed as to be capable of preventing the passage of smoke and flame for the complete period of the one-hour standard fire test. It is to be insulated with approved non-combustible materials, so that the average temperature on the unexposed side will not rise by more than 139°C above the original temperature, nor will the temperature at any one point, including any joint, rise more than 180°C above the original temperature within 60 minutes.

1.5.2 'Steel or other equivalent material'. In this context, 'equivalent material' means any material which, by itself or due to insulation provided, has structural and integrity properties equivalent to steel at the end of the applicable standard fire test exposure period (e.g. aluminium with appropriate insulation).

1.5.3 'The standard fire test' is one in which specimens of the relevant bulkheads or decks, having a surface area of approximately 4,65 m² and a height of 2,44 m, resembling as closely as possible the intended construction and including, where appropriate, at least one joint, are exposed in a test furnace to heat on a time-temperature relationship, approximately as follows:

- At the end of the first 5 minutes, 538°C.
- At the end of the first 10 minutes, 704°C.
- At the end of the first 30 minutes, 843°C.
- At the end of the first 60 minutes, 927°C.

1.5.4 A 'non-combustible material' means a material which neither burns nor gives off flammable vapours in sufficient quantity for self-ignition when heated to approximately 750°C. Any other material is a 'combustible material'.

Section 2 Construction

2.1 Hull

2.1.1 The structure of the ship is to be strengthened as necessary to withstand the forces imposed by the fire-extinguishing systems when operating at their maximum capacity.

2.2 Sea suction

2.2.1 The sea suction of the fire pumps are to be arranged as low as practicable in the ship's structure to avoid icing or the ingress of oil from the surface of the sea.

2.2.2 All sea inlet valves are to be provided with a low pressure steam or compressed air connection for clearing purposes.

2.3 Stability

2.3.1 Each ship is to comply with the draught and stability requirements of the National Authority and is to have on board sufficient stability data to enable the ship to be properly loaded and handled. This data is to take full account of the effect of the monitors when they are operating at their maximum output in all possible directions of use.

2.4 Manoeuvrability

2.4.1 Arrangements are to be provided to enable the ship to maintain position, so that the monitors may be effectively deployed.

2.5 Bunkering

2.5.1 The Owner should ensure that any fuel which may be required while the ship is operating on station can be safely received on board.

Section 3 Fire-extinguishing

3.1 Water monitors

3.1.1 The minimum number of monitors, their discharge rate, their range and their height of trajectory above sea level are to comply with the requirements of Table 3.1.1.

3.1.2 The monitors are to be so arranged that the required direction, range and height of trajectory can be achieved separately, with the required number of monitors operating simultaneously.

3.1.3 The monitors are to be capable of adequate adjustment in the vertical and horizontal direction and are to be so positioned that the jets will be unimpeded within the required range of operation.

3.1.4 Means are to be provided for preventing the monitor jets from impinging on the ship's structure and equipment.

3.1.5 The monitors are to be capable of being activated and manoeuvred by remote control from a protected position providing a good view of the monitors and the operating area of the water jets.

3.1.6 The monitors are to be of robust construction and their seating arrangements are to be of adequate strength for all modes of operation, particular attention being paid to shock loading when all the monitors are activated simultaneously.

Fire-fighting Ships

Part 7, Chapter 3

Sections 3 & 4

3.1.7 For the class notations **Fire-fighting ship 2** and **Fire-fighting ship 3**, an arrangement with one less monitor than required in Table 3.1.1 may be considered as an equivalent solution. In such cases the total pump capacity is to be as required in Table 3.1.1. The minimum range of monitor jets and minimum height of trajectory of jets of monitors above sea level are to be 180 m and 110 m, respectively.

3.2 Pumps

3.2.1 The pumps and their piping system which are intended for serving the monitors are not to be available for services other than fire-extinguishing and water spraying. They are to be provided with independent sea inlets.

3.2.2 Where the pumps are used for fixed water spray systems, the piping is to be independent of that supplying the monitors. The water spray systems are to be adequately protected against overpressure.

3.2.3 The minimum total pump capacities required are shown in Table 3.1.1.

3.2.4 For assignment of the notations **Fire-fighting ship 2** or **Fire-fighting ship 3**, there are to be at least two pumps serving the monitors and they should be of approximately equal capacity. For assignment of the notation **Fire-fighting ship 1**, one pump only need be provided.

3.3 Hose stations

3.3.1 Hose stations are to be provided on each side of the ship in accordance with Table 3.1.1.

3.3.2 Each hose station is to be provided with a hydrant, a hose and a nozzle capable of producing a jet or a spray and simultaneously a jet and a spray. The hoses are to be 15 m in length and not less than 38 mm nor more than 65 mm in diameter. Where hose stations are connected to the monitor supply lines, provision is to be made to reduce the water pressure at the hydrants to an amount at which each fire hose nozzle can be safely handled by one man. The water pressure shall be sufficient to produce a water jet throw of at least 12 m.

3.4 Fireman's outfits

3.4.1 The number of fireman's outfits provided, in addition to those provided in accordance with Pt 6, Ch 4, 12 or SOLAS Reg. II-2/A, 17 as applicable, is to be in accordance with Table 3.1.1. They are to be stored in a safe position which is readily accessible from the open deck.

3.4.2 The composition of a fireman's outfit is to be as follows:

- Protective clothing of material to protect the skin from heat radiating from the fire and from burns and scalding by steam. The outer surface is to be water-resistant.
- Boots and gloves of rubber or other electrically non-conducting material.

- A rigid helmet providing effective protection against impact.
- An electric safety lamp (hand lantern) of an approved type with a minimum operating period of three hours.
- An axe having an insulated handle.
- A self-contained breathing apparatus, which is to be capable of functioning for a period of at least 30 minutes and having a capacity of at least 1200 litres of free air. Spare, fully charged air bottles are to be provided at the rate of at least one set per required apparatus.
- For each breathing apparatus, a fireproof lifeline of sufficient length and strength is to be provided capable of being attached by means of a snaphook to the harness of the apparatus or to a separate belt, in order to prevent the breathing apparatus becoming detached when the life-line is operated.

3.5 Recharging of equipment

3.5.1 A suitable air compressor for recharging the bottles used in the breathing apparatus of the fireman's outfits is to be provided. It is to be capable of recharging the bottles of the breathing apparatus required to be carried, in accordance with Table 3.1.1, in a time not exceeding 30 minutes.

Section 4 Fire protection

4.1 General

4.1.1 In ships which are not provided with a water spray system as described in 4.2 all windows and port lights are to be provided with efficient deadlights or external steel shutters, except in the wheelhouse.

4.2 Water spray systems

4.2.1 Ships which are intended to operate in close proximity to a large fire will require protection from the heat radiated from the fire. Such protection may be afforded by a system which provides a water spray over the surface of the ship, or by a combination of insulation and a water spray system. Alternative arrangements providing an equivalent level of protection may be accepted where it can be demonstrated that such arrangements are effective for the environmental conditions in which the ship is intended to operate.

4.2.2 The water spray system is to be a fixed system which is capable of delivering a spray of water over all the exposed external vertical surfaces of the hull in the lightest sea-going condition, including the superstructures and deck-houses and over the monitor position. The water spray system will also be required to cover the areas of deck which form the crowns of machinery spaces and other spaces containing combustible materials.

Fire-fighting Ships

Part 7, Chapter 3

Sections 4 & 5

4.2.3 The system is to have a capacity of 10 litres/min per m² of the protected area of uninsulated steel and 5 litres/min per m² of the protected area which is insulated internally to A-60 standard.

4.2.4 The system is to be divided into sections, so that it will be possible to close down sections covering surfaces which are not exposed to radiant heat.

4.2.5 The nozzles are to be arranged to give an even distribution of water spray over the protected area.

4.2.6 The pumping capacity is to be sufficient to supply simultaneously at the required pressure the sections which serve the maximum area which may be exposed to radiant heat from a fire. If the main fire pumps are used for this purpose, they are to be capable of operating this system and the monitors and hose stations simultaneously at the required pressures, *see also* 3.2.2.

4.2.7 Deck scuppers and freeing ports are to be of sufficient area to ensure efficient drainage of water from decks and horizontal surfaces in all conditions when the water spray system is in operation.

■ Section 5 Lighting

5.1 General

5.1.1 Two searchlights should be provided for illuminating the burning structure and facilitate the effective deployment of the water monitors at night.

5.1.2 The searchlights are to be capable of providing at a range of 250 m in clear atmospheric conditions a level of illumination of 50 lux within an area of not less than 11 m diameter. They are to be capable of being adjusted in the horizontal and vertical directions.

Dynamic Positioning Systems

Part 7, Chapter 4

Section 1

Section

- 1 **General**
- 2 **Class notation DP(CM)**
- 3 **Class notation DP(AM)**
- 4 **Class notation DP(AA)**
- 5 **Class notation DP(AAA)**
- 6 **Performance Capability Rating (PCR)**
- 7 **Testing**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships with installed dynamic positioning systems and are additional to those applicable in other Parts of these Rules.

1.1.2 A ship provided with a dynamic positioning system in accordance with these Rules will be eligible for an appropriate class notation which will be recorded in the *Register Book*.

1.1.3 Requirements, additional to these Rules, may be imposed by the National Administration with whom the ship is registered and/or by the administration within whose territorial jurisdiction it is intended to operate. Where national legislative requirements exist, compliance with such regulations shall also be necessary.

1.1.4 For the purpose of these Rules, dynamic positioning means the provision of a hydrodynamic system with automatic and/or manual control capable of maintaining the heading and position of the ship during operation within specified limits and environmental conditions.

1.1.5 For the purpose of these Rules, the area of operation is the specified allowable position deviation from a set point, see 1.3.2.

1.1.6 Special consideration will be given where the dynamic positioning system is used primarily for purposes other than position keeping, e.g. track following. A descriptive note may be entered in column 6 of the *Register Book* to this effect.

1.2 Classification notations

1.2.1 Ships complying with the requirements of this Chapter will be eligible for one of the following class notations, as defined in Pt 1, Ch 2:

- DP(CM)** See Section 2.
- DP(AM)** See Section 3.
- DP(AA)** See Section 4.
- DP(AAA)** See Section 5.

1.2.2 The notations given in 1.2.1 may be supplemented with a Performance Capability Rating (PCR). This rating indicates the calculated percentage of time that a ship is capable of maintaining heading and position under a standard set of environmental conditions (North Sea), see Section 6.

1.2.3 Additional descriptive notes may be entered in column 6 of the *Register Book* indicating the type of position reference system, control system, etc.

1.2.4 Where a **DP** notation is not requested, dynamic positioning systems are to be installed in accordance with the requirements of Section 2 as far as is practicable.

1.3 Information and plans required to be submitted

1.3.1 The information and plans specified in 1.3.2 to 1.3.7 are to be submitted in triplicate. The Operation Manuals specified in 1.3.8 are to be submitted in a single set.

1.3.2 Details of the limits of the area of operation and heading deviations, together with proposals for redundancy and segregation provided in the machinery, electrical installations and control systems, are to be submitted. These proposals are to take account of the possible loss of performance capability should a component fail or in the event of fire or flooding, see *also* 1.3.6 and Sections 4 and 5.

1.3.3 Where a common power source is utilised for thrusters, details of the total maximum load required for dynamic positioning are to be submitted.

1.3.4 Plans of the following, together with particulars of ratings in accordance with the relevant Parts of the Rules, are to be submitted for:

- (a) Prime movers, gearing, shafting, propellers and thrusters.
- (b) Machinery piping systems.
- (c) Electrical installations.
- (d) Pressure vessels for use with dynamic positioning system.

1.3.5 Plans of control, alarm and safety systems, including the following, are to be submitted:

- (a) Functional block diagrams of the control system(s).
- (b) Functional block diagrams of the position reference systems and the environmental sensors.
- (c) Details of the electrical supply to the control system(s), the position reference system(s) and the environmental sensors.
- (d) Details of the monitoring functions of the controllers, sensors and reference systems, together with a description of the monitoring functions.
- (e) List of equipment with identification of the manufacturer, type and model.

Dynamic Positioning Systems

Part 7, Chapter 4

Sections 1 & 2

- (f) Details of the control stations, e.g. control panels and consoles, including the location of the control stations.
- (g) Test schedules (for both works testing and sea trials) that are to include the methods of testing and the test facilities provided.

1.3.6 For assignment of a **DP(AA)** or **DP(AAA)** notation, a Failure Mode and Effects Analysis (FMEA) is to be submitted, demonstrating that adequate segregation and redundancy of the machinery, the electrical installation and the control systems have been achieved in order to maintain position in the event of equipment failure (see Section 4); or fire or flooding, see Section 5. The FMEA is to take a formal and structured approach and is to be performed in accordance with an acceptable and relevant national or international standard, e.g. IEC 60812.

1.3.7 Where the **DP** notation is to be supplemented with a Performance Capability Rating (PCR) (see 1.2.2), the following information is to be submitted for assignment of a PCR:

- (a) Lines plan.
- (b) General arrangement.
- (c) Details of thruster arrangement.
- (d) Thruster powers and thrusts.

1.3.8 Operation Manuals, including details of the dynamic positioning system operation, installation of equipment, maintenance and fault finding procedures, together with a section on the procedure to be adopted in emergency, are to be submitted. A copy of the manual is to be placed and retained on board the ship.

Section 2 Class notation DP(CM)

2.1 General

2.1.1 For assignment of **DP(CM)** notation, the requirements of 2.1.2 and 2.2 to 2.5 are to be complied with.

2.1.2 Control engineering systems, electrical and piping installations and machinery items are to be designed, constructed, installed and tested in accordance with the relevant requirements of Parts 5 and 6.

2.2 Thrusters

2.2.1 Thruster installations are to be designed, constructed, installed and tested in accordance with the requirements of Pt 5, Ch 20, as applicable.

2.2.2 Thruster installations are to be designed to minimise potential interference with other thrusters, sensors, hull or other surfaces, which could be encountered in the service for which the ship is intended.

2.2.3 Thruster intakes are to be located at sufficient depth to reduce the possibility of ingesting floating debris and vortex formation.

2.2.4 The response and repeatability of thrusters to changes in propeller pitch or propeller speed/direction of rotation are to be suitable for maintaining the area of operation and heading within specified limits.

2.3 Electrical systems

2.3.1 This Section applies to the electrical generation and distribution system associated with the Dynamic Positioning System, whether this generating system is dedicated to the DP system or forms a central generating arrangement for all loads on the ship.

2.3.2 The electrical installation is to be designed, constructed and installed, in accordance with the requirements of Pt 6, Ch 2, together with the requirements of 2.3.3 to 2.3.12.

2.3.3 Where thrusters are electrically driven, the relevant requirements, including surveys, of Pt 6, Ch 2, 15 are to be complied with.

2.3.4 Essential services are those defined in Pt 6, Ch 2, 1.5, as applicable, together with thruster auxiliaries, computers, generator and thruster control equipment, reference systems, environmental sensors and electrically driven thrusters.

2.3.5 The number and rating of generator sets, transformers and converter equipment are to be sufficient to ensure the operation of essential services, even when one generating set, transformer or converter equipment is out of action.

2.3.6 For electrically driven thruster systems, the generator rating is to be determined by the maximum dynamic positioning load, together with the maximum ancillary load.

2.3.7 There are to be arrangements to prevent overloading of the running generator(s). The tripping of non-essential loads and the temporary reduction in the load demands of electrically driven thrusters may form part of these arrangements.

2.3.8 An alarm is to be initiated when the total electrical load exceeds a preset percentage of the running generator(s) capacity. This alarm is to be adjustable between 50 and 100 per cent of the running capacity and is to be set with regard to the number of generators in service and the effect of the loss of any one generator.

2.3.9 On loss of power due to the failure of the operating generator(s), there is to be provision for the automatic starting and connection to the switchboard of a standby set and the automatic sequential restarting of essential services. Consideration may be given to cases where arrangements for automatic re-starting of thrusters would not be practicable. Details are to be submitted in such cases to show that manual means for the immediate re-starting of thrusters would be available at the control station from where the dynamic positioning system would be operated.

Dynamic Positioning Systems

Part 7, Chapter 4

Sections 2 & 3

2.3.10 Any loads that require an uninterrupted electrical power supply are to be provided with uninterruptible power systems (UPS) having a capacity for a minimum of 30 minutes' operation following loss of the main supply. A UPS is to be provided for each control computer system.

2.3.11 An indication of the absorbed power and the available on-line generating capacity is to be provided at the main dynamic positioning control station.

2.3.12 Essential services are to be served by individual circuits. Essential services that are duplicated are:

- (a) to be supplied from independent sections of their switchboard or section board;
- (b) to have their circuits separated throughout their length as widely as is practicable; and
- (c) not to depend upon common feeders, transformers, converters, protective devices, control circuits or control gear assemblies to operate.

2.4 Control stations

2.4.1 Control stations from which the dynamic positioning system may be operated are to be designed in accordance with sound ergonomic principles, and are to be provided with sufficient instrumentation to provide effective control and indicate that the systems are functioning correctly. Colour schemes and screen layouts are to be selected such that necessary information is readily available and clearly displayed. See also Pt 6, Ch 1,2.10 for general ergonomic requirements.

2.4.2 Control station(s) are to be located such that the operator has a good view of the ship's exterior limits and surrounding area.

2.4.3 Indication of the following is to be provided at each station from which it is possible to control the dynamic positioning system:

- (a) The heading and location of the ship relative to the desired reference point or course.
- (b) Vectorial thrust output, individual and total.
- (c) Operational status of position reference systems and environmental sensors.
- (d) Environmental conditions, e.g. wind speed and direction.
- (e) Availability status of standby thrusters.

2.4.4 At least one position reference system, heading reference sensor and wind sensor are to be provided to ensure that the specified area of operation and heading can be effectively maintained.

2.4.5 Position reference systems are to incorporate measurement techniques suitable for the service conditions for which the ship is intended.

2.4.6 Where necessary for the correct functioning of a position reference system, a vertical reference sensor is to be provided to correct for the pitch and roll of the ship. There are to be at least as many vertical reference units as there are associated position reference systems.

2.4.7 Alarms, in accordance with the requirements of Pt 6, Ch 1,2.3, are to be provided for the following fault conditions as applicable:

- (a) When the ship deviates from the area of operation.
- (b) When the heading exceeds the allowable deviation.
- (c) Position reference system fault (for each reference system).
- (d) Heading reference sensor fault.
- (e) Vertical reference sensor fault.
- (f) Wind sensor fault.
- (g) Taut wire excursion limit.
- (h) Automatic changeover to a standby position reference system or environmental sensor.

A permanent record of the occurrences of alarms and warnings, and of status changes is to be provided.

2.5 Control system

2.5.1 A centralised remote manual control system is to be provided such that changes in the vectorial thrust output may be readily effected by a single operator action.

2.5.2 Suitable processing and comparative techniques are to be provided to validate the control system inputs from position and other sensors. Abnormal signal errors revealed by the validity checks are to operate alarms.

2.5.3 The control system for dynamic positioning operation is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.

2.5.4 Automatic controls are to be provided to maintain the heading of the ship within specified limits.

2.5.5 The allowable deviation from the desired heading is to be adjustable, but should not exceed the specified limits, see 1.1.4. Arrangements are to be provided to fix and identify the set point for the desired heading.

2.5.6 Alarms, in accordance with the requirements of Pt 6, Ch 1,2.3, are to be provided for the following fault conditions:

- (a) Control computer system fault.
- (b) Automatic changeover to a standby control computer system, as applicable, see 4.1.7.

Section 3 Class notation DP(AM)

3.1 Requirements

3.1.1 For assignment of **DP(AM)** notation, the applicable requirements of Section 2, together with 3.1.2 to 3.1.6, are to be complied with.

Dynamic Positioning Systems

Part 7, Chapter 4

Sections 3 & 4

3.1.2 An automatic and a manual control system are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative. Arrangements for manual control are to satisfy the requirements of Section 2 when the automatic system is inoperative.

3.1.3 At least two position reference systems suitable for the intended service conditions and incorporating different measurement techniques, are to be provided and arranged, so that a failure in one system will not render the other system inoperative. Special consideration will be given where the use of different techniques would not be practicable during DP operations.

3.1.4 At least two heading reference sensors and two wind sensors are to be provided and arranged, so that a failure of one sensor will not render the other sensor(s) inoperative.

3.1.5 In the event of a single failure of a position reference, heading reference, or wind sensor, the control systems are to continue operating on signals from the remaining sensors without manual intervention.

3.1.6 The area of operation is to be adjustable, but is not to exceed the specified limits based on a percentage of water depth, or as applicable, a defined absolute or relative surface movement. Arrangements are to be provided to fix and identify the set point for the area of operation.

4.1.3 Cables, pipes and other components essential for correct functioning of the DP system are to be located and protected, where necessary, such that the risk of fire or mechanical damage is minimised.

4.1.4 The electrical generation and distribution arrangements are to be isolatable such that at least the minimum number of any duplicated, or otherwise replicated, items required to provide essential services would remain operational in the event of a single fault. Evidence to verify compliance with this requirement is to be submitted for consideration when required; for example, where it is intended to operate with the independent sections required by 2.3.12 connected together; or where division would be via a single circuit breaker.

4.1.5 For electrically driven thruster systems:

- (a) a reduction in position keeping capability may be accepted, but this is not to result in a loss of position in the environmental conditions in which the DP system is intended to operate; and
- (b) provision is to be made for the automatic starting, synchronising and load sharing of a non-running generator before the load reaches the alarm level required by 2.3.8.

4.1.6 Two automatic control systems are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative.

4.1.7 Control systems are to be arranged such that, in the event of failure of the working control system, the standby system takes control automatically without manual intervention and without any adverse effect of the ship's station keeping performance.

4.1.8 At least three position reference systems incorporating at least two different measurement techniques are to be provided and arranged so that a failure in one system will not render the other systems inoperative.

4.1.9 At least three heading reference sensors are to be provided and arranged so that a failure of one sensor will not render the other sensors inoperative.

4.1.10 The DP system is to incorporate a computer based consequence analysis to determine whether the position of the vessel would remain within the limits set by the operator in the event of a worst case fault. An audible and visual alarm is to be initiated where the consequence analysis determines that the limits would be exceeded. Where applicable to the timescale for safely terminating operations, the consequence analysis is to allow for manual input of predicted environmental conditions.

Section 4 Class notation DP(AA)

4.1 Requirements

4.1.1 For assignment of **DP(AA)** notation, the applicable requirements of Sections 2 and 3, together with 4.1.2 to 4.1.10 are to be complied with.

4.1.2 Power, control and thruster systems and other systems necessary for, or which could affect, the correct functioning of the DP system are to be provided and configured such that a fault in any active component or system will not result in a loss of position. This is to be verified by means of a FMEA, see 1.3.6. Such components may include, but are not restricted to, the following:

- Prime movers (e.g. auxiliary engines).
- Generators and their excitation equipment.
- Gearing.
- Pumps.
- Fans.
- Switchgear and control gear, including their assemblies.
- Thrusters.
- Valves (where power actuated).

Systems which are not part of the DP system but which, in the event of a fault, could affect the correct functioning of the DP system (for example, fire suppression systems, engine ventilation systems, shutdown systems, etc.) are to be included in the FMEA.

Dynamic Positioning Systems

Part 7, Chapter 4

Sections 5 & 6

■ Section 5 Class notation DP(AAA)

5.1 Requirements

5.1.1 For assignment of **DP(AAA)** notation, the applicable requirements of Sections 2, 3 and 4, together with 5.1.2 to 5.1.12 are to be complied with.

5.1.2 The DP system is to be arranged such that failure of any component or system necessary for the continuing correct functioning of the DP system, or the loss of any one compartment as a result of fire or flooding, will not result in a loss of position. This is to be verified by means of a FMEA. See 1.3.6.

5.1.3 Thruster units are to be installed in separate machinery compartments, separated by a watertight A-60 class division.

5.1.4 Generating sets, switchboards and associated equipment are to be located in at least two compartments separated by an A-60 class division, so that at least half of the equipment will be available following a fire or similar fault in one of the compartments. If the equipment is located below the operational waterline, the division is also to be watertight. There is to be provision to connect the switchboard sections together by means of circuit-breakers.

5.1.5 Duplicated cables and pipes for services essential for the correct functioning of the DP system are not to be routed through the same compartments. If this is not practicable, then they are to be carried in A-60 protected ducts. The termination arrangements are also to take due account of the degree of protection. Alternative arrangements will be considered.

5.1.6 Where duplicated cables and pipes for services essential for the correct functioning of the DP system are installed in adjacent compartments, A-60 rated fire protection is to be provided between the spaces. Details of alternative arrangements which demonstrate essential equipment located in an adjacent space will continue to operate satisfactorily and essential services will continue to be available in the event of a fire in the adjacent space may be submitted for consideration.

5.1.7 An additional/emergency automatic control unit is to be provided at an emergency control station, in a compartment separate from that for the main control station, and is to be arranged to operate independently from the working and standby control units required by 4.1.7.

5.1.8 Arrangements are to be provided such that, in the event of a failure of the working and standby control units, a smooth transfer of control to the emergency control unit may be effected from the emergency control station by manual means.

5.1.9 Arrangements are to be provided at the emergency control station so that changes in the resultant vectorial thrust output may be readily effected by a single operator action.

5.1.10 The control/indication unit of one of the position reference systems required by 4.1.8 is to be located at the emergency control station. A repeater control/indication unit from this system is to be located at the main control station.

5.1.11 One of the heading reference sensors required by 4.1.9 is to be located at the emergency control station.

5.1.12 One wind sensor is to directly supply the additional/emergency control unit.

5.1.13 The additional/emergency control unit is to be supplied from its own independent UPS, see 2.3.10.

■ Section 6 Performance Capability Rating (PCR)

6.1 Requirements

6.1.1 Where the **DP** notation is to be supplemented with a Performance Capability Rating (PCR) (see 1.2.2), the calculation will be carried out using the information specified in 1.3.7.

6.1.2 Two rating numerals are calculated:

- (a) The first numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with all thrusters operating.
- (b) The second numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with the most effective thruster being inoperative.

A typical rating might be (95), (70).

6.1.3 In calculating the PCR, the following parameters are considered:

- (a) Thruster force vectors.
- (b) Thruster/thruster, thruster/hull and thruster/current interactions.
- (c) Sea current loads on the ship.
- (d) Wind force on the ship.
- (e) Wave drift force on the ship.

6.1.4 Where the ship has been subject to alteration or addition, which may affect the performance characteristics of the DP system, the PCR is to be recalculated.

■ Section 7 Testing

7.1 General

7.1.1 Control units are to be surveyed at the manufacturer's works and are to be tested in accordance with the approved test schedule to the Surveyor's satisfaction, see 1.3.5(g).

7.1.2 Before a new installation (or any existing installation, which has been subject to alteration or addition which may affect the performance characteristics of the system) is put into service, sea trials are to be carried out to the approved schedule and to the Surveyor's satisfaction, see 1.3.5(g).

7.1.3 The suitability of the dynamic positioning system is to be demonstrated during sea trials, observing the following:

- (a) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power, verifying the findings of the FMEA where required.
- (b) Response of the system under a set of predetermined manoeuvres for changing:
 - (i) Location of area of operation.
 - (ii) Heading of the ship.
- (c) Continuous operation of the system over a period of four to six hours.

7.1.4 Two copies of the dynamic positioning system sea trial test schedules, as required by 1.3.5(g), each signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed and retained on board the ship and the other submitted to LR.

7.1.5 Records and data regarding the performance capability of the dynamic positioning system are to be maintained on board the ship and are to be made available at the time of the Annual Survey, see Pt 1, Ch 3,2.2.17.

Ships Equipped for Oil Recovery Operations

Part 7, Chapter 5

Sections 1 & 2

Section

- 1 **General**
- 2 **Oil recovery**
- 3 **Ship structure**
- 4 **Machinery arrangements**
- 5 **Electrical equipment**
- 6 **Fire protection and extinction**
- 7 **Operating Manual**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships equipped to handle, store and transport oil recovered from a spill in emergency situations.

1.1.2 For ships of less than 500 gross tons, also fishing vessels of 12 m length and over, but less than 45 m length, and ships not fitted with propelling machinery, the arrangements for fire protection and extinction are to comply with Section 6. Consideration will be given to the acceptance of the fire safety measures for oil recovery ships prescribed and approved by the Government of the Flag State.

1.1.3 For ships of 500 gross tons and over, also fishing vessels of 45 m length and over, it is the responsibility of the Government of the Flag State to give effect to the fire safety measures, see Pt 6, Ch 4, 1.1. Where the Government of the Flag State has no National Requirements for oil recovery ships, Lloyd's Register (hereinafter referred to as 'LR') will apply the fire safety measures required by Section 6 for classification purposes.

1.1.4 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.2 Classification and class notations

1.2.1 A ship complying with the requirements of this Chapter will be eligible for the notation **Oil Recovery**.

1.2.2 A ship dedicated solely to oil recovery duties will be given the class notation **Oil Recovery Ship**. The scantlings will be specially considered on the basis of the requirements of Pt 4, Ch 9.

1.3 Surveys

1.3.1 The arrangements and equipment referred to in this Chapter are to be examined and tested on completion of the installation and, subsequently, annually.

1.4 Plans and supporting documentation

1.4.1 In addition to the supporting documentation required for classification as specified in other Parts of the Rules, details relevant to oil recovery operations are to be submitted.

1.4.2 Plans covering the following items are to be submitted for approval:

- Structural support in way of equipment.
- Structural arrangement of recovered oil tanks including access.
- Piping system arrangements for recovered oil including venting.
- Power supply, electrical protection and cabling for oil recovery equipment.
- Hazardous areas and spaces.
- Electrical equipment located in hazardous areas and spaces.
- Structural fire protection and extinguishing equipment.

1.4.3 The following supporting documents are to be submitted:

- General arrangement of recovery equipment, including portable items, handling facilities, access, ventilation details, arrangement of other openings to hazardous spaces and adjacent compartments, machinery exhaust outlet positions.
- Gas detection equipment specification.
- Operating Manual.

1.4.4 The following supporting calculations are to be submitted:

- Deck equipment support structure loadings.
- Schedule of loads on the electrical system for oil recovery operations.

■ Section 2 Oil recovery

2.1 General

2.1.1 The ship is to be capable of performing the following functions at a safe distance from the source of oil spill:

- (a) Removal of the oil from the surface of the sea.
- (b) Handling, storage and transportation of the recovered oil.

Ships Equipped for Oil Recovery Operations

Part 7, Chapter 5

Sections 2, 3 & 4

2.2 Equipment and deck arrangement

2.2.1 The arrangements for collection, handling and transfer of recovered oil are to be such that the probability of oil spill on deck and overflow is minimised and the operation is to be performed as far away from the accommodation spaces as practicable.

2.2.2 In way of working areas, hand rails and gratings or other non-slip surfaces are to be provided.

2.2.3 Means are to be provided to keep deck spills away from the accommodation and service areas. This may be accomplished by provision of a permanent continuous coaming not less than 150 mm high.

2.2.4 At least two portable instruments are to be available on board for gas detection.

2.2.5 For engines used in oil recovery operations, see 4.4.

2.2.6 Masts and derricks, etc., are to comply with the appropriate sections of Chapters 2 and 3 of LR's *Code for Lifting Appliances in a Marine Environment*.

Section 3 Ship structure

3.1 Structural arrangement

3.1.1 The position of bulkheads is to comply with the requirements of Pt 3, Ch 3,4.

3.1.2 Any tanks not utilised during oil recovery operations are to be arranged so that recovered oil cannot be transferred to them inadvertently.

3.1.3 In tanks intended for recovered oil, internal obstructions are to be avoided as far as practicable to prevent the entrapment of foreign objects usually present in recovered oil. Adequate drainage openings are to be provided to ensure free flow of residues to assist in cleaning and gas freeing on completion of recovery operations.

3.1.4 Tanks used for the storage of recovered oil are to be located outside the accommodation and machinery spaces.

3.1.5 Except where permitted by 3.1.6 and 3.1.7, tanks intended for the storage of recovered oil are to be separated from accommodation and machinery spaces by cofferdams. Cofferdams are to be at least one frame spacing in length (600 mm minimum) and are to cover the whole area of the boundary under consideration.

3.1.6 A pump room, oil fuel bunker, water ballast tank or other closed space where oil recovery handling equipment is stored will be accepted in lieu of a cofferdam.

3.1.7 In the case of a ship not primarily intended for oil recovery operations, where cofferdams are impractical to arrange, tanks arranged adjacent to machinery spaces may be accepted for storage of recovered oil. Acceptance will be conditional upon the tank boundary bulkheads being readily accessible for inspection. The bulkheads are to be carried continuously through joining structure to the top of the tank, where full penetration welding is to be carried out. Such tanks will require to be pressure tested at every Periodical Survey, see Table 1.8.2 in Pt 3, Ch 1, as applicable to oil tankers. Special consideration will be given to arrangements incorporating double bottom tanks in these locations.

3.1.8 All openings to tanks for recovered oil are to be located on the open deck. This includes sounding pipes, vent pipes, and hatches for the deployment of portable pumps and hoses. Suitable access hatches, not less than 600 mm x 600 mm, are to be arranged to facilitate tank cleaning and gas freeing. Dual access hatches, as widely separated as practicable, are to be provided for tanks of a cellular internal structure.

3.1.9 Where there is a risk of significant sloshing induced loads, additional strength calculations may be required, see Pt 3, Ch 3,5,4.

3.1.10 Where recovered oil temperatures are to be increased significantly above 65°C during transit voyages, attention is drawn to Pt 4, Ch 9,12 regarding thermal stress considerations.

3.2 Scantlings

3.2.1 The scantlings and arrangements are, in general, to be as required by Pt 4, Ch 1. If the ship is to perform the duties of a supply ship the requirements of Pt 4, Ch 4 are also to be complied with, as applicable.

Section 4 Machinery arrangements

4.1 Piping arrangements

4.1.1 Piping arrangements for the recovered oil system are to be located outside machinery spaces and are to have no connections to such spaces.

4.1.2 When the ship is in oil recovery mode, means are to be provided to isolate the oil recovery system from any other system to which it may be connected.

4.1.3 Ventilation outlets from the recovered oil tanks are to have a minimum height of 2,4 m above deck and be fitted with flame screens. Temporary pipe sections may be used for this purpose. Outlets are to be located not less than 5 m measured horizontally from the nearest air intakes and openings to accommodation and enclosed spaces containing a source of ignition and from deck machinery and equipment which may constitute an ignition hazard.

Ships Equipped for Oil Recovery Operations

Part 7, Chapter 5

Sections 4 & 5

4.1.4 Each recovered oil tank is to be fitted with suitable means of ascertaining the liquid level in the tank. Sounding pipes or other approved devices are acceptable for this purpose.

4.2 Pump room for recovered oil

4.2.1 Pump rooms are to be fitted with a permanent ventilation system of the mechanical extraction type.

4.2.2 The ventilation system is to be capable of being operated from outside the compartment being ventilated and a notice is to be fixed near the entrance stating that no person is to enter the space until the ventilation system has been in operation for a specified period, sufficient to achieve at least five air changes based on the gross volume of the space.

4.2.3 The ventilation system is to be capable of at least six air changes per hour, based on the gross volume of the space.

4.2.4 Protection screens of not more than 13 mm square mesh are to be fitted outside openings of ventilation ducts, and ventilation intakes are to be so arranged as to minimise the possibility of recycling hazardous vapours from any ventilation discharge opening. Vent exhausts are to be arranged to discharge to a safe place on the open deck and comply with the requirements of 4.2.5.

NOTE

If the pump room is designed to recover chemicals listed in Chapter 17 of the *International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk*, (IBC Code) the vent exhausts are to be arranged to discharge upwards.

4.2.5 The vent exhausts from pump rooms are to discharge at least 3 m above deck, and from the nearest air intakes or openings to accommodation and enclosed working spaces, and from possible sources of ignition.

4.2.6 Ventilation fans to be constructed in accordance with Pt 5, Ch 15, 1.8.

4.2.7 Pump rooms are to have no direct communication with machinery spaces.

4.2.8 Bilge drainage of the pump room is to be effected by pumps or bilge ejector suction. For ships of less than 500 gross tons, the pump room bilge may be drained by a hand pump having a 50 mm bore suction.

4.3 Ventilation of machinery spaces

4.3.1 Where machinery spaces adjacent to recovered oil tanks are permitted by 3.1.7, the ventilation arrangements are to comply with 5.4.1(a) and (b).

4.4 Exhaust systems

4.4.1 The exhaust lines of diesel engines, boilers and equipment containing sources of ignition and the vents of diesel engine crank cases are to be led to a position outside any hazardous area as defined in 5.3. In addition, suitable spark arrestors are to be fitted.

4.5 Miscellaneous

4.5.1 Low sea suction is to be provided to supply water for the machinery and all fire pumps.

4.5.2 Means are to be provided to enable heating coils in recovered oil tanks and adjacent tanks to be blanked off during recovery operations.

4.5.3 The heating medium supply and return lines are not to penetrate the recovered oil tank plating, other than at the top of the tank to reduce the possibility of the recovered oil entering the heating system in the event of a failure of the heating pipework within the tank.

4.5.4 If required to facilitate discharge operations, steam returns are to be led to an observation tank which is to be in a well-ventilated and well-lighted part of the machinery space remote from the boilers.

Section 5 Electrical equipment

5.1 General

5.1.1 The electrical installation is to comply with the relevant requirements of Pt 6, Ch 2, with the specific exceptions of 13.1, 13.2, 13.4, 13.6, 13.7 and 13.9, which are replaced by 5.3 to 5.6 of this Chapter.

5.2 Systems of supply and distribution

5.2.1 Only the systems of generation and distribution, listed under Pt 6, Ch 2, 5.1.2, are acceptable.

5.3 Hazardous zones and spaces

5.3.1 The following zones or spaces are regarded as hazardous during and on completion of oil recovery operations, until proven gas-safe:

- The interiors of tanks intended for the storage of recovered oil.
- The interiors of piping systems intended for the handling of recovered oil.

Ships Equipped for Oil Recovery Operations

Part 7, Chapter 5

Section 5

- (c) Spaces separated by a single bulkhead, deck or other tank boundary, from the interior of a tank intended for recovered oil, or having a bulkhead immediately above or below and in line with a bulkhead of a tank intended for recovered oil, unless protected by a diagonal plate in accordance with Pt 4, Ch 9, 1.2.7 or the arrangements comply with the requirements of 3.1.7.
- (d) Spaces housing piping systems or other equipment containing or contaminated with recovered oil and having flanged joints or glands or other openings from which leakage of fluid may occur under normal operating conditions.
- (e) Zones on open deck within a 3 metre radius of the ventilation outlets, or inspection hatches permitted to be opened under normal operating conditions, of tanks intended for recovered oil.
- (f) Zones on open deck within a 1,5 m radius of any sampling or sounding point of a tank intended for recovered oil.
- (g) Zones on open deck within a 1,5 m radius of any flanged joints, glands or other parts of any equipment containing or contaminated with recovered oil from which leakage may occur under normal operating conditions.
- (h) Zones on open deck within the confines of, and extending 1,5 m beyond, any bund or barrier intended to contain a spillage of recovered oil, up to a height of 1,5 m.
- (j) Zones on open deck within a 1,5 m radius of any opening into a space described by (c) or (d).
- (k) Zones on open deck over all tanks intended for recovered oil, where the tops of the tanks are exposed to the weather, to the full width of the ship plus 3 m fore and aft of the forwardmost and aftmost tank bulkhead, up to a height of 0,45 m above the deck or to the height of any bulwarks.
- (l) Zones on open deck extending 1,5 m beyond those defined by 5.3.1(e) to (j).
- (m) Any enclosed or semi-enclosed space having a direct opening into a hazardous zone or space identified above, unless the space is protected by pressurisation in accordance with 5.5.1 or 5.5.2, or the opening is a ventilation outlet arranged in compliance with 5.4.2.

5.4 Ventilation

5.4.1 The extent of any hazardous zone within an enclosed or semi-enclosed space may be limited to that defined for an equivalent situation on open deck, provided that the ventilation arrangements fulfil all the following conditions:

- (a) Mechanical ventilation is provided, with the air intake and outlet located outside any hazardous area defined by 5.3.1, ensuring at least 12 air changes per hour, and leaving no region of stagnant air.
- (b) Ventilation air flow is continuously monitored and so arranged that, in the event of failure of ventilation, an alarm is given at an attended station.

5.4.2 An enclosed or semi-enclosed space having a ventilation outlet situated in a hazardous zone, as defined under 5.3.1(k) or (l), may be regarded as non-hazardous if fulfilling all the following conditions:

- (a) The space has mechanical ventilation with the air intake located outside any hazardous area defined by 5.3.1.
- (b) The ventilation outlet is equipped with a self-closing flap or other suitable means of closure operating automatically on loss of ventilation airflow.
- (c) The space contains no equipment of a type described in 5.3.1(d), or vent from or opening into any hazardous space or zone defined by 5.3.1, other than the ventilation outlet under consideration.
- (d) The space is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil.

5.5 Pressurisation

5.5.1 A space having access to a hazardous space or zone, as defined under 5.3.1(c) to (j), may be regarded as non-hazardous if it fulfils all of the following conditions:

- (a) Access is by means of an air-lock, having gastight doors, the inner of which, as a minimum, is self-closing without any hold-back arrangement.
- (b) It is maintained at an over-pressure of at least 50 Pa relative to the external hazardous area by ventilation from a non-dangerous area.
- (c) The relative air pressure within the space is continuously monitored and so arranged that, in the event of loss of over-pressure, an alarm is given at an attended station.
- (d) It contains no piping system or equipment of a type described in 5.3.1(d), and no vent from or opening into any hazardous space or zone defined by 5.3.1, other than the access under consideration.
- (e) It is separated by at least two gastight bulkheads from the interior of any tank intended for recovered oil.

5.5.2 A space having access to a hazardous zone, as defined under 5.3.1(k) or (l), may be regarded as non-hazardous if it fulfils all of the following conditions:

- (a) Access is by means of a gastight self-closing door without any hold back arrangement.
- (b) It is maintained at an overpressure in accordance with 5.5.1(b).
- (c) The air pressure within the space is monitored in accordance with 5.5.1(c).
- (d) It contains no piping system or equipment of a type described in 5.3.1(d), and no vent from or opening into any hazardous space or zone defined by 5.3.1, other than the access under consideration.
- (e) It is separated from the interior of any tank intended for recovered oil in accordance with 5.5.1(e).

5.5.3 A space having access to a hazardous space or zone, as defined under 5.3.1(c) to (j), and fulfilling the conditions given under 5.5.2(a) to (e) may be regarded, for the purposes of selection of electrical equipment, as equivalent to an open-deck hazardous area, such as defined under 5.3.1(k).

Ships Equipped for Oil Recovery Operations

Part 7, Chapter 5

Section 5

5.6 Selection of electrical equipment for installation in hazardous areas

5.6.1 The installation of electrical equipment in hazardous areas is to be minimised as far as is consistent with operational necessity and the provision of lighting, monitoring, alarm or control facilities enhancing the overall safety of the ship.

5.6.2 When electrical equipment is to be installed in hazardous areas, unless permitted otherwise by 5.6.3 or 5.6.4, it is to be of a 'safe type', as listed below, certified or approved by a competent authority for Group IIA, temperature class T3. The construction and type testing is to be in accordance with IEC 60079: *Electrical Equipment for Explosive Gas Atmospheres*, or an acceptable and relevant National Standard.

- | | |
|-------------------------|--------|
| • Intrinsically safe | Ex 'i' |
| • Increased safety | Ex 'e' |
| • Flameproof | Ex 'd' |
| • Pressurised enclosure | Ex 'p' |
| • Powder filled | Ex 'q' |
| • Encapsulated | Ex 'm' |

5.6.3 Consideration may additionally be given to the use of equipment of the following types:

- Equipment such as control panels, protected by purging and pressurisation and capable of being verified by inspection as meeting the requirements of IEC 60079-2.
- Simple non-energy-storing apparatus having negligible surface temperature rise in normal operation, such as limit switches, strain gauges, etc., incorporated in intrinsically-safe circuits.
- Submersible pumps, having at least two independent methods of shutting down automatically in the event of low liquid level.
- Radio aerials having robust construction, meeting the relevant requirements of IEC 60079-15. Additionally, in the case of transmitter aerials, it is to be shown, by detailed study or measurement, or by limiting the peak radiated power and field strength to 1 W and 30 V/m, respectively, that they present negligible risk of inducing incendive sparking in adjacent structures or equipment.
- Electrical apparatus having a special type of protection (Ex's'), certified or approved by a competent authority.
- Electrical apparatus having the type of protection Ex'n' (or Ex'N'), that, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere, and in which a fault capable of causing ignition is not likely to occur.

5.6.4 Equipment not meeting the requirements of 5.6.5 to 5.6.14 may be installed in hazardous zones or spaces, or locations rendered non-hazardous by ventilation or pressurisation, if not required to be energised during oil recovery operations, and not essential for the safety of the ship or crew. Such equipment is to be controlled by multi-pole switches or circuit breakers situated outside any hazardous area. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

5.6.5 In tanks and piping systems defined by 5.3.1(a) and (b), only the following electrical equipment will be permitted:

- Intrinsically-safe apparatus of category 'ia'.
- Simple apparatus, as defined under 5.6.3(b), incorporated in an intrinsically-safe circuit of category 'ia'.
- Submersible pumps, as defined under 5.6.3(c).
- Ex's' apparatus, certified for use in Zone 0, as defined by IEC 60079-10.
- Cable required for the operation of the equipment installed.

5.6.6 In spaces adjacent to tanks, as defined by 5.3.1(c), with no mechanical ventilation, only the following electrical equipment will be permitted:

- That described in 5.6.5(a), (b), (d) and (e).
- Ex'd' lighting fittings.
- Ex'p' lighting fittings of either the air-driven type, or pressurised from an external source of protective gas and arranged to be de-energised automatically on loss of pressurisation.
- Gas detector heads having sinter-type flametrap protection, included within an intrinsically-safe circuit, all of which is to be certified as a system.
- Ex'd' alarm sounders, without internal sparking contacts.
- Cables for impressed current cathodic protection systems (for external hull protection only) installed in heavy gauge steel pipes with gastight joints up to the upper deck; the arrangements are to comply with Pt 3, Ch 2,3.5.3.
- Through runs of cables, installed in heavy gauge steel pipes with gastight joints.

The electrical equipment described in (b), (c) and (e) will be permitted only where personnel are required to have access to the space during oil recovery operations.

5.6.7 In spaces adjacent to tanks, as defined by 5.3.1(c) having mechanical ventilation, and in spaces and zones containing piping systems, equipment, etc., or close to vents, flanges, etc., and other zones as defined by 5.3.1(d) to (j), only the following electrical equipment will be permitted:

- That described in 5.6.6.
- Intrinsically-safe apparatus of category 'ib'.
- Simple apparatus, as defined under 5.6.3(b), incorporated in an intrinsically-safe circuit of category 'ib'.
- Other apparatus certified as Ex'e', Ex'd', Ex'q', Ex'm' or Ex's'.
- Pressurised equipment, certified Ex'p', or as described in 5.6.3(a), arranged to be de-energised automatically on loss of pressurisation.
- Through runs of cable in spaces and zones described in 5.3.1(d) to (j) only.

5.6.8 In zones defined by 5.3.1(k) and (l), only the following electrical equipment will be permitted:

- That described in 5.6.7.
- Pressurised equipment, certified Ex'p', or as described in 5.6.3(b), arranged to give an audible and visual alarm at a manned station in the event of loss of pressurisation.
- Equipment as described in 5.6.3(d) and (f).

5.6.9 Electrical installations in enclosed or semi-enclosed spaces, as described in 5.3.1(m), are to comply with the requirements for the space or zone into which the opening leads, unless ventilated in accordance with 5.4.1 or 5.4.2.

5.6.10 Electrical installations in enclosed or semi-enclosed spaces, ventilated as described in 5.4.1, are to comply with the requirements for hazardous zones, as described in 5.3.1(e) to (l), within the radii or distances from adjacent sources of hazard or sources within the space specified by these paragraphs. Equipment within a radius of 3 m from any ventilation outlet of such a space is to be of a type described in 5.6.8. Equipment not of a type described in 5.6.7 is to be provided with a means of disconnection capable of being controlled from an attended station in the event of ventilation failure. Where the means of disconnection is located within the space, then it is to be of a 'safe type'.

5.6.11 Electrical installations in machinery spaces adjacent to recovered oil tanks, where permitted by 3.1.7, are to comply with the requirements of 5.6.10, and the additional requirement that equipment within 0,45 m of the tank bulkhead or the bottom of the space is to be of a type described in 5.6.8.

5.6.12 In pressurised spaces defined by 5.5.1, electrical equipment not of a type described in 5.6.8 is to be automatically disconnected in the event of loss of overpressure. Other equipment is to be provided with a means of disconnection capable of being controlled from an attended station in the event of loss of overpressure. Where the means of disconnection is located within the space, it is to be of a 'safe type'. Emergency lighting, pressure monitoring equipment and any alarm sounders or lights are to be of types described in 5.6.6.

5.6.13 In pressurised spaces defined by 5.5.2, any equipment not of a type described in 5.6.8 is to be provided with a means of disconnection capable of being controlled from an attended station in the event of loss of overpressure.

5.6.14 In pressurised spaces defined by 5.5.3, only electrical equipment as described in 5.6.8 may be permitted. Any equipment that is not of a type described in 5.6.7 is to be provided with a means of disconnection capable of being controlled from an attended station in the event of loss of overpressure. Emergency lighting, pressure monitoring equipment and any alarm sounders or lights are to be of types described in 5.6.6.

Section 6 Fire protection and extinction

6.1 Structural fire protection

6.1.1 Exterior boundaries of superstructures and deck-houses enclosing accommodation and service spaces, including any overhanging decks which support such accommodation and service spaces, are to be insulated to 'A-60' standard for all parts which face deck areas where there are arrangements for collection, handling and transfer of recovered oil and for a distance 3 m aft or forward thereof.

6.1.2 Windows and side scuttles in the exterior boundaries, referred to in 6.1.1, are to be provided with permanently installed inside covers of steel. Aluminium alloy components are not to be used in the construction of the windows and side scuttles.

6.1.3 As an alternative to compliance with 6.1.1 and 6.1.2, a fixed water spraying system may be accepted. The system is to be capable of delivering water at a rate of 10 litres/m²/min. on all boundaries, windows and side scuttles, that would otherwise be required to comply with 6.1.1 and 6.1.2.

6.2 Fire-extinguishing arrangements

6.2.1 Deck areas, where there are arrangements for the collection, handling and transfer of recovered oil, are to be provided with the following fire-extinguishing equipment:

- (a) Two dry powder fire-extinguishers, each at least 50 kg capacity.
- (b) At least one portable low expansion foam applicator.

6.2.2 The fire-extinguishers are to be located near the working deck identified in 6.2.1 and are to be fitted with discharge hoses.

6.2.3 The foam installation is to be capable of applying foam to any part of the working deck. The capacity of any applicator is to be not less than 400 litres/min. of foam solution and the applicator throw in still air conditions is to be not less than 15 m. Sufficient foam concentrate is to be provided for at least 0,4 litres/m² of the working deck area with a minimum quantity of 200 litres.

6.3 Fireman's outfits

6.3.1 At least two fireman's outfits, additional to those required by Pt 6, Ch 4,12 or SOLAS Reg II-2/A, 17.3 as applicable, are to be provided.

■ *Section 7*
Operating Manual

7.1 General

7.1.1 Information regarding the safe use of the ship with respect to the oil recovery and subsequent operations is to be prepared.

7.1.2 The Operating Manual is, in general, to contain information regarding procedures for:

- (a) establishing and maintaining a safe atmosphere in any space(s) liable to become hazardous during oil recovery and subsequent operations;
 - (b) isolation, where necessary, of electrical equipment in zones or spaces considered hazardous during oil recovery and subsequent operations, and in spaces described in 7.1.2(a) prior to carrying out, or on failure of, the measures required to establish and maintain a safe atmosphere;
 - (c) fire-fighting;
 - (d) gas measurements;
 - (e) recovery and storage of oil;
 - (f) ballasting;
 - (g) transfer of recovered oil;
 - (h) tank cleaning;
 - (i) gas freeing; and
 - (k) contacts in the event of an emergency.
-

Arrangements for Offshore Loading

Part 7, Chapter 6

Section 1

Section

- 1 **General**
- 2 **Arrangements**
- 3 **Positioning, monitoring and control arrangements**
- 4 **Fire protection, detection and extinction**
- 5 **Piping systems**
- 6 **Trials and testing**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to tankers equipped with bow/stern loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals, such as loading platforms, loading buoys, FPSOs and FSUs, and are additional to those applicable in other Parts of the Rules. These requirements also apply to submerged turret loading systems where applicable.

1.1.2 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.1.3 The materials used are to be suitable for the intended service conditions.

1.2 Class notations

1.2.1 Ships complying with the requirements of this Chapter will be eligible to have one of the following special features notations included in the class notation:

- (a) Ships fitted with a bow loading system, **BLS**.
- (b) Ships fitted with a stern loading system, **SLS**.
- (c) Ships fitted with submerged turret loading systems, **TLS**.

1.3 Surveys

1.3.1 The survey of these items is to be arranged to coincide with hull and machinery surveys, see Pt 1, Ch 3.

1.4 Submission of plans and documentation

1.4.1 In addition to the plans and information required by other relevant Sections of the Rules, the plans and information detailed below are to be submitted:

(a) Bow/stern loading:

Detail drawing(s) showing:

- Cargo loading equipment.
- Manifold position and pipeline connections.
- Mooring equipment layout, including design loads and supporting structure.
- Fire safety arrangements.
- Control station(s).

(b) Systems and arrangements:

General arrangement. Plans showing the general arrangement of all areas where the piping systems are located, together with ventilation arrangements and details of openings for any enclosed spaces at the fore and/or aft part of the ship.

Diagrammatic arrangement. Plans indicating all piping systems arrangements associated with loading systems between cargo tank area and manifold. The plans are to include details of means of isolation, manifold arrangement, means of draining, inerting, cleaning and gas freeing of the cargo piping. Also details of manifold drip tray arrangements with means of drainage, together with any stripping line arrangements, are to be submitted. If the ship is to be installed with a vapour emission control system, plans showing details of piping arrangements are also to be submitted.

Piping system specification. Piping design information which includes the materials specifications, design pressure, maximum allowable transfer rate, corrosion allowance, and design ambient weather conditions. Also the design forces and moments for which the presentation manifold, together with the terminal flange and associated supporting arrangements, have been designed are to be submitted.

Operating Manuals. Operating Manuals are to be submitted for approval and provided on board. The Manuals are to include the following information:

- Particulars of piping arrangements and control systems.
- Operating criteria.
- Procedures for connecting/disconnecting the cargo hose, isolation arrangements, inerting, cleaning, gas freeing of the pipe line and drainage of the drip tray.
- Procedures to be followed during cargo handling operations. These are to include guidance on procedures to be followed in the event of sudden closure of the terminal valve.
- Detailed communication sequence concerning pre-mooring, mooring, pre-loading, loading and tanker departure phases.

Where the ship is fitted with dynamic positioning and/or a positional mooring system(s), the information required by Ch 4, 1.3.7 and Ch 8, 1.5.6 is also to be submitted as applicable.

(c) Submerged turret loading:

Detail drawing(s) showing:

- Arrangement of turret room, including receiving structure, locking mechanism and traction winch equipment with associated supporting structure and design loadings.
- Turret hatch and operating equipment, including hydraulic power pack and control systems, and cargo loading equipment.
- Turret room fire safety arrangements.

Arrangements for Offshore Loading

Part 7, Chapter 6

Sections 1, 2 & 3

- Turret room electrical installations.
- Piping arrangements for all systems associated with the turret loading.

Section 2 Arrangements

2.1 Mooring arrangements

2.1.1 The ship is to be provided with sufficient mooring arrangements, which may be combined with the ship's manoeuvring system, to ensure adequate alignment and security during bow, stern or submerged turret loading operations.

2.1.2 The mooring/positioning system is to be arranged to prevent mooring forces being transmitted to the loading line connector.

2.1.3 Suitable single point mooring arrangements are indicated in Pt 3, Ch 13,8.

2.1.4 Particular attention is to be given to operational requirements and conditions in the design and mounting of securing devices and fittings. Seatings for equipment are to be designed to avoid the formation of pockets or recesses which may lead to excessive corrosion in service.

2.2 Materials for mooring fittings

2.2.1 Where mooring fittings are used as part of a positional mooring system, they are to comply with the requirements of Chapter 8.

2.3 Strength of mooring fittings

2.3.1 The strength of the mooring arrangements associated with the bow/stern loading system is to be considered on the basis of Pt 3, Ch 13,8, and Chapter 8 as applicable.

2.4 Enclosed spaces adjacent to manifold connection

2.4.1 In addition to the arrangements required by Section 4, the following are to be complied with:

- Spaces where an explosive gas atmosphere may be present are to be suitably ventilated prior to entry.
- Spaces required to be entered during normal operations are to be provided with permanent ventilation arrangements capable of being operated from outside the compartment.

2.4.2 The ventilation arrangements are to provide a minimum of eight air changes per hour, see Pt 6, Ch 2,13.

Section 3 Positioning, monitoring and control arrangements

3.1 General

3.1.1 The requirements of this Section are additional to those given in Pt 6, Ch 1, and Chapter 4 and Chapter 8.

3.1.2 If the ship is fitted with a dynamic positioning system, it is at least to comply with the DP(AM) requirements, see Chapter 4.

3.2 Control station

3.2.1 A control station for offshore loading may be arranged within the bow area or on the navigation bridge. All operations concerning positioning of the ship and monitoring of mooring and loading parameters are to be capable of being performed from this station.

3.3 Instrumentation

3.3.1 Bow/stern mooring instrumentation is to monitor:

- Mooring line traction.
- Chain stopper.
- Data logger system for recording of mooring and load parameters.

3.3.2 The mooring system is to be provided with a tension meter capable of continuously indicating the tension during the bow loading operation. Consideration may be given to waiving this requirement for ships fitted with a dynamic positioning system.

3.3.3 Bow/stern/submerged turret loading instrumentation is to be provided as follows:

- Indicator for loading connector coupling position.
- Cargo valve position indicators.
- Cargo tank level indicators and high level alarm.
- A system for automatic transfer of signals from the control and safety system, to enable personnel on the offshore terminal to effect control of cargo transfer pump(s) and closing of valve(s) on the terminal.

3.4 Emergency disconnect arrangements for pipeline and mooring

3.4.1 In addition to any automatic disconnection systems, a manually operated backup emergency disconnection system is to be provided. This system is to make possible individual operation of the chain stopper and coupling by-pass locks located in the bow control station.

3.4.2 Where an emergency quick-release system is fitted for the mooring system, an equivalent arrangement is to be provided to release the cargo loading hose outboard of the ship.

Arrangements for Offshore Loading

Part 7, Chapter 6

Sections 3, 4 & 5

3.5 Communication

3.5.1 Main and emergency means of communication are to be provided between the bow control station and the offshore loading terminal. The communication equipment is to be intrinsically-safe.

3.5.2 Continuous communication is to be maintained between the control station and the offshore terminal at all times.

Section 4 Fire protection, detection and extinction

4.1 General

4.1.1 The fire protection and extinction arrangements are to comply with the requirements of the *International Convention for the Safety of Life at Sea, 1974*, as amended, or as required by the National Authority.

4.1.2 When Lloyd's Register (hereinafter referred to as 'LR') is authorised to act on behalf of the National Authority in giving effect to the fire safety measures on non-convention tankers or the application of SOLAS for convention ships, LR will also apply the *Guidelines for bow and stern loading and unloading arrangements on oil tankers* as given in IMO MSC/Circ.474, dated 19 June 1987.

4.1.3 Tankers of less than 500 gross tons will be specially considered.

Section 5 Piping systems

5.1 Materials

5.1.1 All materials used in the piping systems are to be suitable for use with the intended cargoes and ambient weather conditions, and are to comply with the relevant requirements of Pt 5, Ch 12 and the applicable requirements of the *Rules for the Manufacture, Testing and Certification of Materials*.

5.2 Piping system design

5.2.1 All piping, valves and fittings are to be suitable for the design operating and environmental conditions.

5.2.2 The piping is to comply with the requirements for manufacture, testing and certification of Class II piping systems.

5.2.3 The pipelines and associated piping systems and equipment forward and/or aft of the cargo area are to have only full penetration butt welded joints, except at the loading station where valve connections may be flanged. The pipes are not to pass through enclosed spaces and are to be, as far as possible, self-draining.

5.2.4 Means of mechanical isolation are to be provided in the cargo area, where any pipes used for cargo handling are branched off from the cargo system. Such isolation is to be as near as possible to the boundary of the aftmost, in the case of stern loading, or forwardmost, in the case of bow loading, cargo tank bulkhead and within the cargo area.

5.2.5 A manually operated shut-off terminal valve is to be provided at the manifold. In addition, a blank flange, or equivalent arrangement, is to be provided at the bow and/or stern pipe line end connection.

5.2.6 The terminal pipe, valves and other fittings to which the cargo hose is directly connected are to be of steel or other approved ductile material. They are to be of robust construction, adequately supported and suitable for the stated design conditions. Attention is drawn to the *Recommendations for Oil Tanker Manifolds and Associated Equipment*, published by OCIMF.

5.2.7 Means of emptying, cleaning, inerting and gas-freeing the pipe lines used for cargo handling are to be provided. The venting arrangements are to be located in the cargo deck area. Isolation similar to that described in 5.2.4 is also to be provided.

5.2.8 A drip tray of adequate size, together with means of drainage, are to be provided at the manifold. Suitable spray shields are to be fitted in way of the terminal manifolds where leakage may occur at valves and pipe joints.

5.2.9 Zones on open deck within 3 m of loading manifolds or pipe joints, and within 3 m of the spillage drip tray, are to be regarded as dangerous with regard to machinery or other equipment which could constitute a possible source of ignition, see also Pt 6, Ch 2, 13.4 and 13.9.

5.2.10 Air vent pipes to the tanks and enclosed spaces, and mechanical ventilation outlets are to be located as far as possible, but in no case less than 3 m, from the terminal manifold or the nearest barrier of the spillage drip tray, whichever is closer.

5.3 Piping system testing and non-destructive examination

5.3.1 Testing and non-destructive examination of the piping system is to comply with the relevant requirements for Class II piping.

■ Section 6 Trials and testing

6.1 General

6.1.1 The arrangements and equipment referred to in this Chapter are to be examined and tested on completion of the installation, including calibration of coupling equipment.

6.1.2 Examination and testing is to include witnessing of the initial hook-up trials and the implementation of operational procedures for the range of actions covered by the Operating Manual.

Burning of Coal in Ships' Boilers

Part 7, Chapter 7

Sections 1 & 2

Section

- 1 **General**
- 2 **Coal storage, handling, ash collection and disposal arrangements**
- 3 **Coal burning equipment**
- 4 **Ship structure**
- 5 **Electrical equipment**
- 6 **Control engineering systems**
- 7 **Fire protection and extinction**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships using coal as a primary source of heat for the generation of steam for main and essential auxiliary services.

1.1.2 The relevant requirements of the Rules and those of the National Authority with whom the ship is registered, together with any special requirements of the Administration within whose territorial jurisdiction the ship is intended to operate, are to be complied with. Attention is drawn to the statutory requirements concerning intact and damaged stability of the ship.

1.1.3 For the purpose of these requirements, it is assumed that no manual handling of coal for the transportation from bunkers to boiler, or for actual firing of the boiler, will be employed. The emphasis has been placed on the presumption that the boiler firing will be by some form of moving grate. Special consideration will be given to other forms of firing, such as pulverised fuel, slurries of coal-oil-water mixtures or fluidised bed firing, if submitted.

1.1.4 For single main boiler installation, see Pt 5, Ch 3,5.3.

1.2 Submission of plans

1.2.1 The plans and information required by 1.2.2 to 1.2.4 are to be submitted in triplicate for consideration.

1.2.2 General arrangement plans and specification of the storing, handling and burning equipment and ash handling plant.

1.2.3 Structural plans showing details and arrangements in way of coal bunkers, and support arrangements for coal handling and ash disposal plants.

1.2.4 A general arrangement plan showing details of construction, fire protection and extinction for coal bunkers and coal handling systems, supplemented as necessary, by detailed plans and calculations for fire-extinguishing, explosion suppression, temperature monitoring and carbon monoxide detection systems.

1.3 Surveys

1.3.1 Coal bunkering, coal handling, burning and ash disposal plants are to be built, installed, and tested under operating conditions to the Surveyors' satisfaction and subsequently at each Boiler Survey. Fire-extinguishing, explosion suppression, temperature monitoring and carbon monoxide detection systems are to be installed and tested to the Surveyors' satisfaction and subsequently examined annually as required by Pt 1, Ch 3,2.2.

1.4 Additional bilge drainage

1.4.1 It should be noted that, under the provision of SOLAS 1974, additional bilge drainage is required for passenger ships burning coal, as detailed in 1.4.2 and 1.4.3.

1.4.2 In passenger ships there shall be provided in the boiler room, in addition to the other suctions required by the Rules, a flexible suction hose of suitable diameter and sufficient length capable of being connected to the suction side of an independent power pump.

1.4.3 In passenger ships where there is no watertight bulkhead between the engine and the boiler spaces, a direct discharge overboard or, alternatively, a by-pass shall be fitted from any circulating pump discharge used for emergency bilge pumping duties.

■ Section 2 Coal storage, handling, ash collection and disposal arrangements

2.1 Coal storage

2.1.1 The arrangements for coal bunkers, including hatchways, ventilation, monitoring and their design characteristics regarding intact and damaged stability are to comply with the requirements detailed in Sections 4 and 7, as applicable.

2.1.2 Coal is to be stored in not less than two bunkers. Vessels on restricted routes having a voyage time less than the capacity of the daily service hoppers, or where the boiler has the alternative means of firing, or where alternative means of propulsion are fitted, may be provided with only one bunker.

Burning of Coal in Ships' Boilers

Part 7, Chapter 7

Sections 2 & 3

2.1.3 The clearance spaces between the boilers, other heated surfaces and the coal bunkers are to be adequate for the free circulation of air necessary to avoid transmission of heat to the coal.

2.1.4 A daily service storage hopper is to be provided for each coal-fired boiler.

2.1.5 Coal bunkers and daily service storage hoppers are to be designed to avoid dead spots and areas where coal can accumulate and impede the normal flow or can provide the conditions to promote spontaneous combustion.

2.1.6 Bunker and daily service storage hopper outlet gravity-fed discharges are to be provided with shut-off devices. Stopping the transfer device will be acceptable in lieu where a bunker delivers to transfer arrangements and stopping the transfer device effectively prevents flow from the bunker, see 2.2.4.

2.1.7 Shut-off devices on the coal bunker and daily service storage hopper outlets are to be capable of being operated locally and also from an accessible position outside the compartment in which they are situated.

2.1.8 The arrangements for loading coal into bunkers or during transfer into daily service storage hoppers should, in general, avoid the tendency of the coal to segregate. For this purpose, multiple loading points should be used if necessary.

2.2 Coal handling

2.2.1 Each daily service storage hopper is to be provided with a separate system for transferring coal from the bunker(s). In the case of a single boiler installation, more than one transfer system from the bunker(s) to the daily service storage hopper are to be provided, unless alternative means of firing the boiler is available.

2.2.2 Adequate access facilities are to be provided in the coal feeder systems to permit maintenance and removal of blockages.

2.2.3 Where coal screens or crushers are necessary for the efficient operation of the coal burning equipment, they are to be provided in each boiler coal feed arrangement.

2.2.4 The coal handling plant is to be capable of being stopped locally and from an accessible position outside the compartment in which it is situated, see 2.1.6.

2.2.5 The use of milling systems for the production of pulverised fuel will be specially considered.

2.3 Ash collection and disposal arrangements

2.3.1 Each coal fired boiler is to be provided with a bottom ash and fly ash collecting and disposal arrangement.

2.3.2 Where both bottom ash and fly ash collecting and disposal arrangements are operated by either pneumatic or water systems, then these may be made common.

2.3.3 Two independent means of supplying the operating medium for ash collection and disposal systems are to be provided.

2.3.4 Heated ash storage and transfer systems are to be efficiently lagged to minimise risk of fire and to prevent damage by heat.

2.3.5 Where wet ash water transfer systems are used, consideration is to be given to the effects of corrosion and erosion on the collection, transfer and storage equipment.

2.3.6 Ash transfer systems employing water separation arrangements are to be such that water will drain naturally back to the de-watering bins or into a collection tank. Such drainage facilities should not, in general, be led directly to bilge wells.

2.3.7 Where a dry ash collection system is proposed, the arrangement of conveyors, pipes and chutes should avoid condensation due to excessive cooling to prevent solidification of the ash.

2.3.8 Adequate ash storage capacity, with access facilities to permit maintenance and removal of blockages, is to be provided for systems using boilers which have no alternative means of firing. Certain National Authorities or local Administrations prohibit the direct discharge of ash overboard.

Section 3 Coal burning equipment

3.1 Operating conditions

3.1.1 The design and arrangements for coal burning equipment are to be such that it can be manually controlled from a suitable position local to the boiler fronts.

3.1.2 Burning arrangements for solid fuel firing:

- (a) The arrangements should permit a sufficient level of control of coal feed to the grates or bed to avoid uneven firing conditions likely to cause damage to the grate or bed, due to excessive heat or coal build-up, under all operating conditions.
- (b) In addition to the adequate supplies of air for efficient combustion, sufficient capacity and means of control of the combustion air supply below the grates or beds are to be provided to ensure cooling of the grate or bed under all conditions of coal or alternative means of firing.
- (c) When the coal bed is not fully incandescent, i.e. during low steaming conditions when coal-fired beds are banked or reduced in output, sufficient purging sequences to sweep the furnace volumes are to be provided before any alternative means of firing is attempted.

3.1.3 Where it is proposed to provide means of firing the boiler simultaneously on coal and oil, details of the arrangements for furnace purging and ignition of oil burners are to be submitted and will be the subject of special consideration.

Burning of Coal in Ships' Boilers

Part 7, Chapter 7

Sections 3 & 4

3.2 Forced and induced draught air fans

3.2.1 In boilers fitted with forced and induced draught fans, suitable bias is to be maintained to avoid gas leakage into the boiler room.

3.2.2 In the event of induced draught fan failure, the forced draught fan should be arranged to stop automatically. Alternative arrangements which will permit the forced draught fan to be controlled to reduce the supply of air may be considered.

3.3 Fuel characteristics and specification

3.3.1 In general, the coal burning equipment is to be designed to utilise the various grades of coal likely to be encountered.

3.4 Alternative means of firing

3.4.1 Where it is proposed to use an alternative means of firing, such as oil or coal/oil slurry mixtures, the arrangements are to be in accordance with the requirements for oil burning, see Pt 5, Ch 14.

3.4.2 Particular attention is drawn to the requirements concerning arrangements for securely locking up-take dampers in the fully open position when burning oil fuel.

3.4.3 Where it is proposed to use oil fuel burners for lighting up coal fires, details are to be submitted of the pre-purging sequences of the boiler before lighting-up burners are introduced into the furnace.

3.4.4 Where it is proposed to employ lighting-up burners using diesel oil or similar marine distillate fuels, they are to be provided with their own combustion air supply.

3.4.5 Where it is proposed to use steam purging or steam atomising oil burners with coal-fired boilers, particular attention is to be given to furnace purging arrangements. Details of the purging sequences are to be submitted.

3.4.6 The arrangements for purging the oil burners are to be such that the minimum practicable volume of oil will be introduced into the boiler furnace.

4.1.2 Other than as permitted in 4.3.2, separation between coal bunkers and adjacent spaces is to be gastight. In oil or chemical tankers, coal bunkers are to be separated from cargo tanks by means of cofferdams.

4.1.3 Boiler room access doors are to comply with Pt 3, Ch 11,6.4, as applicable.

4.1.4 Coaling ports on the side shell are to comply with parts of Pt 3, Ch 11,8 as applicable.

4.1.5 No side scuttles are to be fitted in spaces appropriated exclusively for the carriage of coal.

4.1.6 All openings from coal bunkers are to be located clear of the defined hazardous area for the particular ship type.

4.2 Coal bunker hatchways

4.2.1 Coal bunker hatchways are to be provided with gasketed steel covers and coamings, complying with Pt 3, Ch 11, as applicable.

4.2.2 Coal bunker hatchways are to be located clear of the defined hazardous area for the particular ship type.

4.3 Coal bunker bulkheads

4.3.1 The scantlings of main coal bunker boundary bulkheads which are counted towards the number of bulkheads required by Pt 3, Ch 3,4, or which form the boundary of deep tanks, are to satisfy the requirements of Pt 4, Ch 1,9. Other boundaries are to satisfy the requirements of Pt 4, Ch 1,9, but the load head may be taken to the top of the bunker. The scantlings of cofferdam bulkheads not forming the boundaries of a cargo tank in oil or chemical tankers are to satisfy the requirements of Pt 4, Ch 9,7. In all cases when flooding is envisaged as a means of fire-extinction, the moduli of stiffening members on bunker bulkhead boundaries are to be increased by 25 per cent.

4.3.2 Where the coal bunker is situated immediately forward of the engine room, the aft coal bunker bulkhead may be non-watertight. The scantlings for this bulkhead are to be as required for watertight bulkheads (Pt 4, Ch 1,9) but the load head may be taken to the top of the tank. With this arrangement, the forward end of the coal bunker may, if appropriate, be regarded as the engine room forward bulkhead.

4.3.3 The thickness of the plating in way of the bulkhead knuckles in the region of the hoppers and the plating of the hopper apexes is to be increased by 1,5 mm over that derived from 4.3.1 and 4.3.2. However, the minimum thickness of the lowest strake in the coal hopper is to be not less than 9 mm. Where solid stainless steel is employed, the plate thickness may be reduced by 10 per cent or 1 mm, whichever is the lesser.

Section 4 Ship structure

4.1 General

4.1.1 The requirements of this Section are additional to those given in other parts of these Rules and in separate Rules for specific ship types.

Burning of Coal in Ships' Boilers

Part 7, Chapter 7

Sections 4, 5 & 6

4.3.4 Non-watertight coal bunker bulkhead scantlings are to be as required by Table 1.4.8 in Pt 4, Ch 1, but the thickness of the lowest strake is to be not less than 9 mm.

4.3.5 The scantlings of the boundaries of compartments intended for the storage of ash in liquid or slurry form will be specially considered.

4.3.6 Watertight doors may be fitted in watertight bulkheads between permanent and reserve bunkers, and may be of the sliding, hinged or equivalent type. They are to be accessible at all times, see also Pt 3, Ch 11.9.

4.3.7 Arrangements are to be made by means of screens or otherwise to prevent the coal from interfering with the closing of watertight doors.

4.4 Longitudinal strength

4.4.1 For the purpose of longitudinal strength, the requirements for the relevant ship types are to be applied.

4.4.2 The calculation of still-water shear forces and bending moments are to cover both departure and arrival conditions, and any special mid-voyage conditions caused by variation in coal bunkering and ballast distribution. Details of typical coal stowage rates are to be submitted, as well as trim and stability data for these conditions.

4.4.3 Where local reduction of double bottom depth is proposed to accommodate coal handling equipment, the strength of the double bottom and scarfing arrangements will require special consideration. Adequate scarfing of longitudinal material in way of double bottom and hopper tanks should be arranged.

4.5 Ventilation

4.5.1 Ventilators serving coal bunkers or boiler rooms are to comply with Pt 3, Ch 12.2 as applicable. In addition, the atmosphere in the bunkers is to be sampled by means of fixed or portable monitors as follows:

- (a) prior to entering the space – for oxygen deficiency,
- (b) prior to opening the hatchways – for accumulation of flammable gases.

4.5.2 Ventilator exits from main coal bunkers and coal processing spaces are to discharge clear of the defined hazardous area for the particular ship type and not less than 3 m from the nearest intake or opening to accommodation and enclosed working spaces, and from possible source of ignition.

Section 5 Electrical equipment

5.1 General

5.1.1 All electrical equipment should be situated in positions where it is not exposed to concentration of coal dust. Where this is not practicable, the enclosure of the equipment should be designed and installed such that:

- (a) Dust cannot enter the interior of the enclosure. An ingress protection rating of at least I.P. 55 in accordance with IEC 60529, if not of a safe-type, is considered to be acceptable.
- (b) Dust will not collect on the surface of the enclosure to such an extent that proper cooling is prevented, thus causing a dangerous rise in temperature.
- (c) The maximum surface temperature of the enclosure is not capable of igniting the dust, and should be limited to 165°C for equipment not subjected to overloading and 120°C for equipment such as motors, that may be overloaded.

5.2 Arrangements in coal bunkers

5.2.1 Electrical equipment located within the coal bunkers is to be of a safe-type certified for Group II A atmospheres and temperatures Class T1 in accordance with IEC 60079, *Electrical Apparatus for Explosive Atmospheres*, or an equivalent National Standard.

5.2.2 The switches and protective devices for such equipment are to interrupt all lines or phases and are to be located outside the coal bunker spaces. Provision is to be made for the complete isolation of these circuits and locking the means of control in the off position.

Section 6 Control engineering systems

6.1 General

6.1.1 The requirements of Pt 6, Ch 1 are applicable. The additional requirements for boilers which are coal grate-fired and under normal operation are remotely controlled or are automatic in operation, are given in Table 7.6.1.

6.1.2 In general, ships complying with the relevant requirements of Pt 6, Ch 1.4 or Ch 1.5 will be eligible for the notations **UMS** (unattended machinery space) or **CCS** (centralised control station) respectively.

Burning of Coal in Ships' Boilers

Part 7, Chapter 7

Sections 6 & 7

Table 7.6.1 Coal burning: Alarms and safeguards

Item	Alarm	Note
Drum water level	Low	Combustion air; coal spreaders and/or any alternative fuel supply to be shut-off automatically
Daily service hopper level	High/Low	—
Coal feed plant	Failure	—
Primary combustion air system	Failure	Coal spreaders to be stopped automatically
Secondary combustion air system	Failure	—
Coal supply controller (if separate from spreader)	Failure	Per controller
Spreader drive	Failure/ Overload	Per drive. See also primary combustion air system failure
Grate drive	Failure/ Overload	Per drive
Localised overheating of the grate	Excessive	—
Induced draught fan	Failure	Coal spreaders to be stopped automatically, see also 3.2.2
Ash disposal system	Failure	—
NOTE Interlocks are to be provided to prevent the burning of oil fuel, unless dampers in the gas passages of uptakes have been securely locked in the fully-open position, see also 3.4.2.		

7.1.2 The spaces above the coal in the coal bunkers and coal processing spaces are to be adequately ventilated to prevent the accumulation of flammable gases. The ventilators are to be provided with means of closure which are readily accessible at all times. Where mechanical ventilation is provided, means are to be provided for stopping the fans from a position which will be readily accessible at all times.

7.2 Fire-extinction

7.2.1 A fixed fire-extinguishing system should be provided in the coal bunkers. This system should discharge CO₂, but alternative arrangements such as water flooding will be considered, see also 4.3.

7.2.2 Where, due to operating conditions, it is considered likely that coal dust in significant quantities will be present in the coal crushing and conveying system, an explosion suppression system is to be provided in the coal crushing and conveying system. Activation of the explosion suppression system is to operate an audible and visual alarm.

7.2.3 A fixed fire-extinguishing system should be provided in the ready-use coal hopper and this should be extended to the boiler room, if there is any danger of the spread of fire to that space. The system should depend on CO₂, but alternative extinguishing media will be considered. Where it can be shown that the residence time, of the coal in the hopper, is of sufficiently short duration that a fire in the hopper is unlikely to be sustained, consideration will be given to dispensing with this requirement.

Section 7 Fire protection and extinction

7.1 Fire protection

7.1.1 In general, the coal bunkers are to be separated from adjacent spaces by 'AO' divisions, but where such spaces are intended to contain highly flammable substances, such as the cargo tanks of an oil tanker, they are to be separated from the coal bunkers by a cofferdam or equivalent space.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to Lloyd's Register (hereinafter referred to as 'LR') classed ships with positional mooring systems or thruster-assisted positional mooring systems and are additional to those applicable in other Parts of the Rules. The Rules are not intended to apply to vessels which have station-keeping capabilities, but which are not required to remain on station in adverse weather conditions. This normally precludes the Rules being applicable to small ships.

1.1.2 Compliance with this Chapter is not mandatory, but ships provided with a positional mooring system or thruster-assisted positional mooring system which do comply will be eligible for an appropriate class notation which will be recorded in the *Register Book* at the specific request of an Owner.

1.1.3 The mooring system will be considered for classification with LR on the basis of operating constraints and procedures specified by the Owner and recorded in the Operations Manual.

1.1.4 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the administration within whose territorial jurisdiction it is intended to operate.

1.2 Classification notations

1.2.1 Ships provided with a positional mooring system which complies with the requirements of this Chapter will be eligible to have included in the class notation one of the following special features notations:

- (a) For ships fitted with a positional mooring system:
PM (Positional mooring system), or
PMC (Positional mooring system for mooring in close proximity to other ships or installations. This notation will apply in particular to any ship operating in conjunction with a fixed installation, e.g. crane barge, accommodation unit, maintenance vessel, etc.)
- (b) For ships fitted with a thruster-assisted positional mooring system:
PM [Ⓙ] [or [Ⓣ] or [Ⓝ]]
or
PMC [Ⓙ] [or [Ⓣ] or [Ⓝ]]
The numeral in the circled supplementary notation, [Ⓙ], etc., defines the thruster allowance which may be permitted in the design of the positional mooring system, and is determined by the capacity/redundancy of the thrust/machinery installation, see Table 8.3.2.

1.2.2 Additional descriptive notes may be given and entered in column 6 of the *Register Book* indicating the type of positional mooring system, reference system, control system, limiting environmental criteria, etc.

1.3 Surveys

1.3.1 The positional mooring and thruster-assisted positional mooring systems and their associated equipment are to be examined and tested during construction and under working conditions on completion of the installation. The Periodical Survey of these items is to be arranged to coincide with Hull and Machinery Surveys as required by other Parts of these Rules.

1.4 Definitions

1.4.1 Positional mooring is a method of station keeping by means of multiple anchor lines laid out in catenary array. Each positional mooring system is to consist of the following:

- (a) Anchors or anchor piles.
- (b) Anchor lines.
- (c) Anchor line fittings (shackles, connecting links, wire rope terminations, quick release devices, etc.).
- (d) Fairleads.
- (e) Winches or windlasses.
- (f) Chain or wire rope stoppers.

Where applicable, the structural or mechanical connection of these items to the ship is also considered to be part of the positional mooring system.

1.4.2 'Thruster-assisted Mooring' is the use of thrusters and main propulsion, if so designed, to supplement the ship's anchoring system.

1.5 Plans and data submission

1.5.1 The information and plans specified in 1.5.2 to 1.5.5 are to be submitted in triplicate. One copy of the Operations Manual referred to in 1.5.6 is to be forwarded for information.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Sections 1 & 2

1.5.2 Plans and data dealing with positional mooring arrangements and the associated equipment are to be submitted, including the following:

- (a) Mooring arrangements with details of mooring patterns, anchor lines and fittings, etc.
- (b) Mooring equipment with details of anchors, fairleads and cable stoppers.
- (c) Winches or windlasses with details of gearing shafting, brake systems, ratchet and pawl, drum/cable lifter and frame.

1.5.3 For thruster-assisted positional mooring systems, plans of the following, together with particulars of ratings, in accordance with the relevant Parts of these Rules are to be submitted for the following:

- (a) Prime movers, gearing, shafting, propellers and thrust units, *see also* Pt 5, Ch 8.
- (b) Machinery piping systems.
- (c) Electrical installations.

In addition, details of proposals for the redundancy provided in machinery, electrical installations and control systems are to be submitted. These proposals are to take account of the possible loss of performance capability should a component fail. Where a common power source is utilised for thrusters, details of the total maximum load required for thruster-assist are to be submitted.

1.5.4 Plans of control, alarm and safety systems, including the following, are to be submitted:

- (a) Functional block diagrams of the control system(s).
- (b) Functional block diagrams of the position reference systems and the environmental sensors.
- (c) Details of the electrical supply to the control system(s), the position reference system(s) and the environmental sensors.
- (d) Details of the monitoring functions of the controllers, sensors and reference system, together with a description of the monitoring functions.
- (e) List of equipment with identification of the manufacturer, type and model.
- (f) Details of the overall alarm system linking the centralised control station, subsidiary control stations, relevant machinery spaces and operating areas.
- (g) Details of the control stations, e.g. control panels and consoles, including the location of the control stations.
- (h) Test schedules which are to include the methods of testing and the test facilities provided.

1.5.5 The following supporting plans, data, calculations or documents are to be submitted:

- (a) General arrangement showing plan views, side elevations and sections of the ship.
- (b) Design criteria showing operating and survival environment, water depth range and required station keeping limits.
- (c) Environmental forces on ship showing wind, current and wave drift. These forces are to be verified by direct calculation, model test reports, or full-scale data, etc.
- (d) Ship motions showing first order wave motions, surge, sway and yaw. Tank test data or equivalent to be provided.
- (e) Mooring analysis, including computer printout where relevant.

- (f) Strength calculations for anchors, fairleads, winches/windlasses, cable stoppers and special fittings.
- (g) Thruster arrangements for thruster-assist systems, including powers, thrusts and interactions between thrusters, thruster and hull, thruster and current.

1.5.6 An Operations Manual for the system is to be placed on board the ship. This Manual is to contain all necessary information and instructions regarding positional mooring and, where relevant, thruster-assisted positional mooring. It would normally also contain descriptions of the following:

- Mooring systems.
- Laying the mooring system.
- Anchor pre-loading.
- Pre-tensioning anchor lines.
- Tension adjustment.
- Winch performance.
- Winch operation.
- Procedure in event of failure or emergency.
- Procedure for operating thrusters.
- Fault-finding procedures for thruster-assist system.

■ Section 2 Environmental criteria – Forces and motions

2.1 Limiting environmental criteria

2.1.1 Limiting criteria in the form of maximum operating and survival environmental conditions are to be specified by the Owner or Designer.

2.1.2 The limiting criteria are to be defined in terms of wind and current speeds, wave heights and periods, and water depth range.

2.1.3 As water depth will have a large influence on a ship's mooring capability, the limiting environmental criteria may be varied according to water depth.

2.1.4 **Maximum operating conditions** will be those in which the ship is able to carry out its primary operational activities, while anchor line tensions remain within designated operating limits. *See* 3.2 for required factors of safety in operating conditions.

2.1.5 **Survival conditions** are to be based on an average recurrence period of not less than 50 years. The mooring system is to be such that maximum line tensions will be limited in these conditions to designated survival levels. *See* 3.2 for required factors of safety.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Sections 2 & 3

2.2 Design environmental criteria

2.2.1 Wind. The design wind speed for wind force determination can normally be taken as the one-hour mean value referenced to 10 m above sea level. Account is to be taken of the variation of wind speed with height above sea level. The wind velocity gradient can be calculated from the following:

$$V_H = V_{10} \left(\frac{H}{10} \right)^{0,125}$$

where

V_H = wind velocity at H height above sea level

V_{10} = 1 hour mean wind speed referenced to 10 m above sea level.

2.2.2 Current. The design current speed is to be taken as the sum of wind-induced and tidal current velocities. For calculation purposes, tidal current velocity can be assumed constant over water depth, and wind-induced current velocity can be taken to reduce linearly from its maximum value at the surface to zero at 50 m below sea level.

2.2.3 Wave. The significant wave height and period range is to be defined for each relevant design case.

2.3 Environmental forces

2.3.1 In determining environmental forces, it is to be assumed that the defined limiting environment of wind, waves and current will act concurrently. For fixed azimuth mooring systems, these forces are considered to act in the same direction.

2.3.2 Environmental loading on the ship (and the corresponding catenary system motions analysis to determine anchor loads and line tensions, etc.) will require to be investigated for a sufficient number of directions to establish the critical cases.

2.3.3 It is generally to be assumed that the maximum specified environmental conditions can come from any direction relative to the ship's heading. However, in cases where a ship is to be restricted to specific defined locations, consideration will be given to the acceptance of an environmental rosette (allowing the ship to be headed in the most favourable direction with respect to mooring loads).

2.3.4 Where quasi-static methods of analysis are adopted (see 3.1.2), at least the wind, current, and mean wave drift forces acting on the ship in the various relevant design conditions are to be calculated or determined. In addition, any significant yawing moments induced by these effects are to be taken into account when carrying out the mooring system motions analysis.

2.3.5 Environmental forces and moments can be determined by suitable methods of direct calculation or by model testing. In either case, account must be taken of all significant load generating structural elements or equipment. In the case of wind force and moment determination, all deck structures, fittings, cranes, towers, superstructures, etc., are to be considered, and for current force, account is to be taken of thrusters, nozzles, propellers, etc.

2.3.6 First order wave motions – the oscillatory motions of the ship – are to be determined. Surge and sway are the most relevant motions in terms of quasi-static mooring analysis, see 3.1.2 and Fig. 8.3.1.

2.3.7 The first order wave motions of the ship are to be determined from appropriate wave spectra, either by use of tank testing or by suitable direct calculation methods.

2.3.8 Account is to be taken of the effects of shallow water on the ship's first order wave motions.

Section 3 Mooring system – Design and analysis

3.1 General

3.1.1 The positional mooring system is to be designed to meet the specified limiting environmental criteria (see 2.1), and any associated operational constraints (restricted offset of ship, etc.) as contained in the Operations Manual.

3.1.2 This Section in general, and the anchor line factors of safety in particular, relate principally to the quasi-static approach to mooring analysis. This method of analysis takes wind, current and wave drift forces to be steady effects which will displace the moored ship from its original equilibrium position to a new mean position where the mooring system will have developed sufficient restoring force to 'balance' the steady applied force. Wave-induced oscillatory vessel motions take place about this new mean position. In quasi-static analysis, maximum anchor line tensions are taken to occur at the extremity of vessel offset, see also Fig. 8.3.1.

3.1.3 Consideration will be given to the adoption of alternative methods of design for the mooring system, including the use of part-dynamic or full-dynamic analysis techniques. In such cases, factors of safety, etc., will be specially considered.

3.1.4 For ships which intend to utilise thruster assistance, as an aid to position-keeping or as a means of reducing anchor line tensions, the extent of thruster allowance which is permitted in calculations is given in Table 8.3.2.

3.1.5 Anchor line length is to be sufficient to avoid uplift forces occurring at the anchors in the worst damaged survival condition.

3.1.6 Account is to be taken in the mooring analysis of the elastic stretch of anchor lines.

3.2 Design cases and factors of safety

3.2.1 The design cases which require to be considered, and the associated minimum anchor line factors of safety are given in Table 8.3.1.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 3

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Sections 3 & 4

Table 8.3.1 Minimum anchor line factors of safety

Design case	Description	Factor of safety	
		Class notation	
		PM, $\overline{\text{T1}}$ etc.	PMC, $\overline{\text{T1}}$ etc.
1	Operating – Intact The ship in an operating mode with its mooring system intact, subject to specified operating constraints (limiting environment and permissible offset of the ship).	2,7	3,0
2	Survival – Intact The ship in survival mode with mooring system intact, subject to maximum (survival) environmental conditions.	1,8	2,0
3	Operating – Damaged As Case 1, but with loss of restraint of any one anchor line, see also Note 3.	1,8	2,0
4	Survival – Damaged As Case 2, but with loss of restraint of any one anchor line.	1,25	2,0/1,4 (See Note 5)

NOTES

- In the context of this Chapter, Cases 1 and 2 ('Intact' Cases) refer to the mooring system with all anchor lines intact. Cases 3 and 4 ('Damaged' Cases) refer to the mooring system with the loss of any one anchor line.
- Anchor line factor of safety = $\frac{\text{Minimum rated break strength}}{\text{Maximum line tension}}$
- The factors of safety given in Table 8.3.1 are to be based on maximum line tensions resulting from steady force offset of the ship, plus maximum first order wave motion. In Design Cases 3 and 4, the factors relate to the ship in its post-damage settled position, following the loss of restraint from an anchor line, (i.e. neglecting transient effects, but see Note 4).
- In addition to the 'static' considerations in Design Cases 3 and 4 (see Note 3), account is also to be taken of transient vessel motions following anchor or line failure. The motion path taken by the vessel in moving to a new static equilibrium position is to be determined for each line breakage case to ensure that:
 - The ship maintains adequate clearance from any adjacent installation (applicable where **PMC** or **PMC $\overline{\text{T1}}$** etc. notation is to be assigned). A minimum dimensional clearance of 10 m will normally be required.
 - The ship remains within its required operational excursion limits.
 - Successive line failures will not occur. In calculating factors of safety, the maximum anchor line tensions in this case are to be those resulting from the extreme point of transient motion, with the ship subject to steady force and significant wave motion.
- The factor of safety of 2,0 applies to critical lines maintaining separation between the moored ship and an adjacent installation.

Table 8.3.2 Thruster allowance

Case	Thruster allowance		
	$\overline{\text{T1}}$	$\overline{\text{T2}}$	$\overline{\text{T3}}$
Operating (Intact)	None	70% of all thrusters, less one	All thrusters, less one
Survival (Intact)	70% of all thrusters	All thrusters	All thrusters
Operating (Damaged)	None	70% of all thrusters, less one	All thrusters, less one
Survival (Damaged)	70% of all thrusters	All thrusters	All thrusters

NOTES

- The conditions for assignment of supplementary notations $\overline{\text{T1}}$, $\overline{\text{T2}}$ and $\overline{\text{T3}}$ are defined in Section 8.
- Where all thrusters are permitted, the net effect of all thrusters can be included in calculations.
- Where all thrusters except one are permitted, the net effect of all thrusters, less the single most effective one, can be included in calculations.

Section 4

Mooring equipment

4.1 Anchors

4.1.1 Anchors for positional mooring are to be sufficient in number and holding power, and are to have adequate structural strength, for the intended service. It is the Owners'/Operators' responsibility to ensure adequate anchor holding power for each location or holding ground.

4.1.2 The anchors are to be of an approved type. Supporting calculations to verify the structural strength of the anchor under proof test loading are to be submitted.

4.1.3 The anchors are to be manufactured in accordance with the requirements of Chapter 10 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

4.1.4 The anchors are to be proof tested in the manner laid down in Chapter 10 of the Rules for Materials. The level of proof test loading for positional mooring anchors is to be the greater of the following:

- 50 per cent of the minimum rated break strength of the intended anchor line; or
- the value given in Table 10.1.1 in Chapter 10 of the Rules for Materials.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 4

4.2 Fairleads

4.2.1 Fairleads are to be designed to permit free movement of the anchor line in all mooring configurations. Fig. 8.4.1 shows the minimum operating range of the fairlead to be considered in conjunction with the design load.

4.2.2 Fairleads and their supporting structures are to be designed for a load equivalent to the rated minimum break strength of the anchor line.

4.2.3 Maximum allowable stresses for the design criteria given in 4.2.1 and 4.2.2 are to be based on the following factors of safety:

Shear	1,89	} Factors relate to tensile yield stress
Tension, compression or bending	1,25	
Combined	1,11	

$$(\text{combined stress} = \sqrt{\sigma_X^2 + \sigma_Y^2 - \sigma_X \sigma_Y + 3\tau^2})$$

Where σ_X and σ_Y are the combined axial and bending stresses in the X and Y directions respectively and τ is the combined shear stress due to torsion and/or bending in the X-Y plane.

4.2.4 Materials and steel grades are generally to comply with the requirements given in 5.2 for Type P components.

4.2.5 Chain cable fairleads are to have a minimum of five pockets.

4.2.6 Wire rope fairleads are generally to have a minimum diameter of 20 times the wire rope diameter.

4.3 Stoppers

4.3.1 Stoppers may require to be provided depending on the winch arrangements, see Section 5.

4.3.2 Where stoppers are fitted, they are to comply with Section 5 in respect to mechanical and strength aspects, and Section 6 for release arrangements.

4.4 Anchor lines

4.4.1 Anchor lines are generally to be of stud link chain cable, steel wire rope or a combination of both. Special consideration will be given to proposals for the use of alternative materials.

4.4.2 Stud link chain cable is to be either of unified grade (U2 or U3) meeting the requirements of Chapter 10 of the Rules for Materials, or an approved special grade.

4.4.3 Wire rope for anchor lines is to have a suitable construction for its purpose (6 x 37 construction with independent wire rope core is generally acceptable).

4.4.4 Steel wire ropes are generally to comply with Ch 10,5 of the Rules for Materials, or with an equivalent recognised National or International Standard.

4.4.5 Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 5

Section 5 Anchor winches and windlasses

5.1 General

5.1.1 Machinery items are to be constructed, installed and tested in accordance with the relevant requirements of Part 5. For electrical and control equipment, see Section 6.

5.2 Materials

5.2.1 Materials are generally to comply with the requirements of Pt 5, Ch 1,2.2.

5.2.2 Components have been categorised in this Section as Type P (Primary) and Type S (Secondary) for material selection purposes:

- (a) **Type P:** Components where failure would result in the loss of a primary function of the winch or windlass, e.g.:
- Winch drum.
 - Windlass cable lifter.
 - Reduction gears.
 - Shafts.
 - Brakes.
 - Pawl stoppers.
 - Bedplates.

NOTE

Consideration will be given to designating any of the above components as Type S (see below), provided adequate redundancy of operation exists.

- (b) **Type S:** Secondary, stressed items, not categorised as Type P, and where failure would not result in the loss of a primary winch function.

5.2.3 Steel materials for Type P or Type S components are generally to comply with the following Chapters and Sections of the Rules for Materials:

- (a) Plates and bars: Chapter 3, Sections 1 and 2, 3 or 6, as appropriate.
 (b) Castings: Chapter 4, Sections 1 and 7.
 (c) Forgings: Chapter 5, Sections 1 and 8.
 Consideration will be given to the acceptance of suitable equivalent National Standards.

5.2.4 Material grades are to be selected to provide the necessary notch toughness. See Table 8.5.1 for suitable Grades.

5.2.5 The requirements of 5.2.3 and 5.2.4 apply where the minimum design air temperature is within the range 0°C to minus 15°C. Requirements for design temperatures outside this range will be subject to special consideration.

Table 8.5.1 Material grades

Component type	Thickness (mm)	Grade					
		Plate		Castings		Forgings	
		AW (<i>see Note 1</i>)	PWHT (<i>see Note 2</i>)	AW	PWHT	AW	PWHT
P	$t \leq 25$	D, DH32, DH36	AH, B	C-Mn	C-Mn	LT20	LT0
	$25 < t \leq 50$	E, EH32, EH36	DH32, DH36	C-Mn	C-Mn	LT40	LT20
	$50 < t \leq 60$	E, EH32, EH36	E, EH32, EH36* *(<i>See Note 5</i>)	C-Mn	C-Mn	LT40	LT40 (<i>See Note 5</i>)
	$60 < t \leq 80$	LT60 (<i>See Note 3</i>)	E, EH32, EH36	2 ¹ / ₄ Ni (<i>See Note 3</i>)	C-Mn	LT60 (<i>See Note 3</i>)	LT40
	$80 \leq t \leq 100$	LT60	LT60 (<i>See Note 3</i>)	2 ¹ / ₄ Ni	2 ¹ / ₄ Ni (<i>See Note 3</i>)	LT60	LT60 (<i>See Note 3</i>)
	$100 < t \leq 130$	(<i>See Note 4</i>)	LT60	3 ¹ / ₂ Ni	2 ¹ / ₄ Ni	(<i>See Note 4</i>)	LT60
	$130 < t \leq 160$	1 ¹ / ₂ Ni	(<i>See Note 4</i>)	(<i>See Note 7</i>)	(<i>See Note 7</i>)	1 ¹ / ₂ Ni	(<i>See Note 4</i>)
S	$t \leq 60$	DH32, EH36	Not normally applied (<i>See Note 6</i>)				
	$60 < t \leq 80$	E, EH32, EH36* *(<i>See Note 5</i>)					
	$80 < t \leq 100$	E, EH32, EH36					
	$100 < t \leq 130$	LT60 (<i>See Note 3</i>)					
	$130 < t \leq 160$	LT60					
NOTES 1. AW. Without post-weld heat treatment. 2. PWHT. With post-weld heat treatment or not welded. 3. Impact test temperature may be raised to –50°C. 4. Use either 1 ¹ / ₂ Ni or 1 ¹ / ₂ Ni with impact test at –70°C. 5. Impact test temperature may be raised to –30°C. 6. If PWHT is used, grades will be specially considered. 7. To be specially considered.							

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Section 5

5.2.6 For components such as gears, shafts and boltings made from rolled or forged bar materials not subject to welding, the material composition and heat treatment, etc. may be submitted for approval as an alternative to the requirements of Table 8.5.1.

5.2.7 Non-ductile materials are not to be used for torque transmitting items or for those elements subject to tensile/bending stresses.

5.2.8 Spheroid graphite iron castings are to comply with Ch 7,3 of the Rules for Materials, Grades 370/17 or 400/12, or to an equivalent National Standard.

5.2.9 The use of grey iron castings will be subject to special consideration. Where approved, they are to comply with the requirements of Ch 7,2 of the Rules for Materials. This material is not to be used for gear components.

5.2.10 Brake lining materials are to be compatible with operating environmental conditions.

5.3 Brakes

5.3.1 Each anchor winch or windlass is required to have one primary braking system and one secondary braking system. The two systems are to operate independently.

5.3.2 The braking action of the motor unit may be used for secondary braking purposes where the design is suitable.

5.3.3 A residual braking force of at least 50 per cent of the maximum braking force required by 5.5.1 is to be immediately available and automatically applied in the event of a power failure.

5.4 Stoppers

5.4.1 If the winch motor is to be used as a secondary brake, then a stopper is to be provided to take the anchor line load during maintenance of the primary brake.

5.4.2 The stopper may be one of two different types – a pawl stopper fitted at the cable lifter/drum shaft, or a stopper acting directly on the anchor line.

5.4.3 Where the stopper acts directly on the cable, its design is to be such that the cable will not be damaged by the stopper at a load equivalent to the rated breaking strength of the cable.

5.4.4 See also 6.2.1 and 6.2.2 for stopper control station requirements, and 6.4.5 for emergency release of stoppers.

5.5 Winch/Windlass performance

5.5.1 The primary brake is required to hold a static load equal to the minimum break strength of the anchor line (at the intended outer working layer of wire rope on storage drum winches). The static load capacity of the primary brake can be reduced to 80 per cent of that value when a stopper capable of holding 100 per cent of the breaking strength of the line is fitted.

5.5.2 The secondary brake is required to hold a static load equal to 50 per cent of the minimum breaking strength of the anchor line.

5.5.3 The anchor winch or windlass is to have adequate dynamic braking capability. The two brake systems in joint operation are to be capable of fully controlling, without overheating, the anchor lines during:

- (a) all anchor handling operations;
- (b) adjustment of anchor line tensions. (This is particularly relevant where the mooring system has been designed and sized, on the basis of active adjustment of anchor lines in extreme conditions, to minimise line tensions).

5.5.4 See also 6.2 for control of winches, windlasses, stoppers and pawls, and 6.4 for brake fail safe requirements and standby power for operation of brakes and release of stoppers in the event of a failure of normal power supply.

5.5.5 The pulling force of the winches or windlasses is to be sufficient to carry out anchor pre-loading on location, to the necessary level. A minimum low-speed pull equal to 40 per cent of the anchor line breaking strength is recommended.

5.6 Strength

5.6.1 Design load cases for the winch or windlass assembly and the stopper when fitted are given in Table 8.5.2. The associated maximum allowable stresses are to be based on the factors of safety given in Table 8.5.3.

Table 8.5.2 Design load cases

Load case	Condition	Anchor line load percentage of break strength
1	Winch braked	100% (See Note)
2	Stopper engaged	100%
3	Winch pulling	40% or specified duty pull if greater
<p>NOTE</p> <p>Where stopper is fitted, anchor line load in Case 1 can be taken as brake slipping load, but is not to be less than 80 per cent break strength.</p>		

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Sections 5 & 6

Table 8.5.3 Safety factors for design load cases

Stress	Load case	
	1 & 2	3
	Factor of safety	
Shear	1,89	2,5
Tension, compression, bending	1,25	1,67
Combined	1,11	1,43
NOTES 1. Factors of safety relate to tensile yield stress. 2. Combined stress = $\sqrt{\sigma_X^2 + \sigma_Y^2 - \sigma_X\sigma_Y + 3\tau^2}$ Where σ_X and σ_Y are the combined axial and bending stresses in the X and Y directions respectively and τ is the combined shear stress due to torsion and/or bending in the X-Y plane.		

5.7 Testing

5.7.1 Works tests are to be carried out in the presence of the Surveyor, on at least one of the winch or windlass units out of the total outfit for the vessel. The tests to be carried out are given in Table 8.5.4. Alternatively, where a prototype winch has been suitably tested, consideration will be given to the acceptance of these results.

Table 8.5.4 Works test

Test	Test load
Static brake – Primary	100% Anchor line break strength (or 80% where stopper fitted. See 5.5.1)
Static brake – Secondary	50% Anchor line break strength
Stopper (where fitted)	100% Anchor line break strength
Motor stall test	Specified stall load

5.7.2 The residual braking capability (see 5.5.4) is to be verified.

5.7.3 Each winch or windlass is to be tested on board the vessel, in the presence of the Surveyor, to demonstrate that all main aspects, including dynamic brakes, function satisfactorily. The proposed test programme is to be submitted.

5.8 Type approval

5.8.1 Winches or windlasses may be type approved in accordance with LR's Type Approval Scheme. Where this type approval is obtained, the requirements of 5.7.1 may not be applicable.

Section 6 Electrical and control equipment

6.1 General

6.1.1 The electrical installation is to be designed, constructed and installed in accordance with the relevant requirements of Pt 6, Ch 2.

6.1.2 Control, alarm and safety systems are to be designed, constructed and installed, in accordance with the relevant requirements of Pt 6, Ch 1, together with the requirements of 6.2 to 6.4.

6.2 Control stations

6.2.1 The operation of winches, windlasses and associated brakes, chainstoppers and pawls is to be controlled locally from weather-protected control stations which provide good visibility of the equipment and associated anchor handling operations.

6.2.2 A central control station, which may be located on the bridge or a separate manned control room, is to be provided from which brakes, chainstoppers and pawls can be remotely released.

6.2.3 For each anchor winch, the respective local control station is to be provided with a means of indicating the following:

- Line tension.
- Length of line paid out.
- Line speed.

6.2.4 The indication required by 6.2.3(a) and (b) is to be repeated to the central control station and, in addition, a means of indicating the following is to be provided at this position:

- Mooring patterns and anchor line catenaries.
- Status of winch operation.
- Position and heading, see also 6.4.6.
- Gangway angle and extension, when applicable.
- Riser angle, when applicable.
- Wind speed and direction, see also 6.4.9.

6.2.5 Means of voice communication are to be provided between the central control station, each local control station and anchor handling vessels, when applicable.

6.3 Alarms

6.3.1 Alarms are to be provided at the local and central control stations for the following fault conditions:

- Excessive line tension.
- Loss of line tension.
- Excessive gangway angle and extension, when applicable.
- Excessive riser angle, when applicable.

6.3.2 Alarms are to be provided adjacent to the winches and windlasses to warn personnel prior to and during any remote operation.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Sections 6, 7 & 8

6.3.3 Alarms are to be provided at the central control station for the following fault conditions:

- (a) When the ship deviates from its predetermined area of operation.
- (b) When the ship deviates from its predetermined heading limits.

These alarms are to be adjustable, but should not exceed specified limits. Arrangements are to be provided to fix and identify their set points.

6.4 Controls

6.4.1 Adequate controls are to be provided at the local control station for satisfactory operation of the winch(es).

6.4.2 The braking system is to be arranged so that the brakes, when applied, are not released in the event of a failure of the normal power supply.

6.4.3 Standby power is to be provided to enable winch brakes to be released within 15 seconds in an emergency. The release arrangements are to be operable locally at each winch and from the central control position, and are to be such that the entire anchor line can be lowered in a controlled manner.

6.4.4 The standby power is to be such that, during lowering of the anchor line, it is possible to apply the brakes once and then release them again in a controlled manner.

6.4.5 Standby power is to be provided, so that any anchor line stoppers or pawl mechanisms may be released from either the local or central control stations up to a line tension equal to the minimum rated break strength of the anchor line. These mechanisms are to be capable of release at the maximum angles of heel and trim under the damage stability and flooding conditions for which the ship is designed.

6.4.6 At least one position reference system and one gyrocompass or equivalent is to be provided, when applicable, to ensure the specified area of operation and heading deviation can be effectively monitored.

6.4.7 Position reference systems are to incorporate suitable position measurement techniques which may be by means of acoustic devices, radio, radar, taut wire, riser angle, gangway extension and angle or other acceptable means depending on the service conditions for which the ship is intended.

6.4.8 A vertical reference sensor is to be provided, if applicable, to measure the pitch and roll of the ship.

6.4.9 Means are to be provided to ascertain the wind speed and direction acting on the ship.

Section 7 Thruster-assisted positional mooring

7.1 General

7.1.1 When the positional mooring system is supplemented by thrusters, the requirements of Pt 7, Ch 4, are to be generally complied with in respect of the machinery, electrical and control engineering arrangements. In applying these requirements, the arrangements for the notations **DP(CM)**, **DP(AM)** and **DP(AA)** may be regarded as equivalent to those for supplementary notations **T1**, **T2** and **T3** respectively, unless otherwise stated in this Chapter.

7.2 Control systems

7.2.1 Suitable processing and comparative techniques are to be provided at the central control station to validate the control system inputs, thereby ensuring optimum performance of the thruster-assisted mooring system.

7.2.2 Abnormal signal errors revealed by the validity checks required by 7.2.1 are to initiate alarms.

7.2.3 The control system is to be stable throughout its operational range and is to meet the specified performance and accuracy criteria.

7.2.4 An alarm is to be provided for a control computer system fault.

7.2.5 Sufficient instrumentation is to be fitted at the central control station to ensure effective control and indicate that the system is functioning correctly, *see also* 6.2.

7.2.6 The deviation from the desired heading and/or position is to be adjustable, but should not exceed the specified limits. Arrangements are to be provided to fix and identify the set points for the desired heading and/or position.

Section 8 Thruster-assisted mooring – Classification notation requirements

8.1 Notation **T1**

8.1.1 For assignment of notation **T1**, the applicable requirements of Sections 6 and 7, together with 8.1.2, are to be complied with.

Positional Mooring and Thruster-Assisted Positional Mooring Systems

Part 7, Chapter 8

Sections 8 & 9

8.1.2 Centralised automated manual control of the thrusters is to be provided to supplement the position mooring system. The manual control system is to provide output signals to the thrusters, via the manual controller, to change the speed, pitch and azimuth angle, as applicable, thereby optimising line tension, as indicated at the central control station, see 6.2.4.

8.2 Notation (T2)

8.2.1 For assignment of notation (T2), the applicable requirements of Sections 6 and 7, together with 8.2.2 to 8.2.5, are to be complied with.

8.2.2 Automatic and manual control systems are to be provided to supplement the positional mooring systems and arranged to operate independently, so that failure in one system will not render the other system inoperative. See also 8.1.2 for manual control.

8.2.3 The automatic control system is to utilise automatic input(s) from the position reference system, the environmental sensors and line tensions, and automatically provide output signals to the thrusters to change the speed, pitch and azimuth angle, as applicable, thereby optimising line tension.

8.2.4 In the event of line failure or failure of the most effective thruster, the ship is to be capable of maintaining its predetermined area of operation and desired heading in the environmental conditions for which the ship is designed and/or classed.

8.2.5 Control, alarm and safety systems are to incorporate a computer-based consequence analysis, which may be continuous or at predetermined intervals, and is to analyse the consequence of predetermined failures to verify that the anchor line tensions and position/heading deviations remain within acceptable limits. In the event of a possible hazardous condition, arising as a result of the consequence analysis, an alarm is to be initiated at the central control station.

8.3 Notation (T3)

8.3.1 For assignment of notation (T3), the applicable requirements of Sections 6 and 7, together with 8.2.3 to 8.2.5 and 8.3.2 to 8.3.5, are to be complied with.

8.3.2 Two automatic control systems are to be provided and arranged to operate independently, so that failure in one system will not render the other system inoperative.

8.3.3 In the event of failure of the working system, the standby automatic control system is to be arranged to changeover automatically without manual intervention and without any adverse effect on the ship's station keeping capability. The automatic changeover is to initiate an alarm.

8.3.4 At least two position reference systems, as defined by 6.4.7, are to be provided.

8.3.5 At least two of each of the environmental sensors, as required by 6.4.8 and 6.4.9, are to be provided.

Section 9 Trials

9.1 General

9.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, trials are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are to be based on the approved test schedules list as required by 1.5.4(h).

9.1.2 The suitability of the positional mooring and/or thruster-assisted positional mooring system is to be demonstrated during sea trials, observing the following:

- (a) Response of the system to simulated failures of major items of control and mechanical equipment, including loss of electrical power.
- (b) Response of the system under a set of predetermined manoeuvres for changing:
 - (i) Location of area of operation.
 - (ii) Heading of the ship.
- (c) Automatic thruster control and line tension optimisation.
- (d) Monitoring and consequence analyses.
- (e) Simulation of line breakage and damping.
- (f) Continuous operation of the thruster-assisted positional mooring system over a period of four to six hours.

9.1.3 Two copies of the test schedules, as required by 1.5.4(h), signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed on board the ship and the other submitted to LR.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 1

Section

- 1 **General requirements**
- 2 **Physical conditions**
- 3 **Workstations**
- 4 **Systems**
- 5 **Integrated Bridge Navigation System – IBS notation**
- 6 **Trials**

■ Section 1 General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to ships where an optional class notation for optimising environment on the bridge for navigational tasks, including periodic operation of the ship under the supervision of a single watch-keeper on the bridge and/or integrated bridge systems, is requested, and are additional to those applicable in other Parts of the Rules.

1.1.2 The requirements of this Chapter are based on the understanding that the *International Regulations for Preventing Collisions at Sea* and all other relevant Regulations relating to Radio Communications and Safety of Navigation required by Chapters IV and V respectively of SOLAS are complied with.

1.1.3 Requirements additional to those in this Chapter may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction it is intended to operate.

1.1.4 The requirements of this Chapter are framed on the understanding that contingency plans for emergencies are specified and the conditions under which one man watch is permitted are clearly defined in an operations manual which is acceptable to the Administration with which the ship is registered.

1.1.5 In general, ships complying with the requirements of Sections 1 to 4 of this Chapter will be eligible for the notation **NAV1**.

1.1.6 Section 5 of this Chapter states additional requirements which apply where the navigational functions are integrated. In general, ships complying with the requirements of Section 5 will be eligible for the notation **IBS**, see Pt 1, Ch 2,2.4. In addition to the assessment of the navigational function integration, the assignment of the notation **IBS** requires that the layout of the bridge and the equipment located on the bridge is to the satisfaction of Lloyd's Register (hereinafter referred to as LR), see 5.2.1.

1.2 Information and plans required to be submitted

1.2.1 The following information and plans are to be submitted in triplicate:

- For programmable electronic systems, the plans required by Pt 6, Ch 1,1.2.5.
- Details of the intended area of operation of the ship.
- List of navigational equipment detailing manufacturer, and model and National Authority approval (where applicable).
- Functional block diagrams and descriptions of the navigational equipment, internal communications systems and watch safety system indicating their relationship to each other.
- Details of the electrical power supplies to the navigational equipment, internal communications systems, watch safety system, and clear view arrangements.
- A general arrangement of the ship showing the fields of vision from the bridge.
- A general arrangement of the bridge and wheelhouse showing the positions of consoles, panels, handrails, seating, windows and clear view arrangements.
- A profile view of the wheelhouse detailing the inclination of windows, heights of upper and lower edges of windows, and dimensions of consoles.
- Detailed arrangements of consoles and panels showing the layout of equipment.
- Test schedules which should include methods of testing and test facilities provided.
- A schedule of the electrical and electronic equipment referred to in 2.2.10 giving details of:
 - equipment description;
 - manufacturer;
 - type and/or model; and
 - evidence of electromagnetic compatibility.

1.3 Definitions

1.3.1 The following definitions are applicable to these Rules:

- (a) **Workstation:**
A position at which one or several tasks, constituting a particular activity, is carried out.
- (b) **Navigation workstation:**
A workstation at which the navigator may carry out all tasks relevant for deciding, executing and maintaining course and speed in relation to waters and traffic. The instrumentation and controls at the navigation workstation should allow the navigator to:
 - analyse the traffic situation;
 - monitor position, course, track, speed, time, propeller revolutions and pitch, rudder angle, depth of water, rate of turn, and wind speed and direction;
 - alter course and speed;
 - effect internal and external communications;
 - give and receive sound signals;
 - control navigational lights;
 - monitor and acknowledge navigational alarms;
 - confirm his well-being and watch-keeping awareness; and
 - record navigational data.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Sections 1 & 2

- (c) **Main steering position:**
That part of the navigation workstation where those controls and instrumentation relevant to controlling the ship's course are located.
- (d) **Conning position:**
A place on the bridge which is used by navigators when commanding, manoeuvring and controlling a ship.
- (e) **Voyage planning workstation:**
A workstation at which the navigator may carry out the following tasks without affecting the actual navigation of the vessel:
- examine and update charts and other relevant documentation;
 - plan a voyage as a series of waypoints, courses, speeds and turns;
 - calculate an estimated time of arrival at various points on the voyage; and
 - determine and plot the ship's position.

Section 2 Physical conditions

2.1 Bridge and wheelhouse arrangement

2.1.1 The bridge configuration, arrangement of consoles and equipment location are to be such as to enable the officer of the watch to perform navigational tasks and other functions allocated to the bridge, as well as maintain an effective lookout. The following tasks are to be supported:

- navigation and manoeuvring;
- monitoring;
- manual steering;
- docking;
- planning;
- safety;
- communications; and
- conning.

2.1.2 Equipment and associated displays and indicators are to be sited at clearly defined workstations.

2.1.3 Consoles, including the chart table, are to be positioned, so that the instrumentation they contain is mounted in such a manner as to face a person looking forward. As far as practicable, operating surfaces are to be normal to the operator's line of sight.

2.1.4 From other workstations within the wheelhouse it is to be possible to monitor the navigation workstation and to maintain an effective lookout.

2.1.5 The main access to the bridge is to be by means of an internal stairway. Secondary external access is also to be provided.

2.1.6 Clear passage of at least 700 mm width is to be available to allow movement around the bridge with a minimum of inconvenience. Particular attention is to be paid to the following routes which are to be as direct as possible:

- From bridge wing to bridge wing, a clear passage of at least 1200 mm in width.
- Between the internal entrance to the bridge and the route in (a) a clear passage of at least 700 mm in width is to be provided.
- Between adjacent workstations, a clear passage of at least 700 mm is to be provided.
- Between the bridge front bulkhead or any consoles and installations placed against the front bulkhead, to any consoles or installations placed away from the bridge front, a clear passage of at least 800 mm is to be provided.

Space necessary for operating at a workstation is to be considered as part of the workstation and is not to be part of the passageway.

2.1.7 The clear height between the wheelhouse deck surface covering and the underside of the deckhead is to be at least 2250 mm. The lower edge of deckhead mounted equipment is to be at least 2100 mm in open areas, passageways and at standing workstations.

2.1.8 Toilet facilities are to be provided on the bridge or adjacent to the bridge on the bridge deck.

2.2 Environment

2.2.1 The bridge is to be free of physical hazards to personnel. There are to be no sharp edges or protuberances and wheelhouse, bridge wing and upper bridge decks are to be free of trip hazards and have non-slip surfaces whether wet or dry.

2.2.2 Sufficient hand-rails or equivalent are to be fitted inside the wheelhouse and around workstations to enable personnel to move or stand safely in bad weather. Protection of stairway openings is to be given special consideration.

2.2.3 Provision for seating is to be made in the wheelhouse. Means for securing the seating are to be provided having regard to storm conditions.

2.2.4 Glare and reflections from surfaces are to be minimized. In this respect, walls, ceilings, consoles, chart tables and other major fittings are to be provided with a suitable low reflective finish. Arrangements are to be provided to prevent the obscuration of information presented on visual display units and instruments which are fitted with transparent covers.

2.2.5 Entrance doors to the wheelhouse are to be securable from the inside, and operable with one hand. Bridge wing doors are not to be self-closing, and are to be provided with means to hold them open.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 2

2.2.6 An adequate air conditioning or mechanical ventilation system, together with sufficient heating according to climatic conditions, is to be provided in order to maintain the temperature of the wheelhouse within the range of 14°C to 30°C and the humidity within the range 20 per cent to 60 per cent. The discharge of hot or cold air is not to be directed towards bridge personnel. Control of this system is to be provided in the wheelhouse.

2.2.7 The noise level on the bridge is not to interfere with verbal communication, mask audible alarms, or be uncomfortable to bridge personnel. In this respect, the ambient noise level in the wheelhouse in good weather is not to exceed 65 dB(A).

2.2.8 A sound reception system or alternative means is to allow external sound signals to be heard and their direction determined within the wheelhouse.

2.2.9 Permanently installed electrical and electronic equipment is to be installed so that electromagnetic interference does not affect the proper function of the navigational systems and equipment. Installation of the equipment in accordance with the guidelines and recommendations included in IEC 60533: *Electrical and electronic installations in ships – Electromagnetic compatibility*, or an acceptable equivalent Standard, would generally be considered to meet the requirement.

2.2.10 Permanently installed electrical and electronic equipment, on the bridge and in the vicinity of the bridge, that is not subject to the approval required by 3.1.13, is to have undergone electromagnetic compatibility testing that demonstrates the equipment satisfies the conducted and radiated emission requirements of:

- IEC 60533: *Electrical and electronic installations in ships – Electromagnetic compatibility*; or
- IEC 60945: *Maritime navigation and radio communication equipment and systems – General requirements – Methods of testing and required test results*.

Testing in accordance with other appropriate standards is subject to consideration and details are to be submitted.

2.2.11 To demonstrate compliance with 2.2.10, a schedule of applicable equipment is to be compiled, see 1.2.1. Where it is proposed to add to or modify the equipment referred to in 2.2.10 the schedule is to be maintained accordingly, see also 6.1.1. A copy of the schedule documentation is to be placed on board the vessel and a copy is to be made available to the LR Surveyor on request.

2.2.12 Passive electromagnetic equipment, considered not liable to cause or be susceptible to electromagnetic disturbances, may be provided with an exemption statement in place of evidence of electromagnetic compatibility for the purposes of 2.2.11. Examples of passive electromagnetic equipment include cables, purely resistive loads and batteries.

2.3 Lighting

2.3.1 The level of lighting is to enable bridge personnel to perform all bridge tasks, including maintenance and chart and office work, by day and night. Controls, indicators, instruments, keyboards, etc., on the bridge are to be capable of being seen in the dark, either by means of internal lighting within the equipment or the wheelhouse lighting system. A satisfactory level of flexibility within the lighting system is to be available to enable the bridge personnel to adjust the lighting in brightness and direction as required in different areas of the bridge and by the needs of individual instruments and controls.

2.3.2 All illumination and lighting of instruments, keyboards and controls are to be adjustable down to zero, except the lighting of alarm indicators and the controls of dimmers which are to remain readable.

2.3.3 Two separate circuits are to be provided for wheelhouse lighting, such that failure of any one of the circuits does not leave the space in darkness, see Pt 6, Ch 2,5.7.

2.3.4 Emergency lighting is to be provided for the wheelhouse, stairways and exits, see Pt 6, Ch 2,3.

2.3.5 Lighting used in areas and at items of equipment requiring illumination, whilst the ship is navigating, is to be such that night vision is not impaired, e.g. red lighting. Such lighting is to be arranged, so that it cannot be mistaken for a navigation light by another ship, and to prevent glare and stray image reflections.

2.3.6 In order to avoid possible confusion in colour discrimination, red lighting is not to be fitted over chart tables.

2.3.7 To avoid unnecessary light sources in the front area of the bridge, only instruments necessary for the safe navigation and manoeuvring of the ship are to be located in this area.

2.3.8 Means are to be provided to prevent the sudden flooding of light onto the bridge from alleyways, accommodation areas and the chart table area.

2.3.9 Deck and superstructure lights which may impair safe navigation are to be controlled from the bridge.

2.3.10 Each navigation light is to be provided with an audible and visual alarm to indicate failure of the light, see Pt 6, Ch 2,14.5.

2.3.11 Means are to be provided to test alarm and indicator lamps.

2.4 Windows

2.4.1 All wheelhouse windows are to be constructed of shatterproof toughened glass having a strength commensurate with the degree of exposure of the bridge to storm conditions and complying with a recognised National or International Standard, e.g. ISO 3254 *Shipbuilding and marine structures – Toughened safety glass for rectangular windows*.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 2

2.4.2 Windows are to be as wide as possible and divisions between them are to be kept to a minimum. No division is to be positioned immediately forward of any workstation or on the ship's centreline.

2.4.3 To reduce reflections from internal lighting, etc., the bridge windows are to be inclined from the vertical plane top out, at an angle of not less than 10° and not more than 25°. Alternative arrangements will be specially considered.

2.4.4 The height of the lower edge of the front windows is to allow a forward view over the bow for a person at the navigation workstation and is not to obstruct any of the required fields of vision, see 2.5. In this respect, the height of the lower edge of the front windows above the deck is to be kept as low as possible and, as far as practicable, is not to be more than 1000 mm above the deck surface.

2.4.5 The upper edge of the front windows is to allow a forward view of the horizon for a person with an eyeheight of 1800 mm at the conning position when the ship is pitching in heavy seas and, as far as practicable, is not to be less than 2000 mm above the deck surface.

2.4.6 Clear views through the windows in front of the conning position, navigation workstation, and, where applicable, bridge wings are to be provided at all times regardless of weather conditions. At least two windows are to provide such a view.

2.4.7 To ensure a clear view in bright sunshine, sun-screens with minimum colour distortion are to be provided. Such screens are to be readily removable and not permanently installed. Polarised and tinted windows are not to be fitted.

2.4.8 Heavy duty wipers, preferably provided with an interval function and a fresh water wash, are to be fitted.

2.4.9 Efficient cleaning, de-icing and de-misting systems are to be fitted.

2.4.10 Suitable safe external access arrangements fitted under the bridge windows are to be provided to enable cleaning in the event of failure of the above systems.

2.5 Fields of vision

2.5.1 It is to be possible to observe all objects necessary for navigation, including other traffic and navigation marks, in any direction from inside the wheelhouse. In this respect, there is to be a field of view around the ship of 360° obtained by an observer moving within the confines of the wheelhouse.

2.5.2 The view of the sea surface from the conning position and the navigation workstation is not to be obscured by more than two ship lengths, or 500 m, whichever is less, forward of the bow to 10° on either side, irrespective of the ship's draught, trim and deck cargo, see Fig. 9.2.1.

2.5.3 Blind sectors caused by cargo, cargo gear and other obstructions outside of the wheelhouse forward of the beam obstructing the view of the sea surface as seen from the conning position and the navigation workstation are not to exceed 10° each. The total arc of blind sectors is not to exceed 20° and the clear sector between blind sectors shall be at least 5°. However, in the view described in the preceding paragraph, each individual blind sector is not to exceed 5°.

2.5.4 The horizontal field of vision from the conning position and the navigation workstation is to extend over an arc from more than 22,5° abaft the beam on one side, through forward, to more than 22,5° abaft the beam on the other side, see Fig. 9.2.2.

2.5.5 From the main steering position, the field of vision is to extend over an arc from dead ahead to at least 60° on each side, see Fig. 9.2.3.

2.5.6 From each bridge wing, the field of vision is to extend over an arc from at least 45° on the opposite bow through dead ahead and then aft to 180° from dead ahead, see Fig. 9.2.4.

2.5.7 There is to be a line of sight from the port wing to the starboard wing through the wheelhouse.

2.5.8 The ship's side is to be visible from the bridge wing.

2.5.9 From workstations for functions other than navigation, the field of vision is to enable an effective lookout to be maintained and, in this respect, is to extend at least over an arc from 90° on the port bow, through forward, to 22,5° abaft the beam on the starboard side, see Fig. 9.2.5.

4155/01

Fig. 9.2.1 View of sea surface from conning position and navigation workstation

2.5.10 The height of consoles is not to interfere with the fields of vision defined above and is not to exceed 1350 mm.

Section 3 Workstations

3.1 Navigation workstation

3.1.1 A workstation for navigation is to be arranged to enable efficient operation by one person under normal operating conditions. The workstation area is to be sufficient to allow at least two operators to use the equipment simultaneously. The arrangement of instruments and controls is to allow the use of all instruments and controls necessary for navigating and manoeuvring in any normal working position.

3.1.2 An adequate conning position is to be provided close to the forward centre window. If the view in the centreline is obstructed by large masts, cranes, etc., two additional conning positions giving a clear view ahead are to be provided, one on the port side and one on the starboard side of the centreline, no more than 5 m apart. In addition to the conning position, a second position with a view of the area immediately in front of the bridge superstructure is to be provided close to a forward window or, alternatively, the conning position is to be wide enough to accommodate two persons.

3.1.3 The main steering position is to be located on the ship's centreline, unless the view ahead is obstructed by large masts, cranes, etc. In this case, the steering position is to be located a distance to starboard of the centreline sufficient to obtain a clear view ahead and special steering references for use by day and night are to be provided, e.g. sighting marks forward.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 3

3.1.4 The following facilities are to be provided at the navigation workstation:

- Radar and radar plotting facilities, see 3.1.5.
- Position-fixing system displays, see 3.1.6.
- Echo sounder display.
- Speed and distance indications, see 3.1.11 and 3.1.12.
- Gyrocompass displays, see 3.1.7.
- Magnetic compass display.
- Wind speed and direction indication.
- Steering controls and indication, see Pt 5, Ch 19,5.
- Rate of turn indication.
- Course/track controls and indications, see 3.1.8 to 3.1.10.
- Main propulsion and thruster controls and indication, see Pt 6, Ch 1,2.6 and 3.10.
- Watch safety system acknowledge.
- Watch safety system manual initiation.
- Internal communications system.
- VHF radiotelephone.
- Time indication.
- Window clear view controls.
- Navigation lights controls.
- Whistle control.
- Morse light keys.
- Wheelhouse/equipment lighting controls.
- Automatic ship identification system (AIS) information.
- Sound reception system where fitted, see 2.2.8.
- Means to cease the distribution of long-range identification and tracking information, where required by SOLAS Ch V, Reg.19-1,7.

3.1.5 Two functionally independent radars or alternative means are to be provided to determine and display the range and bearing of radar transponders and other surface craft, obstructions, buoys, shorelines and navigational marks. One of the radars is to operate in the X-band (9 GHz) and the other is to operate in the S-band (3 GHz). Both radars are to include automatic plotting aids to determine collision risks, and at least one radar is to be equipped with an automatic radar plotting aid (ARPA), capable of tracking at least 20 targets, while the other is to be either ARPA or an automatic tracking aid (ATA).

3.1.6 At least two different automatic position-fixing systems giving a continuous display of latitude and longitude are to be provided. One of these is to be GPS or equivalent. The other is to be Loran C or equivalent, depending on the area of operation.

3.1.7 A gyrocompass or alternative means for determining, displaying and transmitting the ship's heading by shipborne, non-magnetic means, is to be provided and is to be clearly readable by the helmsman at the main steering position. The heading information is to be used directly by the radars, radar plotting aids and automatic identification system, see 3.1.5 and 3.1.13. The gyrocompass is to be provided with a gyrocompass heading repeater located at the emergency steering position in the steering gear compartment and a gyrocompass bearing repeater allowing bearings to be taken over 360°.

3.1.8 An autopilot, track control system or alternative means of automatically maintaining the ship's heading or a straight track is to be provided. At any time, it is to be possible to immediately restore manual control.

3.1.9 Heading monitoring is to be provided to monitor the actual heading information by independent heading sources. An off-course warning is to be given if the actual heading of the ship deviates from the set track course beyond a pre-set value. The pre-set off-course warning limit is to be large enough to prevent unnecessary alarms.

3.1.10 Where automatic track following is provided, sufficient warning is to be given of the approach of a waypoint, so that, in the event of no acknowledgement from the officer of the watch, there is adequate time for the backup navigator to reach the bridge and accept the change of course.

3.1.11 A speed log or alternative means of indicating the ship's speed and distance through water is to be provided. The speed through water measurement is to be used directly by the ARPA as an aid to collision avoidance.

3.1.12 A speed log or alternative means of indicating the ship's speed and distance over ground is to be provided. Speed over ground is to be indicated in both the fore-aft and athwartships directions.

3.1.13 Navigational systems and equipment are to be of a type approved by the national administration and in conformity with appropriate performance standards not inferior to those adopted by IMO from time to time. Documentary evidence to this effect is to be submitted. See SOLAS 1974 as amended, Ch V, Reg. 18.

3.1.14 Where alternative means of fulfilling the navigational requirements are permitted, the means are to be approved by the national administration and in conformity with appropriate performance standards.

3.2 Voyage planning workstation

3.2.1 A voyage planning workstation is to be provided at which the following facilities are available:

- Chart table with instruments.
- Position-fixing systems.
- Time indication.

3.2.2 Time indication at the voyage planning workstation is to be derived from the same system as used at the navigation workstation.

3.2.3 The chart table is to be large enough to accommodate all chart sizes normally used internationally for maritime traffic and is to have facilities for illuminating the chart, see also 2.3.8.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 4

Section 4 Systems

4.1 Alarm and warning systems

4.1.1 Alarms associated with navigation equipment are to be both audible and visual and are to be centralized for efficient identification. Repeater displays may be fitted on the bridge wings and at other appropriate positions on the bridge where necessary.

4.1.2 The following alarms are to be provided:

- Closest point of approach.
- Shallow depth.
- Waypoint approaching (where automatic track following is provided).
- Off-course.
- Off-track (where automatic track following is provided).
- Steering alarms, see Table 19.5.1 in Pt 5, Ch 19 or Table 20.4.1 in Pt 5, Ch 20, as applicable.
- Navigation light failure.
- Gyrocompass failure.
- Watch safety system failure.
- Failure of any power supply to the distribution panels referred to in 4.4.1.

4.1.3 Audible signals are to be designed not to startle operators. Suitable types are shown in Table 9.4.1.

Table 9.4.1 Suitable audible signals

Type	Typical characteristics	Considerations
Buzzer	Low intensity and frequencies	Good alerting in quiet environment without startling
Bell	Moderate intensity and frequencies	Penetrates low frequency noise well, abrupt onset has a high alert value
Chime	Moderate intensity and frequencies	Good in quiet environment, non-startling
Tone	Moderate intensity and limited frequency range	Convenient for intercom transmission, high alert value if intermittent

4.2 Watch safety system

4.2.1 A watch safety system satisfying the requirements of the IMO performance standards for a bridge navigational watch alarm system (BNWAS) and approved by the national administration is to be provided to monitor the well-being and awareness of the watchkeeper. The system is not to cause undue interference with the performance of bridge functions.

4.2.2 The watch safety system is to automatically become operational whenever the ships heading or track control system is activated.

4.2.3 The system is to be such that, at a predetermined time, the watchkeeper receives warning that he must indicate his well-being by accepting the warning.

4.2.4 The time interval between warnings is to be adjustable up to a maximum of 12 minutes.

4.2.5 It is to be possible to acknowledge the warning at the navigation workstation and at other appropriate locations on the bridge where an effective look-out may be kept. Acknowledgement of any alarm is automatically to reset the time interval between warnings. Manual adjustment of controls may also be used for this purpose.

4.2.6 Visual warning indications are to be visible, and audible warning indications are to be audible, from all operational positions on the bridge where the watchkeeper may reasonably be expected to be stationed. The colour of visual indicators is not to impair night vision.

4.2.7 In the event that the watchkeeper fails to respond and accept the warning or if any alarm has not been acknowledged on the bridge, within a period of 30 seconds, the system is to immediately initiate a watch alarm to warn the Master and the appointed backup navigator through a fixed installation.

4.2.8 In the event that the watch alarm is not acknowledged, the system is to initiate the watch alarm at the locations of further crew members capable of taking corrective actions following a time delay sufficient to allow the Master or backup navigator to reach the bridge. The time interval is to be adjustable between 90 seconds up to a maximum of 3 minutes. In ships, other than passenger ships, the watch alarm to warn the further crew members may be initiated at the same time as the watch alarm to warn the Master and backup navigator.

4.2.9 The watch alarms which sound in the locations of the Master, officers and further crew members capable of taking corrective action should be easily identifiable by its sound and should indicate urgency. The volume of this alarm should be sufficient for it to be heard throughout the locations above and to wake sleeping persons.

4.2.10 Manual initiation of the watch alarm from the bridge is to be possible at any time.

4.2.11 The system is to be designed and arranged such that only the ship's Master has access for enabling and disabling it and setting the appropriate intervals, so as to prevent accidental or unauthorised operation, e.g. removing the fuses or keeping the acknowledgement button permanently depressed either accidentally or deliberately.

4.2.12 The fixed installation is to be connected to the Master's and navigating officers' cabins, offices, mess and public rooms.

4.2.13 Acknowledgement of the watch alarm is only to be possible on the bridge.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Sections 4 & 5

4.2.14 If, depending upon the shipboard work organisation, the backup navigator may attend locations not connected to the alarm transfer system, a wireless portable device is to be provided enabling both the transfer of alarms and two-way speech communication with the bridge. An audible warning from the portable device is to be provided in the event of loss of the wireless link with the bridge. Alternative arrangements will be considered.

4.2.15 Failure of the watch alarm system is to activate an audible and visual alarm at the centralised alarm system.

4.3 Communications

4.3.1 A telephone system is to be provided to enable two-way speech communication between the wheelhouse and at least the following locations:

- machinery control station space, see Pt 6, Ch 1,2.6.8;
- emergency steering position in the steering gear compartment;
- Master's and Navigating Officers' cabins, offices, mess and public rooms.

4.3.2 The bridge is to have priority over the system.

4.3.3 A list of extension numbers is to be clearly displayed adjacent to each telephone.

4.4 Power supplies

4.4.1 Local distribution panels are to be provided for all items of electrically operated navigational equipment, the telephone system, the watch safety system and the clear view systems. These panels are to be supplied by two exclusive circuits, one fed from the main source of electrical power and one fed from an emergency source of electrical power. Each item of equipment is to be individually connected to its distribution panel. The power supplies to the distribution panels are to be arranged with automatic changeover facilities between the two sources, see also Pt 6, Ch 2,14.6. Failure of any power supply to the distribution panels is to initiate an audible and visual alarm. This alarm should be included in the ship's alarm system, as required by Pt 6, Ch 1,4.2, where applicable.

4.4.2 The watch safety system and the telephone system are to remain operational during blackout conditions.

4.4.3 Following a loss of power which has lasted for 45 seconds or less, all navigation functions are to be readily re-instated. In this respect, all navigational equipment is to recover within five minutes, with minimum operator intervention, by virtue of the emergency source and, where necessary, an uninterruptible power source.

Section 5 Integrated Bridge Navigation System – IBS notation

5.1 General

5.1.1 Where it is proposed that the bridge navigation functions are so arranged as to form an integrated bridge system, the requirements of 5.2 to 5.6 are to be complied with.

5.2 General requirements

5.2.1 For assignment of the notation **IBS**, in addition to satisfying the other requirements of this Section:

- (a) the layout of the bridge and the equipment located on the bridge is to satisfy the requirements of a relevant international or national ergonomic or human-centred design Standard or an acceptable equivalent; or
- (b) the notation **NAV1** is also to be assigned and the layout of the bridge and the equipment on the bridge are to satisfy the requirements Sections 1 to 4; or
- (c) where the bridge is not intended to operate a periodic one man watch, the layout of the bridge and the equipment on the bridge are to satisfy the requirements of Sections 1 to 4, with the exception that the requirements of 4.2 and 4.3 may be relaxed.

5.2.2 Where 5.2.1(a) is applicable, the submissions required by 1.2.1 are to include evidence demonstrating satisfaction of the requirements of an identified relevant Standard.

5.2.3 To satisfy 5.2.2, the evidence submitted is to:

- (a) be submitted to LR for assessment, including identification of testing necessary to verify compliance in the submitted test schedules; or
- (b) include relevant statutory documentation demonstrating compliance with the relevant identified standard to the satisfaction of the National Administration. Such documentation is to be submitted prior to the assignment of the **IBS** notation. This may necessitate co-ordination of classification and statutory Surveys, particularly for new construction, before the **IBS** notation may be assigned.

5.2.4 Where 5.2.1(c) is applicable, the submissions required by 1.2.1 are to include plans and information for the consideration of LR which demonstrate that the applicable requirements of Sections 1 to 4 have been satisfied.

5.2.5 The design features for computer hardware, local area networks and software required by Pt 6, Ch 1,2.10, 2.11, 2.12 and 2.13 respectively are to be complied with. Alarms associated with hardware and data communication are to be incorporated in the centralised alarm system required by 4.1.

5.2.6 Failure of a part of the integrated bridge navigation system is not to affect other parts except for those that directly depend upon the information from the defective part. Following such a failure, it is to be possible to operate each other part of the system separately.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 5

5.3 Equipment

5.3.1 Two independent gyrocompasses are to be available to provide heading information to the system. The heading signal from each gyrocompass is to be continuously available for display and for providing input to all relevant items of navigational equipment.

5.3.2 Only one gyrocompass is to be used by the integrated bridge system at any time for main display and control purposes. The navigating officer is to be able to switch between compasses at any time. The non-selected compass is to be used automatically as the independent heading source for the off-course warning required by 3.1.9.

5.3.3 It is to be possible to compare readings from each gyrocompass via the navigation workstation displays.

5.3.4 Automatic comparison between the gyrocompasses is to be provided and an alarm given if the difference between heading signals exceeds a pre-set value.

5.3.5 The capability to receive and utilise differential GPS corrections (or an equivalent) is to be included in the integrated bridge system.

5.3.6 As a minimum, the following information is to be displayed at the navigation workstation via visual display units:

- Steering mode.
- Gyro heading.
- Course to steer.
- Rate of turn.
- Rate of turn order.
- Speed and distance (from log and from GPS).
- Speed order.
- Waypoint bearing, distance and ETA.
- Water depth and alarm setpoint.
- Position fix from each available system.
- Main propulsion and thruster indication, see Pt 6, Ch 1,2.6 and Pt 6, Ch 1,3.10.
- Steering indication, see Pt 5, Ch 19,5.
- Wind speed and direction.
- Time, see 3.2.2.

5.3.7 Additional information such as machinery monitoring, fire detection, cargo control, etc., may also be provided via additional pages on the visual display units.

5.3.8 The centralised alarm system and the watch safety system required by 4.1 and 4.2 respectively are to be incorporated as functions of the integrated bridge system and are to be presented to the navigating officer via the conning display. The presentation and display of alarms is not to mask, obscure or degrade essential information displayed to aid navigational functions and maintain awareness of the navigational information, see also 5.5.

5.3.9 A route planning capability is to be provided by the integrated bridge system. This is to allow a voyage to be pre-planned as a series of waypoints and turn radii. It is to be possible to edit a voyage plan at any time without affecting route control and monitoring.

5.3.10 An automatic track following capability is to be provided in conjunction with the pre-planned route. The position fix used by the system is to be based at least upon GPS or equivalent, and is to be cross-checked by dead-reckoning, based upon speed over ground provided by the ship's log. In areas where differential corrections are available, it is to be possible to utilise these in the track following system.

5.3.11 In the event of failure of the track following capability, the current heading or rate of turn is to be maintained until manually altered by the navigating officer. The quality of position fix input to the system is to be monitored, see also 3.1.10 and 4.1.2.

5.3.12 The integrated bridge system is to incorporate an electronic chart display, which combines simultaneously a high resolution colour representation of a nautical chart with a continuously updated record of own ship's position, pre-planned track, and radar targets in the vicinity. The entire tactical situation is to be displayed for the navigating officer in such a way that any risk from approaching, overtaking or crossing vessels may be assessed. Factors affecting the vessel's freedom to manoeuvre, such as water depths, channel boundaries, separation zones and other traffic are to be shown on the display.

5.3.13 The following alarms are to be provided and included in the centralised alarm system specified by 4.1.1:

- Off-track.
- Waypoint approaching, see 3.1.10.
- Position fix inaccurate/lost.
- Loss of heading input.
- Loss of log input.
- Equipment or sub-system failure.
- Gyro mis-match.

5.3.14 Manual adjustment of any of the facilities of the integrated bridge system is to reset automatically the watch safety interval timer.

5.4 Operator interface

5.4.1 Integrated display and control functions are to adopt a consistent man-machine interface philosophy and strategy. Particular consideration is to be paid to symbols, colours, controls, and information priorities.

5.4.2 The size, colour and density of text and graphic information displayed on a visual display unit is to be such that it may be read easily from the normal operator position under all operational lighting conditions.

5.4.3 Means are to be provided for the manual adjustment of the brightness of each visual display unit.

5.4.4 All information is to be presented on a background of high contrast, emitting as little light as possible by night.

5.4.5 Paged displays are to be presented in a way which allows the operator to find quickly the information needed. An overview page is to be easily available to remind the operator of the paging system.

Navigational Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Sections 5 & 6

5.4.6 Pages are to have a standardised format. Particular types of information and functional areas should be presented in a consistent manner, e.g. in the same position on different pages.

5.4.7 Each page is to have a unique identifying label on the screen.

5.4.8 Keyboards are to be divided logically into areas enabling rapid access to a desired function. Alphanumeric, paging and specific system keys are to be grouped separately and grouping is to be identical at all operator interfaces.

5.4.9 Soft keys may be used for display control and operation of systems non-critical to the safe operation of the vessel, otherwise dedicated controls are to be used.

5.4.10 Functions requested by the operator are to be acknowledged and confirmed by the system on completion.

5.4.11 Default values, where applicable, are to be indicated by the system when requesting operator input.

5.4.12 If an input error is detected by the system, it is to allow the operator to correct the error immediately.

5.4.13 The system is to require confirmation from the operator for critical actions, e.g. they should not rely on single keystrokes.

5.4.14 Input error messages are to guide the correct responses, e.g.:

- | | |
|------------|--|
| use | Invalid entry: re-enter set point between 0 and 10 |
| not | Invalid entry. |

5.4.15 All functions of the integrated bridge system are to remain available in the event of a single failure of an operator interface. This is to be achieved through redundancy in the integrated bridge system interfaces.

5.5 Alarm management

5.5.1 All alarms provided on the bridge are to be included in the centralised alarm system required by 4.1.1.

5.5.2 In general, the alarm system is to be in accordance with Pt 6, Ch 1,2,3.

5.5.3 Alarm management on priority and functional levels is to be provided within the integrated bridge system, including distribution and recording of alarms, as required. Priorities are to be as follows:

- (a) **Emergency alarms** – alarms which indicate that immediate danger to human life, or to the ship and its machinery exists and that immediate action must be taken.
- (b) **Distress, urgency and safety alarms** – alarms which indicate that a caller is in distress or has an urgent message to transmit.
- (c) **Primary alarms** – alarms which indicate a condition that requires prompt attention to prevent an emergency condition.
- (d) **Secondary alarms** – all other alarms.

5.5.4 Appropriate alarm management on general and functional levels is to be provided. This includes prioritisation, distribution and recording of alarms as required.

5.5.5 Within each priority, alarms are to be arranged in groups, in order to reduce the quantity of information presented to the operator. More detailed information on the group alarm is to be readily available from the integrated bridge system on request.

5.5.6 Group alarms may be arranged on the bridge to indicate machinery faults, but alarms associated with faults requiring speed or power reduction or the automatic shut-down of propulsion machinery are to be identified by separate group alarms or by individual alarm parameters.

5.5.7 The following alarms are not to be grouped:

- Emergency alarms.
- Separate group alarms associated with faults requiring speed or power reduction or the automatic shutdown of propulsion machinery.
- Steering gear alarms.

5.5.8 Alarms are to be displayed in order of priority. Within the priorities, alarms are to be displayed in the order in which they occur. The visual display units are to provide immediate display of new alarm information, regardless of the information display page currently selected. This may be achieved by provision of a dedicated alarm monitor, a dedicated area of screen for alarms or other suitable means.

5.5.9 Unacknowledged alarms are to be distinguished by either flashing text or a flashing marker adjacent to the text, and not merely by a change of colour. Acknowledged alarms are to be distinguished by either steady illuminated text or a steady illuminated marker adjacent to the text.

5.6 Power supplies

5.6.1 All equipment forming part of the integrated bridge navigation system is to be regarded as navigational equipment and, as such, is to have power supplies in accordance with 4.4.

Section 6 Trials

6.1 General

6.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, tests are to be carried out to ensure satisfactory operation of the navigational equipment. These tests are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are based on the approved test schedule as required by 1.2.1.

Navigation Arrangements and Integrated Bridge Systems

Part 7, Chapter 9

Section 6

6.1.2 For **IBS** Notation, testing at the manufacturer's works and trials on board are to be carried out that cover the individual components and their interaction; and the bridge functions and their integration to form the Integrated Bridge System.

6.1.3 Two copies of the test schedule, signed by the Surveyor and Builder, are to be provided on completion of the survey. One copy is to be placed on board the ship and the other submitted to LR.

6.1.4 Acceptance tests and trials for Programmable Electronic Systems are to include verification of software lifecycle activities appropriate to the stage in the system's lifecycle at the time of system examination.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Section 1

Section

- 1 **General requirements**
- 2 **Plans and documentation**
- 3 **Ventilation and hold temperature**
- 4 **Electrical, including container plug-in sockets**
- 5 **Instrumentation, control and alarm systems**
- 6 **Hold access and maintenance access arrangements**
- 7 **Water cooler refrigeration units**
- 8 **Deck-stowed refrigerated containers**
- 9 **Inspection and testing on completion**
- 10 **Spare gear**

1.1.6 An example of a typical class notation for a reefer ship classed with LR, fitted with electrical plug-in points for deck stowed refrigerated containers, would be:

✱ **CRC -/110** to maintain 110 deck-stowed refrigerated containers operating at their design condition with a 24 hour average external ambient air temperature of 35°C.

1.1.7 In addition to any class notation, an appropriate descriptive notation may be assigned to provide additional information about the ship's ability to carry refrigerated containers.

1.1.8 An example of a typical descriptive notation, which may be assigned in addition to the class notation, would be:
crc 2,800 kW provided with a power generating capacity of 2,800 kW dedicated to supplying the container plug-in points.

crc 60%/40% stowage ratio of 60% deep frozen and 40% chilled cargoes

1.1.9 These Rules do not cover any requirements for alarm and monitoring systems that may be fitted to container refrigeration units.

■ Section 1 General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to ships where the class notation **CRC** 'carriage of refrigerated containers' is requested.

1.1.2 This notation may be applied to any ship which has the ability to carry refrigerated containers. The requirements of this Chapter cover refrigerated containers stowed on deck as well as in a hold space. A descriptive notation may be assigned in addition to the **CRC** notation giving details of electrical power and type of cargo.

1.1.3 The requirements are additional to the classification requirements for ships contained in other applicable parts of the Rules.

1.1.4 Ships which comply with the requirements of this Chapter will be eligible for the applicable class notation specified in Pt 1, Ch 2,2.5.

1.1.5 An example of a typical class notation for a container ship classed with LR, fitted with a ventilation system built under Special Survey and fitted with electrical plug-in points for deck stowed refrigerated containers, would be:

✱ **CRC 230/140** to maintain 230 hold-stowed and 140 deck-stowed refrigerated containers operating at their design condition with a 24 hour average external ambient air temperature of 35°C.

1.2 Novel arrangement and designs

1.2.1 Where the proposed ventilation arrangement is novel in design, or the ventilation system involves the use of an arrangement different from that specified in the following sections, special tests may be required and a suitable descriptive note may be assigned.

1.2.2 The carriage of refrigerated containers in the hold spaces of ships other than dedicated container ships will be given special consideration. The **CRC** and descriptive notations will be assigned provided that the ventilation system is approved, installed and tested in accordance with the requirements of this Chapter.

1.2.3 Where a dedicated fresh water circulation system is installed to supply cooling water to containers fitted with an optional water cooled condenser, the fresh water system will also need to comply with the relevant Sections of Pt 5, Ch 12 of the Rules.

1.3 Definitions

1.3.1 **Balanced ventilation system** means a ventilation system consisting of a combination of forced draught and induced or natural draught, to produce a pressure condition in the hold space approximately equal to atmospheric pressure.

1.3.2 **Blackout** means that the main and auxiliary machinery installations, including the main power supply, are out of operation but the services for bringing them into operation (e.g. compressed air, starting current from batteries, etc.) are available.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Sections 1 & 2

1.3.3 Container cell means the position of an individual container. This is usually within a set of vertical cell guides and is normally enclosed by transverse stringers located above and below the container.

1.3.4 Container electrical power supply means the generated power supply which is dedicated to supplying the total number of refrigerated containers and the hold ventilation system fan motors.

1.3.5 Container plug-in point means an electrical socket located at each applicable container location on deck and each cell location below deck being in accordance with Annex L of ISO 1496-2: 1996.

1.3.6 Design conditions means the lowest design internal container temperature and the design maximum hold space temperature.

1.3.7 Hold space means an enclosed space containing refrigerated containers. The containers are usually restrained within cell guides. For hatch coverless ships, hold space means the space below the hatch coamings.

1.3.8 Independent ventilation system means a ventilation system that is in no way connected to another ventilation system and there is no provision available to allow connection to another ventilation system.

1.3.9 Refrigerated container means a standard container with a self-contained refrigeration system, located within the outer dimensions of the container, which can be driven by electrical power fed from an external power supply. The refrigeration system may be either a 'clip-on' or an integral type of cooling unit.

1.3.10 Stack factor means the ratio of the actual heat flowing into the containers forming the stack, to the heat which would flow into the same containers if all their surfaces were completely exposed to the hold temperature.

1.3.11 Standard container means a forty-foot equivalent unit (FEU) standard production container constructed in compliance with LR's *Container Certification Scheme*, or another recognised Container Certification Scheme in accordance with ISO 1492/2 requirements. The container may be of the normal or 'high-cube' type.

1.3.12 Stowage ratio means the proportion of deep-frozen cargo in relation to banana or chilled cargoes. Unless specifically stated, the stowage ratio will be deemed to be 50 per cent deep-frozen and 50 per cent chilled cargo.

1.3.13 Ventilation system means a forced ventilation arrangement using mechanical fans to supply and/or extract air from the hold space.

Section 2 Plans and documentation

2.1 General

2.1.1 The following plans and information regarding the hold ventilation systems and the electrical supplies to container plug-in points are to be submitted in triplicate for appraisal before construction is commenced:

(a) Plans of ventilation arrangements:

- Location and installation details of each hold space ventilation system showing duct arrangement and sizes.
- Details of all mechanical ventilation fans including locations, number, duty at design conditions and power consumption.
- Details of air inlets including number, type, size and locations.
- Details of air outlets including number, type, size and locations.
- Details and locations of dampers and flaps, if applicable.

(b) Plans of hold spaces:

- Refrigerated container stowage plans, including sectional elevation and plan views.
- Design pressure or vacuum in each hold space.
- Details of hatch cover sealing arrangements.
- Personnel access arrangements.
- Details and locations of hold temperature measurement sensors.
- Details of any pressure/vacuum safety valves if applicable.

(c) Ventilation throughput:

- Specified air throughput rate and proposed method of measurement.
- Design temperature rise in the hold space and corresponding diurnal external ambient air temperature and relative humidity.
- Schematic arrangement of the ventilation system showing proposed air volume and velocity at junctions.

(d) Plans of deck-stowed containers:

- Refrigerated container stowage plans, including sectional elevation and plan views.
- Details of access arrangements for maintenance and monitoring of refrigeration units fitted to deck-stowed containers.

(e) Hull structure:

- Details of associated openings through the hull structure are to be submitted.

(f) Electrical. In addition to the applicable requirements of Pt 6, Ch 2, 1.2, the following information and plans specific to the container plug-in points and ventilation system are to be submitted:

- Power supply arrangements to the deck stowed refrigerated containers.
- Power supply arrangements to the hold space stowed refrigerated containers.
- Power supply arrangements to the ventilation system.
- Single-line diagram of the ventilation system. This is to include rating of motors, insulation type, size and current loading of cables and make, type and rating of protective devices.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Sections 2 & 3

- A schedule of normal operating loads of the ventilation system estimated for the design conditions expected.
- (g) **Control equipment.** In addition to the applicable requirements of Pt 6, Ch 1, 1.2, the following information and plans specific to the ventilation system are to be submitted:
 - Line diagram of control circuits.
 - List of monitored, control and alarm points.
 - Locations of control panels and consoles.
 - Details of alarm system, including location of control panel and audible and visual warning devices.
- (h) **Testing:**
 - Details of the testing and commissioning programme, including instrumentation to be used, are to be submitted.

Section 3 Ventilation and hold temperature

3.1 Ventilation system

3.1.1 Means are to be provided to maintain the hold space at an acceptable temperature. This can be achieved by either; the direct removal of the waste heat from the refrigerant equipment of each container, or by the dissipation of the waste heat using large quantities of external ambient air. In each case the system is to be arranged in such a way as to minimise its effect on the hold space temperature. This may be accomplished by the use of a ventilation system of a mechanical supply and/or extract type.

3.1.2 The selection of a maximum allowable hold temperature is to be agreed between the designer and Operator/Owner. Whilst the recommendations given in these Rules do not stipulate a maximum allowable hold temperature, generally it should not exceed 45°C dry bulb. Guidance should be sought from container manufacturers on the maximum allowable ambient air temperature. When determining the maximum allowable hold temperature, the maximum number of refrigerated containers within the hold space, operating at their design condition, is to be taken into consideration.

3.1.3 The ventilation system is to have sufficient capacity to remove or dissipate the heat from each designated refrigerated container cell and maintain the hold temperature at or below the maximum allowable hold temperature.

3.1.4 The volume of air to be supplied or exhausted from a hold space per refrigerated container is at the discretion of the ventilation system designer. For guidance purposes, an indication of the amount of air required for a standard FEU having an air cooled condenser operating at the example notation as stated in 1.1.5 is as follows:

Simple supply only system	90 m ³ /min
Supply and exhaust duct system	75 m ³ /min
Sealed exhaust system	37 m ³ /min

3.1.5 The design of the hold space is to be compatible with the type of ventilation system proposed. For example, for supply and ducted exhaust systems, the semi enclosure of each stringer level may be beneficial. For a simple supply only system the provision of multiple gratings in each stringer level would benefit the free circulation and removal of warm air.

3.1.6 Only container cells served by the ventilation system are to be used for the transportation of refrigerated containers.

3.1.7 The design heat rejection for each container cell and the total hold space heat rejection, including any heat imparted from the ventilation system fans, if applicable, are to be stated. Guidance on heat rejection values which may be used is given below.

3.1.8 The minimum quantity of air supplied or extracted for each container cell and for each hold space is dependent on the type of system proposed and to be stated.

3.1.9 The ventilation system designer is to stipulate the maximum allowable back pressure occurring within the hold space. Due regard needs to be given to this value when selecting the ventilation fans and their ability to operate efficiently against the proposed maximum back pressure. The lower the back pressure, the more efficient the system and, hence, the lower the electrical power requirement to drive the fan motors for a given air throughput.

3.1.10 For supply air systems, the air outlet at each container location is to be such as to provide a flow of air towards the container's integral refrigeration system. Consideration should be given to the use of movable spigot outlets or ducting to allow both standard and high-cube containers to be stowed in any location.

3.1.11 The positions of supply air inlets and exhaust air outlets are to be such as to reduce the possibility of short-cycling. An adequate distance is to be maintained between inlet and outlet vents on the open deck.

3.1.12 The effect of warm exhaust air on deck-stowed refrigerated containers is to be taken into consideration. Similarly, the effect of warm exhaust air from deck-stowed refrigerated containers on the inlet air to the hold is to be considered.

3.1.13 Arrangements are to be provided to permit a rapid shutdown and effective closure of the ventilation system in each hold space in case of fire.

3.1.14 Ventilation ducts which penetrate the deck and/or hatch coaming, including dampers and/or closures, are to be made of steel and their arrangement is to be to the satisfaction of the relevant Administration. The use of non-metallic flexible ducts, local to each container location, will be acceptable provided the material demonstrates suitable low flame spread characteristics.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Sections 3 & 4

3.2 Heat balance

3.2.1 The amount of heat absorbed from the hold space by each container, which is used to determine the design air change rate, is to be stated.

3.2.2 The heat gain or loss from all adjacent spaces, such as fuel oil tanks, ballast tanks, engine room, etc., is to be stated.

3.2.3 The heat rejection from the refrigeration unit of a standard TEU or FEU container when working at low temperature (minus 18°C), chill temperature (2°C) and banana carriage temperature (13°C), used to determine the design air change rate, is to be stated. The following FEU values may be used for guidance purposes:

Frozen cargo (minus 18°C/38°C)	7,0 kW
Chill cargo (2°C/38°C)	10,0 kW
Banana cargo (13°C/38°C)	13,0 kW.

3.2.4 The above heat rejection values are for the container during normal operation after the cooling down period of a non-precooled cargo.

3.2.5 The stowage ratio, for the carriage of containers at different internal temperatures, which is used to determine the design air change rate, is to be stated.

3.2.6 When an extraction ventilation system is proposed, a stack factor of 0,9 may be used in the heat balance calculations. If a ventilation system using supply air only is proposed, then no stack factor can be allowed.

3.3 Fan redundancy

3.3.1 A single supply or exhaust fan is not to be used for multiple container stack locations.

3.3.2 Individual container cells may be fed by a system having a single mechanical fan or fans to supply and/or extract air.

3.3.3 Installed standby fans are not required. However, a minimum of one replacement fan, or fan blade assembly and motor, of each size is to be carried onboard. Fans are to be arranged to enable each to be replaced whilst the remaining systems remain in operation.

3.4 Hull structures

3.4.1 Special consideration will be given to installations using hull spaces for air distribution, rather than dedicated ductwork.

3.4.2 Consideration is to be given to measures to prevent ingress of water into air inlets and exhaust outlets, where applicable.

Section 4 Electrical, including container plug-in sockets

4.1 General

4.1.1 In addition to the requirements of Pt 6, Ch 2, the following are to be complied with:

- (a) Electrical power for the ventilation system is to be provided by one or more separate feeder circuit(s) from the main switchboard.
- (b) Under sea-going conditions, the number and rating of service generators are to be sufficient to supply all container plug-in socket outlets and the hold space ventilation system in addition to the ship's essential services, when any one generating set is out of action.

4.1.2 The choice between a low (440 V) or high (6,600 V) distribution system serving the container plug-in point is considered a purely commercial decision. Consideration needs to be given to the fault level of the generating equipment selected and the total generating capacity of the ship. Independent of the system voltage, only the dedicated plug-in socket outlet kW value will be stated in the notation.

4.1.3 Where a distribution system exceeding 1000 V a.c. is employed, the plug-in socket outlets for each hold space may be fed from a local transformer and the following are to be complied with:

- (a) Transformers are to be fed from individual circuits divided between different sections of the main switchboard.
- (b) The electrical power for the ventilation system may be fed locally from each transformer.

4.1.4 Container plug-in socket outlets are to comply with the requirements of Pt 6, Ch 2, 12.6.

4.2 Plug-in socket outlet supply transformers

4.2.1 A standby transformer serving the container plug-in socket outlets is to be provided. However, if the CRC notation is not assigned, then there is no specific requirement covering the installation of a standby power supply.

4.2.2 If a standby transformer is to be provided, then the exact requirements are open to interpretation and consideration should be given to the contents of IACS Unified Interpretation SC 83 with regard to the equipment provided.

4.3 Container plug-in socket outlets

4.3.1 The distribution and sub-circuit cabling for the container plug-in socket outlets is to be rated at the full load capacity (maximum rated capacity).

4.3.2 Groups of container plug-in socket outlets may be fed from a number of independent sub circuits.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Sections 4, 5 & 6

4.3.3 Sub circuits are to be able to be individually switched, thus allowing a sequential start up after a prolonged (12 hours) blackout. A suitable procedure is to be proposed and approved that takes into consideration the requirements of 4.4 in addition to the requirements of Pt 6, Ch 2.

4.4 Generated power for plug-in socket outlets

4.4.1 When determining the dedicated generating power for the plug-in socket outlets, the electrical power drawn by the refrigeration unit of a standard TEU and FEU refrigerated container when working at both low temperature (minus 18°C) and chill temperature (2°C), is to be stated.

4.4.2 The following values for various cargoes operating at normal design conditions may be used for guidance purposes:

4.4.3 Twenty foot equivalent unit (TEU):	
Frozen cargo (minus 18°C/38°C)	5,5 kW
Chill cargo (2°C/38°C)	7,5 kW
Banana cargo (13°C/38°C)	see 4.4.5

4.4.4 Forty foot equivalent unit (FEU) including high-cube containers:

Frozen cargo (minus 18°C/38°C)	8,5 kW
Chill cargo (2°C/38°C)	11,0 kW
Banana cargo (13°C/38°C)	see 4.4.5

4.4.5 If the Owner, charterer or operator has operational data indicating that, for the ship's specific trade (for example banana only cargoes), the power provision for the refrigerated containers requirements exceeds those stated above, then these higher values should be substituted and submitted for consideration.

4.4.6 The above values are for the container during normal operation after the cooling-down period of a non-pre-cooled cargo.

4.4.7 An overall diversity factor may be applied to the container's total power requirement. Consideration is to be given to Pt 6, Ch 2.5.6. This diversity factor is to be applied to all refrigerated container cell locations. For guidance purposes, the diversity factor is not generally to be less than 0,75.

Section 5 Instrumentation, control and alarm systems

5.1 General

5.1.1 The alarm system is to indicate failure of each independent ventilation system in each hold space. If a balanced ventilation system is proposed, indication of failure for each individual part is to be given. The alarm system may be integral with the machinery space alarm system or, if fitted, the refrigerated container monitoring system.

5.1.2 Alarms are to be initiated in a manned location. Where alarms are displayed as group alarms in the main machinery space alarm system, provision is to be made to identify individual alarms at a separate control panel.

5.1.3 Alarms are to give both an audible and visual warning.

5.2 Hold space temperature monitoring

5.2.1 A minimum of two temperature sensors are to be provided in each hold space carrying refrigerated containers. The sensors are to be positioned to give an indication of the mean air temperature occurring in the hold space used for the carriage of refrigerated containers. Sensors are to be positioned so as not to be directly affected by warm air from the condensers.

5.2.2 The hold temperature is to be continually monitored. Temperatures are to be recorded, either automatically or manually as a hold temperature log. If temperatures are to be logged manually, then the mean temperature in each hold space is to be recorded.

5.2.3 If the mean hold space temperature rises above the design maximum, then an alarm is to be initiated.

5.3 Container refrigeration system alarms

5.3.1 These Rules do not cover any requirements for alarm and monitoring systems fitted to containers. It is acceptable to utilise the container power supply cables to transmit signals to a suitable receiver or data logger.

Section 6 Hold access and maintenance access arrangements

6.1 Hold pressure/vacuum

6.1.1 The maximum permitted pressure or vacuum that may occur in the hold space is to be stated. It is proposed that a value, in accordance with the contents of Pt 3, Ch 1.8.3.4, may be considered as a maximum value. An over-pressure of 0,15 bar may be used for guidance purposes. If the ventilation system is capable of producing a positive pressure or vacuum in excess of the design allowable figure, then means are to be provided to protect the hold space against the effect of over pressure or vacuum. If axial supply fans are proposed, even if aerofoil fan blades are fitted, it is unlikely that the fans will be able to produce a pressure above 0,025 bar (250 mm water gauge).

6.1.2 If required, consideration is to be given to the use of a pressure or vacuum relief device or other arrangement set to operate below the maximum allowable hold pressure or vacuum.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Sections 6, 7 & 8

6.1.3 The proposed pressure or vacuum relief device for each hold space is to be of adequate size.

6.2 Hold access arrangements

6.2.1 Suitable means are to be provided to allow personnel safe access to each hold space when the ventilation system is in operation. Consideration is to be given to the possible over pressure or partial vacuum that may occur in the hold space. The use of an airlock arrangement may need to be considered.

6.3 Maintenance access arrangements

6.3.1 Free access to each applicable container cell and hold space is to be provided to allow replacement of refrigeration equipment in the event of failure or malfunction.

6.3.2 Adequate access is to be provided to allow plugging in, data recording or retrieval and general maintenance of all deck- and hold-stowed refrigerated containers. Suitable means are to be provided to allow the removal of the compressor and electric motor from each refrigerated container.

6.3.3 Suitable safe access is to be provided to each tier of deck-stowed refrigerated containers to allow electrical connection, monitoring and maintenance. The use of fixed platforms, such as lashing bridges, should be proposed where possible.

Section 7 Water cooler refrigeration units

7.1 Cooling water system

7.1.1 A minimum of two independently operated circulation pumps are to be installed. One of the pumps may be used for other services, such as a general service pump.

7.1.2 The capacity of each pump should be sufficient to supply each container at the required flow rate with an excess capacity of at least 10 per cent. This required flow rate should be obtained from the container manufacturer.

7.1.3 The fresh water system is to provide sufficient flow and even distribution to each container location. This is to be achieved using all possible combinations of fresh water pumps and dedicated refrigerated container cells.

7.1.4 The temperature of the cooling water is to be maintained in accordance with the container manufacturer's recommendations.

7.1.5 Flexible hoses are to be utilised for connecting the water supply and return pipes. The connectors on the ends of the flexible hoses are to be of a type that self-closes on disconnection. Adequate valves are to be provided to allow isolation of each cargo hold sub-circuit in the event of a leak or pipe fracture.

7.1.6 A minimum of two fresh-water to sea-water heat exchangers are to be provided. Each is to be rated at 100 per cent of the required cooling duty at the notation conditions. The second heat exchanger may be a standby or part of a common central system such as that used for main engine cooling duties. The heat exchangers are to be supplied by a minimum of two separate sea-water pumps.

7.1.7 If metal pipes are used, the contents of Pt 5, Ch 12,10.8 are to be given due consideration.

Section 8 Deck-stowed refrigerated containers

8.1 General

8.1.1 Consideration is to be given to the effect of the warm air discharged from the condenser of each deck-stowed refrigerated container. When refrigerated containers are stowed on only two tiers high, it is considered that the warm air from each condenser is dissipated without any undue effect on adjacent containers.

8.1.2 If containers are to be carried three or more tiers high, then consideration is to be given to limiting the effect of short-cycling warm discharge air within the central section of the stack. The proposed method or methods for dealing with this effect are to be stated. Possible options would include reserving the central cells of each stack for non-refrigerated containers, to reduce the block effect or providing fans and ductwork to supply ambient temperature air to the bottom of each vertical stack. Trials of any proposed system are to be undertaken.

8.1.3 Any adverse effect that the warm air discharged from the hold space ventilation system has on the deck stowed refrigerated containers is to be minimised. Similarly, the warm air discharged from the deck stowed refrigerated containers is to be shielded from entering the hold space ventilating system.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Section 9

■ Section 9 Inspection and testing on completion

9.1 General

9.1.1 On completion of construction and all appropriate safety checks, the acceptance tests prescribed in 9.2 are to be carried out. Their purpose is to verify the correct functioning of the installation and its ability to maintain the air throughput required for the assignment of the intended class notation.

9.1.2 The proposed test schedules, including methods of testing and details of the test equipment to be provided are to be submitted to LR before the tests commence. The proposed test methods are to be appropriate for the design of the system installed and are to include such acceptance criteria as:

- (a) Volume of air to be supplied and/or exhausted at each container cell location.
- (b) Maximum allowable deviation from this air volume.
- (c) Maximum allowable pressure within the hold space when the system is under normal operating conditions.

9.1.3 Trials of the air distribution system within the hold spaces are to be witnessed by LR surveyors before the ship is put into service and prior to the **CRC** notation certificate being issued. These trials are to be in addition to any tests which may have been carried out whilst commissioning the system.

9.2 Acceptance tests

9.2.1 The acceptance tests (see also 9.2.2 and 9.2.3) are to comprise the following:

- (a) Control and alarm systems are to be tested to demonstrate that they operate correctly, see also Pt 6, Ch 1,2,3.
- (b) The accuracy, calibration and functioning of all instrumentation is to be verified.
- (c) For supply air systems: Verification of each supply fan's output when running at maximum speed. Verification of the air discharge rate and operation of any distribution arrangements at each individual container cell location. During the test, all supply fans serving the hold space are to be operated simultaneously, thus replicating normal operating conditions. If a common or multiple supply fan distribution system is fitted, then the arrangements are to be verified; firstly, with all supply fans in operation and, secondly, with any one fan out of action.
- (d) For exhaust air systems: Verification of each exhaust fan's output when running at maximum speed. The volume of air being extracted from each individual container cell location is to be verified with each exhaust fan running at maximum speed. All exhaust fans serving the same hold space are to be operated simultaneously thus replicating normal operating conditions.

- (e) For combined supply and exhaust air systems: Verification of each supply and exhaust fan's output when both are running at maximum speed. The volume of air being supplied and extracted from each individual container cell location is to be verified. All fans serving the same hold space are to be operated simultaneously thus replicating normal operating conditions.
- (f) If the supply and/or exhaust ductwork is prefabricated and installed in one piece testing at the manufacturer's works may be accepted provided the following are considered:
 - Any change in the supply and/or exhaust fan(s) output due to differences in electricity supply.
 - Any de-rating of the fan throughput due to a back pressure or partial vacuum occurring within the hold space during normal operating conditions.
 - Verification of the test results is to be undertaken in a single hold space.
- (g) Where the air volume required to meet the class notation cannot be verified during testing for practical reasons, assignment of the notation is to be deferred until it is demonstrated that the system is able to achieve the specified air throughput within each hold space during a loaded passage.

9.2.2 Where a number of identical fan and ductwork installations are constructed and fitted within each hold space, the acceptance trials required in 9.2.1 need only be carried out in two separate hold spaces, provided that the results are satisfactory.

9.2.3 Where the same system is installed on a number of identical sister ships for the same Owner and by the same shipyard, the testing in accordance with 9.2.1 will only be required on the first ship of the series, provided that the results are satisfactory.

9.2.4 The effect of exhausting warm hold space ventilation air on the operation of the integral air-cooled condensers of deck stowed containers is to be established under normal operational conditions. The discharge from hold space discharges is to be suitably modified if necessary.

9.3 Testing of cooling water system

9.3.1 Cooling water piping that is welded *in situ* is to be hydraulically strength tested at 1,5 times the design pressure, but in no case less than 3,5 bar g.

9.3.2 A distribution test is to be carried out to ensure that even fresh water distribution to each container as well as sufficient flow is achieved. As the fresh water system may be somewhat complicated, this test should be carried out with care, using all possible combinations of fresh water pumps installed.

9.3.3 If required, the distribution test can be carried out without containers, utilising flexible hoses for connecting the water supply and return pipes together. The return valves should be partly closed or flexible pipe may be crimped to represent the condenser pressure drop. Water flow meters are to be installed at the highest and the lowest container levels to verify equal water flow.

Carriage of Refrigerated Containers

Part 7, Chapter 10

Sections 9 & 10

9.3.4 The capacity of each pump should be measured by a flow meter with an accuracy of ± 3 per cent. Alternatively, this capacity could be obtained from the manufacturer's curves if the static pressure difference across a pump under test conditions is measured.

9.3.5 Sea-water pumps and heat exchangers are normally subjected to a functional test only.

■ Section 10 Spare gear

10.1 General

10.1.1 Adequate spares, together with the tools necessary for maintenance or repair of the ventilation systems are to be carried. The spares are to be determined by the Owner according to the design and intended service.

10.1.2 A minimum of one replacement fan, or complete fan impeller and motor assembly for each size fitted is to be carried onboard.

10.1.3 The maintenance of the spares is the responsibility of the Owner.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Section 1

Section

1 General requirements

2 Environmental Protection (EP) class notation

3 Supplementary characters

4 Survey requirements

Section 1 General requirements

1.1 Application

1.1.1 This Chapter contains requirements for the control of operational pollution.

1.1.2 Compliance with this Chapter is optional. A ship meeting the requirements of this Chapter will be eligible for the **EP** class notation, which will be recorded in the *Register Book*.

1.1.3 Where a ship is classed with another IACS Member and all the requirements of this Chapter are met, a Statement of Compliance will be issued. At the specific request of the Owner, the descriptive note **EP** may be recorded in the *Register Book*.

1.1.4 Additional requirements may be imposed by the National Authority with which the ship is registered and/or by the Administration within whose territorial jurisdiction it is intended to operate. Where such additional requirements are relevant to the ship, compliance with such Regulations is the responsibility of the Owner. If specifically requested, Lloyd's Register (hereinafter referred to as 'LR') may provide suitable certification or statement of compliance.

1.1.5 LR is to be advised of any matter that relates to the environmental performance of the ship that would affect the assignment of the **EP** class notation.

1.2 EP class notation

1.2.1 Section 2 states the minimum requirements to be met for assignment of the **EP** notation.

1.2.2 Section 3 contains additional requirements. Ships complying with these requirements will be eligible for one or more of the following associated supplementary characters, as applicable:

- A** Anti-fouling coatings.
- B** Ballast water management.
- G** Grey water.
- N** Oxides of nitrogen (NO_x) exhaust emissions.
- P** Protected oil tanks.
- R** Refrigeration systems.
- S** Oxides of sulphur (SO_x) exhaust emissions.

- V** Vapour emission control systems (tankers only).
- O** Oily bilge water.

1.3 Information to be submitted

1.3.1 The following are to be submitted:

- (a) One copy of all plans and information listed in 1.3.4.
- (b) Two copies of the Operational Procedures listed in 1.3.3.
- (c) One copy of every Certificate listed in 1.3.2.

1.3.2 Certificates:

- (a) MARPOL certificates, as applicable.
- (b) Safety Management Certificate (SMC) and Document of Compliance (DOC) in accordance with the International Safety Management Code (ISM Code).
- (c) Interim Engine International Air Pollution Prevention (EIAPP) Certificate or statement of compliance with the NO_x emission requirements of MARPOL Annex VI.
- (d) Incinerator certificate or statement of compliance with the requirements of MARPOL Annex VI, Regulation 16.
- (e) Vapour emission control system certificate or statement of compliance with the requirements of USCG 46 CFR 39 or the IMO Standards for Vapour Emission Control Systems (MSC Circular 585) (supplementary character **V** only).
- (f) Sewage system and, where fitted, sewage treatment system statement of compliance with the requirements of USCG 33 CFR 159 and/or MARPOL 73/78 Annex IV.

1.3.3 Operational procedures:

- (a) NO_x emission control, as applicable.
- (b) Oil fuel management for the control of SO_x emissions.
- (c) Refrigerant management.
- (d) Oil pollution prevention measures.
- (e) Garbage management.
- (f) Sewage treatment and discharge control.
- (g) Precautionary measures to minimise the transfer of non-native organisms in ballast water.
- (h) Ballast water management, as applicable.

1.3.4 Information and plans:

- (a) SERS registration number or statement of membership of alternative scheme from IACS Member service provider.
- (b) Details of engine type, rated power and intended use for all installed engines.
- (c) Details of NO_x control arrangements, as applicable.
- (d) Arrangements of permanently installed refrigeration systems (including those used for cargo temperature control, air conditioning, domestic store rooms and chiller units).
- (e) Capacity of refrigeration system.
- (f) Details of intended refrigerant(s).
- (g) Details of fire-extinguishing media to be used in fixed fire-fighting systems and portable extinguishers.
- (h) Bilge holding, waste oil and sludge tank capacities and piping arrangements.
- (i) Arrangements of non-cargo oil loading and discharge connections together with associated drip trays and drainage systems.
- (k) Oil fuel storage, settling and service tank high level alarms/overflow systems.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Sections 1 & 2

- (l) Cargo and ballast tank arrangements (tankers only).
- (m) Cargo and ballast piping system plans, including cargo tank overfill prevention arrangements (tankers only).
- (n) Arrangements of tanker cargo manifolds together with associated drip trays and drainage systems.
- (o) Details of sewage treatment and handling systems.
- (p) Capacity of sewage holding and/or treatment system.
- (q) Maximum numbers of crew and passengers.
- (r) Details of incinerator arrangements, as applicable, associated piping systems, control and monitoring equipment.
- (s) Hull coating system and leaching rate.
- (t) Ballast water treatment arrangements, as applicable (for supplementary **B** character only).
- (u) Arrangements for protected oil tanks (for supplementary **P** character only).
- (v) Details of grey water treatment plant and effluent quality (for supplementary **G** character only).
- (w) Details of self-contained vapour recovery systems, where fitted (for supplementary **V** character only).
- (x) Any information relating to the environmental performance of the ship, which may influence the assignment of the **EP** notation.

1.4 Alterations and additions

1.4.1 When an alteration or addition to the approved arrangements and procedures is proposed, appropriate details are to be submitted for approval.

1.5 In-service records

1.5.1 Records demonstrating the effective implementation of the operational procedures specified in 1.3.3, as applicable, are to be maintained.

1.5.2 These records are to be kept on board for a minimum period of three years, in a readily accessible form, and are to be available for inspection by LR Surveyors, as required.

Section 2 Environmental Protection (EP) class notation

2.1 General

2.1.1 It is a prerequisite for assignment of the **EP** notation that the ship:

- (a) complies with all adopted Annexes of MARPOL, whether ratified or not, relevant to the ship;
- (b) has a valid Safety Management Certificate (SMC), in accordance with the ISM Code issued by the Flag State Administration with which the ship is registered or a duly authorised organisation complying with Resolution A.739(18) and authorised by the National Authority with which the ship is registered; and

- (c) is enrolled in LR's Ship Emergency Response Service (SERS) or the equivalent scheme of another IACS Member.

2.1.2 Where a ship, by virtue of its gross tonnage, is not required by the MARPOL Convention to have MARPOL Certification, the following are to be maintained:

- (a) An Oil Record Book in accordance with MARPOL Annex I.
- (b) A garbage management plan and record book in accordance with MARPOL Annex V.

2.1.3 Where a ship, by virtue of its gross tonnage is not required to have a SMC, it is exempt from this requirement.

2.1.4 High speed craft, as defined in LR's *Rules and Regulations for the Classification of Special Service Craft*, will be the subject of special consideration.

2.2 Oxides of nitrogen (NO_x)

2.2.1 These requirements apply to all installed diesel engines with an individual output power greater than 130 kW, other than those used solely for emergency purposes. There are no specific requirements relating to NO_x emissions from boilers, incinerators or gas turbine installations.

2.2.2 All engines falling within the scope of MARPOL Annex VI, Regulation 13 are to comply with its provisions and be certified accordingly. Certification is to be issued by a Flag State Administration or a duly authorised organisation, complying with IMO Resolutions A739(18) and A789(19).

2.2.3 Engines over 130 kW, other than those used solely for emergency purposes, not falling under the requirements of MARPOL Annex VI, Regulation 13, are also to comply with the applicable emission values detailed in paragraph 3(a) of that Regulation. The test procedure and measurement method are to be in accordance with either the Simplified Measurement Method or Direct Measurement and Monitoring Method as detailed in Chapter 6 of the NO_x Technical Code.

2.2.4 Where the NO_x emission limits specified in MARPOL Annex VI, Regulation 13 are exceeded, an emission reduction plan is to be developed and agreed with LR.

2.2.5 Equipment and systems used to control NO_x emission levels are to:

- (a) be arranged so that failure will not prevent continued safe operation of the engine;
- (b) be operated in accordance with manufacturer's instructions;
- (c) be designed, constructed and installed to ensure structure integrity and freedom from significant vibration;
- (d) be designed to include adequate hatches for inspection and maintenance purposes; and
- (e) be instrumented to record operation. Records of operation and the degree of control are to be maintained.

Alternative control arrangements will be given special consideration.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Section 2

2.2.6 Procedures covering the use and maintenance of the equipment and systems specified in 2.2.5 are to be established and effectively implemented. Records are to be maintained which demonstrate the operation of the equipment and systems and the resultant level of NO_x emissions to the atmosphere.

2.3 Oxides of sulphur (SO_x)

2.3.1 Emission of SO_x is to be controlled by limiting the sulphur content of oil fuels used on board.

2.3.2 The maximum sulphur content of oil fuel to be used on board will be dependent upon area of operation and bunkering ports. The maximum permissible fuel sulphur content will not exceed 3,5 per cent.

2.3.3 Where the grade of fuel normally used cannot be obtained with the appropriate fuel sulphur level, then a better grade of fuel meeting this requirement will need to be purchased.

2.3.4 An oil fuel management system is to detail the maximum sulphur content to be specified when ordering oil fuels and the means adopted to verify that the sulphur content of oil fuels supplied meets that requirement. This management system is to include the practices to be adopted to ensure that appropriate low sulphur oil fuels are used when the ship is within IMO designated 'SO_x Emission Control Areas', as applicable.

2.3.5 Where testing to determine the sulphur content of fuel received on board is to be carried out, a representative sample is to be drawn at the time of delivery from the ship's bunker manifold using the manual or automatic sampling methods defined in ISO 3170 or 3171, or their national respective equivalents. Fuel sulphur content is to be subsequently determined using the laboratory test method ISO 8754 or an equivalent National Standard based on ISO 8754.

2.4 Refrigeration systems

2.4.1 These requirements apply to refrigeration and air conditioning installations on all ships. This includes refrigeration installations on conventional refrigerated cargo ships, container ships carrying produce in containers cooled by ducted air, and gas carriers fitted with reliquefaction plants. These requirements do not apply to the domestic stand-alone refrigerators used in galleys, pantries, bars and crew accommodation.

2.4.2 The use of chlorofluorocarbons (CFC) in refrigeration or air conditioning installations is prohibited.

2.4.3 Systems are to be arranged with suitable means of isolation so that maintenance, servicing or repair work may be undertaken without releasing the refrigerant charge into the atmosphere. Unavoidable minimal releases are acceptable when using recovery units.

2.4.4 For the purposes of refrigerant recovery, the compressors are to be capable of evacuating a system charge into a liquid receiver. Additionally, recovery units are to be provided to evacuate a system either into the existing liquid receiver or into cylinders dedicated for this purpose. The number of cylinders is to be sufficient to contain the complete charge between points of isolation in the system.

2.4.5 Where different refrigerants are in use they are not to be mixed during evacuation of systems.

2.4.6 Refrigerant leakage is to be minimised by leak prevention and periodic leak detection procedures. The annual refrigerant leakage rate for each system shall be less than 10 per cent of its total charge.

2.4.7 A leak detection system appropriate to the applicable refrigerant is to be provided to monitor continuously the spaces into which the refrigerant could leak. An alarm is to be given in a permanently manned location when the concentration of refrigerant in the space exceeds a predetermined limit (25 ppm for ammonia; 300 ppm for halogenated fluorocarbons). Remedial measures to repair the leakage are to be implemented as soon as practicable after an alarm is activated.

2.4.8 Procedures detailing the means to be adopted to control the loss, leakage, venting and disposal of refrigerants are to be established and implemented effectively.

2.4.9 Refrigerant inventory and log book records are to be maintained covering:

- (a) Refrigerant added to each system.
- (b) Refrigerant leaks, including remedial actions.
- (c) Refrigerant recovered and where stored.
- (d) Refrigerant disposal.

2.5 Fire-fighting systems

2.5.1 The use of halon or halo-carbons as the fire-extinguishing medium in fixed fire-fighting systems or extinguishers is not permitted.

2.6 Oil pollution prevention

2.6.1 All ships are to comply with the requirements of 2.6.2 to 2.6.11. In addition, tankers are to comply with the requirements of 2.6.12 to 2.6.18.

2.6.2 Drainage from machinery space bilges may be discharged to sea in accordance with the requirements of MARPOL 73/78, Annex I.

2.6.3 The oil-in-water content of the water discharged is to be less than 15 ppm. Oily bilge water is to be discharged through approved oil filtering equipment and a 15 ppm alarm combined with a device for automatically stopping any discharge to sea when the oil content in the discharge exceeds 15 ppm. Full records of all discharges are to be kept.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Section 2

2.6.4 Oil fuel, lubricating oil and other oil loading or discharge connections on deck are to be fitted with drip trays. Drip trays are to be fitted with closed drainage systems.

2.6.5 Oil fuel storage, settling and service tanks are to be fitted with high level alarms and/or acceptable overflow systems.

2.6.6 Leakages and waste oil from machinery and equipment are to be collected in a dedicated waste oil tank prior to disposal ashore or incineration. This waste oil tank is to be separate from the sludge tank specified in MARPOL Annex I, Regulation 2. The volume of the waste oil tank is to be of sufficient capacity to hold a complete lubricating oil charge from the largest engine used for propulsion or electrical generating purposes.

2.6.7 For those ships which only operate on distillate fuel, the waste oil and sludge tanks may be combined to form a single tank. Where such a combined tank is fitted, the total capacity is to be equal to or greater than the aggregated total of the required individual tank capacities.

2.6.8 The bilge holding tank, the waste oil tank and the sludge tank are to be arranged to facilitate the periodic removal of accumulated sediments and other material.

2.6.9 Discharge piping systems to deck from the bilge holding tank, and the waste oil tank, are to be separate from the oil fuel loading and transfer systems. The bilge holding tank and waste oil tank piping systems are to be terminated with the standard discharge connections specified in MARPOL Annex I, Regulation 13. The sludge tank may be discharged through the same piping system as the waste oil tank.

2.6.10 Means are to be provided for the collection and recovery of any oil spilled on decks.

2.6.11 Procedures covering the handling of all oils and oily wastes are to be established and implemented effectively. As a minimum, these are to cover:

- (a) loading, storage and transfer of oil fuels, lubricants, hydraulic oil, thermal heating oil and drummed oil products;
- (b) storage, transfer, discharge and disposal of oily mixtures contained in the ship's sludge, bilge holding and waste oil tanks and machinery space bilges; and
- (c) recovery of any oil spilled on decks.

2.6.12 The constructional requirements of MARPOL Annex I, Regulations 19 and 20 as applicable, are to apply to all oil tankers greater than 600 tonnes deadweight.

2.6.13 Cargo tanks are to be fitted with high level alarms and/or acceptable overflow systems.

2.6.14 The cargo tanks are to be fitted with arrangements to prevent the possible outflow of oil under overfilling conditions.

2.6.15 Cargo tank ballasting arrangements and segregated ballast systems are to be connected to separate and distinct sea chests.

2.6.16 A screw-down non-return valve is to be provided to isolate the cargo piping system from the sea connections.

2.6.17 Cargo manifold connections are to be fitted with drip trays with closed drainage systems.

2.6.18 Cargo manifold terminal pieces are to be designed, where practicable, in accordance with the relevant Oil Companies International Marine Forum (OCIMF) Recommendations for oil tanker manifolds and associated equipment.

2.7 Garbage handling and disposal

2.7.1 Procedures covering garbage management are to be established and effectively implemented. As a minimum, these procedures are to include:

- (a) identification of the sources of garbage;
- (b) means of minimising garbage production;
- (c) procedures for the safe and hygienic collection, segregation, storing, processing and disposal of garbage, including the use of the equipment (compactors, comminuters, incinerators or other devices) on board. These procedures are to cover all garbage generated during the normal operation of the ship. The disposal of the following materials is to be specifically covered:
 - Cargo residues.
 - Cargo associated wastes.
 - Waste oil.
 - Paint and painting materials.
 - Medical wastes.
 - Large metal objects such as oil drums and machinery components.
 - Ropes: metal, synthetic or natural fibre.
 - Rust/scale debris.
 - Ballast tank sediments.
 - Equipment containing refrigerants.

2.7.2 Where fitted, incinerators are to be designed and constructed in accordance with the requirements of IMO Resolution MEPC 76(40). A certificate of compliance issued by LR, another IACS Member or the relevant Flag State Administration is to be provided.

2.7.3 Where incineration is to be carried out, procedures are to be developed and implemented covering:

- (a) operation in accordance with the requirements of MARPOL Annex VI, Regulation 16; and
- (b) prevention of incineration within areas where incineration is prohibited by the Coastal State Administration.

2.8 Sewage treatment

2.8.1 The capacity of the sewage treatment system, where fitted, is to be sufficient for the maximum number of persons on board. Where 'black water' only is treated, the minimum capacity is to be 115 litres/person/day for a conventional flushing system or 15 litres/person/day for a vacuum system. Where both 'black water' and 'grey water' are treated, an additional allowance of 135 litres/person/day is to be made.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Sections 2 & 3

2.8.2 Procedures for the operation of a sewage treatment system, including the certification of performance, are to be established and effectively implemented. Records are to be maintained of maintenance, repair, remedial work and disinfectant closing rates.

2.8.3 The manufacturer's restriction on materials, which may be disposed of through the sewage treatment system, are to be clearly displayed at each input point.

2.8.4 The disinfectant dosing points of the sewage treatment system are to be readily accessible. Ready access is also to be provided for the taking of samples.

2.8.5 As an alternative to treatment, sewage may be retained onboard. The sewage holding tank is to be of adequate capacity taking into account the operation of the ship, the number of persons on board and other relevant factors. The tank is to be fitted with a visual contents gauge and a high level alarm.

2.8.6 Records are to be maintained detailing discharges from the holding tank. These should include:

- (a) the date, location and quantity of sewage discharged from the holding tank either ashore or at sea;
- (b) distance from land and ship's speed, when sewage is discharged to sea.

2.8.7 Ventilation pipes from the sewage system are to be independent of other vent systems.

2.8.8 A suitable piping system from the sewage treatment system or holding tank is to be provided to allow discharge from the system/tank to shore reception facilities. The systems discharge pipe is to terminate with a standard discharge connection complying with the requirements of MARPOL Annex IV, Regulation 10.

2.9 Hull anti-fouling systems

2.9.1 Prior to 1 January 2003, the application of anti-fouling systems containing tributyltin (TBT) is acceptable provided that the leaching rate does not exceed 4 µg/cm²/day, as determined by ASTM Method 5108-90.

2.9.2 From 1 January 2003, the application of anti-fouling systems containing TBT is prohibited. Ships to which TBT-based anti-fouling systems have been applied prior to this date will be accepted until 1 January 2008, provided the TBT leaching rate does not exceed 4 µg/cm²/day, as determined by ASTM Method 5108-90.

2.10 Ballast water

2.10.1 All ships carrying ballast water are to implement precautionary measures to minimise the translocation of non-native organisms in their ballast water unless it can be demonstrated that the risk of translocation of non-native organisms in their ballast water and sediments is minimal.

2.10.2 As a minimum, precautionary measures to minimise the translocation of non-native organisms are to include:

- (a) minimising the uptake of aquatic organisms, pathogens and sediments during ballasting, by limiting (or minimising) ballasting in situations where the numbers of aquatic organisms are likely to be increased locally. For example:
 - in darkness, when bottom-dwelling organisms may rise up the water column;
 - in very shallow water;
 - where propellers may stir up sediment;
 - in areas specified by the Port State for avoidance or restriction of ballasting;
- (b) monitoring of sediment build up and, where practical, routine cleaning of ballast tanks to remove sediments;
- (c) planning uptake and discharge of ballast water such that where ballast needs to be taken on and discharged in the same port, discharge of ballast loaded in another port is to be avoided, where practicable.

Section 3 Supplementary characters

3.1 Hull anti-fouling systems – A character

3.1.1 For assignment of the **A** character, the anti-fouling system applied to the ship's hull is to be non-biocidal.

3.2 Ballast water management – B character

3.2.1 Where ballast water management is undertaken, for assignment of the **B** character, a ballast water management plan approved by the Administration with which the ship is registered, is to be in place and implemented effectively.

3.2.2 The ballast water management plan is to be developed in accordance with IMO Resolution MEPC 127(53) and take note of the safety considerations in IMO Resolution MEPC 124(53).

3.2.3 For new ships, the guidance within IMO Resolutions MEPC 149(55) and MEPC 150(55) is to be taken account of, as far as is practicable.

3.3 Grey water – G character

3.3.1 Where plant for the treatment of grey water is installed and utilised effectively, the **G** character will be assigned, subject to the plant effluent meeting the standards specified in 3.3.2 or 3.3.3, as applicable.

3.3.2 Where it is not intended that the effluent is recycled or re-used for any purpose, the effluent of the grey water treatment plant is to meet the following standards:

- (a) Faecal coliforms: Content is not to exceed 250/100 ml M.P.N. (most probable number) as determined by a multiple tube fermentation analysis or an equivalent procedure.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Section 3

(b) Suspended solids:

- Where the equipment is tested onshore, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed 50 mg/l.
- Where the equipment is tested onboard the ship, the geometric mean of the total suspended solids content of the samples of effluent taken during the test period is not to exceed the suspended solids content of the ambient water used onboard plus 100 mg/l.

(c) Biochemical Oxygen Demand (BOD₅):

- The geometric mean of a 5-day Biochemical Oxygen Demand is not to exceed 50 mg/l.
- When testing onboard the ship, if insufficient time is available for obtaining a number of samples over a period of days, a BOD₅ not exceeding 100 mg/l on a single sample will be accepted providing that suspended solids are within the value stated above.

3.3.3 Where it is intended that the effluent of the grey water treatment plant is to be re-used or recycled for any purpose, the effluent is to meet the potable water quality standards of the Flag or Port State Administration, as appropriate.

3.4 Oxides of nitrogen (NO_x) – N character

3.4.1 For assignment of the **N** character, the total weighted value of NO_x emissions from all installed diesel engines defined within 2.2.1 is not to exceed 80 per cent of the total weighted NO_x emission limits specified in MARPOL Annex VI, Regulation 13.

3.4.2 The total weighted emission value for the ship (*WV*) is to be calculated as follows:

$$WV_{[ship]} = \frac{WAEV_{[cert]}}{WAEV_{[IMO]}}$$

where

$$WAEV_{[cert]} = \frac{\sum_{n=1}^n (NO_{x[cert]}) \cdot P}{\sum_{n=1}^n (P)}$$

$$WAEV_{[IMO]} = \frac{\sum_{n=1}^n (NO_{x[IMO]}) \cdot P}{\sum_{n=1}^n (P)}$$

n = the number of individual engines on board the ship

P = the rated power, in kW, of each individual installed engine

NO_{x[cert]} = the certified NO_x emission value, in g/kWh, for each individual engine

NO_{x[IMO]} = the NO_x emission limit value, in g/kWh, of each individual engine as specified in Regulation 13 of Annex VI to MARPOL.

3.4.3 The **N** character will be assigned when:

$$\frac{WAEV_{[cert]}}{WAEV_{[IMO]}} \leq 0,8$$

3.4.4 The test procedure and measurement method are to be in accordance with either the Simplified Measurement Method or Direct Measurement and Monitoring Method given in Chapter 6 of the IMO NO_x Technical Code.

3.4.5 Systems and equipment used to control the NO_x emissions are to comply with the requirements specified in 2.2.5.

3.4.6 In the case where the individual engines are 'family' or 'group' engines, as defined in the NO_x Technical Code, the certified emission value may be based on that of the parent engine.

3.5 Oily bilge water – O character

3.5.1 For assignment of the **O** character, all drainage from machinery space bilges is to be discharged ashore, except under exceptional circumstances.

3.5.2 Alternatively, discharge to sea is permitted where it can be demonstrated that the oil-in-water content of the water discharged is less than 5 ppm.

3.5.3 Full records of all discharges are to be kept.

3.6 Protected oil tanks – P character

3.6.1 For assignment of the **P** character, oil fuel and lubricating oil tanks are to be located in a protected location away from the ship's side or bottom shell plating.

3.6.2 The location of tanks is to be in accordance with the requirements relating to oil fuel tank protection given in IMO Resolution MEPC.141(54).

3.6.3 The requirements apply to oil fuel and lubricating oil tanks. Main engine lubricating oil drain tanks are excluded.

3.6.4 Arrangements providing equivalent protection will be given special consideration.

3.6.5 Suction wells may protrude below oil fuel tanks provided they are as small as possible and the distance between the tank bottom and the ship's bottom shell plating is not reduced by more than 50 per cent.

3.7 Refrigeration systems – R character

3.7.1 For assignment of the **R** character, in addition to compliance with the requirements of 2.4, all refrigerants used onboard are to have an Ozone Depleting Potential (ODP) rating of zero and a Global Warming Potential (GWP) of less than 1950, based on a 100-year time horizon.

3.8 Oxides of sulphur (SO_x) – S character

3.8.1 For assignment of the **S** character, all gas oil used onboard is to have a sulphur content of less than 0,20 per cent m/m. All heavy fuel oil is to have a sulphur content of less than 1,5 per cent m/m.

Arrangements and Equipment for Environmental Protection

Part 7, Chapter 11

Section 3 & 4

3.8.2 The sampling, fuel sulphur analysis methods and verification requirements stipulated in 2.3.4 and 2.3.5 are to be complied with.

3.9 Vapour emission control systems – Vc and Vp characters

3.9.1 Tankers carrying crude oil, petroleum products or chemicals having a flash point not exceeding 60°C (closed-cup test) will be assigned the **Vc** or **Vp** character provided the provisions of either 3.9.2 or 3.9.3 are complied with.

3.9.2 For assignment of the **Vc** character, a vapour emission control system is to be fitted. The system is to be designed and constructed in accordance with the requirements of USCG 46, CFR 39 or the IMO Standards for Vapour Emission Control Systems (MSC Circular 585). A certificate or statement of compliance issued by LR or a competent authority recognised by LR is to be provided. As an alternative, a self-contained vapour recovery system, which is of a type approved by LR and which achieves equivalent performance to the systems above, may be fitted.

3.9.3 For assignment of the **Vp** character, a self-contained system capable of preventing vapour emission formation during loading is to be fitted. This vapour emission prevention system is to be of a type approved by LR and is to reduce vapour emission formation by at least 75 per cent (v/v) as compared to an equivalent ship to which no vapour emissions prevention system has been fitted.

4.1.4 Audits are to confirm by direct observation, examination of internal audit reports and scrutiny of records that each of the procedures have been implemented effectively over the preceding period. It is also to be verified that:

- (a) the required resources and equipment have been provided; and
- (b) the ship's staff are aware of their duties and responsibilities, and can perform the assigned tasks.

4.2 Periodical Surveys and Audits

4.2.1 **EP** Annual Surveys and Audits are to be held on all ships to which the **EP** notation applies within three months of each anniversary of assignment of the full **EP** notation.

4.2.2 At the **EP** Annual Survey and Audit, the Surveyor is to be satisfied that the arrangements and equipment comply with these Rules and operating procedures have been implemented effectively. As far as possible, the installed equipment, together with associated control and alarm systems, are to be demonstrated under working conditions. Additionally:

- (a) where changes to arrangements or equipment fitted to meet the requirements of these Rules have been made, it is to be verified that these changes are in accordance with approved documentation; and
- (b) records for the preceding 12 months are to be reviewed.

4.2.3 **EP** Audits are to be undertaken in accordance with the requirements given in 4.1.4.

4.3 Change of company

4.3.1 Where the company (as defined in the ISM Code) changes, the **EP** notation will be suspended.

4.3.2 The new company may adopt the previously approved procedures as required by these Rules or may compile new procedures which would need to be submitted for approval.

4.3.3 Following implementation of the approved procedures, an audit, in accordance with the requirements in 4.1.3 and 4.1.4, is to be undertaken.

4.3.4 The **EP** notation will be re-assigned following successful completion of the audit provided that the ship has a valid Safety Management Certificate (SMC) and the general requirements given in 2.1.1 are complied with.

Section 4 Survey requirements

4.1 Initial Survey and Audit

4.1.1 Following satisfactory review of the plans and other information submitted (see 1.3), an **EP** Initial Survey is to be undertaken for ships under construction or in service.

4.1.2 At the **EP** Initial Survey, the Surveyor is to be satisfied that the requirements of these Rules, including those relating to any requested supplementary characters, are complied with. The Surveyor is to verify that the hull and machinery arrangements are in accordance with the approved documentation. The installed equipment, together with associated control and alarm systems, is to be demonstrated under working conditions.

4.1.3 Following the successful completion of the Initial Survey, the **EP** notation may be assigned to a ship. The **EP** notation will be valid, in the first instance, for a period not exceeding 12 months. During this period, an audit of the procedures as required by these Rules is to be undertaken. This audit is to be performed after the procedures have been fully implemented, subjected to internal audit and have generated at least 3 months of records under in-service conditions.

Integrated Fire Protection (IFP) Systems

Part 7, Chapter 12

Sections 1 & 2

Section

- 1 **General**
- 2 **Centralised fire-control station**
- 3 **Control and monitoring of active fire protection and fixed fire-extinguishing systems**
- 4 **Integration of other systems**
- 5 **Testing, trials and maintenance**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to ships where an optional class notation is requested for the control and monitoring of all active fire protection and fixed fire-extinguishing systems from a centralised fire-control station, implemented by means of an Integrated Fire Protection system. The requirements are additional to those applicable in other Parts of the Rules.

1.1.2 Ships provided with arrangements complying with the requirements of this Chapter will be eligible for the class notation **IFP** – Integrated Fire Protection.

1.1.3 Requirements additional to these Rules may be imposed by the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction it is intended to operate.

1.1.4 It is the responsibility of the National Authority to give effect to the fire safety and other ship, passenger and crew safety measures required by the *International Convention for the Safety of Life at Sea*, 1974, as amended (SOLAS).

1.1.5 Special consideration will be given where control and monitoring arrangements prescribed and approved by the National Authority give rise to deviation from the requirements of these Rules.

1.2 Submission of plans and information

1.2.1 The following plans and information are to be submitted:

- A plan showing the location and physical arrangement of the centralised fire-control station.
- A list of systems and equipment that are to be controlled and monitored from the centralised fire-control station, see 1.2.2.
- Details of controls, alarms, instrumentation and monitoring including line diagrams of control circuits, descriptions of operation and programmable electronic systems details required by Pt 6, Ch 1, 1.2.5.
- Details of the power supply arrangements.

- Remote stopping arrangements for independently driven oil pumps and remote oil valve closing arrangements.
- Test schedules including methods of testing and required test results.
- Failure Mode and Effects Analysis (FMEA) report, including worksheets.

1.2.2 Plans for the control and monitoring arrangements of active fire protection, fire-fighting and other integrated systems are to be submitted, including as applicable:

- Fixed fire detection and fire-alarm systems.
- Fire-pumps and fire main systems.
- Fixed water-based fire-extinguishing systems
- Fixed gas fire-extinguishing systems.
- Dry extinguishing powder systems.
- Protected space openings and ventilation systems, including related crew and passenger emergency systems, see Pt 6, Ch 2, 17.

1.3 Definitions

1.3.1 The definitions given in Pt 6, Ch 4, 2 are relevant with regard to the requirements of this Chapter.

■ Section 2 Centralised fire-control station

2.1 General

2.1.1 A centralised fire control station is to be located on the navigating bridge or in some other suitable compartment that is readily accessible from the accommodation spaces and is provided with two escape routes from the compartment, one of which is to lead directly to an open deck.

2.1.2 A copy of the fire-control plan is to be permanently displayed at the centralised fire-control station.

2.1.3 An Integrated Fire Protection system is to be located at the centralised control station, see Section 3. The system is to enable efficient control and indication of all essential parameters necessary for the safe and effective operation of the active fire protection and fixed fire-extinguishing systems, including the operational status of running and standby machinery.

2.2 Communication

2.2.1 At the centralised fire-control station, fixed means of two-way speech communication is to be provided to all the accommodation and service spaces and other control stations, including the main machinery control station and bridge, if applicable. This means of communication is to be independent of the main source of electrical power.

Integrated Fire Protection (IFP) Systems

Part 7, Chapter 12

Sections 2 & 3

2.2.2 In addition to the communication required by 2.2.1, a public address system is to be provided that is clearly audible throughout the accommodation and service spaces and other control stations, including the main machinery control station and navigating bridge, if applicable. The public address system is to be operable from the centralised fire-control station and comply with Pt 6, Ch 2,17.3.

2.2.3 Each required breathing apparatus is to incorporate effective means of communication to enable individual fire fighters to communicate easily with each other and the centralised fire-control station during fire-fighting operations.

(c) any such failures are evident at the centralised fire-control station, by means of audible and visual alarms.

NOTE:

The FMEA is to be carried out to the level of identifiable hardware and software component parts providing defined functions, e.g. display unit, network interface card, etc. and is to consider the effects of:

- (i) random failures of hardware components, and,
- (ii) common mode failures of hardware and software components, unless these components have been certified for use in safety applications, see Pt 6, Ch 1,2.

3.1.6 The Integrated Fire Protection system is to be provided with two independent sources of power, one of which is to be the emergency source, with automatic changeover and audible and visual alarm in the event of any power supply failure.

3.1.7 Where the automatic changeover between supplies may affect operation of the Integrated Fire Protection system, a local transitional source of power of not less than thirty minutes capacity is to be provided. The transitional source is to be arranged such that a fault will not affect the supply of main and emergency power to the system, or the changeover arrangement between them. See *a/so* 4.1.3.

3.1.8 Control and monitoring functions for active fire protection and fixed fire-extinguishing systems are to be provided by the Integrated Fire Protection system in accordance with 3.2 to 3.7.

Section 3 Control and monitoring of active fire protection and fixed fire-extinguishing systems

3.1 General

3.1.1 The Integrated Fire Protection system is to comply with relevant requirements of the Rules, in particular:

- Pt 6, Ch 1,2 in respect of control, alarm and programmable electronic systems;
- Pt 6, Ch 2, 3 in respect of power supply arrangements;
- Pt 6, Ch 2,16 in respect of fire safety systems;
- Pt 6, Ch 2,17 and 18 in respect of crew, passenger and ship safety systems (where applicable, see Section 4).

3.1.2 The Integrated Fire Protection system is to provide a consistent and common user interface to control and monitoring functions by means of multi-function displays and controls. Functions are to be logically grouped to minimise operator workload with means provided to ensure ease of navigation, e.g. hot-keys to emergency functions, overview pages, etc.

3.1.3 The number of user interfaces is to be sufficient to ensure that the operator can simultaneously display all information necessary to enable safe and effective control and monitoring, with due regard to any functions required to be continuously available.

3.1.4 Means are to be provided to override any safety functions automatically initiated by the Integrated Fire Protection system.

3.1.5 A Failure Mode and Effects Analysis (see Pt 6, Ch 1,2.13.5) is to be carried out, which is to demonstrate that:

- (a) failure of any part of the Integrated Fire Protection system will not result in a loss or degradation of centralised control and monitoring functions for more than one active fire protection or fixed fire-extinguishing system,
- (b) failure of any active fire protection or fixed fire-extinguishing system will not result in the loss or degradation of another system as a result of their interconnection through the Integrated Fire Protection system, and

3.2 Fixed fire detection and fire-alarm systems

3.2.1 The Integrated Fire Protection system is to provide means to indicate the status of each detector head and manual call point and their location in relation to the spaces and fire zones served.

3.2.2 Audible and visual indication is to be provided automatically and immediately in the event of a detector or manual call point being operated.

3.2.3 Information is to be available detailing the location of each section in relation to the spaces and fire zones served.

3.2.4 System faults resulting in the loss or degradation of fire detection and fire-alarm functions are to be automatically indicated by audible and visual alarms at the centralised fire control station, which are to be clearly distinguishable from those required by 3.2.2.

3.3 Fixed water-based fire-extinguishing systems, including local application systems

3.3.1 Alarms and monitoring arrangements are indicated in Table 12.3.1.

Integrated Fire Protection (IFP) Systems

Part 7, Chapter 12

Section 3

Table 12.3.1 Alarms and monitoring arrangements for fixed water based systems

Item	Alarm	Indication	Note
Fire pumps	—	Running/stopped	—
Fire pumps electric power supply	Failure	—	—
System water pressure	Low	Pressure	—
Sea valves serving fire pumps	—	Open/closed	—
System isolating valves	—	Open/closed	—
Distribution control valves	—	Open/closed	—
Activation of system	Warning	Section activated	Not more than one minute after activation
Lubricating oil inlet temperature for diesel-driven pumps	High	—	—
Pump engine lubricating oil pressure	Low	—	—
Pump engine coolant temperature	High	—	For >220 kW
Pump engine coolant pressure or flow	Low	—	—
Pump engine service oil fuel tank level	Low	—	—
Pump engine overspeed	High	—	See Pt 5, Ch 2,5
Pump engine starting air pressure	Low	Pressure	—
Pump engine electrical starting battery charge level	Low	—	—

3.3.2 Controls are to be provided for the following:

- The starting and stopping of all fire pumps.
- The opening and closing of all sea valves serving the fire pumps.
- The opening and closing of all system(s) isolating valves and distribution control valves for water and foam solution.
- The effective operation of foam monitors. Where a clear view of foam monitor nozzles is not available from the centralised fire-control station, television surveillance or other suitable means for observing the monitors may be accepted.

3.4 Fixed gas fire-extinguishing systems

3.4.1 Alarms and monitoring arrangements are indicated in Table 12.3.2.

3.4.2 Controls are to be provided for the release of the extinguishing media and the opening and closing of the distribution control valves for conveying the media into selected protected spaces. These controls are to be protected against misuse.

Table 12.3.2 Alarms and monitoring arrangements for fixed gas fire-extinguishing systems

Item	Alarm	Indication	Note
Operation of medium release	Warning	Instructions relating to the operation of the system having regard to the safety of personnel	An audible warning is to be given automatically of the release of the medium into any space in which personnel normally work or have access and is to operate for a suitable period before the medium is released
Distribution control valves	—	Open/closed	—
Electric power for medium release	Failure	—	—
Hydraulic or pneumatic pressure for medium release	Low	—	—
Discharge manifold pressure	High	Pressure	—

3.4.3 Means are to be provided to stop all ventilation fans serving the selected protected space before the extinguishing medium is released, see also 3.6.

3.4.4 The requirements of 3.4.2 and 3.4.3 need not be applied to systems protecting cargo spaces except where a limit is placed on the duration of the discharge.

3.5 Dry extinguishing powder fire-extinguishing systems

3.5.1 Alarms and monitoring arrangements are indicated in Table 12.3.3.

Table 12.3.3 Alarms and monitoring arrangements for dry extinguishing powder fire-extinguishing systems

Item	Alarm	Indication	Note
Dry extinguishing powder container pressure	—	System energised	—
Monitor flow control valve(s)	—	Open/closed	—

Integrated Fire Protection (IFP) Systems

Part 7, Chapter 12

Sections 3, 4 & 5

3.5.2 Controls are to be provided for the following:

- Energising the system in readiness for discharge.
- The opening and closing of monitor flow control valve(s).
- The effective operation of the monitor nozzle(s), where applicable. Where the monitor nozzle(s) is required to be aimed remotely, and a clear view of the monitor(s) is not available from the centralised fire-control station, television surveillance or other suitable means for observing the monitor nozzle(s) may be accepted.

3.6 Protected space openings and ventilation systems

3.6.1 Alarms and monitoring arrangements are indicated in Table 12.3.4.

Table 12.3.4 Alarms and monitoring arrangements for protected space openings and ventilation systems

Item	Alarm	Indication	Note
Ventilation fans	—	Running/stopped	—
Forced and included draught fans	—	Running/stopped	—
Inlets and outlets in ventilation systems	—	Open/closed	—
Miscellaneous openings	—	Open/closed	See 3.6.2(c), (e) and (f)
Loss of ventilating capacity in Ro-Ro cargo spaces	Warning	—	—
Operation of remote release devices for self-closing doors	—	Hold-back arrangements released	—

3.6.2 Controls are to be provided for the following:

- The start and stop of all ventilation fans.
- The start and stop of all forced and induced draught fans.
- The opening and closing of openings into spaces protected by fixed gas fire-extinguishing systems.
- The opening and closing of all main inlets and outlets of ventilation systems, including fire dampers.
- The opening and closing of machinery space skylights and openings in funnels.
- Remote release devices for self-closing doors provided with hold-back arrangements.
- Manual operation of escape route or low location lighting, see Pt 6, Ch 2, 17.4.

3.7 Oil storage, transfer and pumping arrangements in machinery spaces

3.7.1 Alarms and monitoring arrangements are indicated in Table 12.3.5.

Table 12.3.5 Alarms and monitoring arrangements for oil storage, transfer and pumping systems

Item	Alarm	Indication	Note
Deep tank valves	—	Open/closed	—
Oil pumps	—	Running/stopped	See 3.7.2(b)
High pressure fuel delivery lines	Failure	—	See Pt 6, Ch 1, 3.1.5

3.7.2 Controls are to be provided for the following:

- The closure of valves on all pipes that, if damaged, could allow oil to escape from storage, settling or daily service tanks situated above the double bottom.
- The stopping of oil fuel transfer pumps, oil fuel unit pumps lubricating oil pumps, piston cooling pumps, hydraulic oil pumps and other similar types of pumps.

Section 4 Integration of other systems

4.1 General

4.1.1 The Integrated Fire Protection system is to provide functions required for fire protection purposes only, excepting where permitted below.

4.1.2 Other ship, passenger or crew safety systems, see Pt 6, Ch 2, 17 and 18, may be integrated such that control and monitoring functions are accessed via the common user interface, subject to 1.1.4. Any such arrangements are to be in accordance with the general requirements of 3.1, and comply with any Rules applicable to these systems.

4.1.3 Where watertight door control and indication functions are included, the power supply arrangements are to be in accordance with Pt 6, Ch 2, 3.2.9 or 3.3.9 as applicable. In this case, the requirement of 3.1.7 will be waived.

4.1.4 The **IP** (Integrated Propulsion, see Pt 5, Ch 18), **ICC** (Integrated Computer Control, see Pt 6, Ch 1, 6) or **IBS** (Integrated Bridge Navigational System, see Pt 7, Ch 9, 5) class notations may be applicable to ships where other control and monitoring functions are implemented by an integrated system.

Section 5 Testing, trials and maintenance

5.1 General

5.1.1 The Integrated Fire Protection system is to be examined and tested at the manufacturer's works in accordance with the approved test schedule, see 1.2.1.

5.1.2 The factory acceptance test is to demonstrate that:

- (a) the system is correct with regard to its specification (i.e. verification tests);
- (b) as far as applicable, the system fulfils the requirements of these Rules (i.e. validation tests).

Where sample testing of hardware or software modules is proposed, records of prior verification testing are to be made available to the attending Surveyor.

5.1.3 The arrangements are to be subject to examination and functional testing on completion of the installation. These validation tests are to be based on the approved test schedule and are to demonstrate that the requirements of these Rules have been satisfied. In addition, details of commissioning tests for verification purposes are to be made available to the attending Surveyor.

5.1.4 The arrangements are to be examined and a sample of functions tested at Annual and Special Surveys.

5.2 Modifications

5.2.1 Where any modification of the Integrated Fire Protection system is to be carried out, details are to be submitted to Lloyd's Register for consideration. A suitable testing program is to be submitted for consideration, demonstrating that the system will continue to provide required functions.

5.2.2 All modifications are to be carried out in accordance with a traceable change control procedure. Software versions and relevant documentation are to be updated.

Arrangements and Equipment for the Safety of Bulk Carriers Part 7, Chapter 13 and Single Hold Cargo Ships other than Bulk Carriers

Sections 1 & 2

Section

1 Water ingress detection arrangements

2 Drainage and pumping arrangements

■ Section 1 Water ingress detection arrangements

1.1 General requirements

1.1.1 Equipment for detecting the ingress of water in bulk carriers is to be fitted in accordance with the requirements of SOLAS 1974 as amended, Chapter XII, Regulation 12.

1.1.2 Equipment for detecting the ingress of water in single hold cargo ships is to be fitted in accordance with the requirements of SOLAS 1974 as amended, Chapter II-1, Regulation 25.

1.1.3 The audible and visual alarms specified in 1.2 and 1.3 are to be located on the navigation bridge.

1.2 Water ingress detection arrangements in bulk carriers

1.2.1 Bulk carriers are to be fitted with water level detectors:

- (a) In each cargo hold, giving audible and visual alarms, one when the water level above the inner bottom in any hold reaches a height of 0,5 m and another at a height not less than 15 per cent of the depth of the cargo hold but not more than 2 m. The water level detectors are to be fitted in the aft end of the cargo holds. For cargo holds which are used for water ballast, an alarm overriding device may be installed. The visual alarms are to clearly discriminate between the two different water levels detected in each hold;
- (b) in any ballast tank forward of the collision bulkhead required by Pt 3, Ch 3,4, giving an audible and visual alarm when the liquid in the tank reaches a level not exceeding 10 per cent of the tank capacity. An alarm overriding device may be installed to be activated when the tank is in use; and
- (c) in any dry or void space other than a chain cable locker, any part of which extends forward of the foremost cargo hold, giving an audible and visual alarm at a water level of 0,1 m above the deck. Such alarms need not be provided in enclosed spaces the volume of which does not exceed 0,1 per cent of the ship's maximum displacement volume.

1.3 Water ingress detection arrangements in single hold cargo ships

1.3.1 Ships having a length (*L*) of less than 80 m and a single cargo hold below the freeboard deck or cargo holds below the freeboard deck which are not separated by at least one bulkhead made watertight up to that deck, are to be fitted in such space or spaces with water level detectors.

1.3.2 The water level detectors required by 1.3.1 are to:

- (a) give an audible and visual alarm when the water level above the inner bottom in the cargo hold reaches a height of not less than 0,3 m, and another when such level reaches not more than 15 per cent of the mean depth of the cargo hold; and
- (b) be fitted at the aft end of the hold, or above its lowest part where the inner bottom is not parallel to the designed waterline. Where webs or partial watertight bulkheads are fitted above the inner bottom, the installation of additional detectors is to be considered.

1.3.3 The water level detectors required by 1.3.1 need not be fitted in ships complying with 1.2, or in ships having watertight side compartments each side of the cargo hold length which extend vertically at least from inner bottom to freeboard deck.

■ Section 2 Drainage and pumping arrangements

2.1 General requirements

2.1.1 Arrangements for drainage and pumping are to be in accordance with the requirements of SOLAS 1974 as amended, Chapter XII, Regulation 13.

2.1.2 On bulk carriers, the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold are to be capable of being brought into operation from a readily accessible enclosed space, the location of which is accessible from the navigation bridge or propulsion machinery control position without traversing exposed freeboard or superstructure decks. Where pipes serving such tanks or bilges pierce the collision bulkhead, valve operation by means of remotely operated actuators may be accepted, as an alternative to the valve control specified in Pt 5, Ch 13,3.5.4, provided that the location of such valve controls complies with this requirement.

2.2 Dewatering capability

2.2.1 The dewatering system for ballast tanks located forward of the collision bulkhead, and for bilges of dry spaces any part of which extends forward of the foremost cargo hold, is to be designed to remove water from the forward spaces at a rate of not less than $320A \text{ m}^3/\text{h}$, where *A* is the cross-sectional area in m^2 of the largest air pipe or ventilator pipe connected from the exposed deck to a closed forward space that is required to be dewatered by these arrangements.

Section

- 1 **General requirements**
- 2 **Noise**
- 3 **Vibration**
- 4 **Testing**
- 5 **Noise and vibration survey reporting**
- 6 **Non-periodical survey requirements**
- 7 **Referenced standards**

■ Section 1 General requirements

1.1 Scope

1.1.1 These Rules set down the criteria for the assessment of the noise and vibration on ships and are applied in addition to the other relevant requirements of the *Rules and Regulations for the Classification of Ships* (hereinafter referred to as the Rules for Ships).

1.1.2 Compliance with these Rules is optional.

1.1.3 These Rules provide for two alternatives:

- (a) **Class Notations** which indicate that the ship has been assessed and complies with noise and vibration criteria in these Rules and that a periodic survey regime has been established for the lifetime of the ship.
- (b) **Certificate of Compliance** which provides evidence that the ship has been assessed and found to comply with the noise and vibration criteria in these Rules.

1.1.4 These Rules recognise existing National and International Standards and specify levels of noise and vibration currently achievable using good engineering practice. Compliance with these requirements will be assessed by review of procedures, inspection and measurement of the relevant parameters and pre-survey reviews. Inspections and measurements are to be conducted, witnessed or assessed by LR's Surveyors unless otherwise agreed by Lloyd's Register (hereinafter referred to as LR).

1.1.5 Accommodation comfort is a function of ship type and layout. These Rules address two types of ship:

- (a) Passenger (e.g. cruise ships, ro-ro ferries).
- (b) Cargo (e.g. container ships, tankers).

1.1.6 These Rules include levels of noise and vibration which should be verified by measurements following completion of the ship. It is recommended that the Builders undertake calculations of noise and vibration characteristics so that any potential problem areas can be identified and control measures implemented.

1.1.7 The sound pressure levels for audible alarms and public address systems fitted in accordance with other sections of the Rules are to satisfy IMO Resolution A.830(19) Code on Alarms and Indicators.

1.2 Definitions

1.2.1 **Passenger spaces** are defined as all areas intended for passenger use, and include the following:

- (a) Passenger cabins.
- (b) Public spaces (e.g. restaurants, hospital, lounges, reading and games rooms, gymnasiums, corridors, shops).
- (c) Open deck recreation areas.

1.2.2 **Crew spaces** are defined as all areas intended for crew use only, and include the following:

- (a) Accommodation spaces (e.g. cabins, offices, mess rooms, recreation rooms).
- (b) Work spaces.
- (c) Navigation spaces.

1.2.3 **Noise level** is defined as the A-weighted sound pressure level measured in accordance with ISO 2923.

1.2.4 **Vibration level** is defined by the application of either of the two versions of the ISO 6954 standard:

- (a) Where ISO 6954:1984 is applied, the vibration level is defined as the single amplitude peak value of deck structure vibration during a period of steady state vibration, representative of maximum repetitive behaviour, in mm/s, over the frequency range 5 to 100 Hz. For frequencies below 5 Hz, the requirements for vibration levels follow constant acceleration curves corresponding to the acceleration at 5 Hz.
- (b) Where ISO 6954:2000 is applied, the vibration level is defined as the overall frequency weighted r.m.s. value of vibration during a period of steady-state operation over the frequency range 1 to 80 Hz.

In general, ISO 6954-2000 is the preferred standard to be applied, however ISO 6954-1984 may be applied where there are practical difficulties in application of ISO 6954-2000 and this has been agreed between the Owner and Builder.

1.3 Class notations

1.3.1 The class notations described in 1.3.2 to 1.3.6 provide standards for noise and vibration levels in different spaces at the time of delivery and during the ships life if substantial changes to the machinery installation or interior arrangements are made.

1.3.2 The **PAC** (Passenger Accommodation Comfort), **CAC** (Crew Accommodation Comfort) and **PCAC** (Passenger and Crew Accommodation Comfort) notations are optional and are primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance, using these requirements as the basis for the assessment and a LR Certificate of Compliance issued (see 1.1.3(b) and 1.4).

Passenger and Crew Accommodation Comfort

Part 7, Chapter 14

Sections 1 & 2

1.3.3 The **PAC** notation indicates that the passenger accommodation meets the acceptance criteria whilst the **CAC** notation indicates that the crew accommodation and work areas meet the acceptance criteria. The **PCAC** notation indicates that the passenger and crew spaces both meet the acceptance criteria.

1.3.4 For ships which achieve the noise and vibration comfort standards specified in these Rules, the notation **PAC**, **CAC** or **PCAC** will be assigned.

1.3.5 Following the **PAC** or **CAC** notation, numerals **1**, **2** or **3** will indicate the acceptance criteria to which the noise and vibration levels have been assessed. In the case of the **PCAC** notation, two numerals will be assigned. The first will indicate the acceptance criteria for passenger accommodation, whilst the second will indicate the crew comfort criteria.

1.3.6 For particular vessels, impact insulation and transient noise in accordance with 2.5 and 2.6 together with any additional or more stringent noise and vibration criteria may be assessed within the scope of the notations where agreed between the Owner, Builder and LR.

1.4 Certificate of Compliance

1.4.1 A Certificate of Compliance records that a ship has been designed and constructed to satisfy the noise and vibration criteria contained in these Rules. This is to be confirmed by measurements and reporting in accordance with Sections 4 and 5.

1.4.2 A Certificate of Compliance is optional and if requested, any ship can be assessed for compliance using the Rule requirements as basis for assessment.

1.4.3 Where noise and vibration levels are at variance with those prescribed by these Rules, these will be added to the certificate for information purposes.

1.4.4 A Certificate of Compliance will be issued after the initial survey required by Section 6.

2.2 Passenger accommodation and public spaces

2.2.1 Under test conditions specified in 4.2, the applicable noise levels specified in Table 14.2.1 should not generally be exceeded. See 2.2.3.

Table 14.2.1 Passenger ships – Maximum noise levels in dB(A)

Location		Acceptance Numeral		
		1	2	3
Passenger cabins:	Standard	49	52	55
	Superior	45	47	50
Public spaces:	Excluding shops	55	58	62
	Shops	60	62	65
Medical centre:		50	55	60
Theatre/auditorium		50	55	60
Open deck recreation areas (excluding swimming pools and similar)		67	72	72
Swimming pools and similar		70	75	75
NOTES 1. The levels may be exceeded by 5dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks. 2. The levels may be exceeded by 3dB(A) in accommodation above the propellers for three decks above the mooring deck. 3. The levels for open deck recreation areas refer to ship generated noise only. On open deck spaces the noise generated from the effects of wind and waves can be considered separately to limits agreed between the Builder and Owner and advised to LR for the trial conditions.				

2.2.2 For cabins bordering discotheques and similar entertainment areas, the deck and bulkhead sound insulation is to be sufficient to ensure that the maximum cabin noise levels are not exceeded even when high external noise levels prevail.

2.2.3 Acceptance of noise levels greater than those specified in Table 14.2.1 may be considered where agreed between the Owner and Builder. Not more than 20 per cent of the passenger cabins, 30 per cent of the public spaces and 20 per cent of the crew cabins should exceed the relevant noise criteria by more than 3 dB(A).

2.2.4 Acoustic insulation of bulkheads and decks between passenger spaces is to be generally in accordance with the values of the weighted apparent sound reduction index R_w as given in Table 14.2.2, calculated using ISO 717/1. See also 2.2.6.

■ Section 2 Noise

2.1 Assessment criteria

2.1.1 Where a space is occupied by both passengers and crew, the more stringent of the relevant requirements apply unless agreed between the Builder and Owner and advised to LR.

Passenger and Crew Accommodation Comfort

Part 7, Chapter 14

Section 2

2.2.5 For the purpose of selecting acoustic sound insulation, the following sound noise levels may be used with the agreement of the Owner and Builder:

- (a) Cabins – 80 dB(A).
- (b) Dining Rooms – 85 dB(A).
- (c) Corridors – 90 dB(A).
- (d) Discotheques, Theatres, Entertainment Areas – 105 dB(A).

2.2.6 Acceptance of bulkhead and deck acoustic insulation values less than those specified in Table 14.2.2 may be considered where agreed between the Owner and Builder. Not more than 20 per cent of the interfaces tested should have airborne sound insulation indices, R_w , more than 3 dB(A) lower than the minimum specified values.

Table 14.2.2 Minimum air-borne sound insulation indices, R_w

Location		Acceptance Numeral		
		1	2	3
Passenger cabins:	Standard	40	38	37
	Superior	45	42	40
Cabin to corridor:	Standard	38	36	34
	Superior	42	40	37
Cabin to stairway:	Standard	47	45	43
	Superior	50	47	45
Cabin to public space (excluding corridors/stairwells and discotheques):	Standard	52	48	48
	Superior	55	50	50
Discotheques to cabins		60	60	60
Discotheques to stairwells and public spaces		52	52	52
Cabin to machinery rooms and engine casing		55	53	50

2.3 Crew accommodation and work areas

2.3.1 Under the applicable test conditions specified in 4.2, the noise levels specified in Tables 14.2.3 and 14.2.4 are not to be exceeded.

2.3.2 Crew space insulation is to comply with the requirements of IMO Resolution A.468(XII).

Table 14.2.3 Crew accommodation – Maximum noise levels in dB(A)

Location	Acceptance Numeral		
	1	2	3
Sleeping cabins, hospitals	52	55	60
Day cabins	55	60	60
Office conference rooms	55	60	65
Mess rooms, lounges, reception areas:			
Within accomodation	57	60	65
On open decks	67	72	75
Alleyways, changing rooms, bathrooms, lockers	70	75	75
NOTE The levels may be exceeded by 5 dB(A) within 3 m of a ventilation inlet/outlet or machinery intake/uptake on open decks.			

Table 14.2.4 Crew work areas – maximum noise levels in dB(A)

Location	dB(A) level
Machinery space (continuously manned) e.g. stores	90
Machinery space (not continuously manned) e.g. pump, refrigeration, thrusters or fan rooms	110
Workshops	85
Machinery control rooms	75
Wheelhouse	65
Bridge wing, additional limits:	
• 250 Hz band	68
• 500 Hz band	63
Radio room	60
Galleys and pantries:	
• Equipment not working	75
• Individual items at 1 metre	85
Normally unoccupied spaces (e.g. holds, decks)	90
Ship's whistle, on bridge or forecastle	110

Passenger and Crew Accommodation Comfort

Part 7, Chapter 14

Section 2

2.4 Maximum noise levels

2.4.1 Where the measured noise level exceeds the specified criterion by 3 dB(A), or contains subjectively annoying low frequency or tonal components, the noise rating (NR) number is to be established in accordance with the graph shown in Fig. 14.2.1. This is achieved by plotting the linear octave band levels on the graph; the NR number is that NR curve to which the highest plotted octave band level is anywhere tangent. The specified criterion may be considered satisfied if the NR number does not exceed the specified A-weighted value minus 5 dB(A).

2.4.2 Guidance on maximum acceptable sound pressure levels and noise exposure limits for crew spaces is given in IMO Resolution A.468(XII).

2.5 Impact insulation

2.5.1 Where agreed between the Owner, Builder and LR, enhanced criteria for noise levels recognising the effects of impact sound pressures may be applied in accordance with 2.5.2 to 2.5.5.

2.5.2 For passenger and crew cabins located below or adjacent to dance floors, stages, aerobics and gymnasium areas, jogging tracks or other areas where impact noise is generated, the normalised impact sound pressure level measured within the cabins is not to exceed 45 dB.

2.5.3 For public rooms under dance floors, stages, aerobics and gymnasium areas, jogging tracks or other areas where impact noise is generated, the normalised impact sound pressure level within the space is not to exceed 55 dB.

2.5.4 For passenger cabins, the normalised impact sound pressure level, $L_{n,w}$, calculated using ISO 717/2, is to be generally in accordance with the values stated in Table 14.2.5. See also 2.5.5.

Table 14.2.5 Passenger cabins normalised impact maximum sound pressure level $L_{n,w}$

Location	dB
Below decks covered with carpet and soft materials	50
Below decks covered in hard materials (such as wood, marble or similar)	60
Below dance floors, theatre or sports rooms	47

2.5.5 Acceptance of normalised impact sound pressure levels greater than those specified in Table 14.2.5 may be considered for assignment of the applicable class notation where agreed between the Owner, Builder and LR. No more than 20 per cent of the passenger cabins tested should exceed the levels specified by more than 3 dB.

2.6 Transient noise

2.6.1 Where agreed between the Owner, Builder and LR, enhanced criteria for transient noise levels may be applied in accordance with 2.6.2.

2.6.2 The maximum sound pressure level (L_{max}) emanating from any machinery or system caused by a single event that produces a noise 'spike' compared to the reference condition sound level (such as vacuum systems or valve operations) is not to cause an increase in noise in comparison with the reference condition as below:

- (a) Passenger cabins and public areas: +2 dB(A)
- (b) Officer cabins: +2 dB(A)
- (c) Crew cabins and public areas: +3 dB(A)

A tolerance of +1 dB(A) may be applied to 5 per cent of cabins and public areas in each fire zone on each deck. This criterion is generally applicable to the specified maximum noise levels for the space concerned.

Fig. 14.2.1 Noise rating curves

Passenger and Crew Accommodation Comfort

Part 7, Chapter 14

Sections 3 & 4

Section 3 Vibration

3.1 Assessment criteria

3.1.1 Where a space is occupied by both passengers and crew, the more stringent of the relevant requirements apply unless agreed between the Builder and Owner and this agreement advised to LR.

3.1.2 The limits apply to vertical, fore and aft and athwartship vibrations which are to be assessed separately.

3.1.3 Under test conditions specified in 4.2, the applicable vibration levels specified in Tables 14.3.1 and 14.3.2 should not be exceeded.

Table 14.3.1 Passenger ship – Maximum vibration levels

Standard	ISO 6954:1984			ISO 6954:2000		
Units:	Peak velocity (5–100 Hz)			Peak velocity (5–80 Hz) velocity mm/s rms		
	Acceptance Numeral					
Location	1	2	3	1	2	3
Passenger cabin Luxury	1,5	2,0	2,5	1,5	1,8	2,1
Passenger cabin Standard	1,5	2,5	4,0	1,8	2,1	2,4
Public spaces	1,5	2,5	4,0	2,0	2,5	3,0
Open recreation decks	2,5	3,5	5,0	2,5	3,0	3,5
NOTE The vibration level may be exceeded by 0,3 mm/s in the ship's aft body directly above the propellers.						

Table 14.3.2 Crew spaces – Maximum vibration levels

Standard:	ISO 6954:1984	ISO 6954:2000
Units:	Peak velocity (5–100 Hz)	Frequency weighted (1–80 Hz) velocity mm/s rms
Location		
Accommodation and navigation spaces	5,0	3,5
Work spaces	6,0	5,0

3.1.4 Acceptance of vibration levels greater than those specified in Tables 14.3.1 and 14.3.2 may be considered for assignment of the applicable class notation where agreed between the Owner, Builder and LR.

3.1.5 The vibration levels for ISO 6954:1984 are stated as peak vibration velocity amplitude. If root mean square levels are measured, each frequency component may be converted to peak vibration velocity amplitude by application of a 1.41 multiplication factor where the ISO 6954:1984 is used for assessment against Tables 14.3.1 and 14.3.2. An approximation of maximum repetitive values may be obtained for direct comparison with the graph in ISO 6954:1984 by further application of the 1,8 conversion factor as stated in the 'Interim guidelines' note of the standard.

3.2 Passenger accommodation and public spaces

3.2.1 Passenger spaces are to comply with the overall vibration levels specified in Tables 14.3.1 and 14.3.2.

3.2.2 No more than 20 per cent of all passenger spaces/areas and public spaces should exceed the relevant vibration criteria specified in Tables 14.3.1 and 14.3.2 by more than 0,3 mm/s whether using ISO 6954:2000 or ISO 6954:1984.

3.3 Crew accommodation and work spaces

3.3.1 Crew spaces are to comply with the overall vibration levels specified in Table 14.3.2.

Section 4 Testing

4.1 Measurement procedures

4.1.1 These requirements take precedence where quoted standards may differ.

4.1.2 The trial measurements may be undertaken by an approved technical organisation as defined in 4.7 or by LR. In the former case, the measurements are to be witnessed by a LR Surveyor.

4.1.3 Subject to agreement by LR and the Owner/Operator, the measurements may be undertaken by the Builder. In this case, the measurements are to be witnessed by a LR Surveyor.

4.2 Test conditions

4.2.1 Test conditions for the surveys are to be in accordance with those detailed in ISO 2923 and ISO 6954:1984 or ISO 6954:2000 as applicable.

Passenger and Crew Accommodation Comfort

Part 7, Chapter 14

Section 4

4.2.2 The intended operating and loading conditions of the ship during assessment surveys are to be submitted to LR for agreement, prior to commencement of surveys.

4.2.3 Surveys are to be conducted when the ship is fully outfitted and all systems contributing to noise and vibration levels are operational.

NOTE

All systems operational are to include those systems that may operate simultaneously with others during normal ship operation.

4.2.4 The test conditions required for the vibration and noise measurements are to be in accordance with the following conditions:

- (a) For passenger ships, prior to measurement surveys being carried out, the ship operating condition where the worst conditions are experienced between 0 and 85 per cent maximum continuous rating of the propulsion machinery is to be determined. To establish this condition, four measurement positions are to be defined with the agreement of LR and measurements taken of the parameters of interest at ship speeds corresponding to percentages of the maximum continuous rating of the propulsion machinery increasing up to 40 per cent MCR in 10 per cent intervals and from 40 per cent in 5 per cent intervals up to the 85 per cent maximum continuous rating of the propulsion machinery. If the 85 per cent maximum continuous rating condition is found to be the worst condition, then this will form the trial operating conditions. However, if a lower speed condition is found to be worse than the 85 per cent maximum continuous rating condition then both that condition and the 85 per cent maximum continuous rating condition will form the trial operating conditions. Where unavoidable any barred range within the values required for the trial operating condition may be excluded on agreement between Owner and Builder subject to approval by LR.
- (b) The power absorbed by the propeller(s) is to be that defined in 4.2.4(a). Alternatively, by special agreement, some lesser power could be accepted if it can be demonstrated by the Owner that this would correspond to a more representative normal service condition.
- (c) Auxiliary machinery essential for the ship's operating conditions together with HVAC systems are to be running at their normal rated capacity during the noise and vibration trials. Combinations of auxiliary machinery operation may be necessary. In addition, the following equipment is to be running if appropriate: stabilisers, waste treatment equipment, swimming pool and jacuzzi equipment.
- (d) For sea-going ships, measurements are to be taken with the ship proceeding ahead, at a constant speed and course, in a depth of water not less than five times the draught of the ship. For other ships, an appropriate water depth is to be agreed with LR prior to the trials.
- (e) Trials are to be conducted in sea conditions not greater than sea state 3 on the WMO sea state code. In addition, noise measurements should not be taken when the wind force exceeds 4 on the Beaufort scale.
- (f) The ship is to be at a displacement and trim representative of an operating condition.

- (g) Rudder angle variations are to be limited to $\pm 2^\circ$ of the midship position and rudder movements are to be kept to a minimum throughout the measurement periods.
- (h) In addition, for ships which are designed to spend a considerable period of time in harbour, the noise and vibration, are to be measured for this condition, with the auxiliary machinery and HVAC systems running at their normal rated capacity.
- (j) For passenger ships, intermittently run equipment such as transverse propulsion units are to be operated at 60 per cent of their rated power for additional measurements in surrounding ship areas.

4.2.5 Prior to survey, a test programme is to be submitted for approval by LR. This programme is to contain details of the following:

- (a) Measurement locations indicated on a general arrangement of the ship.
- (b) The ship's loading condition during survey.
- (c) The machinery operating condition, including HVAC system, during survey.
- (d) Noise and vibration measuring equipment.

4.3 Noise measurements

4.3.1 Noise measurements are to be conducted in accordance with ISO 2923 and IMO Resolution A.468(XII). Measurements of noise levels are to be carried out using precision grade sound level meters conforming to IEC 60651, Type 1 or 2. Subject to demonstration, equivalent standards are acceptable.

4.3.2 Where the measured noise level exceeds the relevant criterion by 3 dB(A), or contains subjectively annoying low frequency noise or obvious tonal components, octave band readings are to be taken, with centre frequencies from 31,5 Hz to 8 kHz.

4.3.3 When outfitting is complete, and all soft furnishings are in place, sound insulation indices for passenger spaces are to be determined in accordance with ISO 140. Cabin to cabin indices are to be determined from a minimum of three locations within the passenger accommodation, the number of test locations being agreed with LR.

4.3.4 If required, impact sound measurements are to be carried out in accordance with ISO 140/7 and presented in accordance with ISO 717/2. See 4.4.4.

4.4 Noise measurement locations

4.4.1 Measurement locations are to be chosen so that the assessment represents the overall noise environment on board the ship. In addition to the requirements of IMO Resolution A.468(XII) for crew spaces, all public spaces and at least 50 per cent of passenger cabins in the after third of the ship, and 25 per cent elsewhere, are to be surveyed. Distribution of the measurement locations is to be agreed by LR.

4.4.2 During measurement trials, recognised noise sources are to be operated at their normal level of noise output (e.g. machinery at design rating).

4.4.3 In larger sized spaces, where noise levels may vary considerably, such as restaurants, lounges, atria and open deck recreation areas, measurements are to be taken at locations not greater than 7 m apart.

4.4.4 The number of and locations for impact noise measurements are to be agreed between the Builder, Owner and LR. The measurements are to be carried out when the ship is in harbour. The number and location of measurements are to take account of all different combinations of construction, areas of application, types of cabin and spaces below.

4.5 Vibration measurements

4.5.1 Vibration measurements are to be conducted in accordance with ISO 6954:1984 or ISO 6954:2000.

4.5.2 Measurements are to be made with instrumentation meeting the requirements of ISO 8041.

4.5.3 Vibration levels are to be given in terms of the velocity measurement appropriate to the version of the standard being used and should be measured over a period of not less than one minute.

4.6 Vibration measurement locations

4.6.1 Measurement locations are to be chosen so that the assessment represents the overall vibration environment onboard the ship. To minimise survey times, readings may be taken at the locations previously defined for the noise assessment part of the survey.

4.6.2 In cabins, vibration readings are to be taken in the centre of the floor area. The measurements are to indicate the vibration of the deck structure. In large spaces, such as restaurants, sufficient measurements are required to define the vibration profile.

4.6.3 Where deck coverings make transducer attachment impracticable, use of a small steel plate having a mass of at least 1 kg, with spikes as appropriate, is permissible.

4.6.4 At all locations, vibrations in the vertical direction are to be assessed. Sufficient measurements in the athwartships and fore and aft directions are to be taken to define global deck vibrations.

4.7 Approved technical organisation

4.7.1 An approved technical organisation for the purposes of these Rules is one that is acceptable to the Owner and LR with proven capability in noise and vibration measurement and satisfies all the criteria set out below:

- (a) Have instrumentation whose calibration, both before and after the measurements, can be traced back to National Standards and, hence, back to International Standards.
- (b) Have analysis procedures capable of data reduction to the requirements and standards set out in these Rules.
- (c) Be able to provide a written report in English with contents as defined by Section 5.

■ Section 5 Noise and vibration survey reporting

5.1 General

5.1.1 Prior to survey, a noise and vibration measurement plan is to be agreed by the Owner, Builder and LR.

5.1.2 The survey report is to comprise the data and analysis for both noise and vibration and is to be submitted to LR for consideration.

5.1.3 The survey report is to be prepared by the organisation undertaking the trial measurements, which may be an approved technical organisation or LR.

5.1.4 The survey report is to be submitted to LR's London Office (MCS/TID) for evaluation and confirmation that the results are in accordance with the noise and vibration levels specified in these Rules and/or agreed between the Owner and Builder. The assignment of a Class Notation or the issue of a Statement of Compliance will be subject to confirmation by LR MCS/TID.

5.2 Noise

5.2.1 The reporting of results is to comply with ISO 2923, and is to include:

- (a) Measurement locations indicated on a general arrangement plan including, where possible, the measured dB(A) level.
- (b) Tabulated dB(A) noise levels, together with octave band analysis for positions where the level exceeds the specified criterion by 3 dB(A), or where subjectively annoying low frequency or tonal components were present. The Noise Rating number is also to be given where octave band analyses have been conducted.
- (c) Ship and machinery details.

- (d) Trial details:
 - Loading condition.
 - Machinery operating condition.
 - Speed.
 - Average water depth under keel.
 - Weather conditions.
 - Sea state.
- (e) Details of measuring and analysis equipment (e.g. manufacturer, type and serial numbers), including frequency analysis parameters (e.g. resolution, averaging time, window function).
- (f) Copies of the relevant instrument calibration certificates, together with the results of field calibration checks

5.3 Vibration

5.3.1 The report is to contain the following information:

- (a) Measurement positions indicated on a general arrangement plan.
- (b) Where ISO 6964:2000 is used, the frequency-weighted overall r.m.s. vibration levels tabulated for all measurement locations calculated using the weighting functions and methodology stated in the standard.
- (c) Where ISO 6954:1984 is used, the maximum peak vibration levels and their corresponding frequencies taken from the frequency spectra, tabulated for all measurement locations.
- (d) Ship and machinery details.
- (e) Trial details:
 - Loading condition.
 - Machinery operating condition.
 - Speed.
 - Average water depth under keel.
 - Weather conditions.
 - Sea state.
- (f) Frequency analysis parameters (e.g. resolution, averaging time and window function), if the analysis is done in the frequency domain.
- (g) Copies of the relevant instrument calibration certificates, together with the results of field calibration.

■ Section 6 Non-periodical survey requirements

6.1 Class notation assignment

6.1.1 Where the assignment of a Class Notation or a Statement of Compliance is requested, an Initial Survey is to comprise sea trial or initial in-service testing, reporting and assessment against the criteria set out in these Rules.

6.1.2 The sea trial or initial in-service testing requirements are set out in Section 4, and are to be reported in accordance with Section 5 and evaluated against the requirements of Sections 2 and 3.

6.2 Maintenance of class notation through-life and following modifications

6.2.1 Where an Owner has requested assignment of a Class Notation, arrangements are to be agreed between LR and the Owner to record observations/complaints of excessive noise and vibration that have been such as to disturb the comfort of passengers and crew. The records of the observations are to be made available to the attending LR Surveyor at each Annual Survey.

6.2.2 Where the observations indicate that the noise and/or vibration levels may exceed the criteria relating to the Class Notation requirements and those measured at the Initial Survey, a measurement programme is to be agreed between the Owner and LR and measurements taken in accordance with these Rules.

6.2.3 A Renewal Survey may be required following modifications, alterations or repairs including replacement of major machinery items. It is the responsibility of the Owner to advise LR of such modifications.

■ Section 7 Referenced standards

7.1 Noise

7.1.1 The following National and International Standards for noise are referred to in these Rules:

- ISO 2923, *Acoustics – Measurement of noise on board vessels*.
- ISO 717/1, *Acoustics – Rating of sound insulation in buildings and of building elements; Part 1: Airborne sound insulation*.
- ISO 717/2, *Acoustics – Rating of sound insulation in buildings and of building elements; Part 2: Impact sound insulation*.
- IMO Resolution A.468(XII), *Code on noise levels on board ships*.
- IEC Publication 651, *Sound level meters*.
- ISO140/4, *Acoustics – Measurement of sound insulation in buildings and of building elements; Part 4: Field measurements of airborne sound insulation between rooms*.
- ISO 140/7, *Acoustics – Measurement of sound insulation in buildings and of building elements; Part 7: Field measurements of impact sound insulation of floors*.

7.2 Vibration

7.2.1 The following National and International Standards for vibration are referred to in these Rules:

- ISO 6954:1984, *Mechanical vibration and shock – Guidelines for the overall evaluation of vibration in merchant ships.*
 - ISO 6954:2000, *Mechanical vibration and shock – Guidelines for the measurement, reporting and evaluation of vibration with regard to habitability on passenger and merchant ships.*
 - ISO 8041, *Human response to vibration. Measuring instrumentation.*
-

On-shore Power Supplies

Part 7, Chapter 15

Section 1

Section

- 1 **General**
- 2 **Essential features**
- 3 **Electrical connection**
- 4 **Electrical system**
- 5 **Control and monitoring**
- 6 **Testing, trials and surveys**

■ Section 1 General

1.1 General

1.1.1 These optional requirements apply to the safety, reliability and availability of shipboard machinery, electrical and control engineering arrangements installed to permit continued operation of services by connection to an external electrical power supply in port. These requirements are additional to those applicable in other Parts of the Rules. Regular operation of ship's services from an external electrical power supply is often referred to as On-shore Power Supply, Cold Ironing, High Voltage Shore Connection or Alternative Marine Power.

1.1.2 These requirements are intended for application to the shipboard elements of designs where the connection(s) with external power supply arrangements are achieved by either extending ship cables from the ship to the external power supply connection points or by bringing external cables on board to connect to shipboard connection points. However, external equipment and machinery (including shore based transformers, circuit breakers, gantries, cables, connectors and control engineering arrangements) are not covered by classification or these requirements.

1.1.3 Compliance with these requirements is intended to assess the suitability of shipboard arrangements for the documented intended application and only addresses compatibility with external power supply arrangements that are suitable for connection to the installed ship arrangements.

1.1.4 Assessment of the overall compatibility and suitability of an external electrical power supply (including combined electrical and control engineering assessments, compliance with applicable regulations, operating practices and risk assessment, etc., as applicable) is necessary before connection and is the responsibility of the Owner. Elements of the overall assessment of compatibility will be required to be completed in advance to prepare for a ship visit to a port where it is intended to connect to an external power supply due to the need to involve competent and responsible parties.

1.2 Authorities and administrations

1.2.1 Additional requirements and/or restrictions may be imposed by the National Authority with which the ship is registered and/or by the appropriate Administration or Authorities within whose jurisdiction the ship is intended to operate and/or by the Owners or Authorities responsible for an external electrical power supply. Where such additional requirements are relevant, compliance is the responsibility of the Owner. If specifically requested, Lloyd's Register (hereinafter referred to as 'LR') may be able to provide a suitable statement of compliance.

1.2.2 Where additional requirements imposed by an Authority or Administration would result in a departure from the requirements of this Chapter, details demonstrating that safety, availability and reliability will not be adversely affected are to be submitted to LR for consideration.

1.3 Class notations

1.3.1 **OPS** machinery class notation may be assigned where machinery, electrical and control engineering arrangements installed onboard to permit continued operation of services by connection to an external electrical power supply are assessed and found to comply with the requirements of this Chapter.

1.4 Plans and information

1.4.1 Three copies of the plans and particulars in 1.4.2 to 1.4.9 are to be submitted for consideration.

1.4.2 Operating Manuals that describe the intended methods of connection together with operating and monitoring instructions. Assessments of the external supplies that are to be connected to the ship together with the mooring and environmental conditions are to be included. Details of equipment and arrangements necessary to ensure safety when connecting, disconnecting, transferring electrical load, testing and operating are to be incorporated.

1.4.3 A Design Statement which details the Defined Operations. This statement is to include a description of the operating capability, functionality, limits and restrictions; in terms of:

- Connection Equipment, see 1.6.2;
- Connection Equipment routes;
- mooring arrangements;
- environmental conditions including tidal and weather and, where applicable, electromagnetic conditions required to ensure compatibility or prevent damage caused by heating or sparking;
- Connection Equipment suitability for hazardous areas, see 2.1.4 and Pt 6, Ch 2, 1.2.6
- arrangements for an external connection cable to be brought on board, where provided;
- Separation details, see 3.2.7;
- the rating of the arrangements;
- ratings and requirements for external power supplies, see 3.1.10; and
- the services to be supplied.

On-shore Power Supplies

Part 7, Chapter 15

Sections 1, 2 & 3

1.4.4 Arrangement plans of equipment, control stations, locations, routes to and from connections, openings and accesses and flexible or movable arrangements.

1.4.5 Operational and construction details of Connection Equipment, including any flexible or adjusting arrangements, including plugs and socket-outlets, see 3.3.8.

1.4.6 Plans for control and electrical engineering arrangements required by Pt 6, Ch 1 and 2, as applicable.

1.4.7 Details of type tests for Connection cables, plugs and socket-outlets required by 3.3.6.

1.4.8 Details of supplementary arrangements required to protect equipment from exposure to moisture, condensation or temperatures outside their rating.

1.4.9 Schedule of testing at manufacturers' works, initial surveys and trials. The test schedules are to address the defined operations and are to include normal operations and failure conditions.

1.5 Additions and alterations

1.5.1 When an alteration or addition to the approved arrangements is proposed, including changes to the defined service profile, details are to be submitted for consideration.

1.6 Definitions

1.6.1 'Defined Operations' include the application, connection, electrical load transfer, in-service operation, failure response, disconnection and stowage of the connection to an external power supply.

1.6.2 'Connection Equipment' is the ship equipment used to connect permanently installed ship equipment with external electrical power supply connection points in accordance with the Design Statement. This includes, as applicable, flexible cables, plugs and socket-outlets, slip rings or other power conductors or control connections, and support and management measures for these connections. For the purposes of this Chapter, 'Connection Equipment' does not include external equipment, see 1.1.

Section 2 Essential features

2.1 General requirements

2.1.1 Connection equipment is to be designed to be compatible with ship mooring arrangements and the limits of acceptable forces, moments and deflections on correctly applied Connection Equipment resulting from the movement of the moored ship under normal operational circumstances is to be defined in the Design Statement.

2.1.2 Electrical and control engineering arrangements for operation with external electrical power supplies are to be in accordance with the requirements of Pt 6, Ch 1 and 2, as applicable.

2.1.3 Connection to an external electrical power supply is not to adversely affect the availability of main, auxiliary or emergency machinery, including ship sources of electrical power to allow ship power to be restored. Details of arrangements provided to maintain availability (for example, pre-heating and lubrication and availability of starting, fuel, lubrication, air and auxiliary systems) are to be included in the Design Statement, see also 4.5 and 5.1.9.

2.1.4 The permanent or temporary installation of electrical equipment in areas containing flammable gas or vapour and/or combustible dust, is to be minimised as far as is consistent with operational necessity and the provision of facilities enhancing the overall safety of the ship and connection to an external power supply. Where it is necessary to install electrical equipment in these areas, the arrangements are to be in accordance with the requirements of Pt 6, Ch 2, 13. The suitability of electrical Connection Equipment for operation in areas containing flammable gas and/or vapour and/or combustible dust while in port is to be defined in the Design Statement and should, additionally, address the implications for Connection Equipment extended ashore, where applicable, and the suitability for operation in berths requiring extended, hazardous areas.

2.1.5 As far as practicable, Connection Equipment is to be located outside of areas where it could be damaged by in-port activities under normal operational circumstances.

2.1.6 Consideration may be given to arrangements that are considered by LR to provide an equivalent level of safety or that comply with the provisions of a relevant standard acceptable to LR.

Section 3 Electrical connection

3.1 General

3.1.1 A connection cubicle is to be provided at a convenient location for the reception or extension of connection cable(s) for connection to the external electrical power supply connection points. The connection cubicle is to contain terminals for the connection cable(s) that can be isolated.

3.1.2 Power connections with external electrical power supply arrangements may be made with either suitable connections or by using socket-outlets and plugs in accordance with 3.3.

On-shore Power Supplies

Part 7, Chapter 15

Section 3

3.1.3 Suitable cables, permanently fixed, are to be provided from the connection cubicle to the Connection Circuit-Breaker switchboard, with on-board overcurrent protection situated at or as close as is practicable to the connection cubicle. Connection Equipment to this overcurrent protection is to be installed in a manner such as to minimise the risk of short-circuit.

3.1.4 Where shipboard connection cables are extended to the external electrical power supply connection points, the connection cubicle is to be situated as close as practicable on board to the point where they are extended from the ship.

3.1.5 Means are to be provided to permit the quality of insulation between Connection Equipment conductors, and between the conductors and earth to be measured to verify suitability prior to the connection of an external power supply. The means of verifying satisfactory insulation quality of Connection Equipment in hazardous areas is to be addressed in the Operating Manuals, see 1.4.2.

3.1.6 An earth connection is to be provided for connecting the hull to an earth appropriate for the external electrical power supply which is being connected.

3.1.7 For high voltage connections, means are to be provided to verify the continuity of the earth connection referred to in 3.1.6.

3.1.8 Means are to be provided for checking the phase sequence of the incoming supply.

3.1.9 An indicator is to be provided at the Connection Circuit-Breaker switchboard, and at the connection cubicle if in a different location, in order to show when connections are energised.

3.1.10 Requirements for an external electrical power supply to be connected are to be defined in the Design Statement and this is to detail the following:

- connections, including control, alarm and safety systems and data communication links;
- emergency Shut-Down requirements, see 5.3;
- nominal voltage(s) or voltage range;
- nominal frequency or frequency range;
- number of phases and system of supply;
- rated current or apparent power;
- quality of power supply;
- reference to protection system design, including protection characteristics for the Connection Circuit-Breaker;
- maximum permitted prospective fault level;
- minimum supply apparent power or current capacity;
- earth fault limiting requirements for earthed high voltage connections;
- isolation and earthing; and
- supply requirements for lightning and surge protection, galvanic isolation of supply circuit from other ships, etc.

Required electrical characteristics are to address steady state, transient and fault conditions, as necessary.

3.1.11 A notice is to be provided at the connection cubicle referencing the Operating Manuals and Design Statement and advising of the requirement to ensure that external electrical power supplies satisfy the requirements of 3.1.10 prior to connection. See 1.1.4 for the conducting of the assessment of overall compatibility.

3.2 Connection Equipment

3.2.1 Connection Equipment support and management arrangements, including those for control engineering arrangements, are to be arranged not to apply damaging forces or tension to correctly applied equipment. Support arrangements are to ensure that the weight of connected cable is not borne by cable end terminations or connections, including those in plugs or socket-outlets.

3.2.2 Connection Equipment arrangements are to be such as not to coil or twist correctly applied equipment in a manner that would result in heating or physical tension beyond its rating during Defined Operations.

3.2.3 Where Connection Equipment passes through support or management arrangements or structural openings or is placed against structures, it is to be suitably protected against damage having regard to the Defined Operations.

3.2.4 Connection Equipment routes are not to reduce the effectiveness of openings required for the safety of the ship, for instance bulkhead or deck penetrations, watertight or fire doors.

3.2.5 Connection Equipment support and management arrangements are to be able to operate satisfactorily without damage during the Defined Operations.

3.2.6 Means are to be provided for Connection Equipment to be readily and safely adjusted in response to tidal changes, and other movements that could lead to damage or failure of connections, during the Defined Operations.

3.2.7 Connections with external electrical power supply arrangements are to be designed to prevent damage to the ship structure or Connection Equipment cable reels, cranes and/or gantries as a result of the connections separating in the event of the ship leaving a berth inadvertently or as a result of high cable tension for other reasons. Evidence of compliance with this requirement is to be included in the submission required by 1.4.3 and is to identify Connection Equipment (weak points) that will be damaged, if any, in the event of separation. Damage to connection cables, plugs and socket-outlets or other identified equipment may be considered.

3.2.8 Connection Equipment cable reels, cranes and/or gantries used to manage, handle or adjust connection cables, plugs and/or socket-outlets, are to be designed and manufactured in accordance with applicable LR Rules or a marine standard acceptable to LR. A manufacturer's certificate verifying suitability for safe and effective operation for the Defined Operations and service profile is to be submitted.

3.2.9 The manufacturer's certificate referred to in 3.2.8 is to be in the English language and include the following information:

- (a) Design and manufacturing standard(s) used.
 - (b) Materials used for construction of key components and their sources.
 - (c) Details of the quality control system applied during design, manufacture and testing.
 - (d) Details of any existing type approval or type testing.
 - (e) Details of installation and testing recommendations.
- The manufacturer is to have a recognised quality management system certified by an IACS member or a Notified Body.

3.2.10 Connection cubicle and connection equipment locations are to have warning notices placed in prominent positions to indicate the presence of moving equipment, electricity and high voltage as applicable.

3.2.11 Effective means are to be provided to prevent the accumulation of moisture and condensation within equipment enclosures.

3.2.12 Connection Equipment support and management arrangements are to ensure that the correctly applied equipment is kept clear of areas where they may be exposed to moisture or temperatures outside their rating.

3.2.13 Arrangements are to be provided for stowage of on-board equipment when not in use such that equipment:

- will not be exposed to environmental conditions outside its rating;
- can be stowed, stored and removed without damage; and
- does not present a hazard during normal ship operation.

Adapters, extensions and parts dismantled after use are also to be provided with stowage arrangements.

3.3 Connection cables, plugs and socket-outlets

3.3.1 Plugs and socket-outlets for external electrical power supply connection points, including those for external control engineering arrangements, are to be designed to avoid the possibility of incorrect connections being made.

3.3.2 Plugs are to conform to applicable requirements that ensure compatibility with the intended socket-outlet type.

3.3.3 Plugs and socket-outlets are to have provisions for connection to be made such that no strain is transmitted to the terminals and contacts. They are to be so designed such that when in place they will be held in positive contact.

3.3.4 Plugs and socket-outlets are to be provided with means of locking together in the connected position.

3.3.5 Plugs and socket-outlets are to be designed and constructed with the following sequence of connection and disconnection:

Connection

- earth contacts; then
- power contacts; then
- pilot contacts.

Disconnection

- pilot contacts; then
- power contacts; then
- earth contacts.

Pilot contacts refers to any auxiliary contacts used as part of the plug withdrawal detection required by 5.3.4.

3.3.6 Type tests are to be carried out on power connection plug and socket-outlets and cables, in accordance with appropriate standards, to verify design suitability for the intended application described in the Design Statement. Type test reports are to be submitted that include details of the standards, the tests conducted and their order and the acceptance criteria. Tests to be included are shown in Table 15.3.1 and 15.3.2. Alternative proposals may be submitted for consideration.

Table 15.3.1 Type tests for external power supply connection plugs and socket-outlets

Electrical tests
Partial discharge for high voltage ratings
High voltage
Short time and peak withstand current
Lightning impulse withstand
Withdrawal test to ensure a short-circuit arc cannot initiate in any position between complete insertion of the plug and the position at which withdrawal is detected, <i>see also</i> 5.3.4
Temperature rise
Mechanical tests
Shock and vibration
Enclosure degree of protection
Ageing of gaskets and insulators
Corrosion and resistance to rusting
Environmental tests in accordance with IEC 60092-101, Annex B and IEC 60721-3-6 for the ship environment following IEC TR 60721-4-6 for climatic and biological conditions and exposure to chemically and mechanically active substances and mechanical conditions
Normal operation test (at least 5000 cycles)
NOTE
After conducting the tests above, the temperature rise test, lightning impulse withstand test and high voltage test should be repeated.

Table 15.3.2 Type tests for external power supply connection cables

Tests in accordance with Pt 6, Ch 2, 10.2.2, as applicable
Partial discharge for high voltage ratings following bending tests
Resistance between protective conductors and semi-conductive layers where applicable
Solar radiation resistance
Abrasion resistance
Low temperature

3.3.7 High voltage cables, plugs and socket-outlets that also contain integral low voltage conductors (for example as part of the plug withdrawal detection required by 5.3.4) are to be of a construction and installed such that low voltage conductors are not subjected to high voltage, by physical connection or induction, under normal circumstances or in the event of a failure.

3.3.8 Power connection plugs and socket-outlets are to be assigned with the ratings for the characteristics shown in Table 15.3.3 based on testing, and details are to be provided in the submission required by 1.4.5. Plug and socket-outlets and cable ratings are to address the construction and cover the connections and cores as applicable, including control and auxiliary connections, and are to address the construction and material of the constituent components.

Table 15.3.3 External power supply connection plugs and socket-outlets ratings

Electrical characteristics
Nominal voltage
a.c. withstand voltage
Impulse a.c. withstand voltage
Partial discharge (for high-voltage equipment)
Nominal current
Short time short-circuit withstand capacity
Mechanical characteristics
Non-fixed plug or socket-outlet weight limit
Enclosure degree of protection
Acceptable cable cross-sectional area
Construction materials
Ambient temperature
Shock and vibration
Environmental category in accordance with IEC 60092-101, Annex B and IEC 60721-3-6

3.3.9 Power connection plugs and socket-outlets are to be constructed and located to minimise the potential of arc flash hazards and suitable warning notices are to be provided at locations along Connection Equipment routes, including power connection plugs and socket-outlets operational locations.

3.3.10 Connection Equipment cables are to be of a type, and installed in a manner such as to minimise the risk of short-circuit when correctly applied.

Section 4 Electrical system

4.1 Electrical load transfer

4.1.1 'Dead transfer' arrangements are to be provided that permit transfer between operation using ship sources of electrical power and an external electrical power supply by disconnecting one from the ship distribution system and then connecting the other to the dead system.

4.1.2 Additional arrangements for connecting ship sources of electrical power and an external electrical power supply in parallel temporarily to transfer load from one to the other only are permitted, provided these are in accordance with 4.1.3 to 4.1.9.

4.1.3 Means to automatically synchronise a ship source of electrical power with an external electrical power supply and connect them in parallel for load transfer when requested by operating staff are to be provided.

4.1.4 Means to automatically transfer load between a ship source of electrical power and an external electrical power supply following their connection in parallel, are to be provided. The load transfer is to be completed in as short a time as practicable without causing machinery or equipment failure or operation of protective devices and this time is to be used as the basis for defining the Transfer Time Limit required by 4.1.5.

4.1.5 When transferring of load between ship sources of electrical power and an external electrical power supply exceeds a defined Transfer Time Limit then, arrangements are to be such that:

- the transfer is aborted;
- load is removed from the ship sources of electrical power or external electrical power supply that was intended to take the load; and then
- the Connection Circuit-Breaker is opened.

An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply when the Transfer Time Limit is exceeded and is to indicate the return to previous operating conditions.

4.1.6 The Transfer Time Limit referred to in 4.1.5 may be adjustable to match the ability of an external electrical power supply to accept and shed load. Setting of the Transfer Time Limit is to be demonstrated to the attending Surveyor at Surveys and Trials, see 6.1.

4.1.7 An external power supply may only be connected in parallel with a single ship source of electrical power. Arrangements are to be provided to ensure that this requirement is satisfied before and during parallel connection. Details of alternative proposals may be submitted for consideration.

4.1.8 Arrangements provided to adjust ship sources of electrical power to allow connection in parallel and transfer of load are not to cause machinery or equipment failure, operation of protective devices or damage under normal conditions or in the event of a failure.

On-shore Power Supplies

Part 7, Chapter 15

Section 4

4.1.9 Where load reductions are required to transfer load they are not to result in loss of essential services or the loss of availability of emergency services. Means are to be provided to readily make necessary load reductions and re-instate supplies following transfer.

4.2 Capacity

4.2.1 Arrangements for operating from external supplies are to be sufficiently rated to supply the following:

- essential services normally required in port;
- emergency services;
- services required to ensure ready availability of non-operating main and auxiliary machinery;
- services required to prevent damage to cargo or stores; and
- the services required for the Defined Operations.

The schedule of loads required by Pt 6, Ch 2,1.2.17 is to incorporate operation when connected to an external electrical power supply.

4.2.2 The maximum electrical step load switched on or off is not to cause the power supply quality to exceed the parameters given in Pt 6, Ch 2,1.7 or failure when connected to an external electrical power supply in accordance with the defined requirements, see 3.1.10.

4.2.3 Consideration is to be given to providing means to inhibit automatically the connection of large motors, or the connection of other large loads, that the arrangements are not rated to supply when connected to an external electrical power supply having the defined minimum apparent power or current capacity, see 3.1.10 and Pt 6, Ch 2,6.9.4.

4.3 Protection

4.3.1 Where an external electrical power supply is not arranged to operate in parallel with ship sources of electrical power, the connection to the external electrical power supply is to be provided with a Connection Circuit-Breaker arranged to open simultaneously, in the event of short-circuit, overload or undervoltage, all insulated poles.

4.3.2 Where an external electrical power supply is arranged to operate in parallel with ship sources of electrical power during load transfer, the connection to the external electrical power supply is to be provided with a Connection Circuit-Breaker arranged to open simultaneously, in the event of a short-circuit, an overload or an undervoltage, all insulated poles. This circuit-breaker is to be provided with reverse power protection with time delay, selected or set within the limits of 2 per cent to 15 per cent of full load to a value fixed in accordance with the rating defined in the Design Statement; a fall of 50 per cent in the applied voltage is not to render the reverse power mechanism inoperative, although it may alter the amount of reverse power required to open the circuit breaker.

4.3.3 The electrical system, including short-circuit protective device rating, is to be suitable for the highest prospective fault level at the point of installation. The short-circuit current calculations required by Pt 6, Ch 2,1.2.4 are to identify the system state that would result in the highest prospective fault level. The highest prospective fault level may occur during parallel connection with an external power supply and the resulting combination of:

- (a) ship sources of electrical power, taking into account 4.1.7; and
- (b) an external electrical power supply having the defined maximum permitted prospective fault level, see 3.1.10.

Details of alternative proposals may be submitted for consideration.

4.3.4 The connection circuit is to be arranged such that contamination due to the products of arcing as a result of a fault in the Connection Circuit-Breaker enclosure on the external power supply side will not result in essential or emergency services not being available when supplied by ship sources of electrical power.

4.3.5 Initial connection of an external electrical power supply to the ship switchboards or converter equipment to connect to ship loads is to be arranged to be made by closing of the Connection Circuit-Breaker only.

4.3.6 Converter equipment used to connect an external electrical power supply to the ship electrical system is to ensure that a supply that would result in damage is not applied to the connected ship electrical systems in the event of a failure.

4.3.7 The voltage and time delay settings of the Connection Circuit-Breaker undervoltage release mechanism(s) are to be selected to ensure that the discriminative action required by Pt 6, Ch 2,6.1.1(a) is maintained.

4.3.8 Means are to be provided to prevent closure of the Connection Circuit-Breaker when a connected external electrical power supply has a different phase rotation or has a voltage or frequency that does not match the ship electrical system rating within the tolerances defined by Pt 6, Ch 2,1.7.2 or 1.7.4. Signals are to be provided, where necessary, to allow comparison with ship electrical system characteristics.

4.3.9 Connection power circuits are to be provided with protection against earth faults in accordance with Pt 6, Ch 2,6.4.

4.4 Interlocking and synchronising arrangements

4.4.1 External electrical power supply connections are to be provided with instruments and devices on board equivalent to those required for alternating current generators by Pt 6, Ch 2,7.11.1 where synchronising is not provided, or by Pt 6, Ch 2,7.11.2 to 7.11.3 where synchronising for load transfer is provided. See also Pt 6, Ch 2,7.11 and 7.12.

4.4.2 Means are to be provided to ensure that a source of electrical power or electrical power supply can only be connected to other live parts when synchronised. See also 4.1.2 for temporary parallel connection for load transfer.

4.4.3 The arrangements are to prevent Connection Equipment power conductors being made live by connecting to the ship electrical system.

4.4.4 The simultaneous connection of a ship source of electrical power and external electrical power supply to the same dead part of the electrical system is to be prevented.

4.4.5 For high-voltage connections, suitable means are to be provided to earth the connection power circuit so that it is discharged and so maintained that it is safe to touch.

4.4.6 Means provided to connect a connection power circuit to earth are to be arranged such that the circuit may only be earthed when it is isolated.

4.4.7 Interlocking arrangements are to be provided to prevent the connection of a high-voltage external power supply to a switchboard connected to earth using the means required by Pt 6, Ch 2,7.8.

4.5 Ship power restoration

4.5.1 When the ship main source of electrical power is shut-down and failure of the connected external electrical power supply occurs, the Connection Circuit-Breaker is to be arranged to automatically open followed by:

- (a) connection of the emergency source of electrical power to emergency services in accordance with Pt 6, Ch 2,3.2.6(a)(ii), 3.2.6(b)(ii) to (iii), 3.3.6(a)(ii) or 3.3.6(b)(ii) to (iii) as applicable; and
- (b) automatic connection of the transitional source of electrical power to emergency services in accordance with Pt 6, Ch 2,3.2.7 or 3.3.7 as applicable; and
- (c) automatic starting and connecting to the main switchboard of the main source of electrical power and automatic sequential restarting of essential services, in as short a time as is practicable. See also 2.1.3 and Pt 6, Ch 2,2.2.3.

Failures include loss of power, disconnection, phase failure and quality of supply outside the tolerances given in Pt 6, Ch 2,1.7.2 or 1.7.4.

4.5.2 An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply to indicate activation of the automatic power supply failure response required by 4.5.1. The alarm is to indicate the failure that caused the activation.

4.5.3 The automatic power supply failure response required by 4.5.1 is to be inhibited during the 'dead transfer' required by 4.1.1 but arrangements are to permit personnel to readily revert to operation from ship sources of electrical power if the 'dead transfer' to the external electrical power supply is not completed.

Section 5 Control and monitoring

5.1 General

5.1.1 Control engineering arrangements are to be in accordance with Pt 6, Ch 1, as applicable. The connection of, and the electrical load transfer to and from, an external electrical power supply are only to be controlled on board using shipboard arrangements.

5.1.2 External control of ship equipment may only be provided when in accordance with 5.1.5. Otherwise, external arrangements may be used to send requests for action to ship personnel for consideration.

5.1.3 Integration or connection with external, control, alarm and safety systems is to be 'fail-safe'.

5.1.4 The effects of failure of control, alarm and safety system and data communication link connections are to be documented along with resulting failure responses in the submission required by 1.4.6.

5.1.5 Details of proposals that would involve external control of ship equipment to respond to potentially hazardous situations detected externally are to be submitted for consideration. Provided that the arrangements are considered to be in accordance with the provisions of an acceptable and relevant standard, the following external control functions may be permitted:

- initiation of load reductions;
- initiation of electrical load transfer to ship sources of electrical power; and
- initiation of Emergency Shut-Down.

5.1.6 The connection power circuit is to be isolated, and for high-voltage connections connected to earth so that it is discharged and so maintained that it is safe to touch, until the connections necessary for safe and effective operation are correctly established, including control, alarm and safety system and data communication link connections.

5.1.7 Following the correct establishment of the necessary connections in accordance with 5.1.6:

- where applicable, the connection power circuit may be disconnected from earth; and arranged such that only then
- may the request to make the external power supply connection points live described in 5.1.8 be sent.

5.1.8 Ship control system arrangements are to be provided to request the external electrical power supply conductors to be:

- where applicable, disconnected from earth; and then
- made live up to the connection points.

5.1.9 An alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply upon failure of arrangements required to maintain ready availability in accordance with 2.1.3 (for example pre-heating).

5.1.10 Additional alarms with their associated safeguards are indicated in Table 15.5.1. These are in addition to those required by other Parts of the Rules.

5.1.11 Means are to be provided to allow testing of control, alarm and safety system connections with external arrangements, including operation of Emergency Shut-Down facilities, before electrical connection to an external power supply.

5.2 Connection Equipment control and monitoring

5.2.1 Connection Equipment is to be capable of un-attended operation under normal operating conditions after correct application of the connection. Remote indication of active ship equipment faults at a machinery control station that is attended when connected to an external electrical power supply is to be provided. Details of arrangements that involve periodic attendance to inspect and adjust Connection Equipment may be submitted for consideration.

5.2.2 A control station is to be provided locally to Connection Equipment cable reel, cranes and gantries that permits identification of faults and permits safe and effective supervision and control of this equipment in the foreseeable environmental conditions.

5.2.3 A fixed means of two-way voice communication with a machinery control station that is attended when connected to an external electrical power supply is to be provided at the control station required by 5.2.2.

5.2.4 The control station required by 5.2.2 is to be provided with a means for operators to:

- select manual control; or
- lock equipment in position; or
- where provided, select automatic adjustment.

This status is to be indicated remotely at a machinery control station that is attended when connected to an external electrical power supply.

5.2.5 When the equipment status selection referred to in 5.2.4 is changed whilst an external electrical power supply is connected, an alarm is to be activated at a machinery control station that is attended when connected to an external electrical power supply.

5.2.6 Where correctly applied connection equipment is not protected from submersion in the water between the ship and shore (e.g. submersible equipment, equipment routing or slack cable prevention by torque control), an alarm is to be provided at a machinery control station that is attended when connected to an external electrical power supply when Connection Equipment approaches a situation where it may be submerged in the water between the ship and shore, for instance due to tidal changes. The time between alarm initiation and possible exposure to this water is to be sufficient to allow the equipment to be attended and adjusted prior to exposure to water.

5.3 Emergency Shut-Down

5.3.1 The requirements of this sub-Section apply to arrangements for the emergency disconnection of live electrical power from the connection to an external electrical power supply.

Table 15.5.1 Additional alarms and associated safeguards

Item	Alarm	Note
Presence of voltage on connections		Indicators in accordance with 3.1.9.
Transfer of load	Time limit exceeded	Return to previous operating state to be indicated, see 4.1.5.
Ship power restoration	Activation	See 4.5.2.
Arrangements to ensure main and auxiliary machinery availability	Failure	When shut-down. See 5.1.9.
Applied connection equipment status	Changed	Indication to be provided also. See 5.2.4 and 5.2.5.
Connection equipment	Close proximity to water level	See 5.2.6.
Connection equipment tension	High	Emergency Shut-Down to be activated. See 5.3.10.
Plug connectors	Withdrawal	
Connection cable, for connection ratings	Short-circuit	
Manual disconnection	Activation	
Plug and socket-outlet, if required. See 5.3.5	Not in locked position	
Switchgear enclosure mounted socket-outlets	Arc fault detection	

On-shore Power Supplies

Part 7, Chapter 15

Sections 5 & 6

5.3.2 Emergency Shut-Down facilities are to be provided that, when activated, will instantaneously:

- isolate the connection from ship electrical power supplies; and
- request isolation of the external electrical power supply connection points.

5.3.3 For high-voltage connections, the Connection Equipment power connections are also to be discharged so that they are safe to touch following the isolation from ship and shore electrical power supplies required by 5.3.2 in as short a time as practicable. Where earthing of connecting external equipment by ship equipment would not be permitted by the authorities responsible for the external equipment, details are to be submitted prior to connection for consideration. The submission is to detail alternative proposals for personnel protection and Connection Equipment power conductors discharge in the event of activation of the Emergency Shut-Down facilities.

5.3.4 Means are to be provided to detect or predict tension in the external electrical power supply connection cable that activate the Emergency Shut-Down facilities described in 5.3.2 before damage occurs. Where alternative arrangements to tension detection are proposed (automatic break-away release, connectors with shear bolts and pilot lines, connection with ship/shore Emergency Shut-Down system, etc.), details are to be submitted for consideration.

5.3.5 To detect and react to the withdrawal of plugs from socket-outlets while power supply connections are live, the Emergency Shut-Down facilities described in 5.3.2 are to be activated before the necessary degree of protection is no longer achieved or power connections are broken by the removal of a plug from a connected socket-outlet, including in-line connections.

5.3.6 For high-voltage connections where the means of locking together plugs and socket-outlets required by 3.3.4 are not interlocked to prevent removal from the locked position when the Connection Equipment power connections are not discharged so that they are safe to touch, the Emergency Shut-Down facilities described in 5.3.2 are to be activated when connected plugs are moved from the locked position. Consideration may be given to relaxing this requirement when evidence is submitted which demonstrates that appropriate controls and procedures acceptable to LR are in place to control personnel access plugs and socket-outlets.

5.3.7 Where connection power plugs are connected to socket-outlets mounted on a switchgear enclosure, arrangements are to be provided to activate the Emergency Shut-Down facilities described in 5.3.2 in as short a time as practicable in the event of an arc occurring in the enclosure at the rear of the socket-outlets.

5.3.8 Where shipboard cables are extended to the external electrical power supply connection points then a protective device is to be provided which will activate the Emergency Shut-Down facilities described in 5.3.2 in the event of a short-circuit in the shipboard cables from the connection cubicle when connected to an external power supply in accordance with 3.1.10.

5.3.9 Means to manually activate the Emergency Shut-Down facilities described in 5.3.2 are to be provided at:

- a machinery control station that is attended when connected to an external electrical power supply;
- in close proximity to the connection cubicle; and
- at the switchboard where the fixed cable from the shore connection cubicle are received.

Additional manual activation facilities may also be provided at other locations where it is considered necessary. The means of activation are to be visible and prominent, prevent inadvertent operation and require a manual action to reset.

5.3.10 An alarm to indicate activation of the Emergency Shut-Down is to be provided at a machinery control station that is attended when connected to an external electrical power supply. The alarm is to indicate the cause of the activation. For power supply restoration, see 4.5.1 to 4.5.3.

Section 6 Testing, trials and surveys

6.1 General

6.1.1 The testing and trials required by 6.1.2 to 6.1.4 are to be successfully completed to the Surveyor's satisfaction before **OPS** notation may be assigned. Where appropriate test facilities cannot be provided, trials are likely to require the additional co-operation of a port facility with a suitable external electrical power supply and the ability to operate the defined services to be supplied during these trials and allow the testing described to be conducted.

6.1.2 Electrical and control engineering equipment is to be surveyed at manufacturer's works and undergo survey and operational trials on board in accordance with the approved test schedules and applicable testing requirements in Pt 6, Ch 1 and Ch 2. See also Pt 6, Ch 2, 1.3.5.

6.1.3 Cable reels, cranes and/or gantry drives for Connection Equipment are to be surveyed and tested in accordance with applicable LR Rules and 3.2.9(e).

6.1.4 Trials are to be conducted when connected to a compatible external electrical power supply in accordance with 3.1.10 to demonstrate to the attending Surveyor that the Rules have been complied with in respect of:

- operation of connection management arrangements;
- trials on cable lifting appliances (for example cable reels or cranes) are to be conducted that demonstrate suitability for the maximum mechanical load and duty required by the Defined Operations within the service profile contained in the Design Statement, including connection of extensions or adapters;
- satisfactory performance of the connection and Connection Equipment throughout the Defined Operations, including a run with the defined services to be supplied operational;
- temperature of electrical joints, connections, circuit-breakers and fuses;

- (e) the operation of electrical load transfer arrangements, (including Transfer Time Limit setting), electrical system protection and interlocking devices, Emergency Shut-Down arrangements and other safety devices and ship power restoration;
- (f) where acceptable type-test evidence is not submitted, connection break-away, see 3.2.7;
- (g) voltage regulation when the maximum load is suddenly thrown off and when starting the largest motor connected to the system;
- (h) where more than one external power supply connection can be operated in parallel, satisfactory load sharing at loads up to normal working load; and
- (j) voltage drop is to be measured, where necessary, to verify that this is not in excess of that specified in Pt 6, Ch 2, 1.7.

6.1.5 Arrangements are to be:

- examined at Annual Survey; and
- examined and functionally tested whilst connected to an external electrical power supply during the Complete Surveys of machinery or, where this is not practical, within 12 months of the due date of the Complete Surveys of machinery.

This is to include examination of Connection Equipment.

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 16

Section 1

Section

1 Requirements for machinery and engineering systems of unconventional design

■ Section 1 Requirements for machinery and engineering systems of unconventional design

1.1 General – Scope and objectives

1.1.1 Consistent with the aims of the IMO guidelines for Formal Safety Assessment (MSC/Circ.1023), the requirements of this Section aim to ensure that risks to maritime safety and the environment, stemming from the introduction of machinery or engineering systems of unconventional design, are addressed insofar as they affect the objectives of classification.

1.1.2 The requirements of this section are to be satisfied where:

- (a) machinery is required to be constructed, installed and tested in accordance with Lloyds Register's (hereinafter referred to as LR) Rules and Regulations and for which the corresponding machinery class notation is to be assigned (see Pt 1, Ch 2,2.4); and
- (b) the machinery and engineering systems are considered by LR to be of an unconventional design and which, as a result, are not directly addressed by LR's extant Rules and Regulations.

1.1.3 It is to be noted that as well as the requirements of this section, the general requirements of LR's Rules and Regulations are also to be satisfied as far as they are applicable.

1.1.4 Compliance with ISO15288 *Systems Engineering – System Life Cycle Processes* or an acceptable equivalent National Standard may be accepted as meeting the requirements of 1.3 to 1.11.

1.2 Information to be submitted

1.2.1 Information is to be submitted for assessment of compliance with the general requirements of LR's Rules and Regulations, including the general requirements for:

- (a) Machinery, see Pt 5, Ch 1.
- (b) Steam raising plant and pressure vessels, see Pt 5, Ch 10.
- (c) Machinery and ship piping systems, see Pt 5, Ch 12 to Ch 14.
- (d) Control engineering, see Pt 6, Ch 1.
- (e) Electrical engineering, see Pt 6, Ch 2.
- (f) Materials, see *Rules for the Manufacture, Testing and Certification of Materials*.

1.2.2 In addition to the information identified in 1.2.1, the information described in 1.2.3 and 1.2.4 is also to be submitted for consideration.

1.2.3 General description detailing the extent of the machinery or engineering system, the shipboard services it is to provide, its operating principles, and its functionality and capability when operating in the environment to which it is likely to be exposed under both normal and foreseeable abnormal conditions. The general description is to be supported by the following information as applicable:

- (a) System block diagram.
- (b) Piping and instrumentation diagrams.
- (c) Description of operating modes, including: Start-up, shut-down, automatic, reversionary, manual and emergency.
- (d) Description of safety related arrangements, including: Safeguards, automatic safety systems and interfaces with ships safety systems.
- (e) Description of connections to other shipboard machinery, equipment and systems, including: Electrical, mechanical, fluids and automation.
- (f) Plans of physical arrangements, including: Location, operational access and maintenance access.
- (g) Operating manuals, including: Instructions for start-up, operation, shut-down, instructions for maintenance, instructions for adjustments to the performance and functionality and details of risk mitigation arrangements.
- (h) Maintenance manuals, including: Instructions for routine maintenance, repair following failure, disposal of components and recommended spares inventory.

1.2.4 Project process documentation including:

- (a) Project Management Plan, see 1.3.
- (b) Requirements Definition Document, see 1.4.
- (c) Quality Assurance Plan, see 1.5.
- (d) Design Definition Document, see 1.6.
- (e) Risk Management Plan, see 1.7.
- (f) Configuration Management Plan, see 1.8.
- (g) Verification Plan, see 1.7.
- (h) Integration Plan, see 1.10.
- (i) Validation Plan (certification and survey), see 1.11.

1.3 Project management

1.3.1 A project management procedure is to be established in order to define and manage the key project processes. The project processes are to include the processes described in 1.4 to 1.11.

1.3.2 For the entire project, and each of the processes within the project, the project management procedure is to define the following:

- (a) Activities to be carried out.
- (b) Required inputs and outputs.
- (c) Roles of key personnel.
- (d) Responsibilities of key personnel.
- (e) Competence of key personnel.
- (f) Schedules for the activities.

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 16

Section 1

1.4 Requirements definition

1.4.1 A requirements definition procedure is to be established in order to define the functional behaviour and performance of the machinery or engineering system required by individual stakeholders, in the environments to which the machinery or engineering system is likely to be exposed under both normal and foreseeable emergency conditions.

1.4.2 The procedure is to take account of requirements resulting from key stakeholders, including:

- (a) Ship's owner.
- (b) Ship's operator.
- (c) Ship's crew.
- (d) Shipyard.
- (e) Systems integrator.
- (f) Designers.
- (g) Maintenance personnel.
- (h) Surveyors.
- (j) Manufacturers and suppliers.
- (k) National Administration.
- (l) LR.

1.4.3 The procedure is to take account of requirements resulting from the following influences:

- (a) Ship operations, including:
Underway, manoeuvring, pilotage, docking, alongside and training exercises.
- (b) Ship conditions, including:
Normal operation, abnormal operation, blackout, dead-ship, fire in a single compartment and flooding of a single compartment.
- (c) Environmental conditions, including:
Temperature, humidity, water spray, salt mist, vibration, shock, inclination, electrical fields and magnetic fields.
- (d) Applicable provisions, including:
Statutory legislation, classification requirements, international standards, national standards and codes of practice.
- (e) Expected users, including:
Multi-national users with a range of national languages and cultures, fatigued users, users without dedicated training, and maintenance and survey personnel.
- (f) Design, construction and operational constraints, including:
Effect of particular design decisions or component choices on other aspects of design, risk and production engineering compromises, verification, integration and validation considerations, maintenance and disposal, and changes in use.

1.4.4 The procedure is to specify the functional behaviour and performance requirements and is to identify the source of the requirements.

1.5 Quality assurance

1.5.1 A quality assurance procedure is to be established in order to ensure that the quality of the machinery or engineering system is in accordance with a defined quality management system.

1.5.2 The procedure is to define the specific quality controls to be applied during the project in order to satisfy the requirements of the quality management system.

1.5.3 The quality management system is to satisfy the requirements of ISO9001:2000 *Quality management systems – Requirements*, or an equivalent acceptable National Standard.

1.6 Design definition

1.6.1 A design definition procedure is to be established in order to define the requirements for the design of machinery or an engineering system which satisfies stakeholder requirements, quality assurance requirements and complies with basic internationally recognised design requirements for safety and functionality.

1.6.2 The procedure is to ensure that the design of the machinery or engineering system satisfies:

- (a) Statutory legislation.
- (b) LR's requirements.
- (c) International Standards and Codes of Practice where relevant.

1.6.3 The procedure is to take account of stakeholder requirements, see 1.4.

1.6.4 The procedure is to take account of quality assurance requirements, see 1.5.

1.6.5 The procedure is to ensure that the requirements for the design of major components and subsystems of the machinery or engineering system can be verified before and after integration.

1.6.6 The procedure is to specify the design requirements and is to identify the source of the requirements.

1.6.7 Any deviations from stakeholder requirements are to be identified, justified and accepted by the originating stakeholder.

1.7 Risk management

1.7.1 A risk management procedure is to be established in order to ensure that any risks stemming from the introduction of the machinery or engineering system are addressed, in particular risks affecting:

- (a) The structural strength and integrity of the ship's hull.
- (b) The safety of shipboard machinery and engineering systems.
- (c) The safety of shipboard personnel.
- (d) The reliability of essential and emergency machinery and engineering systems.
- (e) The environment.

1.7.2 The procedure is to consider the hazards associated with installation, operation, maintenance and disposal, both with the machinery or engineering system functioning correctly and following any reasonably foreseeable failure.

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 16

Section 1

1.7.3 The procedure is to take account of stakeholder requirements, see 1.4.

1.7.4 The procedure is to take account of design requirements, see 1.6.

1.7.5 The procedure is to ensure that hazards are identified using acceptable and recognised hazard identification techniques, and that the effects of the following influences are considered:

- (a) Ship operations, including:
Underway, manoeuvring, pilotage, docking, alongside and maintenance, commissioning and trials.
- (b) Ship conditions, including:
Normal operation, blackout, dead-ship, fire in a single compartment and flooding of a single compartment.
- (c) Modes of operation, including:
Start-up, running, shut-down, automatic, reversionary, manual and emergency.
- (d) Environmental conditions, including:
Temperature, humidity, water spray, salt mist, vibration, shock, inclination, electrical fields and magnetic fields.
- (e) Dependencies, including:
Power, fuel, air, cooling, heating, data and human input.
- (f) Environmental impact, including:
Emissions to air, discharges to water, noise and waste products.
- (g) Failures, including:
Human error, supply failure, system, machinery, equipment and component failure, random, systematic and common cause failures.

1.7.6 The procedure is to ensure that risks are analysed using acceptable and recognised risk analysis techniques and that the following effects are considered:

- (a) Local effects:
Loss of function, component damage, fire, explosion, electric shock, harmful releases and hazardous releases.
- (b) End effects on:
Services essential to the safety of the ship, services essential to the safety of shipboard personnel and services essential to the protection of the environment.

1.7.7 The procedure is to ensure that risks are eliminated wherever possible. Risks which cannot be eliminated are to be mitigated as necessary.

1.7.8 Details of risks, and the means by which they are mitigated, are to be included in the operating manual, see 1.2.3.

1.8 Configuration management

1.8.1 A configuration management procedure is to be established in order to ensure traceability of the configuration of the machinery or engineering system, its subsystems and its components.

1.8.2 The procedure is to identify items essential for the safety or operation of the machinery or engineering system (configuration control items) which could foreseeably be changed during the lifetime of the machinery or engineering system, including:

- (a) Documentation.
- (b) Software.
- (c) Sensors.
- (d) Actuators.
- (e) Instrumentation.
- (f) Valves.
- (g) Pumps.

1.8.3 The procedure is to take account of the design requirements, see 1.6.

1.8.4 The procedure is to include items used to mitigate risks, see 1.7.

1.8.5 The procedure is to ensure that any changes to configuration control items are:

- (a) Identified.
- (b) Recorded.
- (c) Evaluated.
- (d) Approved.
- (e) Incorporated.
- (f) Verified.

1.9 Verification

1.9.1 A verification procedure is to be established in order to ensure that subsystems and major components of the machinery or engineering system satisfy their design requirements.

1.9.2 The procedure is to verify design requirements, see 1.6.

1.9.3 The procedure is to identify the requirements to be verified, the means by which they are to be verified, and the points in the project at which verification is to be carried out.

1.9.4 The procedure is to be based on one or a combination of the following activities as appropriate:

- (a) Design review.
- (b) Product inspection.
- (c) Process audit.
- (d) Product testing.

1.10 Integration

1.10.1 An integration procedure is to be established in order to ensure that the machinery or engineering system is assembled in a sequence which allows verification of individual subsystems and major components following integration in advance of validating the entire machinery or engineering system.

1.10.2 The procedure is to take account of the verification requirements, see 1.9.

Requirements for Machinery and Engineering Systems of Unconventional Design

Part 7, Chapter 16

Section 1

1.10.3 The procedure is to identify the subsystems and major components, the sequence in which they are to be integrated, the points in the project at which integration is to be carried out, and the points in the project at which verification is to be carried out.

1.11 Validation (certification and survey)

1.11.1 A validation procedure is to be established in order to ensure the functional behaviour and performance of the machinery or engineering system meets with its functional and performance requirements.

1.11.2 The procedure is to validate stakeholder requirements, see 1.4.

1.11.3 The procedure is to validate arrangements required to mitigate risks, see 1.7.

1.11.4 The procedure is to validate the traceability of the configuration control items, see 1.8.

1.11.5 The procedure is to identify the requirements to be validated, the means by which they are to be validated and the points in the project at which validation is to be carried out, including:

- (a) Factory acceptance testing.
 - (b) Integration testing.
 - (c) Commissioning.
 - (d) Sea trials.
 - (e) Survey.
-

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Section 1

Section

- 1 **General requirements**
- 2 **Construction and installation**
- 3 **Refrigerating machinery and refrigerant storage compartment arrangements**
- 4 **Refrigerant detection systems**
- 5 **Control and monitoring and electrical power arrangements**
- 6 **Personnel safety equipment and systems**
- 7 **Testing and trials**

■ Section 1 General requirements

1.1 General

1.1.1 This Chapter states the requirements for ships having centralised refrigeration systems, designed to reject heat from refrigerated stores or from the air-conditioning and ventilation arrangements fitted to both passenger and crew accommodation spaces and are in addition to the relevant requirements of Parts 5 and 6.

1.1.2 The requirements, which are optional, cover arrangements, equipment, and systems necessary for provision stores and air-conditioning arrangements as defined in 1.1.3 and 1.1.4.

1.1.3 The refrigeration system is to include the refrigeration compressor(s), condenser(s), evaporator(s), direct expansion air handling and fan coil units, interconnecting primary refrigerant piping system and fittings.

NOTE

For the purpose of these Rules, the term primary refrigerant system, unless otherwise stated, applies to primary refrigerant systems and secondary refrigerant systems containing volatile refrigerants.

1.1.4 These requirements are intended to mitigate risks associated with the safety of refrigeration and air conditioning machinery, and do not cover air distribution ductwork, chilled water systems or the calculation and verification of air flow rates and cooling loads within the air conditioned or refrigerated spaces. The method used to calculate the capacity of the air-conditioning refrigeration equipment is the responsibility of the Shipbuilder and Owner and should be in accordance with a recognised code or standard such as ISO 7547:2002 *Ships and marine technology – Air-conditioning and ventilation of accommodation spaces – Design conditions and basis of calculations* or, ASHRAE 26-1996(RA2006) *Mechanical Refrigeration and Air-Conditioning Installations Aboard Ship*.

1.1.5 Ships complying with the applicable requirements of this Chapter will be eligible for the optional machinery class notation **RPA** (Refrigeration Machinery for Provision Stores and Air-conditioning).

1.2 Plans and information

1.2.1 The following plans and particulars, as applicable, and any others which may be specially requested for the refrigerating plant and systems, are to be submitted in triplicate for approval, before construction is commenced:

- (a) Schematic plans, including full particulars of piping and instrumentations, for:
 - (i) primary and secondary refrigerant systems containing a volatile fluid;
 - (ii) air cooler defrosting arrangements; and
 - (iii) condenser cooling water systems.
- (b) Detailed dimensioned plans and material specifications for:
 - (i) reciprocating compressor crankshaft and crankcase, where exposed to refrigerant pressure;
 - (ii) rotary-type compressor rotors and casing;
 - (iii) condensers, both shell and tube, and plate type;
 - (iv) evaporators, both shell and tube, and plate type;
 - (v) air coolers or arrangement of air cooling pipe grids and construction method;
 - (vi) liquid receivers;
 - (vii) oil separators; and
 - (viii) any other pressure vessels or heat exchangers containing primary refrigerants, see Pt 5, Ch 11,6.1.
- (c) General arrangement of refrigerating machinery compartments in elevation and plan, showing location and arrangement of the plant, ventilation details and location of temperature sensors and refrigerant vapour detectors.
- (d) Details of automatic controls, alarms and safety systems, see Pt 6, Ch 1,1.
- (e) Details of primary refrigerant level indicators.
- (f) Capacity calculations for pressure relief valves and/or bursting discs, and inlet and discharge pipework pressure drop calculations.
- (g) Programme of tests to be conducted on completion of the installation, see Section 7.

1.2.2 In addition to the applicable requirements detailed in 1.2.1, the following information is also to be submitted for air-conditioning refrigeration equipment:

- (a) Details of direct expansion fan coil units (FCUs).
- (b) Details of cooling coils, fitted to air handling units (AHUs) that contain primary refrigerant.
- (c) General arrangement drawing showing the location of the air-conditioning refrigeration equipment, direct expansion FCUs and AHUs throughout the ship.
- (d) Details of pressure testing procedures for the refrigeration equipment.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Sections 1 & 2

1.2.3 Plans showing the general arrangement of refrigeration plant compartments, together with a description of the equipment and arrangements installed for isolation and distribution of ventilation air and the electrical power supply systems. The plans are to indicate segregation and access arrangements for compartments and associated control rooms and control stations.

1.2.4 A statement of the intended design system capacity for the intended operating conditions for verification purposes at the trials required by 7.2.1

1.2.5 A schedule of testing and trials to demonstrate that systems are capable of operating as designed and as required by Section 7.

1.2.6 Operating manuals are to be submitted for information. The manuals are to include the following information:

- (a) Particulars and a description of the systems.
- (b) Operating instructions for the equipment and systems.
- (c) Maintenance instructions for the installed arrangements.

1.2.7 Evidence that the required performance of refrigeration systems, pump and fan equipment is capable of being maintained under ambient and inclination operating conditions defined in Pt 5, Ch 1,3.5 and 3.6 is to be provided by the manufacturer.

2.2.2 Valves and flexible hose lengths are to comply with the relevant requirements of Pt 5, Ch 12.

2.2.3 Pipes in piping systems are to be permanent pipes made with approved pipe connections to enable ready removal of valves, pumps, fittings and equipment. The pipes are to be efficiently secured in position to prevent chafing or lateral movement.

2.2.4 Suitable means for expansion are to be made, where necessary, in each range of pipes.

2.2.5 Suitable protection is to be provided for all pipes and equipment situated where they are liable to mechanical damage.

2.2.6 All moving parts are to be provided with guards to minimise danger to personnel.

2.2.7 Primary refrigerant pipework, serving AHUs and FCUs, which pass through bulkheads and deckheads is to comply with the requirements of SOLAS Chapter II-2, Regulation 9.3.

2.3 Valves and relief devices

2.3.1 Valves are to be fitted in places where they are readily accessible at all times.

2.3.2 Relief valves are to be adjusted and bursting discs so selected that they relieve at a pressure not greater than the design pressure of the system. When satisfactorily adjusted, relief valves are to be protected against tampering or interference by a locking wire with a lead seal or similar arrangement, *see also* 2.4.4.

2.4 Refrigerant systems

2.4.1 The primary refrigerants ammonia, hydrocarbons or carbon dioxide shall not be used in direct expansion FCUs located in accommodation spaces. The use of these refrigerants in machinery spaces, such as a separate AHU compartment, may be accepted subject to suitable safety arrangements being provided to the satisfaction of Lloyd's Register (hereinafter referred to as LR).

2.4.2 Compartments containing refrigeration plant are to be provided with refrigerant gas leak detectors with an alarm. *See* Section 4.

2.4.3 The design of refrigeration systems is to permit maintenance and repair without unavoidable loss of refrigerant to atmosphere. To minimise refrigerant release to the atmosphere, refrigerant recovery units are to be provided to allow evacuation of a system prior to maintenance.

2.4.4 Refrigeration systems are to be provided with relief devices which are arranged with sufficient margins to avoid circumstances that would allow an inadvertent discharge of refrigerant to the atmosphere. The system is to be so designed that over-pressure due to fire conditions can be safely relieved.

Section 2

Construction and installation

2.1 Materials

2.1.1 The selection of materials for piping systems in provision store refrigeration systems is to take account of the following:

- (a) The pressures and temperatures of the refrigerant fluids.
- (b) Locations of systems and equipment.
- (c) Compatibility of materials.
- (d) Fluid flow rates and static pressure conditions.
- (e) Minimising corrosion and erosion through life of system.
- (f) Refrigerant flammability and toxicity.

2.1.2 Pipes, valves and fittings are in general to be made of steel, ductile cast iron, copper, copper alloy, or other approved ductile material suitable for the intended purpose. The use of plastics materials is also acceptable subject to the restrictions in Pt 5, Ch 12,5.

2.1.3 Where applicable, the piping systems are to comply with the requirements of Pt 5, Ch 12.

2.2 Equipment – Selection and installation

2.2.1 Pressure vessels in provision store and air conditioning refrigeration systems are to be in accordance with Pt 5, Ch 11 or an alternative recognised code acceptable to LR.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Section 2

2.4.5 A pressure relief valve and/or bursting disc is to be fitted between each positive displacement compressor and its gas delivery stop valve, the discharge being led to the suction side of the compressor. The refrigerant flow capacity of the valve or disc is to exceed the full load compressor capacity for the particular refrigerant at the maximum potential suction pressure. For these internal relief valves, servo-operated valves will be accepted. Where the motive power for the compressor does not exceed 10 kW, the pressure relief valve and/or bursting disc may be omitted.

2.4.6 Each pressure vessel which may contain liquid refrigerant and which is capable of being isolated by means of a stop or automatic control or check valve is to be protected by two pressure relief valves or two bursting discs, or one of each, controlled by a changeover device. Pressure vessels that are connected by pipework without valves, so that they cannot be isolated from each other, may be regarded as a single pressure vessel for this purpose, provided that the interconnecting pipework does not prevent effective venting of any pressure vessel.

2.4.7 Omission of one of the specified relief devices and changeover device, as required by 2.4.6, will be accepted where:

- (a) vessels are of less than 300 litres internal gross volume; or
- (b) vessels discharge into the low pressure side of the system by means of a relief valve.

2.4.8 Sections of systems and components that could become full of liquid between closed valves are to be provided with pressure relief devices relieving to a suitable point in the refrigerant circuit.

2.4.9 Where any hermetic or semi-hermetic compressor has the electric motor cooled by the circulating refrigerant, the following arrangements are to be provided:

- (a) Refrigeration circuits are to contain no more than one hermetic or semi-hermetic compressors.
- (b) Each compressor motor is to be fitted with a thermal cut-out device to protect the motor against overheating.
- (c) Each refrigerant circuit is to contain a suitable arrangement to allow debris or contaminants from a motor failure to be removed.
- (d) The pressure envelope of any hermetic or semi-hermetic compressor exposed to the refrigerant pressure is to be designed and constructed in accordance with the requirements of Pt 5, Ch 11 and Pt 5, Ch 17 as applicable. Plans are to be submitted for consideration as required by Pt 5, Ch 11, 1.6.

2.5 Air handling unit(s) (AHUs) for air conditioning systems

2.5.1 Evaporator coils as fitted to direct expansion AHUs are to be considered for approval and plans are to be submitted, see also 1.2.2. All other equipment fitted to an AHU, such as air filtration, dehumidification, heating and humidification systems are outside the scope of these Rules and are the responsibility of the Shipyard and Owner.

2.5.2 Each AHU is to be provided with suitable drip trays and drainage arrangements to remove any condensate which may form.

2.5.3 The installation arrangements of AHUs are to be such as to allow sufficient space for the withdrawal and replacement of the refrigerant cooling coil.

2.6 Air coolers and cooling grids for provision store refrigeration systems

2.6.1 Air cooler fan motors are to be suitably enclosed to withstand the effects of moisture.

2.6.2 Means are to be provided for effectively defrosting air coolers. Air coolers are to be provided with trays of suitable depth arranged to collect all condensate. The trays are to be provided with drains at their lowest points to enable the condensate to be drained away when the refrigerated spaces are in service. When a store operates at temperatures at, or lower than 0°C, provision is to be made for the prevention of freezing of the condensate.

2.6.3 The installation arrangements of air coolers are to be such that when the refrigerated spaces are loaded with provisions, adequate space is provided for the inspection, servicing and renewal of controls, valves, fans and fan motors.

2.6.4 Steel air cooler circuits and cooling grids are to be suitably protected against external corrosion.

2.7 Design pressures

2.7.1 The design pressure of the system will be regarded as equal to its maximum working pressure, see 2.7.5.

2.7.2 The maximum working pressure is the maximum permissible pressure within the system (or part system) in operation or at rest. No pressure relief valve or other protective device is to be set to a pressure higher than the maximum working pressure.

2.7.3 The design pressure of the low pressure side of the system is to be the saturated vapour pressure of the refrigerant at plus 46°C. Due regard is to be taken of defrosting arrangements which may cause a higher pressure to be imposed on the low pressure side of the system. For carbon dioxide design pressures, see 2.7.6.

2.7.4 The minimum design pressure of the high pressure side of the system (P_{dh}), is to be determined from $1,11 \times P_b$, where P_b is an allowance for the compressor high pressure cut-out. P_b is to be not less than to $1,11 \times P_a$, where P_a is the condenser working pressure, when operating in tropical zones and equates to the saturation pressure of the refrigerant at plus 46°C.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Sections 2 & 3

2.7.5 Design pressures applicable to refrigerants are to be not less than the values given in Table 17.2.1 when condensers are sea-water cooled. The design pressure for other refrigerants and condensing arrangements is to be agreed with LR.

Table 17.2.1 Design pressure limits

Refrigerant	Pressure, (bar g)	
	High	Low
R-717	21,2	17,2
R-22	20,6	16,7
R-290	18,1	14,7
R-600a	6,4	5,2
R-134a	13,4	10,9
R-407C	23,5	19,0
R-410A	34,5	28,0
R-507A	25,3	20,5
R-404A	24,8	20,1
R-744	See 2.7.6	
NOTE In view of increasing world-wide restrictive legislation and phasing out of the HCFC refrigerant R-22, it is recommended that this refrigerant should not be used in new installations.		

2.7.6 The proposed design pressure for a carbon dioxide system is to be stated, taking account of the maximum working pressure and the maximum pressure at rest conditions. Where the maximum pressure at rest condition is maintained by the fitting of a supplementary refrigeration unit, condensing the vapour in a holding vessel, supporting calculation is to be provided to show that this can be undertaken with a local ambient temperature of 45°C. The holding vessel is to be thermally insulated to prevent the operation of the relief devices within a 24 hour period after stopping the supplementary refrigeration unit at an ambient temperature of 45°C and an initial pressure equal to the starting pressure of the refrigeration unit.

2.7.7 Where a carbon dioxide system is designed for hot gas defrosting, due regard is to be given to the possibility of a higher pressure being imposed on the low pressure system. The design pressure for the hot gas defrosting section of the system is to be 10 per cent greater than the maximum pressure experienced during defrosting.

2.8 Insulation materials

2.8.1 Where applicable, having regard to their location and environmental conditions, insulation arrangements are to have:

- materials suitably resistant to fire;
- insulation lining suitably resistant to flame spread;
- effective protection against penetration of water vapour; and
- adequate protection against mechanical damage.

2.8.2 The potential for smoke generation and toxicity of insulation materials is to be in accordance with SOLAS Chapter II-2, Part B, Regulation 6.

2.8.3 Where the *in situ* foam type of insulation is proposed, full details of the process are to be submitted.

2.8.4 Prefabricated panel systems are to be fitted with suitable pressure equalising devices.

2.8.5 All low temperature pipework, valves and fittings are to be provided with suitable thermal insulation. See Pt 6, Ch 3,4.11.10.

2.9 Manufacture and certification

2.9.1 Pressure vessels satisfying the conditions listed in Pt 5, Ch 11,1.6.1 are to be constructed in accordance with the requirements of Pt 5, Ch 11 and 17. Plans are to be submitted for consideration as required by Pt 5, Ch 11,1.6.

2.9.2 Other equipment, apart from applicable pressure vessels and heat exchangers, used for air-conditioning or provision stores refrigeration systems are not required to be constructed under survey.

2.9.3 All major items of equipment, containing refrigerant, such as compressors, condensers, AHU cooling coils and FCUs shall be supplied with a manufacturer's works certificate providing details of the design and test pressures.

Section 3 Refrigerating machinery and refrigerant storage compartment arrangements

3.1 General

3.1.1 Refrigerating machinery is to be installed in a well ventilated compartment. In general, the arrangements are to be such that all components of the refrigerating machinery can be readily opened up for inspection or replacement. Space is to be provided for the withdrawal and renewal of the tubes in 'shell-and-tube' type evaporators (secondary refrigerant coolers) and condensers. Proposals for alternative arrangements are to be submitted to LR for consideration.

3.1.2 Refrigerating machinery using toxic and/or flammable refrigerants is to be located outside the main machinery space in a separate gastight compartment.

3.1.3 Where the refrigerating machinery is located in a separate gastight compartment, outside the main machinery space, this compartment is to be equipped with effective mechanical ventilation to provide 30 air changes per hour based upon the total volume of the space. The mechanical ventilation system is to have two methods of control, one of which is to be operable from outside the compartment.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Sections 3 & 4

3.1.4 Openings for pipes, electrical cables and other fittings in bulkheads and decks are to be fitted with gastight seals.

3.2 Gas storage compartments

3.2.1 Portable steel cylinders containing reserve supplies of refrigerant are to be stored in a well ventilated compartment reserved solely for this purpose.

3.2.2 The storage compartment is to be provided with a mechanical ventilation system providing 10 air changes per hour.

3.2.3 The storage compartment is to be provided with a suitable vapour detection system, see Section 4.

3.2.4 The storage compartment is to be provided with suitable water drainage arrangements not connected with the main machinery spaces.

3.2.5 Steel storage cylinders are to be of an approved type and are to be filled to a level suitable for an ambient temperature of plus 46°C.

3.2.6 The storage compartment is to be provided with racks to facilitate secure stowage of the cylinders.

3.3 Pressure testing at manufacturers' works

3.3.1 Components intended for use with a primary refrigerant are to be subject to pressure testing procedures as detailed in Table 17.3.1.

Table 17.3.1 Test pressure

Component	Test pressure, (bar g)	
	Pressure test	Tightness test
(1) Pressure vessels	See Pt 5, Ch 11	1,0p
(2) Compressor cylinders/ crankcase/casing	1,5p	1,0p
(3) Valves and fittings	2,0p	1,0p
(4) Pressure piping, fabricated. headers, air coolers, etc.	1,5p	1,0p
NOTE p is the design pressure as defined in 2.7.		

3.3.2 Component pressure tests are to be hydraulic or where suitable safety measures are taken, may be pneumatic. The latter is to be carried out with a suitable dry inert gas.

3.3.3 Component tightness tests are to be carried out only after completion of satisfactory pressure tests. Pneumatic pressure is to be applied using a suitable dry inert gas.

3.3.4 Components for use with a secondary refrigerant or cooling water are to be hydraulically tested to 1,5 times the design pressure which, in no case is to be less than 3,5 bar g.

3.4 Pressure test after installation on board ship

3.4.1 For primary refrigerant piping welded in place, pressure tests of the welds are to be carried out at a test pressure of 1,5p. This will normally take the form of a pneumatic test (see 3.4.2) since hydraulic testing media such as water are not acceptable due to their incompatibility with the primary refrigerants and the difficulty of removing all traces from a completed system.

3.4.2 Pneumatic pressure tests are to be carried out using a suitable inert gas.

NOTE

Where pneumatic testing is used, adequate safety precautions recognising the hazards involved should be observed to prevent danger to personnel and to minimise risk to property.

3.4.3 Where pneumatic tests are prohibited by relevant authorities, the tests required by 3.4.1 and 3.4.2 may be omitted provided non-destructive examination has been carried out by an approved operator to the satisfaction of LR and in accordance with the requirements of Pt 5, Ch 17,7.

3.4.4 After completion of the test required by 3.4.1, 3.4.2 or 3.4.3, a tightness test is to be carried out using a suitable inert gas at a pressure equal to the design pressure, in the presence of the surveyor.

3.4.5 Secondary refrigerant piping welded in place is to be hydraulically tested to 1,5 times the design pressure which, in no case is to be less than 3,5 bar g.

Section 4 Refrigerant detection systems

4.1 General

4.1.1 A fixed refrigerant detection system is to be provided in the refrigerating machinery compartment or space and ventilation outlet ducts when the ventilation system is shared with other compartments.

4.1.2 The alarm system is to comply with the requirements of Pt 6, Ch 1 and, as a minimum requirement, the system is to activate at a low-level concentration to give warning of refrigerant leaks, and at a high-level concentration corresponding to the refrigerant's safe occupational level.

4.1.3 Detection equipment is to be so designed that it may be readily tested and calibrated; any failure of the equipment is to initiate an alarm.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Sections 4 & 5

4.1.4 The location of the detectors is to be determined relative to the layouts of the individual compartments and machinery spaces and are to be indicated in the plan submission.

4.1.5 Audible and visual alarms are to be activated, located both inside and outside the affected space. The alarms are to be readily identifiable and be visible and audible in all locations within the space housing the refrigeration equipment.

Section 5 Control and monitoring and electrical power arrangements

5.1 General

5.1.1 Control engineering arrangements are to comply with Pt 6, Ch 1 as applicable.

5.1.2 All cooling and secondary refrigerant pumps are to be provided with an indication of discharge pressure and a low discharge pressure alarm at each control station.

5.1.3 The power to all independently driven ventilation fans is to be capable of being stopped from position(s) outside the fire boundary which will remain readily accessible in the event of fire occurring in any space, as well as from the local control panel.

5.1.4 Electrical engineering arrangements are to comply with Pt 6, Ch 2.

5.1.5 Refrigeration compressors are to be provided with the following instrumentation and automatic shutdowns:

- (a) Indication of suction pressure (saturated temperature), including intermediate stage when applicable.
- (b) Indication of discharge pressure (saturated temperature), including intermediate stage when applicable.
- (c) Indication of lubricating oil pressure.
- (d) Indication of cumulative running hours (screw compressors).
- (e) Automatic shutdown in the event of low lubricating oil pressure.
- (f) Automatic shutdown in the event of high discharge pressure, see also 5.1.13.
- (g) Automatic shutdown in the event of low suction pressure.

5.1.6 For refrigeration compressors greater than 25 kW, the following instrumentation, additional to that required by 5.1.5, is to be provided:

- (a) Indication of lubricating oil temperature.
- (b) Indication of condenser cooling water outlet temperature.
- (c) Indication of cumulative running hours (reciprocating compressors).
- (d) Indication of suction and discharge temperatures.

5.1.7 Alarms are to be initiated in the event of the following fault conditions with refrigeration compressors:

- (a) High discharge pressure.
- (b) Low suction pressure.
- (c) Low oil pressure.
- (d) High discharge temperature.
- (e) High oil temperature.
- (f) Motor shutdown.

5.1.8 Refrigeration plants are to be provided with the following alarms as applicable:

- (a) Failure of condenser cooling water pumps.
- (b) High condenser cooling water outlet temperature.
- (c) Failure of air cooler fans.
- (d) High and low refrigerated air delivery temperatures.
- (e) High secondary refrigerant temperatures.
- (f) Failure of secondary refrigerant pump.
- (g) Low level in secondary refrigerant header tank.

5.1.9 Where the air-conditioning/refrigerating system is fitted with automatic or remote controls, so that, under normal operating conditions, no manual intervention by the operators is required, it is to be provided with the alarms required by 5.1.6 to 5.1.8 in accordance with the relevant requirements of Pt 6, Ch 1.

5.1.10 Where more than one compressor is fitted, the control sequence is to be such as to allow one machine to stop in the event of a reduction in cooling duty. Provision is to be made to allow selection of the lead machine to equalise running hours.

5.1.11 To allow the equipment to be isolated from the power supply in the event of a failure or refrigerant leak, refrigeration compressors and AHUs are to be fitted with local emergency stop switches.

5.1.12 AHUs are to be provided with the following instrumentation as a minimum:

- (a) Indication of primary refrigerant outlet pressure and temperature; and
- (b) Indication of outlet air temperature.

5.1.13 Compressors are to be provided with automatic shutdown in the event of high discharge pressure. For refrigeration systems where the maximum working pressure is less than or equal to 40 bar g, the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,9 of the maximum working pressure. For refrigeration systems where the maximum working pressure is greater than 40 bar g, the automatic shutdown is to operate at a pressure in excess of normal operating pressure but no greater than 0,95 of the maximum working pressure.

Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations

Part 7, Chapter 17

Sections 6 & 7

■ Section 6 Personnel safety equipment and systems

6.1 Personnel safety equipment

6.1.1 Access doors to the refrigerated spaces are to open outwards, alternatively sliding doors may be used where the door is external to the space.

6.1.2 Access ways to the refrigerated spaces are to be designed to facilitate escape in emergencies, and the removal of stretcher-borne personnel.

6.1.3 Access ways and refrigerated compartments are to be provided with an independent lighting system in accordance with the requirements of Pt 6, Ch 2,5.7.2 and 5.7.4, with the means of locking the switches in the 'on' position.

6.1.4 Arrangements are to be such that means are provided for both opening the room door(s) and sounding the alarm required by 6.2.2 from inside refrigerated spaces.

6.1.5 Where ammonia is used in refrigerating systems, the following items of safety equipment are to be provided as a minimum, and positioned in accessible protected storage (e.g. locked glass fronted cabinets) located outside the machinery compartment:

- (a) Two sets of ammonia protective clothing (including helmet, boots and gloves).
- (b) Two portable battery powered hand lamps (to be of certified safe-type).
- (c) Two sets of self-contained breathing apparatus (compressed air).
- (d) Two full face mask respirators.
- (e) Two fire-resistant life-lines.
- (f) Two firemen's axes.
- (g) Two heavy duty adjustable spanners.
- (h) Two wheel wrenches.
- (i) Irrigation facilities or eye wash bottles containing an eye wash solution, distilled water or non-carbonated mineral water.
- (k) Hand or foot-operated douches providing a copious supply of clean water, located outside the compartment's doors.

6.2 Personnel warning systems

6.2.1 A system to monitor the well-being of crew members entering refrigerated spaces is to be provided.

6.2.2 The system is to be such that at a predetermined time, after initiation, the crew member(s) receives warning that the system is to alarm and must indicate their well-being by accepting the warning.

6.2.3 The system is to be designed and arranged such that only an authorised person has access for enabling and disabling it and setting the appropriate intervals, and such that it cannot be operated in an unauthorised manner.

6.2.4 It is to be possible to acknowledge the warning by means of illuminated switches situated near the access doors or hatches of each refrigerated space or chambers within the space.

6.2.5 In the event that the crew member(s) fails to respond and accept the warning within an agreed specified time, the system is to immediately initiate an alarm on the bridge and at the main control station, or subsidiary control stations as appropriate. Manual initiation of the alarm system from the refrigerated spaces is to be possible at any time.

6.2.6 The system is to comply with the relevant requirements of Pt 6, Ch 1.

■ Section 7 Testing and trials

7.1 Testing

7.1.1 The requirements of the Rules relating to testing of pressure vessels, piping and related fittings including hydraulic testing are applicable. See Pt 5, Ch 11 and Ch 12,8.

7.1.2 On completion, tanks and reservoirs for service and storage of system fluids are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.

7.1.3 After installation on board, piping systems together with associated fittings that are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.

7.1.4 Testing is to cover the following items:

- (a) Verification of control, alarm and safety systems.
- (b) Simulation tests for failure of refrigeration equipment, to verify correct functioning of alarms and systems in service.
- (c) Verification of accuracy, calibration and functioning of temperature control for refrigeration systems.

7.2 Trials

7.2.1 Acceptance trials, as stipulated in this Section, are to be conducted. It is to be demonstrated that the provision store or air-conditioning refrigerating system capacity meets the design duty. As far as is practicable, the trials are to represent the operating conditions that will be encountered in service. For example, the condenser cooling water flow should be restricted so that the compressor discharge pressure is at the design value.

RULES AND REGULATIONS FOR THE CLASSIFICATION OF SHIPS

PART 8 RULES FOR ICE AND COLD OPERATIONS

JULY 2009

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

PART	1	REGULATIONS
PART	2	RULES FOR THE MANUFACTURE, TESTING AND CERTIFICATION OF MATERIALS
PART	3	SHIP STRUCTURES (GENERAL)
PART	4	SHIP STRUCTURES (SHIP TYPES)
PART	5	MAIN AND AUXILIARY MACHINERY
PART	6	CONTROL, ELECTRICAL, REFRIGERATION AND FIRE
PART	7	OTHER SHIP TYPES AND SYSTEMS
PART	8	RULES FOR ICE AND COLD OPERATIONS
	Chapter 1	Application
	2	Ice Operations – Ice Class

CHAPTER	1	APPLICATION
Section	1	Scope
	1.1	General
Section	2	Ice environment
	2.1	General
	2.2	Definitions
	2.3	Application
	2.4	Ice Class notations
	2.5	National Authority requirements
	2.6	Ice conditions
Section	3	Air environment
	3.1	Air temperature
Section	4	Icing environment
	4.1	Ice accretion
CHAPTER	2	ICE OPERATIONS – ICE CLASS
Section	1	Strengthening requirements for navigation in ice – Application of requirements
	1.1	Additional strengthening
	1.2	Application for light ice conditions
	1.3	Application for first-year ice conditions
	1.4	Application for multi-year ice conditions
	1.5	Icebreakers
Section	2	General hull requirements for navigation in ice – All Ice Classes
	2.1	General
	2.2	Definitions
Section	3	General machinery requirements for navigation in ice – All Ice Classes
	3.1	Materials for shafting
	3.2	Materials for propellers
	3.3	Ship-side valves
	3.4	Fire pumps in motor ships
Section	4	Hull requirements for light ice conditions – Ice Classes 1D and 1E
	4.1	Ice Class 1D
	4.2	Ice Class 1E – General
	4.3	Shell plating
	4.4	Transverse framing
	4.5	Primary longitudinal members supporting ice frames
	4.6	Stern frame and rudder
	4.7	Weld connections
Section	5	Machinery requirements for light ice conditions – Ice Classes 1D and 1E
	5.1	General
	5.2	Engine power
	5.3	Main engine shafting and propellers
	5.4	Minimum propeller blade tip thickness
	5.5	Blade edge thickness
	5.6	Cooling water lines
Section	6	Hull requirements for first-year conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D
	6.1	Framing – General requirements
	6.2	Primary longitudinal members supporting transverse ice framing
	6.3	Stern
	6.4	Stern
	6.5	Rudder and steering arrangements

Section	7	Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS
	7.1	General
	7.2	Determination of ice torque
	7.3	Propeller blade sections
	7.4	Propeller blade minimum tip thickness
	7.5	Intermediate blade sections
	7.6	Blade edge thickness
	7.7	Mechanisms for controllable pitch propellers
	7.8	Keyless propellers
	7.9	Screwshafts
	7.10	Intermediate and thrust shafts
	7.11	Reduction gearing
Section	8	Hull requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)
	8.1	General
Section	9	Machinery requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)
	9.1	Powering of ice strengthened ships
Section	10	Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7
	10.1	Hull areas
	10.2	Design ice loads – General
	10.3	Glancing impact load characteristics
	10.4	Bow area
	10.5	Hull areas other than the bow
	10.6	Design load patch
	10.7	Pressure within the design load patch
	10.8	Hull area factors
	10.9	Shell plate requirements
	10.10	Framing – General
	10.11	Framing – Transversely-framed side structures and bottom structures
	10.12	Framing – Side longitudinals (longitudinally framed ships)
	10.13	Framing – Web frame and load carrying stringers
	10.14	Framing – Structural stability
	10.15	Plated structures
	10.16	Corrosion/abrasion additions and steel renewal
	10.17	Materials
	10.18	Longitudinal strength – Application
	10.19	Design vertical ice force at the bow
	10.20	Design vertical shear force
	10.21	Design vertical ice bending moment
	10.22	Longitudinal strength criteria
	10.23	Stem and stern frames
	10.24	Appendages
	10.25	Local details
	10.26	Direct calculations
	10.27	Welding
Section	11	Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7
	11.1	Application
	11.2	Drawings and particulars to be submitted
	11.3	System design
	11.4	Materials exposed to sea water
	11.5	Materials exposed to sea water temperature
	11.6	Materials exposed to low air temperature
	11.7	Propeller ice interaction
	11.8	Ice class factors
	11.9	Design ice loads for open propeller
	11.10	Design ice loads for ducted propellers

11.11	Design loads on propulsion line – Torque
11.12	Design loads on propulsion line – Maximum response thrust
11.13	Design loads on propulsion line – Blade failure load for both open and nozzle propellers
11.14	Design – Design principle
11.15	Design – Azimuthing main propulsors
11.16	Blade design – Maximum blade stresses
11.17	Blade design – Blade edge thickness
11.18	Prime movers
11.19	Machinery fastening loading accelerations
11.20	Auxiliary systems
11.21	Sea inlets and cooling water systems
11.22	Ballast tanks
11.23	Ventilation system
11.24	Alternative design

Application

Part 8, Chapter 1

Sections 1 & 2

Section

- 1 **Scope**
- 2 **Ice environment**
- 3 **Air environment**
- 4 **Icing environment**

■ Section 1 Scope

1.1 General

1.1.1 The following requirements are for ships intended for operations in ice and cold conditions.

1.1.2 Guidance on the appropriate requirements and notations is provided in Table 1.1.1.

■ Section 2 Ice environment

2.1 General

2.1.1 This Section is intended to give assistance on the selection of a suitable ice class notation for the operation of ships in ice-covered regions.

2.1.2 The Owner is to confirm which notation is most suitable for their requirements. Ultimately, the responsibility rests with the master of the ship and their assessment of the ice and temperature conditions at the time.

2.1.3 The documentation supplied to the ship is to contain the ice class notation adopted, any operation limits for the ship and guidance on the type of ice that can be navigated for the nominated ice class.

Table 1.1.1 Ice and cold operations

Reference		Conditions	Description	Notation
Ice Operations				
Chapter 2	Section 1	Application		
	Section 2 Section 3	Hull Machinery	General requirements	Applicable to all ice classes
	Section 4 Section 5	Hull Machinery	Light and very light ice conditions	For ships with length less than 150 m Ice Class 1E
				Hull strengthening in forward region only Ice Class 1D
	Section 6 Section 7	Hull Machinery	First-year ice conditions	<i>Finnish-Swedish Ice Class Rules</i> Ice Class 1C FS Ice Class 1B FS Ice Class 1A FS Ice Class 1AS FS
	Section 8 Section 9	Hull Machinery		<i>Finnish-Swedish Ice Class Rules</i> with enhanced engine power for icebreaking capability Ice Class 1C FS(+) Ice Class 1B FS(+) Ice Class 1A FS(+) Ice Class 1AS FS(+)
	Section 10 Section 11	Hull Machinery	Multi-year ice conditions	IACS Polar Ship Rules Ice Class PC7 Ice Class PC6 Ice Class PC5 Ice Class PC4 Ice Class PC3 Ice Class PC2 Ice Class PC1
Cold operations				
Provisional Rules for the Winterisation of Ships	Section 1	Application		
	Section 2	Hull materials	Low temperature operations	Hull construction materials Winterisation H(T)
	Section 3	Equipment and systems	Low temperature operations	Short duration Winterisation C(T)
				Seasonal duration Winterisation B(T)
				Prolonged duration Winterisation A(T)

Application

Part 8, Chapter 1

Section 2

2.2 Definitions

2.2.1 The World Meteorological Organisation's, WMO, definitions for sea ice thickness are given in Table 1.2.1.

Table 1.2.1 WMO definition of ice conditions

Ice conditions	Ice thickness
Medium first-year	1,2 m
Thin first-year, second stage	0,7 m
Thin first-year, first stage	0,5 m
Grey-white	0,3 m
Grey	0,15 m

2.2.2 Table 1.2.2 defines the ice classes in relation to the Rules and the equivalent Internationally Recognised Standards.

2.3 Application

2.3.1 The variable nature of ice conditions is such that the average limits of the conditions are not easily defined. However, it is possible to plot the probable limits of the ice flows and the ice edge for each season. See Figs. 1.2.1 to 1.2.4, and Table 1.2.3.

2.3.2 Operation with **Ice Class 1C FS** may be possible up to 150 nm inside the 7/10 region shown depending on the severity of the winter. Operation with **Ice Class 1A FS** may be possible up to 150 nm inside the medium first-year ice shown depending on the severity of the winter. Operation up to the multi-year ice is possible most years with **Ice Class 1AS FS**.

Table 1.2.3 Concentration of ice

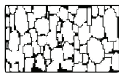

Free ice		0/10		
Open water		<1/10		
Very open drift		1/10		2/10
Open drift		4/10		5/10
Close pack/drift		7/10		8/10
Very close pack		9/10		
Very close pack		9+/10		
Compact/consolidated ice		10/10		

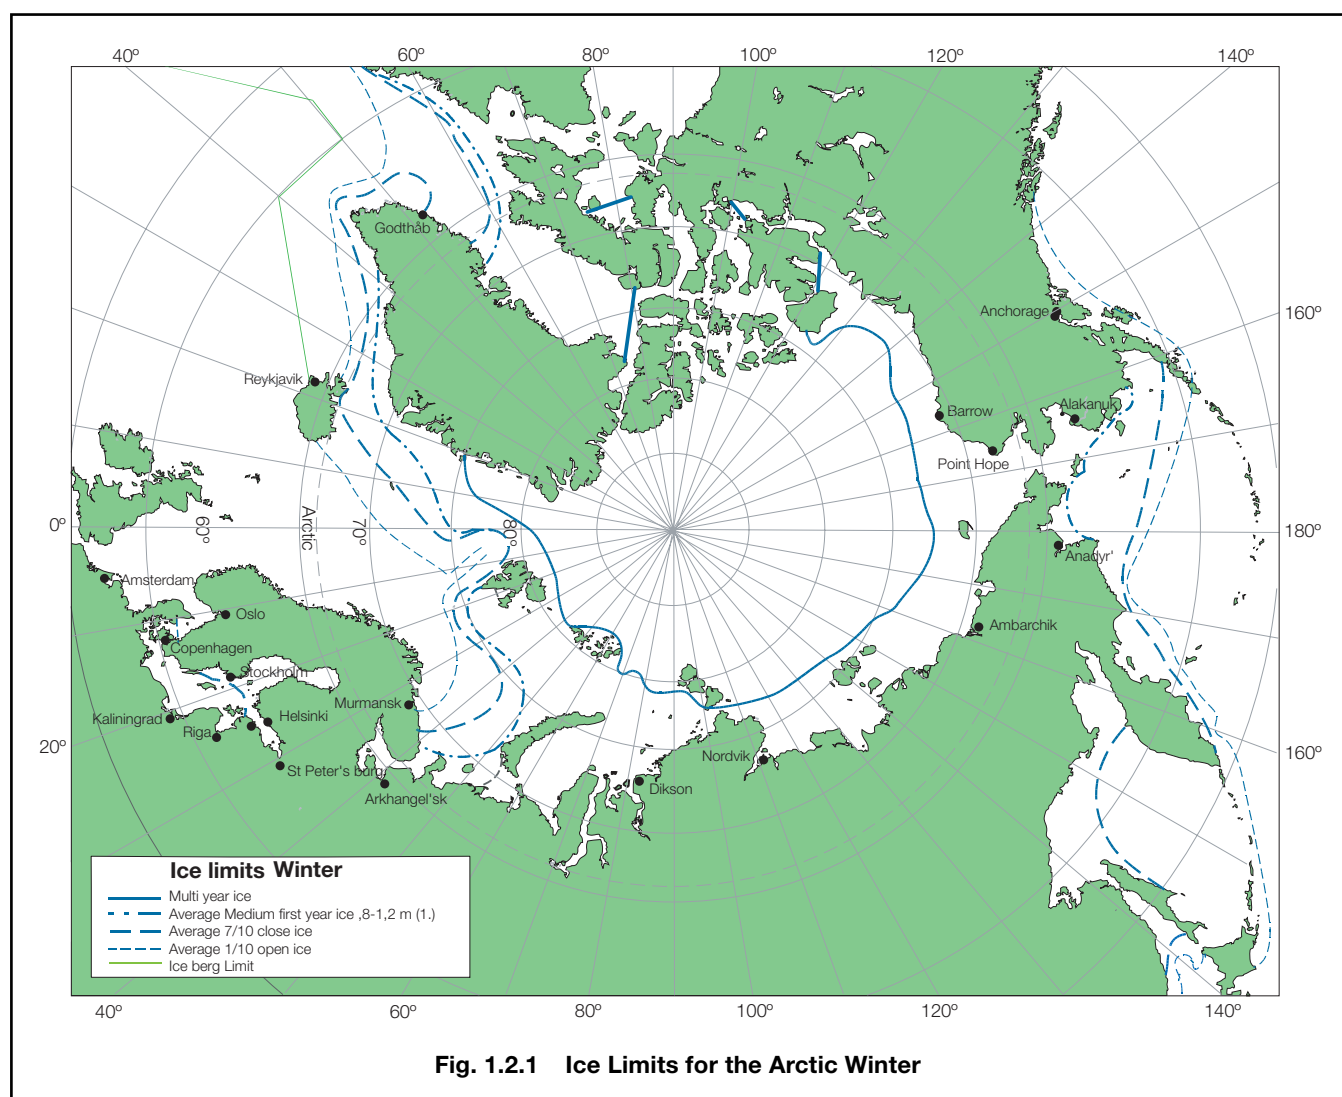

Table 1.2.2 Comparison of ice Standards

Lloyd's Register class notation	Finnish-Swedish Ice Class	Canadian type
Ice Class 1AS FS(+) Ice Class 1AS FS	IA Super	A
Ice Class 1A FS(+) Ice Class 1A FS	IA	B
Ice Class 1B FS(+) Ice Class 1B FS	IB	C
Ice Class 1C FS(+) Ice Class 1C FS	IC	D
Ice Class 1D	—	D
Ice Class 1E	—	E

2.3.3 Operation in the region between 7/10 and 1/10 in the ice-covered regions is possible with due care for ships with no ice class. For ships operating for extended periods in these areas, it will be necessary to specify and design for a minimum temperature for the hull materials. To cover all situations for a non-ice class ship, the material requirements of *The Provisional Rules for the Winterisation of Ships* are recommended.

2.4 Ice Class notations

2.4.1 Where the requirements of Chapter 2 are complied with, the ship will be eligible for a special features notation as defined in Pt 1, Ch 2,2.1.9, see also Table 1.1.1.

2.5 National Authority requirements

2.5.1 Certain areas of operation may require compliance or demonstration of equivalence with National Authority requirements. Table 1.2.2 gives the equivalence of National Authority requirements.

2.5.2 The standards of ice strengthening required by the Rules have been accepted by the Finnish and Swedish Boards of Navigation as being such as to warrant assignment of the Ice Classes given in Table 1.2.2.

2.5.3 Ships intending to navigate in the Canadian Arctic must comply with the *Canadian Arctic Shipping Pollution Prevention Regulations established by the Consolidated Regulations of Canada, 1978, Chapter 353*, in respect of which Lloyd's Register is authorised to issue Arctic Pollution Prevention Certificates.

2.5.4 The Canadian Arctic areas have been divided into zones relative to the severity of the ice conditions experienced and, in addition to geographic boundaries, each zone has seasonal limits affecting the necessary ice class notation required to permit operations at a particular time of year. It is the responsibility of the Owner to determine which notation is most suitable for their requirements.

2.5.5 The Canadian Authorities recognise that in the period November 6 to July 31 and any extension to that period declared by the Canadian Coast Guard, oil and bulk chemical tankers which qualify for Canadian Type A, B, C and D as indicated in Table 1.2.2 are suitable for operating in designated ice control zones within Canadian waters, off the east coast of Canada south of 60° north latitude. For all Type E tankers operating in this zone during the specified period, the Canadian Authorities will require either additional hull strength in way of the forward wing cargo tanks port and starboard, or the level of oil or chemical in these tanks to be not higher than one metre below the waterline of the ship in her condition of transit. Where the latter arrangement is adopted, the effect on longitudinal strength is to be considered.

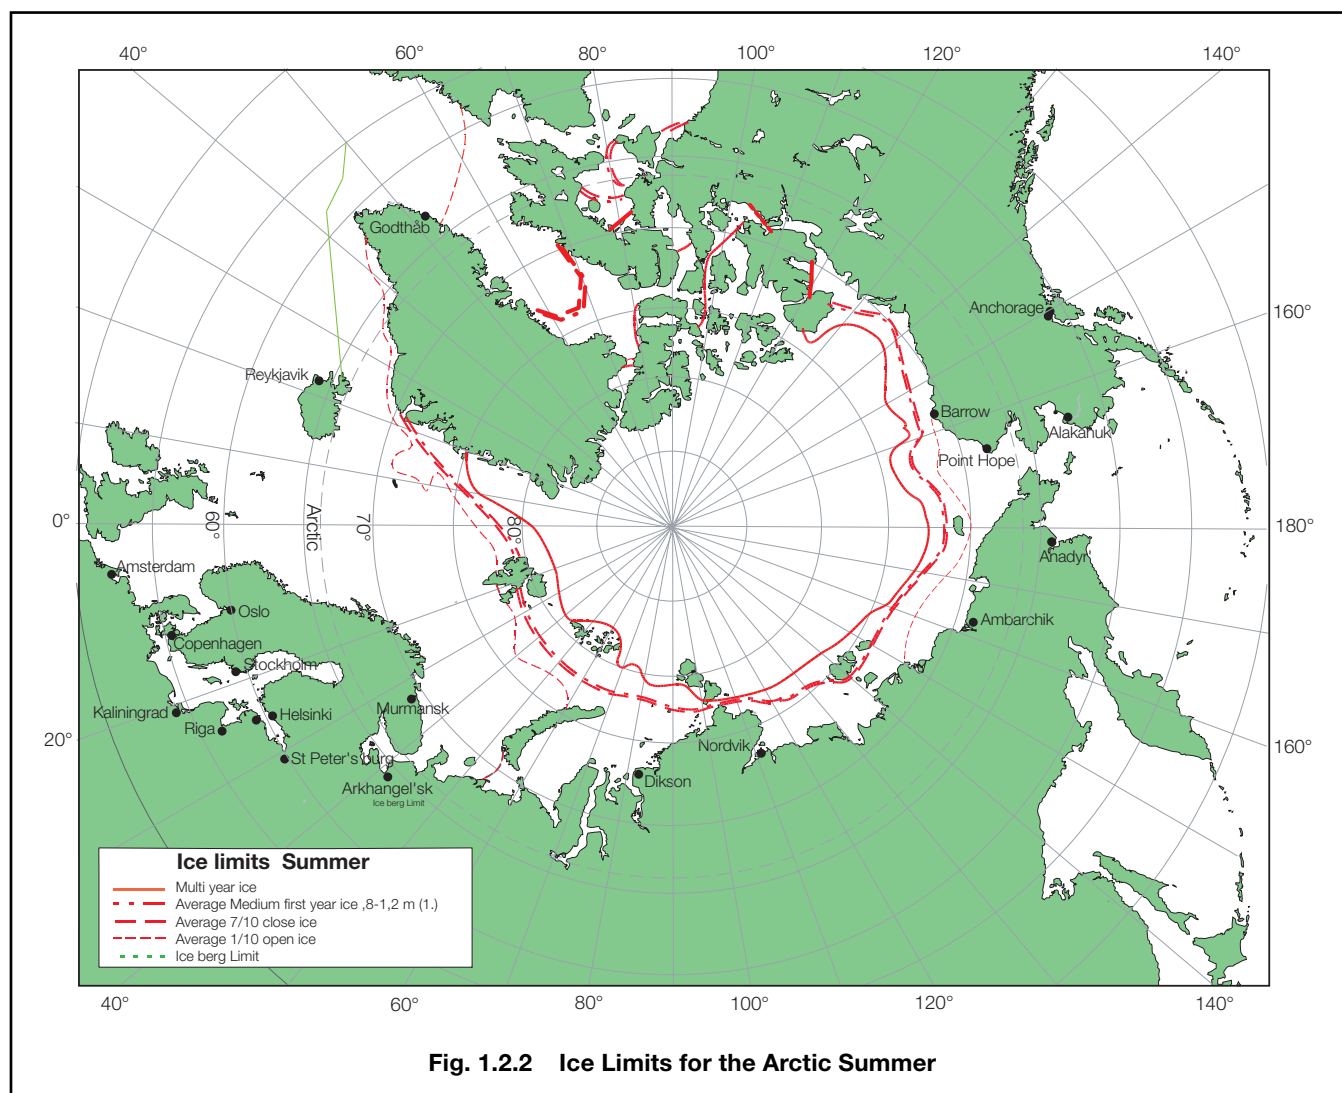

Fig. 1.2.2 Ice Limits for the Arctic Summer

2.5.6 For ships intending to navigate in Finnish-Swedish waters and having a **Polar Ice Class notation**, consideration may need to be given to the installed engine power such that it complies with the applicable *Finnish-Swedish Ice Class Rules*, see Ch 2,7.

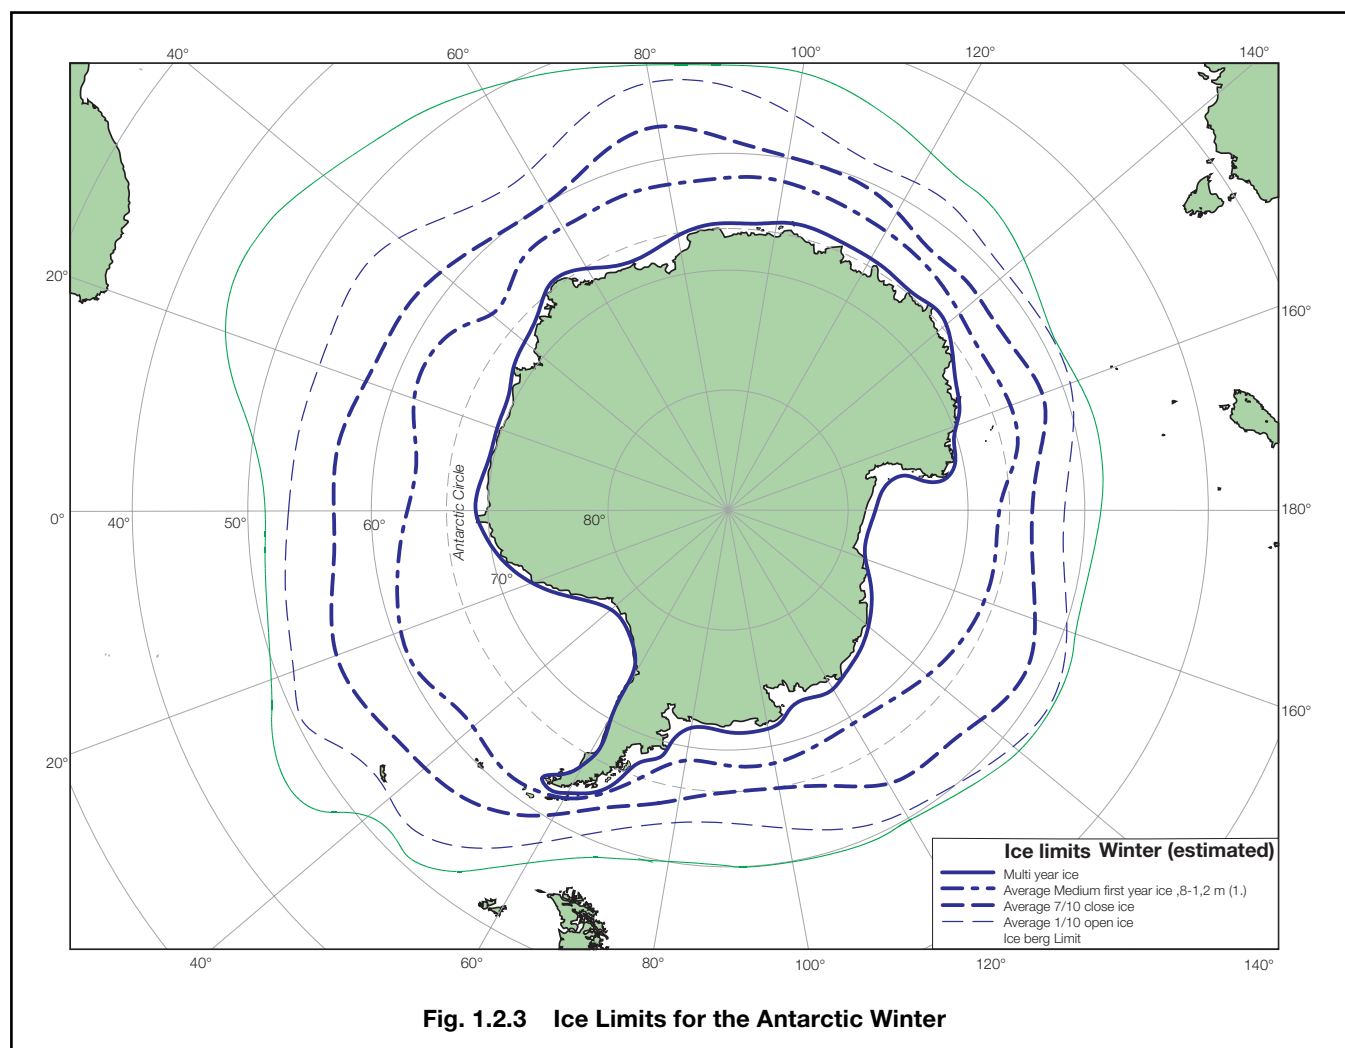

2.6 Ice conditions

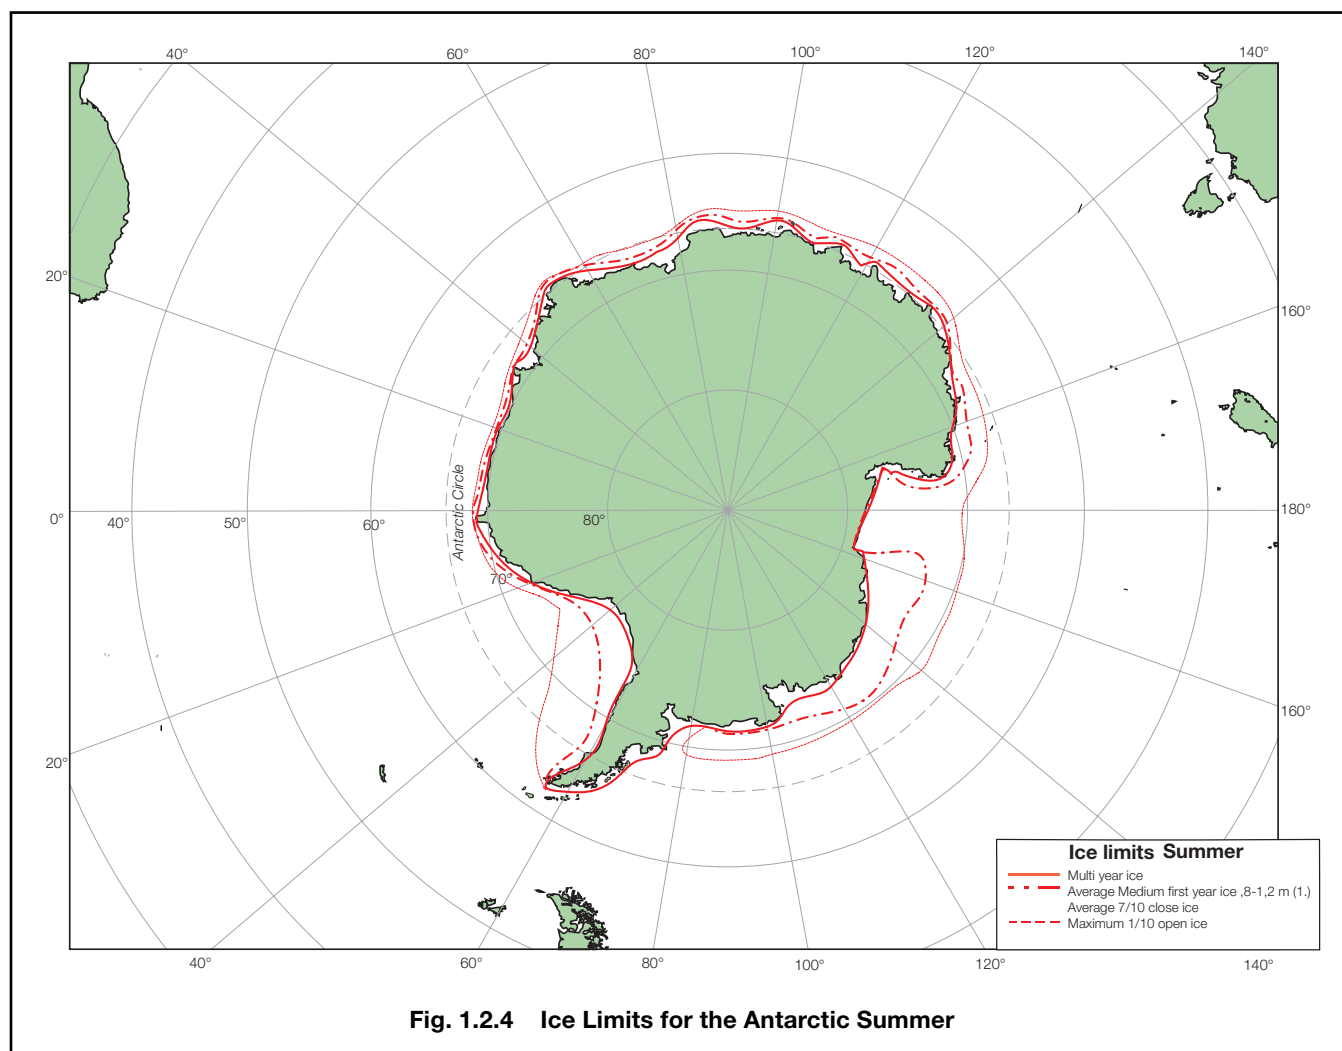

2.6.1 Charts and images for the current and recent ice conditions in all areas of the world plus information on icebergs can be found from the National Ice Centre on the world wide web at:

www.natice.noaa.gov

2.6.2 Daily ice information and consultation is available from the Canadian ice service which is part of the Canadian department of the environment. Their web site can be found at:

www.ice-glaces.ec.gc.ca

Section 3

Air environment

3.1 Air temperature

3.1.1 For ships intended to operate in cold regions, the temperature on exposed surfaces is to be considered. See *The Provisional Rules for the Winterisation of Ships*.

3.1.2 The average external design air temperature is to be taken as the lowest mean daily average air temperature in the area of operation:

where

- Mean = statistical mean over a minimum of 20 years
- Average = average during one day and one night
- Lowest = lowest during the year
- MDHT = Mean Daily High Temperature
- MDAT = Mean Daily Average Temperature
- MDLT = Mean Daily Low Temperature

Fig. 1.3.1 shows the definition graphically.

3.1.3 The lowest external design air temperature is to be taken as the lowest mean daily lowest air temperature in the area of operation. Where reliable environmental records for contemplated operational areas exist, the lowest external design air temperature may be obtained after the exclusions of all recorded values having a probability of occurrence of less than 3 per cent.

3.1.4 Lowest mean daily average air temperatures for the Arctic and Antarctic are provided in Figs. 1.3.2 and 1.3.3.

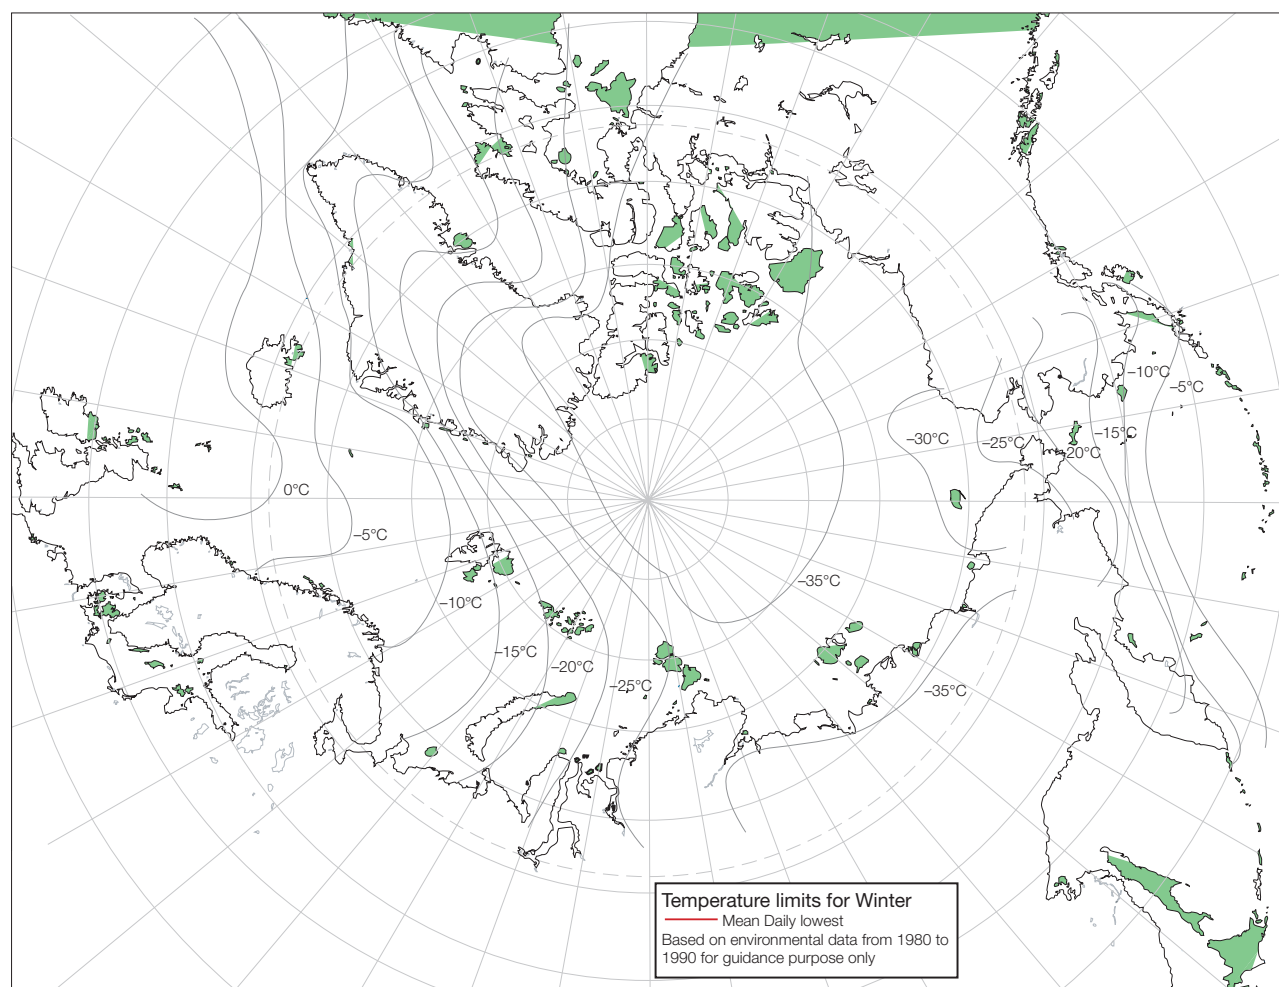

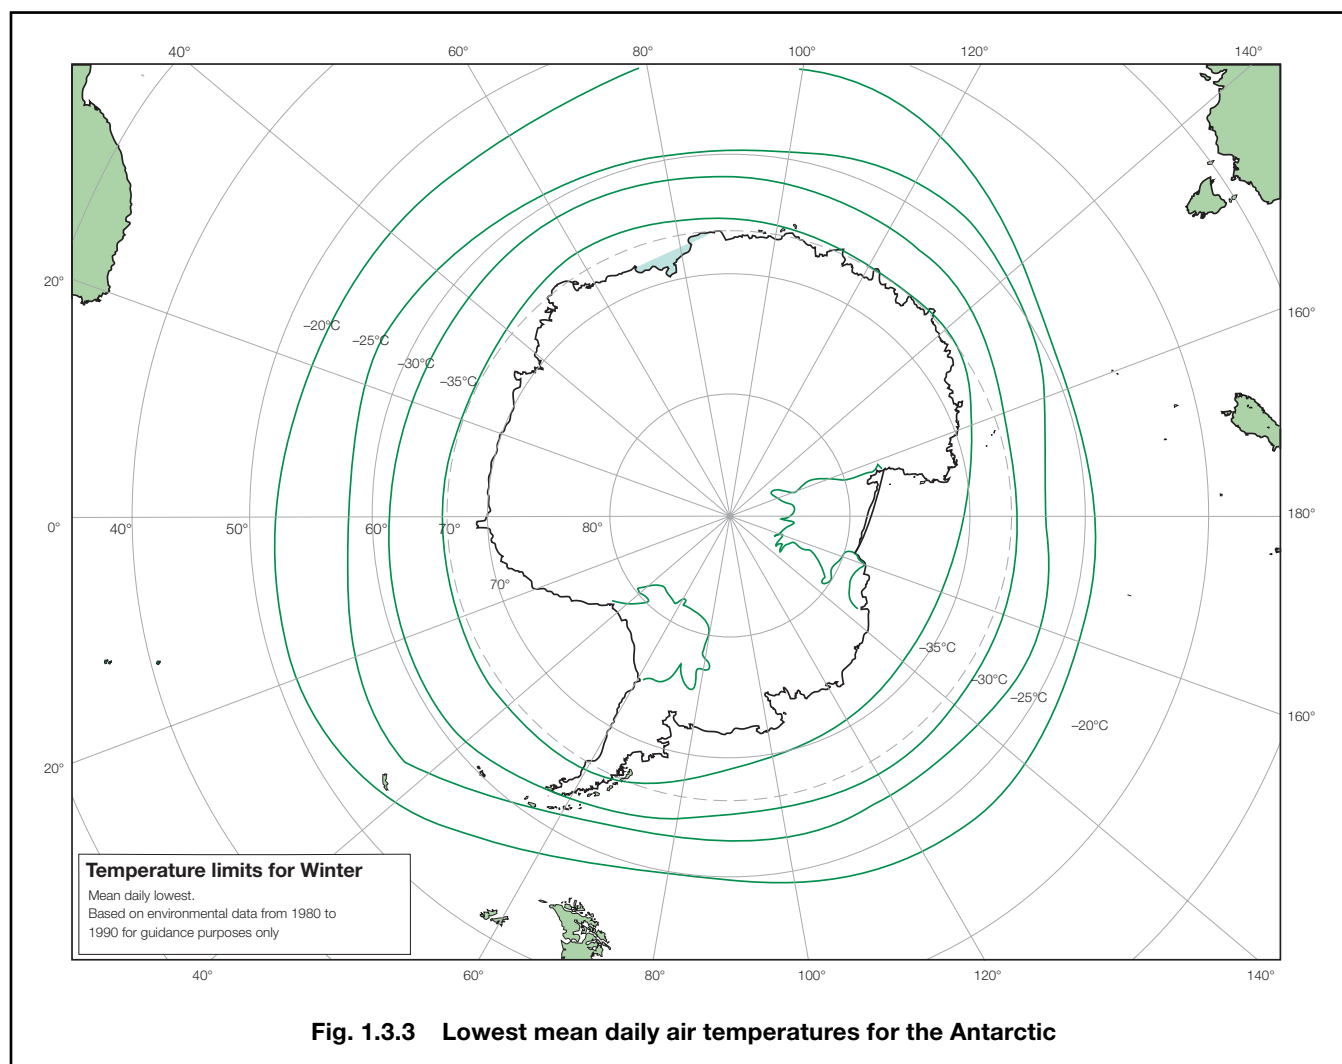

Fig. 1.3.2 Lowest mean daily air temperatures for the Arctic

Section 4 Icing environment

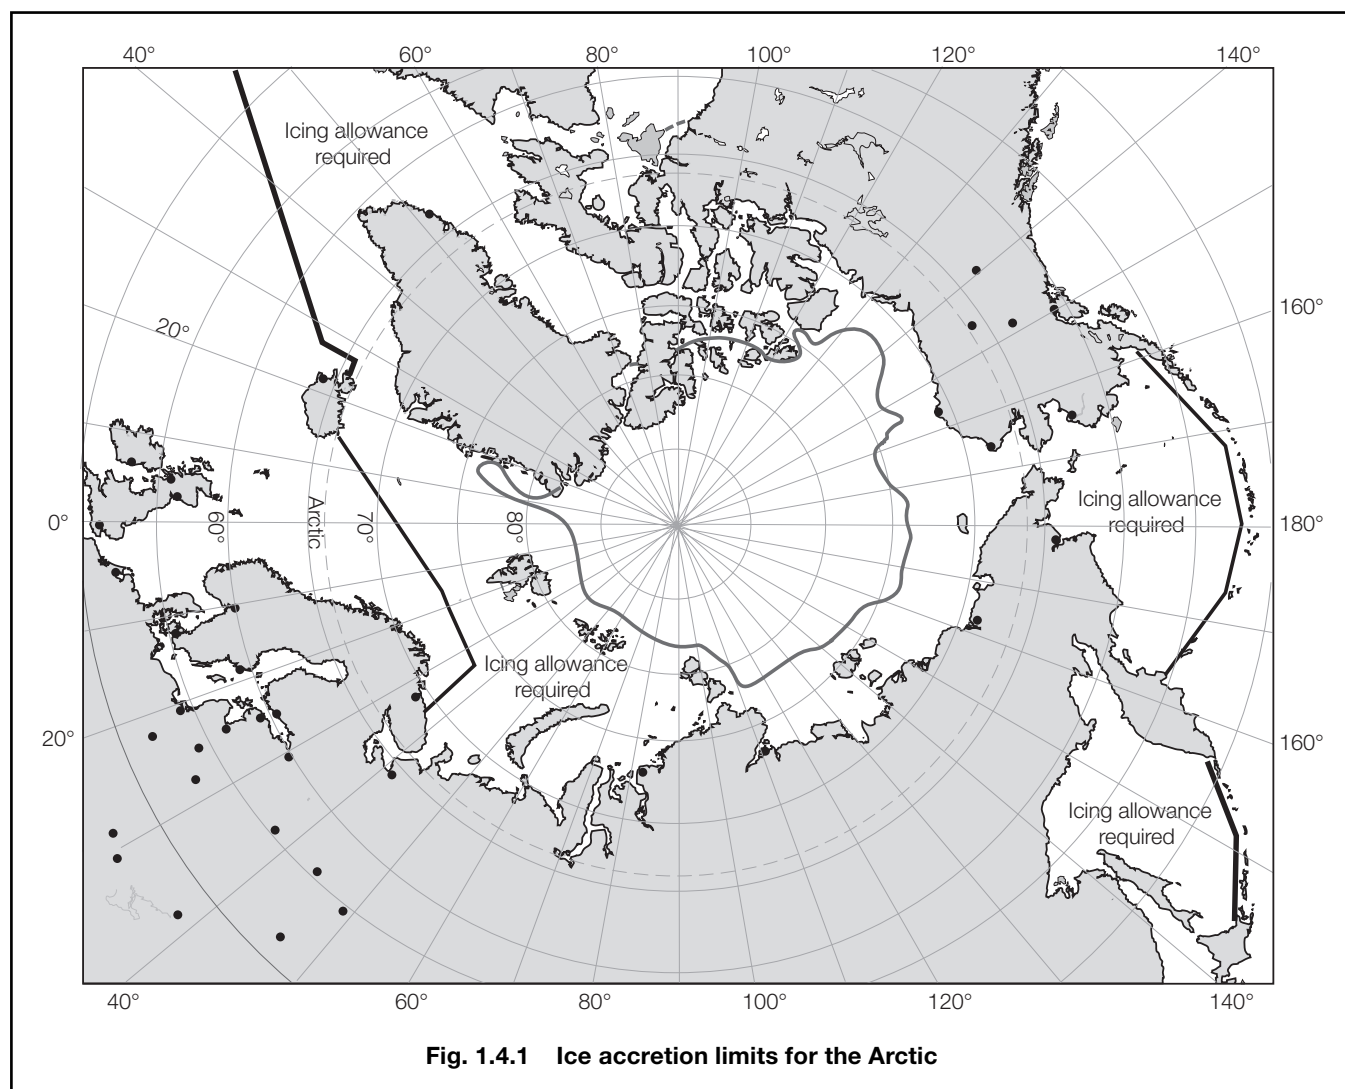

4.1 Ice accretion

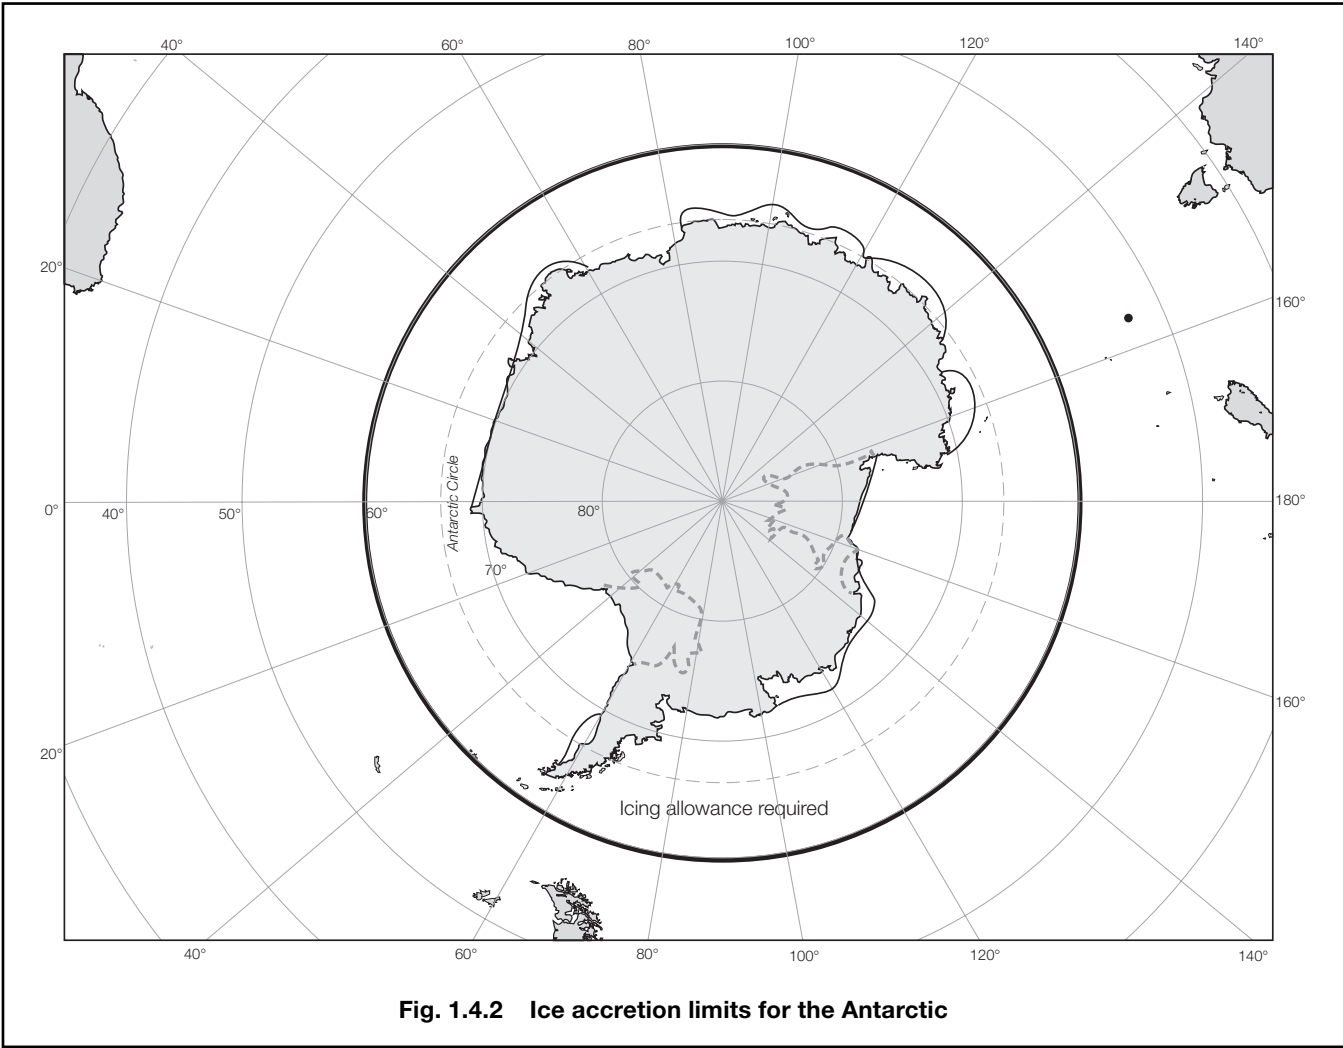

4.1.1 For ships intended to operate in cold regions, the build up of ice on exposed surfaces is to be considered. See *The Provisional Rules for the Winterisation of Ships*.

4.1.2 Icing is to be considered for vessels operating in the following areas, see Figs. 1.4.1 and 1.4.2.

- The area north of latitude 65°30'N, between longitude 28°W and the West coast of Iceland; north of the north coast of Iceland; north of the rhumb line running from latitude 66°N, longitude 15°W to latitude 73°30'N, longitude 15°E, north of latitude 73°30'N between longitude 15°E and 35°E, and east of longitude 35°E, as well as north of latitude 56°N in the Baltic Sea.
- The area north of latitude 43°N bounded in the west by the North American coast and the east by the rhumb line running from latitude 43°N, longitude 48°W to latitude 63°N, longitude 28°W and thence along longitude 28°W.

- All sea areas north of the North American continent west of the areas defined in subparagraphs above.
- The Bering and Okhotsk Seas and the Tartary Strait during the icing season.
- South of latitude 60°S.

- 3 **General machinery requirements for navigation in ice – All Ice Classes**
- 4 **Hull requirements for light ice conditions – Ice Classes 1D and 1E**
- 5 **Machinery requirements for light ice conditions – Ice Classes 1D and 1E**
- 6 **Hull requirements for first-year conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D**
- 7 **Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS**
- 8 **Hull requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)**
- 9 **Machinery requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)**
- 10 **Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7**
- 11 **Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7**

■ Section 1 Strengthening requirements for navigation in ice – Application of requirements

1.1 Additional strengthening

1.1.1 Where additional strengthening is fitted in accordance with the requirements given in this Chapter, an appropriate special features notation will be assigned. It is the responsibility of the Owner to determine which notation is most suitable for his requirements.

1.1.2 Where a special features notation is desired, the ship is to comply with the requirements of the applicable Sections, in addition to those for sea-going service, so far as they are applicable.

1.1.3 Where the hull and machinery are constructed so as to comply with the requirements of different ice classes, then the assigned Ice Class Notation will be indicated for the combination as the lower of these classes on the Certificate of Class. Any compliance of the hull or machinery with the requirements of a higher ice class will be indicated in square brackets after the main notation. Other supplementary information that would influence the ice performance will also be indicated. For example, a ship hull built in compliance with 1B FS and the machinery in compliance with 1AS FS would be assigned the Notation **Ice Class 1B FS [1AS FS Machinery]** or **Ice Class 1B FS [1AS FS azimuth thrusters]** where azimuth thrusters are included in the approval.

1.1.4 The vertical extent of the ice strengthening is related to the ice light and ice load waterlines, which are defined in 2.2. The maximum and minimum draughts at both the fore and aft ends (for the lowest ice class) will be stated on the Certificate of Class.

1.1.5 The installed and required minimum engine output (for the lowest ice class), see Section 7, will be stated on the Certificate of Class.

1.2 Application for light ice conditions

1.2.1 The requirements for **Ice Class IE** are for ships with length less than 150 m and are intended to navigate in very light first-year ice conditions, such as in brash ice and small ice pieces. The requirements of Sections 4 and 5 are to be complied with.

1.2.2 The requirements for **Ice Class 1D** are for ships intended to navigate in light first-year ice conditions. The requirements for strengthening the forward region, the rudder and steering arrangements for **Ice Class 1C FS** are applicable.

1.3 Application for first-year ice conditions

1.3.1 Ships that comply with the requirements of the Finnish Swedish Ice Class Rules and Sections 6 and 7, for **Ice Class IA Super**, **IA**, **IB** and **IC** may be assigned the corresponding notations **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** or **Ice Class 1C FS**. The *Finnish-Swedish Ice Class Rules* may be obtained from the following website: www.fma.fi

1.3.2 For ships where the ice class notation **Ice Class 1AS FS(+)**, **Ice Class 1A FS(+)**, **Ice Class 1B FS(+)** or **Ice Class 1C FS(+)** is requested, the requirements of the *Finnish-Swedish Ice Class Rules*, and Sections 8 and 9 are to be complied with.

1.4 Application for multi-year ice conditions

1.4.1 The requirements for strengthening for navigation in ice, as given in Sections 10 and 11, are intended for ships operating in multi-year ice in Arctic or Antarctic ice conditions under their own power and constructed of steel, except icebreakers, see 1.5.1.

Ice Operations – Ice Class

Part 8, Chapter 2

Sections 1 & 2

1.4.2 Ships that comply with Sections 10 and 11 can be considered for a Polar Class (PC) notation as listed in Table 2.1.1.

Table 2.1.1 Polar class descriptions

Polar Class	Ice description (based on WMO Sea Ice Nomenclature)
Ice Class PC 1	Year-round operation in all Polar waters
Ice Class PC 2	Year-round operation in moderate multi-year ice conditions
Ice Class PC 3	Year-round operation in second-year ice which may include multi-year ice inclusions
Ice Class PC 4	Year-round operation in thick first-year ice which may include old ice inclusions
Ice Class PC 5	Year-round operation in medium first-year ice which may include old ice inclusions
Ice Class PC 6	Summer/autumn operation in medium first-year ice which may include old ice inclusions
Ice Class PC 7	Summer/autumn operation in thin first-year ice which may include old ice inclusions

1.4.3 The Polar Class (PC) notations and descriptions are given in Table 2.1.1. It is the responsibility of the Owner to select an appropriate Polar Class. The descriptions in Table 2.1.1 are intended to guide owners, designers and administrations in selecting an appropriate Polar Class to match the requirements for the ship with its intended voyage or service.

1.4.4 The Polar Class notation is used throughout Sections 10 and 11 to convey the differences between classes with respect to operational capability and strength.

1.5 Icebreakers

1.5.1 Sea-going ships specially designed for ice-breaking duties will be assigned the ship type notation 'Icebreaker' in addition to the special features notation appropriate to the degree of ice strengthening provided. 'Icebreaker' refers to any ship having an operational profile that includes escort or ice management functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, and having a class certificate endorsed with this notation.

Section 2 General hull requirements for navigation in ice – All Ice Classes

2.1 General

2.1.1 In addition to the requirements of the *Finnish-Swedish Ice Class Rules*, the following Sections are to be complied with for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS**, **Ice Class 1C FS** and **Ice Class 1D**, where applicable. Alternative arrangements to attain similar performance will be specially considered.

2.1.2 The ballast capacity of the ship is to be sufficient to give adequate propeller immersion in all ice navigating conditions without trimming the ship in such a manner that the actual waterline at the bow is below the ice light waterline.

2.1.3 Fresh water and sea water ballast tanks situated above the design ballast waterline and adjacent to the shell, which are intended to be used in ice and cold navigating conditions, are to be provided with means to prevent freezing. These measures are to provide protection so that pumping water will not cause a vacuum beneath a layer of ice across the top of the water in the tank, and, are to protect against structural and systems damage from ice expansion. The following tank heating requirements are to be complied with:

- (a) For **Ice Class 1C**, **Ice Class 1D** and **Ice Class 1E**:
Tanks entirely above the waterline are to be provided with heating coils or continuous circulation.
Tanks partially below the waterline are to be provided with heating coils, continuous circulation or air bubbling.
- (b) For all other **Ice Classes**:
All tanks entirely above and partially below the waterline are to be provided with heating coils.

2.1.4 These Rules are formulated for both transverse and longitudinal framing systems but it is recommended that, whenever practicable, transverse framing is selected.

2.1.5 These Rules assume that when approaching ice infested waters, the ship's speed will be reduced appropriately. The vertical extent of ice strengthening for ships intended to operate at speeds exceeding 15 knots in areas containing isolated ice floes will be specially considered.

2.1.6 An icebreaking ship is to have a hull form at the fore end adapted to break ice effectively. It is recommended that bulbous bows are not fitted to **Ice Class 1AS** ships.

2.1.7 The stern of an icebreaking ship is to have a form such that broken ice is effectively displaced.

2.1.8 Where it is desired to make provision for short tow operations, the bow area is to be suitably reinforced. Similarly, icebreakers may require local reinforcement in way of the stern fork.

Ice Operations – Ice Class

Part 8, Chapter 2

Sections 2, 3 & 4

2.1.9 Shell strakes in way of ice strengthening area for plates are to be grade B/AH.

2.2 Definitions

2.2.1 The upper and lower ice waterlines upon which the design of the vessel has been based is to be indicated in the classification certificate. The upper ice waterline (UIWL) is to be defined by the maximum draughts fore, amidships and aft. The lower ice waterline (LIWL) is to be defined by the minimum draughts fore, amidships and aft.

2.2.2 The lower ice waterline is to be determined with due regard to the vessel's ice-going capability in the ballast loading conditions (e.g. propeller submergence).

2.2.3 The upper ice waterline (UIWL) and lower ice waterline (LIWL) are to be indicated on the plans. For navigation in certain geographical areas, the relevant National Authority may require the maximum Ice Class draught to be marked on the ship in a specified manner.

2.2.4 **Displacement Δ** is the displacement at the upper ice waterline (UIWL) when floating in water having a relative density of 1,0. For first-year ice class Rules, the displacement is in tonnes. For multi-year ice class Rules, the displacement is in kilo tonnes.

2.2.5 **Shaft power, P_0** , is the maximum propulsion shaft power, in kW, for which the machinery is to be classed.

3.2.2 For steel propellers, the elongation of the material used is to be not less than 19 per cent for a test piece length of 5d. Charpy impact tests are to be carried out in accordance with the requirements of the Rules for Materials.

3.2.3 Cast steel load transmitting components of controllable pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of Ch 4,5 of the Rules for Materials.

3.2.4 Forged steel load transmitting components of controllable pitch propellers are to be manufactured, tested, and certified in accordance with Ch 5,1 and Ch 5,2 of the Rules for Materials. Impact tests are to be carried out at minus 10°C and the average energy value is to be not less than 27 J.

3.2.5 Spheroidal cast iron load transmitting-components of controllable-pitch mechanisms are to be manufactured, tested and certified in accordance with the requirements of Table 7.3.2 in Ch 7,3 of the Rules for Materials.

3.3 Ship-side valves

3.3.1 The sea inlet and overboard discharge valves which are situated at or below the maximum Load Line, are to be provided with low pressure steam or compressed air connection for clearing purposes, see Pt 5, Ch 13.

3.3.2 When steam is not available for clearing, it is recommended that arrangements be made for supplying water for machinery cooling purposes by circulating from ballast tanks(s) of adequate capacity, preferably situated in the double bottom. Such tank(s) must be used only for storage of water ballast or fresh water.

3.4 Fire pumps in motor ships

3.4.1 In motor ships where clearing steam is not available, fire pumps are to be provided with suctions from a suitable sea water inlet which is maintained ice-free at all times.

3.4.2 At least one of the fire pumps is to be connected to a sea chest which is provided with de-icing arrangements.

Section 3 General machinery requirements for navigation in ice – All Ice Classes

3.1 Materials for shafting

3.1.1 All components of the main propulsion system are to be of steel or other approved ductile material.

3.1.2 For screwshafts in ships intended for the notation **Ice Class 1AS FS** or **Ice Class 1A FS** and where the connection between the propeller and the screwshaft is by means of a key, Charpy impact tests are to be made in accordance with the requirements of Ch 5,3.4.12 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

3.2 Materials for propellers

3.2.1 Propellers and propeller blades are to be of cast steel or copper alloys and are to be manufactured, tested and certified in accordance with Ch 4,1, Ch 4,5 and Ch 9,1 of the Rules for Materials respectively.

Section 4 Hull requirements for light ice conditions – Ice Classes 1D and 1E

4.1 Ice Class 1D

4.1.1 The requirements for strengthening the forward region for **Ice Class 1C FS** are applicable. See Section 6.

Fig. 2.4.1 Extent of application of plating requirements

4.2 Ice Class 1E – General

4.2.1 These requirements apply to ships with length less than 150 m and which are intended to operate in very light first-year ice conditions. Where additional strengthening is fitted in accordance with the requirements of this sub-Section, the notation **Ice Class 1E** will be assigned.

4.2.2 For longitudinally framed ships, the scantlings of shell plating and framing are to comply with the requirements of **Ice Class 1C FS** using 0,9 times the ice pressure. The requirements for shell plating need only be applied in the region shown in Fig. 2.4.1. The requirements for framing need only be applied forward of the flat of side.

4.2.3 For transversely framed ships, the requirements of 4.3 to 4.7 are to be applied.

4.2.4 Where the structural requirements of **Ice Class 1C FS** give lesser scantlings than the requirements of this sub-Section, the lesser scantlings may be applied.

4.3 Shell plating

4.3.1 The shell plating thickness within the region shown in Fig. 2.4.1 is not to be less than:

$$t = 21,75s \sqrt{k \left(\frac{BL^2}{110000} + 1 \right) \left(1,3 - \frac{4,2}{(0,26/s + 1,8)^2} \right)} + 2 \text{ mm}$$

where

s = spacing of main frames, in metres
 L and B = are defined in Pt 3, Ch 1,6.1
 k = is defined in Pt 3, Ch 2,1.2.

4.4 Transverse framing

4.4.1 The section modulus of main frames forward of the flat of side is not to be less than:

$$z = 6,08sIk \left(\frac{BL^2}{140000} + 1,23 \right) \left(7 - \frac{1}{2l} \right) \text{ cm}^3$$

but need not be taken as greater than:

$$z = s L T$$

where

s = spacing of main frames, in metres
 l = span, in metres
 L and B = are defined in Pt 3, Ch 1,6.1
 k = is defined in Pt 3, Ch 2,1.2.

4.4.2 Intermediate ice frames are to be fitted in the region forward of the flat of side and are to extend from 0,62 m above the upper ice waterline to 1 m below the lower ice waterline.

4.4.3 Intermediate ice frames aft of the collision bulkhead are to have a section modulus not less than 65 per cent of that given in 4.4.1.

4.4.4 Intermediate ice frames forward of the collision bulkhead are to have a section modulus not less than 40 per cent of that given in 4.4.1.

4.5 Primary longitudinal members supporting ice frames

4.5.1 Forward of the collision bulkhead, in single deck ships, an ice stringer is to be fitted approximately 0,25 m below the upper ice waterline and is to have scantlings in accordance with Table 5.4.4 in Pt 3, Ch 5.

4.5.2 Aft of the collision bulkhead a series of tripping brackets are to be fitted at each main and intermediate frame at the same level as the ice stringer to a distance 0,1L aft of the flat of side.

Ice Operations – Ice Class

Part 8, Chapter 2

Sections 4, 5 & 6

4.6 Stern frame and rudder

4.6.1 The rudder and stern frame scantlings are to be in accordance with 6.5. However, the ship's speed need not be taken as greater than 14 knots. The hull form factor and the rudder profile coefficients are to be taken as 1,0.

4.7 Weld connections

4.7.1 Weld connections to the shell plating forward of the collision bulkhead are to be double continuous.

Section 5 Machinery requirements for light ice conditions – Ice Classes 1D and 1E

5.1 General

5.1.1 Where the notation **Ice Class 1D** or **Ice Class 1E** is desired, the requirements of this Section, in addition to those for open water service, are to be complied with.

5.1.2 The requirements need not be taken as greater than those for **Ice Class 1C FS**.

5.2 Engine power

5.2.1 The total engine output is to be not less than determined by the following formula:

$$P = 0,72LB \text{ kW}$$

where

L = Rule length, in metres, see Pt 3, Ch 1,6.1.1

B = moulded breadth of ship, in metres, see Pt 3, Ch 1,6.1.3.

5.3 Main engine shafting and propellers

5.3.1 The diameters of the shafting and propeller blade thickness as required by the Rules for open water service are to be increased by the percentages as given in Table 2.5.1. No increase in the diameter of crankshafts, thrustshafts or intermediate shafts is required.

Table 2.5.1 Increase for main engine shafting and propellers

Screwshaft, increase in diameter as required by Pt 5, Ch 6,3.5	5%
Propeller, increase in blade thickness at root and at 60 per cent radius as required by Pt 5 Ch 7,3.1	8%
Keyless propeller fitting, increase in mean torque Q as defined in Pt 5, Ch 7,3.2	15%

5.3.2 The screwshaft may be tapered at the forward end in accordance with Pt 5, Ch 6,3.5.3 and Pt 5, Ch 6,3.5.4 subject to the increase in diameter of 5 per cent as required by 5.3.1.

5.4 Minimum propeller blade tip thickness

5.4.1 The tip thickness, t , of the blade at 95 per cent radius is to be not less than that obtained by the following formula:

$$t = 0,14 (T + 57) \sqrt[3]{\frac{430}{\sigma_u}} \text{ mm}$$

where

T = blade root thickness required by 5.2.1, in mm

σ_u = specified minimum tensile strength of material, in N/mm².

5.5 Blade edge thickness

5.5.1 The edges of the blades are to be suitably thickened for the operating conditions but are to be not less than 50 per cent of the required tip thickness, t , measured at 1,25 times tip thickness, t , from the edge. For controllable pitch propellers, this requirement need only be applied to the leading edges of the blades.

5.6 Cooling water lines

5.6.1 Connections are to be fitted between the cooling water overboard discharge lines and sea inlets for main and/or auxiliary engine cooling water systems so that warm water may be used to assist in maintaining the suction pipes free from ice.

5.6.2 Where the cooling water inlet valves are fitted to a common water box, the connections from the cooling water discharge lines may be led to the water box in a position as near as possible to the inlet valves.

Section 6 Hull requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D

6.1 Framing – General requirements

6.1.1 Where a frame intersects a boundary between two of the hull regions the scantling requirements applicable will be those for the forward region if the forward midship boundary is intersected or for the midship region if the aft midship boundary is intersected.

6.1.2 The effective weld area attaching ice frames to primary members is not to be less than the shear area for the frames.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 6

6.1.3 Asymmetrical frames and frames which are not at right angles to the shell (web less than 90 degrees to the shell) shall be supported against tripping by brackets, intercostals, stringers or similar, at a distance not exceeding 1300 mm. For **Ice Class 1D**, the distance may be increased to 2000 mm. For frames with spans greater than 4 m the extent of anti-tripping supports is to be applied to all regions. For frames with spans less than or equal to 4 m the extent is to be as given in Table 2.6.1. FEA may be carried out to demonstrate equivalent support of alternative arrangements.

Table 2.6.1 Extent of anti-tripping supports

Ice Class	Extent of anti-tripping supports
1AS FS	All regions
1A FS	Forward and midship regions
1B FS	Forward region
1C FS	Forward region
1D	Forward region

6.2 Primary longitudinal members supporting transverse ice framing

6.2.1 The webs of primary longitudinal members supporting transverse ice frames are to be stiffened and connected to the main or intermediate frames so that the distance, r , between such stiffening is not to be greater than given according to the following formula:

$$r = \sqrt{\frac{291t^3}{\alpha_o y^2}} \text{ mm}$$

where

t = thickness, in mm, of the primary longitudinal member adjacent to the shell plating

α_o = longitudinal distribution factor as given in Table 2.6.2

y = (a) Forward region

$$y = 0,653 + 3,217 \sqrt{P_0 \Delta} \times 10^{-5}$$

$$y = 0,876 + 9,908 \sqrt{P_0 \Delta} \times 10^{-6}$$

or

$y = 1,0$, whichever is the least

= (b) Midship and aft regions

$$y = 0,653 + 9,908 \sqrt{P_0 \Delta} \times 10^{-6}$$

or

$y = 1,0$, whichever is the least

P_0 and Δ = are as defined in 2.2.

6.2.2 The minimum thickness of the web plating of longitudinal primary members is to comply with the requirements of Pt 3, Ch 10,4.

6.3 Stem

6.3.1 The stem is to be made of rolled, cast or forged steel or of shaped steel plates. A sharp edged stem, as shown in Fig. 2.6.1 improves the manoeuvrability of the ship in ice.

Table 2.6.2 Longitudinal distribution factor α_o

Ice Class	α_o		
	Forward	Midship	Aft
1AS FS	1,00	0,98	0,89
1A FS	0,87	0,75	0,64
1B FS	0,78	0,64	0,51
1C FS	0,68	0,53	0,37
1D	0,68	—	—

Fig. 2.6.1 A sharp edged stem

6.3.2 The section modulus of the stem in the fore and aft direction is not to be less than determined in accordance with the following formula:

$$Z = 1500 (\alpha_o \gamma^2)^{3/2} \text{ cm}^3$$

where

α_o = longitudinal distribution factor for the forward region as given in Table 2.6.2

γ = is defined in 6.5.2.

6.3.3 The dimensions of a welded stem constructed as shown in Fig. 2.6.1 are to be determined in accordance with the following formula:

$$t = 31 \sqrt{\alpha_o \gamma^2} \text{ mm}$$

where

t = thickness of the side plates, in mm.

6.3.4 In bulbous bow constructions, the extent of plating below the Ice Light Waterline should be such as to cover that part of the bulb forward of the vertical line originating at the intersection of the Ice Light Waterline and the stem contour at the centreline. A suitably tapered transition piece should be arranged between the reinforced stem plating and keel. However, in no case should the reinforced stem plating extend vertically below the Ice Light Waterline for less than 750 mm. The adjacent strake to the reinforced shaped stem plating of the bulb should be in accordance with the requirements for shell plating.

Ice Operations – Ice Class

Part 8, Chapter 2

Sections 6 & 7

6.3.5 Where in the ice belt region the radius of the stern or bulb front plating is large, one or more vertical stiffeners are to be fitted in order to meet the section modulus requirement of 6.7.2. In addition, vertical ring stiffening will be required for the bulb.

6.3.6 The dimensions of the stern may be tapered to the requirements of Pt 3, Ch 5.3.3 at the upper deck. The connections of the shell plating to the stern are to be flush.

6.4 Stern

6.4.1 Where the screwshaft diameter exceeds the Rule diameter, the propeller post is to be correspondingly strengthened, see Pt 3, Ch 6.7.

6.5 Rudder and steering arrangements

6.5.1 Rudder scantlings, posts, rudder horns, solepieces, rudder stocks, steering engine and pintles are to be dimensioned in accordance with Pt 3, Ch 6 and 13 as appropriate. The speed used in the calculations is to be the maximum service speed or that given in Table 2.6.3, whichever is the greater. When used in association with the speed given in Table 2.6.3, the hull form factor and the rudder profile coefficients are to be taken as 1,0.

Table 2.6.3 Minimum speed

Ice Class	Minimum speed, in knots
1AS FS	20
1A FS	18
1B FS	16
1C FS	14
1D	14

6.5.2 For double plate rudders, the minimum thickness of plating and horizontal and vertical webs in the main ice belt zone is to be determined as for shell plating in the aft region. For the horizontal and vertical webs, the corrosion-abrasion increment, *c*, need not be added. For **Ice Class 1D**, the minimum thickness of plating and webs, of double plate rudders and the extent of application are to be determined as for those in **Ice Class 1C FS**.

6.5.3 Where an ice class notation is included in the class of a ship, the nozzle construction requirements, as defined in Table 13.3.1 in Pt 3, Ch 13, are to be upgraded to include abrasion allowance as follows:

Ice Class	Thickness increment
1AS FS	5 mm
1A FS	4 mm
1B FS	3 mm
1C FS	2 mm
1D	2 mm

However, the thickness of the shroud plating is not to be less than the shell plating for the aft region taking frame spacing *s* in the formula as 500 mm.

6.5.4 The scantlings of the stock, pintles, gudgeon and solepiece associated with the nozzle are to be increased on the basis given in 6.5.1. However, the diameter of the nozzle stock is to be not less than that calculated in the astern condition taking the astern speed as half the speed given in Table 2.6.3 or the actual astern speed, whichever is the greater.

6.5.5 Nozzles with articulated flaps will be subject to special consideration.

6.5.6 For the Ice Classes **1AS FS** and **1A FS**, the rudder stock and the upper edge of the rudder shall be protected against ice pressure by an ice knife or equivalent means. The ice knife is to extend down to the ice light waterline; this requirement may be waived where this would lead to impracticable ice knives, e.g. for ships with large draught variations.

6.5.7 For the Ice Classes **1AS FS** and **1A FS**, due regard is to be paid to the excessive load caused by the rudder being forced out of the midship position when backing into an ice ridge. When vessels are intended to operate with significant time in astern operation, then the hull strength is to be based on the method used in the forward region; however, due consideration may be given to the anticipated power in this mode of operation.

6.5.8 Relief valves for hydraulic pressure are to be effective, see Pt 5, Ch 19.3.3. The components of the rudder steering gear are to be able to withstand the yield torque of the rudder stock, see Pt 5, Ch 19.3.2.2. Rudder stoppers working on the rudder blade or rudder head are to be fitted.

Section 7 Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS

7.1 General

7.1.1 Where the notation **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** or **Ice Class 1C FS** is desired, the requirements of this Section, in addition to those for open water service, are to be complied with, so far as these are applicable.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 7

7.2 Determination of ice torque

7.2.1 Dimensions of propellers, shafting and gearing are determined by formulae taking into account the impact when a propeller blade hits ice. The ensuing load is hereinafter defined by ice torque, M .

$$M = m D^2 \text{ kN m}$$

where

$$m = 21,10 \text{ for Ice Class 1AS FS}$$

$$= 15,69 \text{ for Ice Class 1A FS}$$

$$= 13,04 \text{ for Ice Class 1B FS}$$

$$= 11,96 \text{ for Ice Class 1C FS}$$

$$D = \text{diameter of propeller, in metres}$$

7.2.2 If the propeller is not fully submerged when the ship is in ballast condition, the ice torque for **Ice Class 1A FS** is to be used for **Ice Class 1B FS** and **Ice Class 1C FS**.

7.3 Propeller blade sections

7.3.1 The width, L , and thickness, T , of propeller blade sections are to be determined so that:

(a) at the radius $0,25D/2$, for solid propellers

$$LT^2 \geq \frac{26\,478\,000}{\sigma_u (0,65 + 0,7p_r/D)} \left(27,2 \frac{P}{NR} + 2,24M \right)$$

(b) at radius $0,35D/2$ for controllable pitch propellers

$$LT^2 \geq \frac{21\,084\,300}{\sigma_u (0,65 + 0,7p_r/D)} \left(27,2 \frac{P}{NR} + 2,35M \right)$$

(c) at the radius $0,6D/2$

$$LT^2 \geq \frac{9\,316\,320}{\sigma_u (0,65 + 0,7p_r/D)} \left(27,2 \frac{P}{NR} + 2,86M \right)$$

where

D = diameter of propeller, in metres

L = length of the expanded cylindrical section of the blade, at the radius in question, in mm

M = ice torque as defined in 7.2

N = number of blades

p_r = propeller pitch at the radius in question, for solid propellers, in metres

= 0,7 nominal pitch for controllable pitch propellers, in metres

P = shaft power as defined in Pt 5, Ch 1,3.3

R = propeller speed, in rev/min

T = the corresponding maximum blade thickness, in mm

σ_u = specified minimum tensile strength of the material, in N/mm².

7.3.2 Where the blade thickness derived from these formulae is less than the blade thickness derived by Pt 5, Ch 7,3.1, the latter is to apply.

7.4 Propeller blade minimum tip thickness

7.4.1 The blade tip thickness, t , at the radius $D/2$ is to be determined by the following formulae:

Ice Class 1AS FS

$$t = (20 + 2D) \sqrt{\frac{490}{\sigma_u}} \text{ mm}$$

Ice Classes 1A FS, 1B FS and 1C FS

$$t = (15 + 2D) \sqrt{\frac{490}{\sigma_u}} \text{ mm}$$

where

D and σ_u = are as defined in 7.3.

7.5 Intermediate blade sections

7.5.1 The thickness of other sections is to conform to a smooth curve connecting the section thicknesses as determined by 7.3 and 7.4.

7.6 Blade edge thickness

7.6.1 The thickness of blade edges is to be not less than 50 per cent of the derived tip thickness, t , measured at $1,25t$ from edge. For controllable pitch propellers, this applies only to the leading edge.

7.7 Mechanisms for controllable pitch propellers

7.7.1 The strength of mechanisms in the boss of a controllable pitch propeller is to be 1,5 times that of the blade when a load is applied at the radius $0,9D/2$ in the weakest direction of the blade.

7.8 Keyless propellers

7.8.1 When it is proposed to use keyless propellers, the fit of the propeller boss to the screwshaft will be specially considered.

7.9 Screwshafts

7.9.1 The diameter d_s at the aft bearing of the screwshaft fitted in conjunction with a solid propeller is to be not less than:

$$d_s = 1,08 \sqrt[3]{\frac{\sigma_u LT^2}{\sigma_o}} \text{ mm}$$

where

L and T = proposed width and thickness respectively of the propeller blade section at $0,25D/2$, in mm

σ_o = specified minimum yield stress of the material of the screwshaft, in N/mm²

σ_u = specified minimum tensile strength of the blade material, in N/mm²

7.9.2 The diameter, d_s at the aft bearing of the screwshaft fitted in conjunction with a controllable pitch propeller is to be not less than:

$$d_s = 1,15 \sqrt[3]{\frac{\sigma_u LT^2}{\sigma_o}} \text{ mm}$$

where

L and T = proposed width and thickness respectively of the propeller blade section at $0,35D/2$, in mm

Ice Operations – Ice Class

Part 8, Chapter 2

Sections 7, 8 & 9

- σ_o = specified minimum yield stress of the material of the screwshaft, in N/mm²
 σ_u = specified minimum tensile strength of the blade material, in N/mm².

7.9.3 Where the screwshaft diameter as derived by 7.9.1 or 7.9.2 is less than the diameter derived by Pt 5 Ch 6,3.5.1, the latter is to apply.

7.9.4 The diameter, d_s , of the screwshaft determined in accordance with this Section is to extend over a length not less than that to the forward edge of the bearing immediately forward of the propeller or $2,5d_s$ whichever is the greater.

7.9.5 The shaft may be tapered at the forward end in accordance with Pt 5, Ch 6,3.5.3 and Pt 5, Ch 6,3.5.4, except for **Ice Class 1AS FS** ice strengthening, where these diameters are to be increased by 10 per cent.

7.10 Intermediate and thrust shafts

7.10.1 The diameters of intermediate shafts and thrust shafts in external bearings are to comply with Pt 5, Ch 6,3.1 and Pt 5, Ch 6,3.4 respectively, except for **Ice Class 1AS FS** ice strengthening where these diameters are to be increased by 10 per cent.

7.11 Reduction gearing

7.11.1 Where gearing is fitted between the engine and the propeller shafting, the gearing is to be in accordance with Pt 5, Ch 5, and is to be designed to transmit a torque, Y_i , taken as the greater of the following conditions:

(a) Ice load conditions (ice torque applied to mean torque)

$$Y_i = Y + \frac{M I_h u^2}{I_l + I_h u^2} \text{ kN m}$$

where

$$u = \text{gear ratio} \\ = \frac{\text{pinion speed}}{\text{wheel speed}}$$

I_h = mass moment of inertia of machinery components rotating at higher speed

I_l = mass moment of inertia of machinery components rotating at lower speed, including propeller with an addition of 30 per cent of entrained water (I_h and I_l are to be expressed in the same units)

M = ice torque as defined in 7.2

Y = 9,55 P/R

P and R = are as defined in 7.3

(b) Open water conditions (K_A factor applied to mean torque)

$Y_i = Y K_A$ KN m

Y = as above

K_A = application factor as given in Table 5.3.1 in Pt 5, Ch 5.

Section 8

Hull requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)

8.1 General

8.1.1 The requirements for **Ice Class 1AS FS**, **Ice Class 1A FS**, **Ice Class 1B FS** and **Ice Class 1C FS**, as applicable, are to be applied using the installed engine power as given by Section 9.

Section 9

Machinery requirements for first-year ice conditions – Ice Classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)

9.1 Powering of ice strengthened ships

9.1.1 For ships that require additional strengthening in ice, the total shaft power installed is to be calculated using the following Sections, but is not to be less than required by the *Finnish-Swedish Ice Class Rules* in force at the time of contract.

9.1.2 Ice strengthened ships which are to be considered to have an icebreaking capability are to be able to develop sufficient thrust to permit continuous mode icebreaking at a speed of at least five knots in ice having a thickness equal to the nominal value for the desired Ice Class and a snow cover of at least 0,3 m.

9.1.3 The shaft power necessary to provide an ice-breaking capability can be determined by the equation:

$$P_1 = 0,736 C_1 C_2 C_3 \left[240 B h (1 + h + 0,035 v^2) + 70 S_c \sqrt{L} \right] \text{ kW}$$

where

B = moulded breadth of ship, in metres, see Pt 3, Ch 1,6.1.3

L = Rule length, in metres, see Pt 3, Ch 1,6.1.1

Δ = displacement, in tonnes, see Pt 3, Ch 9,7.2.1

$C_1 = \frac{1,2B}{\sqrt[3]{\Delta}}$ but is not to be taken as less than 1,0

C_2 = 0,9 if the ship is fitted with a controllable pitch propeller, otherwise 1,0

C_3 = 0,9 if the rake of the stem is 45° or less, otherwise 1,0. The product $C_2 C_3$ is not to be taken as less than 0,85

C_4 = 1,1 if the ship is fitted with a bulbous bow, otherwise 1,0

h = ice thickness

= 1,0 for **Ice Class 1AS FS(+)**

= 0,8 for **Ice Class 1A FS(+)**

= 0,6 for **Ice Class 1B FS(+)**

= 0,4 for **Ice Class 1C FS(+)**

S_c = depth of snow cover
 v = ship speed, in knots, when breaking ice of thickness h .

Section 10

Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7

10.1 Hull areas

10.1.1 The hull of all polar class ships is divided into areas reflecting the magnitude of the loads that are expected to act upon them, see Fig. 2.10.1. In the longitudinal direction, there are four regions:

- (a) bow, (B);
- (b) bow intermediate, (B_i);
- (c) midbody, (M), and
- (d) stern (S).

The bow intermediate, midbody and stern regions are further divided in the vertical direction into three regions:

- (i) bottom, (b)
- (ii) lower, (l) and
- (iii) icebelt (i).

10.1.2 The upper ice waterline, UIWL, and lower ice waterline, LIWL, are as defined in 2.2.

10.1.3 In addition to Fig. 2.10.1, at no time is the boundary between the bow and bow intermediate regions to be forward of the intersection point of the line of the stem and the ship baseline.

10.1.4 In addition to Fig. 2.10.1, the aft boundary of the bow region need not be more than 0,45L aft of the forward perpendicular, FP.

10.1.5 The boundary between the bottom and lower regions is to be taken at the point where the tangent to the shell is inclined 7° from horizontal.

10.1.6 If a ship is intended to operate astern in ice regions, the aft section of the ship is to be designed based on the bow and bow intermediate hull area requirements.

10.2 Design ice loads – General

10.2.1 For ships of all Polar Classes, a glancing impact on the bow is the design scenario for determining the scantlings required to resist ice loads.

Fig. 2.10.1 Extent of hull areas

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

10.2.2 The design ice load is characterised by an average pressure, P_a , uniformly distributed over a rectangular load patch of height, b , and width, w .

10.2.3 Within the bow area of all polar classes, and within the bow intermediate icebelt area of polar classes **PC6** and **PC7**, the ice load parameters are functions of the actual bow shape. To determine the ice load parameters, P_a , b and w , it is required to calculate the following ice load characteristics for sub-regions of the bow area; shape coefficient, f_{ai} , total glancing impact force, F_i , line load, Q_i , and pressure, P_i .

10.2.4 In other ice-strengthened areas, the ice load parameters, P_a , b_{NB} and w_{NB} , are determined independently of the hull shape and based on a fixed load patch aspect ratio, $AR = 3.6$.

10.2.5 Design ice forces calculated according to 10.3 are only valid for vessels with icebreaking forms. Design ice forces for any other bow forms are to be specially considered.

10.2.6 Ship structures that are not directly subjected to ice loads may still experience inertial loads of stowed cargo and equipment resulting from ship/ice interaction. These inertial loads are to be considered in the design of these structures.

10.3 Glancing impact load characteristics

10.3.1 The parameters defining the glancing impact load characteristics are reflected in the class factors listed in Table 2.10.1.

10.4 Bow area

10.4.1 In the bow area, the force, F , line load, Q , pressure, P , and load patch aspect ratio, AR , associated with the glancing impact load scenario are functions of the hull angles measured at the upper ice waterline, UIWL. The influence of the hull angles is captured through calculation of a bow shape coefficient, f_a . The hull angles are defined in Fig. 2.10.2.

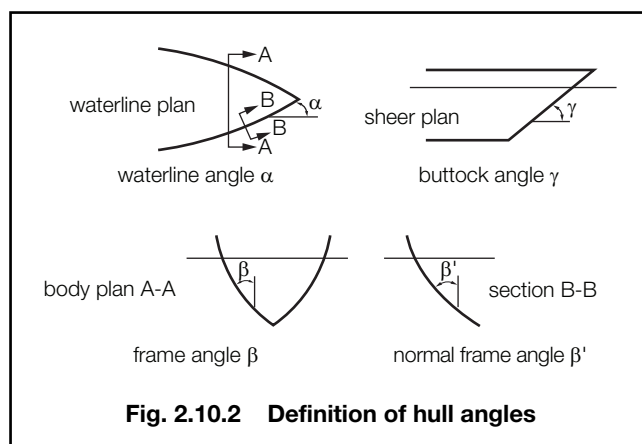

Fig. 2.10.2 Definition of hull angles

10.4.2 The waterline length of the bow region is generally to be divided into four sub-regions of equal length. The force, F , line load, Q , pressure, P , and load patch aspect ratio, AR , are to be calculated with respect to the mid-length position of each sub-region (each maximum of F , Q and P is to be used in the calculation of the ice load parameters P_a , b and w).

10.4.3 The bow area load characteristics are determined as follows:

(a) The shape coefficient, f_{ai} , is to be taken as

$$f_{ai} = \begin{matrix} f_{ai,1} \\ f_{ai,2} \\ f_{ai,3} \end{matrix} \text{ whichever is the lesser} \\ \text{where}$$

$$f_{ai,1} = \left(0,097 - 0,68 \left(\frac{x}{L} - 0,15 \right)^2 \right) \frac{\alpha_i}{\sqrt{\beta'_i}}$$

$$f_{ai,2} = \frac{1,2C_F}{\sin(\beta'_i) C_C \Delta^{0,64}}$$

$$f_{ai,3} = 0,60$$

i = sub-region considered

L = ship length measured at the upper ice waterline (UIWL), in metres

x = distance from the forward perpendicular (FP) to station under consideration, in metres

α = waterline angle, in degrees, see Fig. 2.10.2

β' = normal frame angle, in degrees, see Fig. 2.10.2

Δ = ship displacement, in kilo tonnes, not to be taken less than 5

Table 2.10.1 Class factors

Polar Class	Crushing failure class factor	Flexural failure class factor	Load patch dimensions class factor	Displacement class factor	Longitudinal strength class factor
	C_C	C_F	C_D	C_{DI}	C_L
PC1	17,69	68,60	2,01	250	7,46
PC2	9,89	46,80	1,75	210	5,46
PC3	6,06	21,17	1,53	180	4,17
PC4	4,50	13,48	1,42	130	3,15
PC5	3,10	9,00	1,31	70	2,50
PC6	2,40	5,49	1,17	40	2,37
PC7	1,80	4,06	1,11	22	1,81

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

- C_C = crushing failure class factor from Table 2.10.1
 C_F = flexural failure class factor from Table 2.10.1
- (b) Force, F_i :
 $F_i = f_{a_i} C_C D^{0,64}$ MN
 where
 i = sub-region considered
 f_{a_i} = shape coefficient of sub-region, i
 C_C = crushing failure class factor from Table 2.10.1
 Δ = ship displacement, in kilo tonnes, not to be taken less than 5
- (c) Load patch aspect ratio, AR_i :
 $AR_i = 7,46 \sin(\beta'_i)$
 $AR_i \geq 1,3$
 where
 i = sub-region considered
 β'_i = normal frame angle of sub-region i , in degrees
- (d) Line load, Q_i :
 $Q_i = \frac{F_i^{0,61} C_D}{AR_i^{0,35}}$ MN/m
 where
 i = sub-region considered
 F_i = force of sub-region i , in MN
 C_D = load patch dimensions class factor from Table 2.10.1
 AR_i = load patch aspect ratio of sub-region i
- (e) Pressure, P_i :
 $P_i = F_i^{0,22} C_D^2 AR_i^{0,3}$ MPa
 where
 i = sub-region considered
 F_i = force of sub-region i , in MN
 C_D = load patch dimensions class factor from Table 2.10.1
 AR_i = load patch aspect ratio of sub-region i .

10.5 Hull areas other than the bow

10.5.1 In the hull areas other than the bow, the force, F_{NB} , and line load, Q_{NB} , used in the determination of the load patch dimensions, b_{NB} , w_{NB} , and design pressure, P_a , are determined as follows:

- (a) Force, F_{NB} :
 $F_{NB} = 0,36 C_C \Delta_F$ MN
 where
 C_C = crushing force class factor from Table 2.10.1
 Δ_F = ship displacement factor
 $\Delta_F = \Delta^{0,64}$ if $\Delta \leq C_{DI}$
 $\Delta_F = CF_{DIS}^{0,64} + 0,10 (\Delta - C_{DI})$ if $\Delta > C_{DI}$
 Δ = ship displacement, in kilo tonnes, not to be taken less than 10
 C_{DI} = displacement class factor from Table 2.10.1
- (b) Line Load, Q_{NB} :
 $Q_{NB} = 0,639 F_{NB}^{0,61} C_D$ MN/m
 where
 F_{NB} = force from 10.5.1(a), in MN
 C_D = load patch dimensions class factor from Table 2.10.1.

10.6 Design load patch

10.6.1 In the bow area, and the bow Intermediate Icebelt area for ships with class notation **PC6** and **PC7**, the design load patch has dimensions of width, w_B , and height, b_B , defined as follows:

$$w_B = \frac{F_B}{Q_B} \text{ m}$$

$$b_B = \frac{Q_B}{P_B} \text{ m}$$

where

- F_B = maximum F_i in the bow area, in MN
 Q_B = maximum Q_i in the bow area, in MN/m
 P_B = maximum P_i in the bow area, in MPa.

10.6.2 In hull areas other than those covered by 10.6.1, the design load patch has dimensions of width, w_{NB} , and height, b_{NB} , defined as follows:

$$w_{NB} = \frac{F_{NB}}{Q_{NB}} \text{ m}$$

$$b_{NB} = \frac{w_{NB}}{3,6} \text{ m}$$

where

- F_{NB} = force determined using 10.5.1(a), in MN
 Q_{NB} = line load determined using 10.5.1(b), in MN/m.

10.7 Pressure within the design load patch

10.7.1 The average pressure, P_a , within a design load patch is determined as follows:

$$P_a = \frac{F}{bw} \text{ MPa}$$

where

- F = F_B or F_{NB} as appropriate for the hull area under consideration, in MN
 b = b_B or b_{NB} as appropriate for the hull area under consideration, in metres
 w = w_B or w_{NB} as appropriate for the hull area under consideration, in metres.

10.7.2 Areas of higher, concentrated pressure exist within the load patch. In general, smaller areas have higher local pressures. Accordingly, the peak pressure factors listed in Table 2.10.2 are used to account for the pressure concentration on localised structural members.

10.8 Hull area factors

10.8.1 Associated with each hull area is an area factor that reflects the relative magnitude of the load expected in that area. The area factor, AF , for each hull area is listed in Table 2.10.3.

10.8.2 In the event that a structural member spans across the boundary of a hull area, the largest hull area factor is to be used in the scantling determination of the member.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

Table 2.10.2 Peak pressure factors

Structural member		Peak pressure factor, K_i
Plating	Transversely framed Longitudinally framed	$K_p = (1,8 - s) \geq 1,2$ $K_p = (2,2 - 1,2s) \geq 1,5$
Frames in transverse framing systems	With load distributing stringers With no load distributing stringers	$K_t = (1,6 - s) \geq 1,0$ $K_t = (1,8 - s) \geq 1,2$
Load carrying stringers Side and bottom longitudinals Web frames		$K_s = 1$ if $S_w \geq 0,5w$ $K_s = 2 - \frac{2S_w}{w}$ if $S_w < 0,5w$
Symbols		
s = frame or longitudinal spacing, in metres S_w = web frame spacing, in metres w = ice load patch width, in metres		

Table 2.10.3 Hull area factors (AF)

Hull area		Area	Polar class						
			PC1	PC2	PC3	PC4	PC5	PC6	PC7
Bow (B)	All	B	1,00	1,00	1,00	1,00	1,00	1,00	1,00
Bow intermediate (BI)	Icebelt	BI_i	0,90	0,85	0,85	0,80	0,80	1,00 see Note 1	1,00 see Note 1
	Lower	BI_l	0,70	0,65	0,65	0,60	0,55	0,55	0,50
	Bottom	BI_b	0,55	0,50	0,45	0,40	0,35	0,30	0,25
Midbody (M)	Icebelt	M_i	0,70	0,65	0,55	0,55	0,50	0,45	0,45
	Lower	M_l	0,50	0,45	0,40	0,35	0,30	0,25	0,25
	Bottom	M_b	0,30	0,30	0,25	see Note 2	see Note 2	see Note 2	see Note 2
Stern (S)	Icebelt	S_i	0,75	0,70	0,65	0,60	0,50	0,40	0,35
	Lower	S_l	0,45	0,40	0,35	0,30	0,25	0,25	0,25
	Bottom	S_b	0,35	0,30	0,30	0,25	0,15	see Note 2	see Note 2
NOTES									
1. See 10.2.3.									
2. Indicates that strengthening for ice loads is not necessary.									

10.8.3 Due to their increased manoeuvrability, ships having propulsion arrangements with azimuthing thruster(s) or podded propellers shall have specially considered stern icebelt, S_i , and stern lower, S_l , hull area factors.

10.9 Shell plate requirements

10.9.1 The required minimum shell plate thickness, t , is given by:

$$t = t_{\text{net}} + t_s \text{ mm}$$

where

t_{net} = plate thickness required to resist ice loads according to 10.9.2, in mm

t_s = corrosion and abrasion allowance according to 10.16, in mm.

10.9.2 The thickness of shell plating required to resist the design ice load, t_{net} , depends on the orientation of the framing. The plating, including all bottom plating, i.e. plating in hull areas B_{lb} , M_b and S_b , the net thickness is given by Table 2.10.4.

10.10 Framing – General

10.10.1 Framing members of Polar class ships are to be designed to withstand the ice loads defined in 10.2.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

Table 2.10.4 Shell plate thickness

Transversely framed plating	Obliquely framed plating	Longitudinally framed plating	
$\Omega \geq 70^\circ$	$70^\circ > \Omega > 20^\circ$	$\Omega \leq 20^\circ$	
		$b \geq s$	$b < s$
$t_{\text{net}} = \frac{500s \sqrt{\frac{AF K_p P_a}{\sigma_y}}}{1 + \frac{s}{2b}} \text{ mm}$	linear interpolation	$t_{\text{net}} = \frac{500s \sqrt{\frac{AF K_p P_a}{\sigma_y}}}{1 + \frac{s}{2l}} \text{ mm}$	$t_{\text{net}} = \frac{500s \sqrt{\frac{AF K_p P_a}{\sigma_y}} \sqrt{\frac{2b}{s} - \left(\frac{b}{s}\right)^2}}{1 + \frac{s}{2l}} \text{ mm}$
Symbols			
<p>Ω = smallest angle between the chord of the waterline and the line of the first level framing as illustrated in Fig. 2.10.3, in degrees</p> <p>s = transverse frame spacing in transversely-framed ships or longitudinal frame spacing in longitudinally-framed ships, in metres</p> <p>AF = hull area factor from Table 2.10.3</p> <p>K_p = peak pressure factor from Table 2.10.2</p> <p>P_a = average patch pressure according to 10.7.1, in MPa</p> <p>σ_y = minimum upper yield stress of the material, in N/mm²</p> <p>b = height of design load patch, in m, where $b \leq l - \frac{s}{4}$ in the case of transversely framed plating</p> <p>l = distance between frame supports, i.e. equal to the frame span as given in 10.10.5, but not reduced for any fitted end brackets, in metres. When a load-distributing stringer is fitted, the length, l, need not be taken larger than the distance from the stringer to the most distant frame support</p>			

Fig. 2.10.3 Shell framing angle Ω

10.10.2 The term ‘framing member’ refers to transverse and longitudinal local frames, load-carrying stringers and web frames in the areas of the hull exposed to ice pressure, see Fig. 2.10.1. Where load-distributing stringers have been fitted, the arrangement and scantlings of these are to be suitably designed.

10.10.3 The strength of a framing member is dependent upon the fixity that is provided at its supports. Fixity can be assumed where framing members are either continuous through the support or attached to a supporting section with a connection bracket. In other cases, simple support is to be assumed unless the connection can be demonstrated to provide significant rotational restraint. Fixity is to be ensured at the support of any framing which terminates within an ice-strengthened area.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

10.10.4 The details of framing member intersection with other framing members, including plated structures, as well as the details for securing the ends of framing members at supporting sections, are to be in accordance with Pt 3, Ch 10.

10.10.5 The design span of a framing member is to be determined on the basis of its moulded length. If brackets are fitted, the design span may be reduced in accordance with Pt 3, Ch 3.

10.10.6 When calculating the section modulus and shear area of a framing member, the net thicknesses of the web, flange (if fitted) and attached shell plating are to be used. The shear area of a framing member may include that material contained over the full depth of the member, i.e. web area including portion of flange, if fitted, but excluding attached shell plating.

10.10.7 The actual net effective shear area, A_w , of a framing member is given by:

$$A_w = h t_{wn} \sin \left(\frac{\phi_w}{100} \right) \text{ cm}^3$$

where

h = height of stiffener, in mm, see Fig. 2.10.4

t_{wn} = net web thickness, in mm

$$= t_w - t_c$$

t_w = as built web thickness, in mm, see Fig. 2.10.4

t_c = corrosion deduction, in mm, to be subtracted from the web and flange thickness (as specified in Table 2.10.5, but not less than t_s as required by 10.16.3)

ϕ_w = smallest angle between shell plate and stiffener web, measured at the midspan of the stiffener, see Fig. 2.10.4. The angle ϕ_w may be taken as 90° provided the smallest angle is not less than 75° .

Fig. 2.10.4 Stiffener geometry

Table 2.10.5 Corrosion deductions for web and flange thickness

Category		Corrosion deduction t_c , in mm
Ballast water tanks	Within 3 m below the top of tank, see Note	4,0
	Elsewhere	3,0
Cargo oil tanks	Within 3 m below the top of tank, see Note	4,0
	Elsewhere	2,5
Heated cargo oil tanks	Within 3 m below the top of tank, see Note	4,5
	Elsewhere	3,5
Void spaces	Spaces not normally accessed, e.g. access only via bolted manhole openings, pipe tunnels, etc.	2,0
Dry spaces	Internals of machinery spaces, pump room, store rooms, steering gear space, etc.	1,5

NOTE

Only applicable to cargo and ballast tanks with weather deck as the tank top.

10.10.8 When the cross-sectional area of the attached plate flange exceeds the cross-sectional area of the local frame, the actual net effective plastic section modulus, Z_p , is given by:

$$Z_p = \frac{A_{pn} t_{pn}}{20} + \frac{h_w^2 t_{wn} \sin \phi_w}{2000} +$$

$$\frac{A_{fn} (h_{fc} \sin \phi_w - b_w \cos \phi_w)}{10} \text{ cm}^3$$

where

A_{pn} = net cross-sectional area of attached plate, in cm^2 (equal to $10s t_{pn}$, but not to be taken greater than the net cross-sectional area of the local frame)

t_{pn} = fitted net shell plate thickness, in mm, (shall comply with t_{net} as required by 10.9.2)

h_w = height of local frame web, in mm, see Fig. 2.10.4

A_{fn} = net cross-sectional area of local frame flange, in cm^2

h_{fc} = height of local frame measured to centre of the flange area, in mm, see Fig. 2.10.4

b_w = distance from mid thickness plane of local frame web to the centre of the flange area, in mm, see Fig. 2.10.4

h , t_w , t_c and ϕ_w are as given in 10.10.7

s as given in 10.9.2.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

10.10.9 When the cross-sectional area of the local frame exceeds the cross-sectional area of the attached plate flange, the plastic neutral axis is located a distance z_{na} above the attached shell plate, given by:

$$z_{na} = \frac{100 A_{fn} + h_w t_{wn} - 1000 t_{pn} s}{2 t_{wn}} \text{ mm}$$

and the net effective plastic section modulus, Z_p , is given by:

$$Z_p = t_{pn} s z_{na} \sin \phi_w + \left(\frac{(h_w - z_{na})^2 + z_{na}^2}{2000} t_{wn} \sin \phi_w + \frac{A_{fn} ((h_{fc} - z_{na}) \sin \phi_w - b_w \cos \phi_w)}{10} \right) \text{ cm}^3$$

10.10.10 In the case of oblique framing arrangement ($70^\circ > \Omega > 20^\circ$, where Ω is defined as given in 10.9.2), linear interpolation is to be used.

10.11 Framing – Transversely-framed side structures and bottom structures

10.11.1 The local frames in transversely-framed side structures and in bottom structures (i.e. hull areas B_{lb} , M_b and S_b) are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

10.11.2 The actual net effective shear area of the frame, A_w , as defined in 10.10.7, is to comply with the following condition:

$$A_w \geq A_t$$

where

$$A_t = 5000 I_L s \frac{AF K_t P_a}{0,577 \sigma_y} \text{ cm}^2$$

I_L = length of loaded portion of span, in metres

= need not exceed the lesser of a and b

a = frame span as defined in 10.10.5, in metres

b = height of design ice load patch according to 10.6, in metres

s = transverse frame spacing, in metres

AF = hull area factor from Table 2.10.3

K_t = peak pressure factor from Table 2.10.2

P_a = average pressure within load patch according to 2.10.7, in MPa

σ_y = minimum upper yield stress of the material, in N/mm²

10.11.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p , as defined in 10.10.8 or 10.10.9, is to comply with the following conditions and is to be the greatest of the two load conditions:

(a) ice load acting at the midspan of the transverse frame, and

(b) the ice load acting near a support.

$$Z_p \geq Z_{pt}$$

where

$$Z_{pt} = \frac{100^3 I_L Y s AF K_t P_a a A_1}{4 \sigma_y} \text{ cm}^3$$

$$Y = 1 - \frac{I_L}{2a}$$

A_1 = reflects the two conditions and is to be taken as the greater of A_{1A} or A_{1B}

$$A_{1A} = \frac{1}{1 + \frac{j}{2} + k_w \frac{j}{2} \left(\sqrt{1 - a_1^2} - 1 \right)}$$

$$A_{1B} = \frac{1 - \frac{1}{2a_1 Y}}{0,275 + 1,44k_z^{0,7}}$$

j = 1 for framing with one simple support outside the ice strengthened areas
= 2 for framing without any simple supports

$$a_1 = \frac{A_t}{A_w}$$

A_t = rule minimum shear area of transverse frame as given in 10.11.2, in cm²

A_w = effective net shear area of transverse frame (calculated according to 10.10.7), in cm²

$$k_w = \frac{1}{1 + \frac{2A_{fn}}{A_w}}$$

A_{fn} = as given in 10.10.8

$$k_z = \frac{Z_p}{Z_{pt}} \text{ in general}$$

= 0 when the frame is arranged with end bracket

Z_p = sum of individual plastic section moduli of flange and shell plate as fitted, in cm³

$$= \frac{\frac{b_f t_{fn}^2}{4} + \frac{b_e t_{pn}^2}{4}}{1000}$$

b_f = flange breadth, in mm, see Fig. 2.10.4

t_{fn} = net flange thickness, in mm

= $t_f - t_c$

t_c = as given in 10.10.7

t_f = as-built flange thickness, in mm, see Fig. 2.10.4

t_{pn} = the fitted net shell plate thickness, in mm, but is not to be less than t_n as given in 10.9

b_e = effective width of shell plate flange, in mm
= 500s

Z_p = net effective plastic section modulus of transverse frame (calculated according to 10.10.8 or 10.10.9), in cm³

AF , K_t , P_a , I_L , b , s , a and σ_y are as given in 10.11.2.

10.11.4 The scantlings of the frame are to meet the structural stability requirements of 10.14.

10.12 Framing – Side longitudinals (longitudinally framed ships)

10.12.1 Side longitudinals are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

10.12.2 The actual net effective shear area of the frame, A_w , as defined in 10.10.7, is to comply with the following condition:

$$A_w \geq A_L$$

where

$$A_L = \frac{5000 AF K_s P_a b_1 a}{0,577 \sigma_y} \text{ cm}^2$$

AF = hull area factor from Table 2.10.3

K_s = peak pressure factor from Table 2.10.2

P_a = average pressure within load patch according to 10.7.1, in MPa

B_1 = $k_o b_2$ m

$$k_o = 1 - \frac{0,3}{b'}$$

$$b' = \frac{b}{s}$$

b = height of design ice load patch from 10.6, in metres

s = spacing of longitudinal frames, in metres

$$b_2 = b (1 - 0,25b') \text{ m} \quad \text{if } b' < 2$$

$$= s \text{ m} \quad \text{if } b' \geq 2$$

a = longitudinal design span as given in 10.10.5, in metres

σ_y = minimum upper yield stress of the material, in N/mm²

10.12.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p , as defined in 10.10.8 or 10.10.9, is to comply with the following condition:

$$Z_p \geq Z_{pL}$$

where

$$Z_{pL} = \frac{100^3 AF K_s P_a b_1 a^2 A_4}{8 \sigma_y} \text{ cm}^3$$

$$A_4 = \frac{1}{2 + k_{wl} (\sqrt{1 - a_4^2} - 1)}$$

$$a_4 = \frac{A_L}{A_w}$$

A_L = rule minimum shear area for longitudinal as given in 10.12.2, in cm²

A_w = net effective shear area of longitudinal (calculated according to 10.10.7), in cm²

$$k_{wl} = \frac{1}{1 + \frac{2A_{fn}}{A_w}}$$

A_{fn} = as given in 10.10.8

AF , K_s , P_a , b_1 , a and σ_y are as given in 10.12.2.

10.12.4 The scantlings of the longitudinals are to meet the structural stability requirements of 10.14.

10.13 Framing – Web frame and load carrying stringers

10.13.1 Web frames and load-carrying stringers are to be designed to withstand the ice load patch as defined in 10.7. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimised.

10.13.2 Web frames and load-carrying stringers are to be dimensioned to take into account the combined effects of shear and bending. Where these members form part of a structural grillage system, appropriate methods of analysis are to be used. Where the structural configuration is such that members do not form part of a grillage system, the appropriate peak pressure factor, K_i , from Table 2.10.2 is to be used. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

10.13.3 The scantlings of web frames and load-carrying stringers are to meet the structural stability requirements of 10.14.

10.14 Framing – Structural stability

10.14.1 To prevent local buckling in the web, the ratio of web height, h_w , to net web thickness, t_{wn} , of any framing member is not to exceed:

$$\text{For flat bar sections: } \frac{h_w}{t_{wn}} \leq \frac{282}{\sqrt{\sigma_y}}$$

$$\text{For bulb, tee and angle sections: } \frac{h_w}{t_{wn}} \leq \frac{805}{\sqrt{\sigma_y}}$$

where

h_w = web height

t_{wn} = net web thickness

σ_y = minimum upper yield stress of the material, in N/mm²

10.14.2 Framing members for which it is not practicable to meet the requirements of 10.14.1 (e.g. load carrying stringers or deep web frames) are required to have their webs effectively stiffened. The scantlings of the web stiffeners are to ensure the structural stability of the framing member. The minimum net web thickness for these framing members is given by:

$$t_{wn} = 2,63 \times 10^{-3} c_1 \frac{\sigma_y}{5,34 + 4 \left(\frac{c_1}{c_2} \right)^2} \text{ mm}$$

where

c_1 = $h_w - 0,8h$ mm

h_w = web height of stringer/web frame, in mm, see Fig. 2.10.5

h = height of framing member penetrating the member under consideration (to be taken as zero if no such framing member is fitted), in mm, see Fig. 2.10.5

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

- c_2 = spacing between supporting structure oriented perpendicular to the member under consideration, in mm, see Fig. 2.10.5
 σ_y = minimum upper yield stress of the material, in N/mm²

10.14.3 In addition, the following is to be satisfied:

$$t_{wn} \geq 0,35t_{pn} \sqrt{\frac{\sigma_y}{235}}$$

where

- σ_y = minimum upper yield stress of the material, in N/mm²
 t_{wn} = net thickness of the web, in mm
 t_{pn} = net thickness of the shell plate in way the framing member, in mm.

10.14.4 To prevent local flange buckling of welded profiles, the following are to be satisfied:

- (a) The flange width, b_f , in mm, is not to be less than five times the net thickness of the web, t_{wn} .
(b) The flange outstand, b_o , in mm, is to meet the following requirement:

$$\frac{b_o}{t_{fn}} \leq \frac{155}{\sqrt{\sigma_y}}$$

where

- t_{fn} = net thickness of flange, in mm
 σ_y = minimum upper yield stress of the material, in N/mm².

10.15 Plated structures

10.15.1 Plated structures are those stiffened plate elements in contact with the hull and subject to ice loads. These requirements are applicable to an inboard extent which is the lesser of:

- (a) web height of adjacent parallel web frame or stringer; or
(b) 2,5 times the depth of framing that intersects the plated structure.

10.15.2 The thickness of the plating and the scantlings of attached stiffeners are to be such that the degree of end fixity necessary for the shell framing is ensured.

10.15.3 The stability of the plated structure is to adequately withstand the ice loads defined in 10.7.

10.16 Corrosion/abrasion additions and steel renewal

10.16.1 Effective protection against corrosion and ice-induced abrasion is recommended for all external surfaces of the shell plating for all Polar ships.

10.16.2 The values of corrosion/abrasion additions, t_s , to be used in determining the shell plate thickness for each Polar Class are listed in Table 2.10.6.

10.16.3 Polar ships are to have a minimum corrosion/abrasion addition of $t_s = 1,0$ mm applied to all internal structures within the ice strengthened hull areas, including plated members adjacent to the shell, as well as stiffener webs and flanges.

10.16.4 Steel renewal for ice strengthened structures is required when the gauged thickness is less than $t_n + 0,5$ mm.

10.17 Materials

10.17.1 Plating materials for hull structures are to be not less than those given in Tables 2.10.8 to 2.10.11 based on the as-built thickness of the material, the Polar ice class notation assigned to the ship and the material class of structural members given in Table 2.10.7.

Table 2.10.6 Corrosion/abrasion additions for shell plating

Hull area	t_s , in mm

Ice Operations – Ice Class

Part 8, Chapter 2

Section 10

Table 2.10.7 Material classes for structural members of polar ships

Structural members	Material Class
Shell plating within the bow and bow intermediate icebelt hull areas (B, B_{I1})	II
Plating materials for stem and stern frames, rudder horn, rudder, propeller nozzle, shaft brackets, ice skeg, ice knife and other appendages subject to ice impact loads	II
All weather and sea exposed SPECIAL, as defined in Table 2.2.1 in Pt 3, Ch 2, structural members within $0,2L$ from FP	II
All weather and sea exposed SECONDARY and PRIMARY, as defined in Table 2.2.1 in Pt 3, Ch 2, structural members outside $0,4L$ amidships	I
All inboard framing members attached to the weather and sea-exposed plating including any contiguous inboard member within 600 mm of the shell plating	I
Weather-exposed plating and attached framing in cargo holds of ships which by nature of their trade have their cargo hold hatches open during cold weather operations	I

10.17.2 Material classes specified in Table 2.2.1 in Pt 3, Ch 2, are applicable to polar ships regardless of the ship's length. In addition, material classes for weather and sea exposed structural members and for members attached to the weather and sea exposed shell plating of polar ships are given in Table 2.10.7. Where the material classes in Table 2.10.7 and those in Table 2.2.1 in Pt 3, Ch 2 differ, the higher material class is to be applied.

10.17.3 Steel grades for all plating and attached framing of hull structures and appendages situated below the level of 0,3 m below the lower waterline, as shown in Fig. 2.10.6, are to be obtained from Table 2.2.2 in Pt 3, Ch 2, based on the material class for Structural Members in Table 2.10.7 above, regardless of Polar Class.

10.17.4 Steel grades for all weather exposed plating of hull structures and appendages situated above the level of 0,3 m below the lower ice waterline, as shown in Fig. 2.10.6, are to be not less than given in Table 2.10.8 to Table 2.10.10.

10.17.5 Steel grades for all inboard framing members attached to weather exposed plating are to be not less than given in Table 2.10.11. This applies to all inboard framing members as well as to other contiguous inboard members (e.g. bulkheads, decks) within 600 mm of the exposed plating.

10.17.6 Castings are to have specified properties consistent with the expected service temperature for the cast component.

10.18 Longitudinal strength – Application

10.18.1 Ice loads need only be combined with still water loads. The combined stresses are to be compared against permissible bending and shear stresses at different locations along the ship's length. In addition, sufficient local buckling strength is also to be verified.

10.19 Design vertical ice force at the bow

10.19.1 The design vertical ice force at the bow, F_{IB} , is to be taken as the lesser of $F_{IB,1}$ or $F_{IB,2}$:

$$F_{IB,1} = 0,534C_L K_I^{0,15} \sin^{0,2}(\gamma_s) \sqrt{DK_h} \text{ MN}$$

$$F_{IB,2} = 1,2C_F \text{ MN}$$

where

K_I = indentation parameter

$$= \frac{K_f}{K_h}$$

K_f = for blunt bow forms:

$$K_f = \left(\frac{2C B(1 - e_b)}{1 + e_b} \right)^{0,9} \tan(\gamma_s)^{-0,9(1 + e_b)}$$

= for wedge bow forms ($\alpha < 80$ deg), $e_b = 1$ and the above simplifies to:

$$K_f = \left(\frac{\tan(\alpha)}{\tan^2(\gamma_s)} \right)^{0,9}$$

$K_h = 0,01A_{wp} \text{ MN/m}$

C_L = longitudinal strength class factor from Table 2.10.1

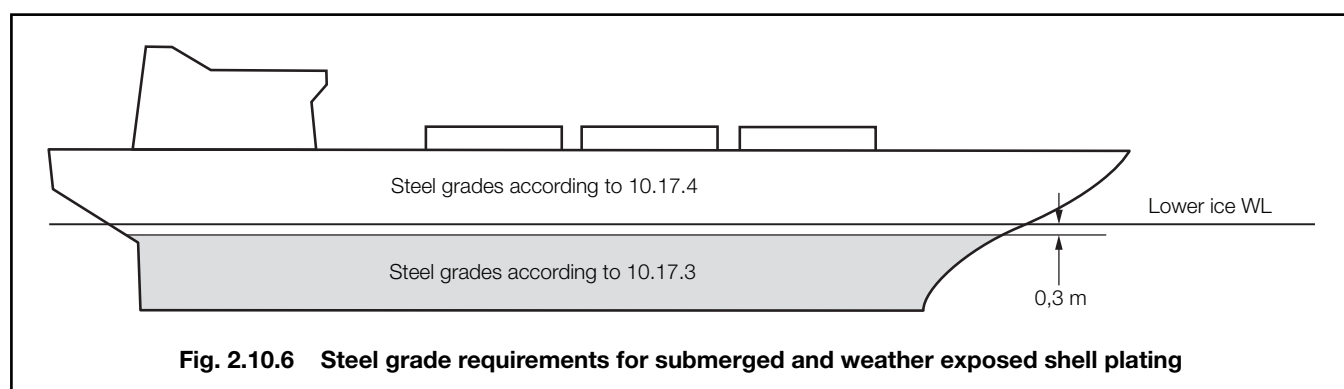

Fig. 2.10.6 Steel grade requirements for submerged and weather exposed shell plating

$35 < t \leq 40$	E	EH	D	DH
$40 < t \leq 45$	E	EH	D	DH
$45 < t \leq 50$	E	EH	D	DH

NOTES

- Includes weather exposed plating of hull structures and appendages, as well as their outboard framing members, situated above a level of 0,3 m below the lowest ice waterline.
- Grades D, DH are allowed for a single strake of side shell plating not more than 1,8 m wide from 0,3 m below the lowest ice waterline.

e_b = bow shape exponent which best describes the waterplane (see Figs. 2.10.7 and 2.10.8).

An approximate e_b determined by a simple fit is acceptable

- = 1,0 for a simple wedge bow form
- = 0,4 to 0,6 for a spoon bow form
- = 0 for a landing craft bow form

γ_s = stem angle to be measured between the horizontal axis and the stem tangent at the upper ice waterline, in degrees (buttock angle as per Fig. 2.10.2 measured on the centreline)

$$C = \frac{1}{2 \left(\frac{L_B}{B} \right)^{e_b}}$$

B = ship moulded breadth, in metres

L_B = bow length, in m, used in the equation:

$$y = \frac{B}{2 \left(\frac{x}{L_B} \right)^{e_b}} \quad (\text{see Figs. 2.10.7 and 2.10.8})$$

Δ = ship displacement, in kilo tonnes, not to be taken less than 10

A_{wp} = ship waterplane area, in m²

C_F = flexural failure class factor from Table 2.10.1

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

**10.20 Design vertical shear force**

10.20.1 The design vertical ice shear force, F_I , along the hull girder is to be taken as:

$$F_I = C_f F_{IB} \text{ MN}$$

where

C_f = longitudinal distribution factor to be taken as follows:

(a) Positive shear force

$C_f = 0,0$ between the aft end of L and $0,6L$ from aft

$C_f = 1,0$ between $0,9L$ from aft and the forward end of L

(b) Negative shear force

$C_f = 0,0$ at the aft end of L

$C_f = -0,5$ between $0,2L$ and $0,6L$ from aft

$C_f = 0,0$ between $0,8L$ from aft and the forward end of L

Intermediate values are to be determined by linear interpolation.

10.20.2 The applied vertical shear stress, τ_a , is to be determined along the hull girder in a similar manner as in Pt 3, Ch 4 by substituting the design vertical ice shear force for the design vertical wave shear force.

10.21 Design vertical ice bending moment

10.21.1 The design vertical ice bending moment, M_I , along the hull girder is to be taken as:

$$M_I = 0,1 C_m L \sin^{-0,2}(\gamma_s) F_{IB} \quad \text{MNm}$$

where

- L = ship length (as defined in Pt 3, Ch 1,6.1.1), in metres
- γ_{stem} = as given in 10.19.1
- F_{IB} = design vertical ice force at the bow, in MN
- C_m = longitudinal distribution factor for design vertical ice bending moment to be taken as follows:
 - $C_m = 0,0$ at the aft end of L
 - $C_m = 1,0$ between $0,5L$ and $0,7L$ from aft
 - $C_m = 0,3$ at $0,95L$ from aft
 - $C_m = 0,0$ at the forward end of L

Intermediate values are to be determined by linear interpolation.

Where applicable, draught dependent quantities are to be determined at the waterline corresponding to the loading condition under consideration.

10.21.2 The applied vertical bending stress, σ_a , is to be determined along the hull girder in a similar manner as in Pt 3, Ch 4, by substituting the design vertical ice bending moment for the design vertical wave bending moment. The ship still water bending moment is to be taken as the maximum sagging moment.

10.22 Longitudinal strength criteria

10.22.1 The strength criteria provided in Table 2.10.12 are to be satisfied. The design stress is not to exceed the permissible stress.

10.23 Stem and stern frames

10.23.1 The stem and stern frame are to be suitably designed. The stem and stern requirements of the *Finnish-Swedish Ice Class Rules* are to be additionally considered, see Section 1.

10.24 Appendages

10.24.1 All appendages are to be designed to withstand forces appropriate for the location of their attachment to the hull structure or their position within a hull area.

10.25 Local details

10.25.1 Local design details are to be suitably designed to transfer ice-induced loads to supporting structure (bending moments and shear forces).

10.25.2 The loads carried by a member in way of cut-outs are not to cause instability. Where necessary, the structure is to be stiffened.

Ice Operations – Ice Class

Part 8, Chapter 2

Sections 10 & 11

Table 2.10.12 Longitudinal strength criteria

Failure mode	Applied stress	Permissible stress	Permissible stress
		$\frac{\sigma_y}{\sigma_u} \leq 0,7$	$\frac{\sigma_y}{\sigma_u} > 0,7$
Tension	σ_a	$\eta \sigma_y$	$\eta \, 0,41(\sigma_u + \sigma_y)$
Shear	τ_a	$\frac{\eta \, \sigma_y}{\sqrt{3}}$	$\frac{\eta \, 0,41(\sigma_u + \sigma_y)}{\sqrt{3}}$
Buckling	σ_a	σ for plating and for web plating of stiffeners $\frac{\sigma_c}{1,1}$ for stiffeners	
	τ_a	τ_c	
Symbols			
σ_a = applied vertical bending stress, in N/mm ² τ_a = applied vertical shear stress, in N/mm ² σ_y = minimum upper yield stress of the material, in N/mm ² σ_u = ultimate tensile strength of material, in N/mm ² σ_c = critical buckling stress in compression, according to Pt 3, Ch 4, in N/mm ² τ_c = critical buckling stress in shear, according to Pt 3, Ch 4, in N/mm ² η = 0,8			

10.26 Direct calculations

10.26.1 Direct calculations are not to be utilised as an alternative to the analytical procedures prescribed in this Section.

10.26.2 Where direct calculation is used to check the strength of structural systems, the load patch specified in 10.2 is to be applied.

10.27 Welding

10.27.1 All welding within ice-strengthened areas is to be of the double continuous type.

10.27.2 Continuity of strength is to be ensured at all structural connections.

Section 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7

11.1 Application

11.1.1 The contents of this Section apply to main propulsion, steering gear, emergency and essential auxiliary systems essential for the safety of the ship and the survivability of the crew.

11.2 Drawings and particulars to be submitted

11.2.1 The following drawings and particulars to be submitted:

- Details of the environmental conditions and the required ice class for the machinery, if different from ship's ice class.
- Detailed drawings of the main propulsion machinery. Description of the main propulsion, steering, emergency and essential auxiliaries are to include operational limitations. Information on essential main propulsion load control functions.
- Description detailing how main, emergency and auxiliary systems are located and protected to prevent problems from freezing, ice and snow and evidence of their capability to operate in intended environmental conditions.
- Calculations and documentation indicating compliance with the requirements of this Section.

11.3 System design

11.3.1 Systems, subject to damage by freezing, are to be drainable.

11.3.2 Single screw vessels classed PC1 to PC5 inclusive are to have means provided to ensure sufficient vessel operation in the case of propeller damage including CP mechanism.

11.4 Materials exposed to sea water

11.4.1 Materials exposed to sea water, such as propeller blades, propeller hub and blade bolts are to have an elongation not less than 15 per cent on a test piece the length of which is five times the diameter. Charpy V impact test are to be carried out for other than bronze and austenitic steel materials. Test pieces taken from the propeller castings are to be representative of the thickest section of the blade. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at minus 10°C.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 11

11.5 Materials exposed to sea water temperature

11.5.1 Materials exposed to sea water temperature are to be of steel or other approved ductile material. An average impact energy value of 20 J taken from three tests is to be obtained at minus 10°C.

11.6 Materials exposed to low air temperature

11.6.1 Materials of essential components exposed to low air temperature shall be of steel or other approved ductile material. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at 10°C below the lowest design temperature. See also *The Provisional Rules for the Winterisation of Ships*.

11.7 Propeller ice interaction

11.7.1 These Rules cover open and ducted type propellers situated at the stern of a vessel having controllable pitch or fixed pitch blades. Ice loads on bow propellers and pulling type propellers are to receive special consideration. The given loads are expected, single occurrence, maximum values for the whole ship's service life for normal operational conditions. These loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. These Rules apply also for azimuthing (geared and podded) thrusters considering loads due to propeller ice interaction. However, ice loads due to ice impacts on the body of azimuthing thrusters are not covered by this Section.

11.7.2 The loads given in 11.7 are total loads (unless otherwise stated) during ice interaction and are to be applied separately (unless otherwise stated) and are intended for component strength calculations only. The different loads given here are to be applied separately.

11.7.3 F_b is a force bending a propeller blade backwards when the propeller mills an ice block while rotating ahead. F_f is a force bending a propeller blade forwards when a propeller interacts with an ice block while rotating ahead.

11.8 Ice class factors

11.8.1 Table 2.11.1 lists the design ice thickness and ice strength index to be used for estimation of the propeller ice loads.

11.9 Design ice loads for open propeller

11.9.1 The maximum backward blade force, F_b , is to be taken as:

when $D < D_{\text{limit}}$

$$F_b = -27S_{\text{ice}}(nD)^{0,7} \left(\frac{EAR}{Z} \right)^{0,3} D^2 \text{ kN}$$

when $D \geq D_{\text{limit}}$

$$F_b = -23S_{\text{ice}}(nD)^{0,7} \left(\frac{EAR}{Z} \right)^{0,3} (H_{\text{ice}})^{1,4} D \text{ kN}$$

where

Table 2.11.1 Propeller ice loads index

Ice Class	H_{ice} , in metres	S_{ice}	S_{qice}
PC1	4,0	1,2	1,15
PC2	3,5	1,1	1,15
PC3	3,0	1,1	1,15
PC4	2,5	1,1	1,15
PC5	2,0	1,1	1,15
PC6	1,75	1,0	1,00
PC7	1,5	1,0	1,00

where
 H_{ice} = ice thickness for machinery strength design
 S_{ice} = ice strength index for blade ice force
 S_{qice} = ice strength index for blade ice torque

$$D_{\text{limit}} = 0,85 (H_{\text{ice}})^{1,4}$$

n = the nominal rotational speed (at MCR free running condition) for CP-propeller and 85 per cent of the nominal rotational speed (at MCR free running condition) for a FP-propeller (regardless of driving engine type)

11.9.2 F_b is to be applied as a uniform pressure distribution to an area on the back (suction) side of the blade for the following load cases:

- Load case 1: from 0,6R to the tip and from the blade leading edge to a value of 0,2 chord length
- Load case 2: a load equal to 50 per cent of the F_b is to be applied on the propeller tip area outside of 0,9R
- Load case 5: for reversible propellers, a load equal to 60 per cent of the F_b is to be applied from 0,6R to the tip and from the blade trailing edge to a value of 0,2 chord length.

See load cases 1, 2, and 5 in Table 2.11.4.

11.9.3 The maximum forward blade force, F_f , is to be taken as:

when $D < D_{\text{limit}}$

$$F_f = 250 \left(\frac{EAR}{Z} \right) D^2 \text{ kN}$$

when $D \geq D_{\text{limit}}$

$$F_f = 500 \left(\frac{1}{1 - \frac{d}{D}} \right) H_{\text{ice}} \left(\frac{EAR}{Z} \right) D \text{ kN}$$

d = propeller hub diameter, in metres

D = propeller diameter, in metres

EAR = expanded blade area ratio

Z = number of propeller blades.

11.9.4 F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side of the blade for the following loads cases:

- Load case 3: from 0,6R to the tip and from the blade leading edge to a value of 0,2 chord length.
- Load case 4: a load equal to 50 per cent of F_f is to be applied on the propeller tip area outside of 0,9R.
- Load case 5: for reversible propellers a load equal to 60 per cent of F_f is to be applied from 0,6R to the tip and from the blade trailing edge to a value of 0,2 chord length.

See load cases 3, 4 and 5 in Table 2.11.4.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 11

11.9.5 The blade spindle torque, Q_{smax} , around the spindle axis of the blade fitting is to be calculated both for the load cases described in 11.9.1 and 11.9.3 for F_h and F_f . If these spindle torque values are less than the default value given below, the default minimum value is to be used:

$$Q_{smax} = 0,25FC_{0,7} \text{ kNm}$$

where

$$C_{0,7} = \text{length of the blade chord at } 0,7R \text{ radius, in m}$$

$$F = F_h \text{ or } F_f \text{ whichever has the greater absolute value.}$$

11.9.6 The maximum propeller ice torque applied to the propeller is to be taken as:

when $D < D_{limit}$

$$Q_{max} = 105 \left(1 - \frac{d}{D}\right) S_{qice} \left(\frac{P_{0,7}}{D}\right)^{0,16} \left(\frac{t_{0,7}}{D}\right)^{0,6} (nD)^{0,17} D^3 \text{ kNm}$$

when $D \geq D_{limit}$

$$Q_{max} = 202 \left(1 - \frac{d}{D}\right) S_{qice} H_{ice}^{1,1} \left(\frac{P_{0,7}}{D}\right)^{0,16} \left(\frac{t_{0,7}}{D}\right)^{0,6} (nD)^{0,17} D^{1,9} \text{ kNm}$$

where

$$D_{limit} = 1,81H_{ice}$$

$$S_{qice} = \text{ice strength index for blade ice torque}$$

$$P_{0,7} = \text{propeller pitch at } 0,7R, \text{ in m}$$

$$= \text{for CP propellers, } P_{0,7} \text{ is to correspond to MCR in bollard condition. If not known, } P_{0,7} \text{ is to be taken as } 0,7P_{0,7n}$$

$$P_{0,7n} = \text{propeller pitch at MCR free running condition}$$

$$t_{0,7} = \text{maximum thickness at } 0,7R$$

$$n = \text{the rotational propeller speed, in rps, at bollard condition. If not known, } n \text{ is to be taken as follows:}$$

$$\text{for CP propellers and FP propellers driven by turbine or electric motor } = n_n$$

$$\text{for FP propellers driven by diesel engine } = 0,85n_n$$

$$n_n = \text{the nominal rotational speed at MCR, free running condition.}$$

11.9.7 The maximum propeller ice thrust applied to the shaft is to be taken as:

$$T_f = 1,1F_f$$

$$T_b = 1,1F_b.$$

11.10 Design ice loads for ducted propellers

11.10.1 The maximum backward blade force, F_b is to be taken as:

when $D < D_{limit}$

$$F_b = -9,5 S_{ice} \left(\frac{EAR}{Z}\right)^{0,3} (nD)^{0,7} D^2$$

when $D \geq D_{limit}$

$$F_b = -66 S_{ice} \left(\frac{EAR}{Z}\right)^{0,3} (nD)^{0,7} D^{0,6} (H_{ice})^{1,4}$$

where

$$D_{limit} = 4 H_{ice}$$

$$n = \text{as in 11.9.1.}$$

11.10.2 F_b is to be applied as a uniform pressure distribution to an area on the back side for the following load cases:

- Load case 1: on the back of the blade from $0,6R$ to the tip and from the blade leading edge to a value of $0,2$ chord length
- Load case 5: for reversible rotation propellers a load equal to 60 per cent of F_b is applied on the blade face from $0,6R$ to the tip and from the blade trailing edge to a value of $0,2$ chord length.

See load cases 1 and 5 in Table 2.11.5.

11.10.3 The maximum forward blade force, F_f , is to be taken as:

when $D \leq D_{limit}$

$$F_f = 250 \left(\frac{EAR}{Z}\right) D^2 \text{ kN}$$

when $D > D_{limit}$

$$F_f = 500 \left(\frac{EAR}{D}\right) D \left(\frac{1}{1 - \frac{d}{D}}\right) H_{ice} \text{ kN}$$

where

$$D_{limit} = \left(\frac{2}{1 - \frac{d}{D}}\right) H_{ice}.$$

11.10.4 F_f is to be applied as a uniform pressure distribution to an area on the face (pressure) side for the following load cases:

- Load case 3: on the blade face from $0,6R$ to the tip and from the blade leading edge to a value of $0,5$ chord length.
- Load case 5: a load equal to 60 per cent F_f is to be applied from $0,6R$ to the tip and from the blade leading edge to a value of $0,2$ chord length.

See load cases 3 and 5 in Table 2.11.5.

11.10.5 The maximum propeller ice torque, Q_{max} , applied to the propeller is to be taken as:

when $D \leq D_{limit}$

$$Q_{max} = 74 \left(1 - \frac{d}{D}\right) \left(\frac{P_{0,7}}{D}\right)^{0,16} \left(\frac{t_{0,7}}{D}\right)^{0,6} (nD)^{0,17} S_{qice} D^3 \text{ kNm}$$

when $D > D_{limit}$

$$Q_{max} = 141 \left(1 - \frac{d}{D}\right) \left(\frac{P_{0,7}}{D}\right)^{0,16} \left(\frac{t_{0,7}}{D}\right)^{0,6} (nD)^{0,17} S_{qice} D^{1,9} H_{ice}^{1,1} \text{ kNm}$$

where

$$D_{limit} = 1,8H_{ice} \text{ in metres}$$

$$n = \text{the rotational propeller speed, in rps, at bollard condition. If not known, } n \text{ is to be taken as follows:}$$

$$\text{for CP propellers and FP propellers driven by turbine or electric motor } = n_n$$

$$\text{for FP propellers driven by diesel engine } = 0,85n_n$$

$$n_n = \text{the nominal rotational speed at MCR at free running condition}$$

$$P_{0,7} = \text{for CP propellers, propeller pitch, } P_{0,7} \text{ is to correspond to MCR in bollard condition. If not known, } P_{0,7} \text{ is to be taken as } 0,7P_{0,7n}$$

$$P_{0,7n} = \text{propeller pitch at MCR free running condition.}$$

11.10.6 The spindle torque for CP-mechanism design, Q_{smax} , around the spindle axis of the blade fitting is to be calculated for the load case described in 11.7. If these spindle torque values are less than the default value given below, the default value is to be used:

$$Q_{smax} = 0,25F C_{0,7} \text{ kNm}$$

where

$$C_{0,7} = \text{the length of the blade section at } 0,7R$$

$$F = F_b \text{ or } F_f \text{ whichever has the greater absolute value.}$$

11.10.7 The maximum propeller ice thrust (applied to the shaft at the location of the propeller) is to be taken as:

$$T_f = 1,1F_f$$

$$T_b = 1,1F_b.$$

11.11 Design loads on propulsion line – Torque

11.11.1 The propeller ice torque excitation for shaft line dynamic analysis is to be described by a sequence of blade impacts which are of half sine shape and occur at the blade. The torque due to a single blade ice impact as a function of the propeller rotation angle is to be taken as:

when

$$\varphi = 0 \dots \alpha_i$$

$$Q(\varphi) = C_q Q_{max} \sin\left(\varphi \left(\frac{180}{\alpha_i}\right)\right)$$

when

$$\varphi = \alpha_i \dots 360$$

$$Q(\varphi) = 0$$

where

$$C_q = \text{as given in Table 2.11.2}$$

$$\alpha_i = \text{as given in Table 2.11.2.}$$

Table 2.11.2 Torque load factors

Torque excitation	Propeller-ice interaction	C_q	α_i .
Case 1	Single ice block	0,50	45
Case 2	Single ice block	0,75	90
Case 3	Single ice block	1,00	135
Case 4	Two ice blocks with 45 degree phase in rotation angle	0,50	45

11.11.2 The total ice torque is obtained by summing the torque of single blades taking into account the phase shift $360^\circ/Z$. The number of propeller revolutions during a milling sequence is to be obtained with the formula:

$$N_Q = 2H_{ice}$$

where

number of impacts = $Z N_Q$ see Fig. 2.11.1.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 11

11.11.3 The milling torque sequence duration is not valid for pulling bow propellers, which are subject to special consideration. The response torque at any shaft component is to be analysed considering excitation torque $Q(\varphi)$ at the propeller, actual engine torque, Q_e , and mass elastic system. Where Q_e is the actual maximum engine torque at considered speed.

11.11.4 The design torque, Q_r , of the shaft component is to be determined by means of torsional vibration analysis of the propulsion line. Calculations are to be carried out for all excitation cases given above and the response is to be applied on top of the mean hydrodynamic torque in bollard condition at considered propeller rotational speed.

11.12 Design loads on propulsion line – Maximum response thrust

11.12.1 The maximum thrust along the propeller shaft line is to be calculated with the formulae below. The factors 2,2 and 1,5 take into account the dynamic magnification due to axial vibration. Alternatively, the propeller thrust magnification factor may be calculated by dynamic analysis.

Maximum shaft thrust forwards

$$T_r = T_n + 2,2T_f \text{ kN}$$

Maximum shaft thrust backwards

$$T_r = 1,5T_b \text{ kN}$$

where

T_n = hydrodynamic propeller bollard thrust, in kN. If not known, T_n is to be as given in Table 2.11.3

T_f = maximum forward propeller ice thrust, in kN.

Table 2.11.3 Propeller thrust factor

Propeller type	T_n
CP propellers (open)	1,25T
CP propellers (ducted)	1,10T
FP propellers driven by turbine or electric motor	T
FP propellers driven by diesel engine (open)	0,85T
FP propellers driven by diesel engine (ducted)	0,75T
Symbols	
T = nominal propeller thrust at MCR at free running open water conditions	

11.13 Design loads on propulsion line – Blade failure load for both open and nozzle propellers

11.13.1 The force is acting at 0,8R in the weakest direction of the blade and at a spindle arm of 2/3 of the distance of axis of blade rotation of leading and trailing edge whichever is the greatest. The blade failure load is to be taken as:

$$F_{ex} = \frac{0,3c t^2 \sigma_{ref}}{0,8D - 2r} \times 10^{-3} \text{ kN}$$

where

$\sigma_{ref} = 0,6\sigma_{0,2} + 0,4\sigma_u$
 $\sigma_{0,2}$ and σ_u = representative values for the blade material
 c, t and r = the actual chord length, thickness and radius of the cylindrical root section of the blade at the weakest section outside root fillet and typically will be at the termination of the fillet into the blade profile.

11.14 Design – Design principle

11.14.1 The strength of the propulsion line is to be designed:

- for maximum loads in 11.7;
- such that the plastic bending of a propeller blade will not cause damage in other propulsion line components;
- with sufficient fatigue strength.

11.15 Design – Azimuthing main propulsors

11.15.1 In addition to the above requirements, special consideration will be given to the loading cases which are extraordinary for propulsion units when compared with conventional propellers. Estimation of the loading cases must reflect the operational realities of the ship and the thrusters. In this respect, for example, the loads caused by impacts of ice blocks on the propeller hub of a pulling propeller are to be considered. Also, loads due to thrusters operating in an oblique angle to the flow are to be considered. The steering mechanism, the fitting of the unit and the body of the thruster is to be designed to withstand the loss of a blade without damage. The plastic bending of a blade is to be considered in the propeller blade position, which causes the maximum load on the studied component.

11.15.2 Azimuth thrusters are also to be designed for estimated loads due to thruster body/ice interaction as in 10.24.

11.16 Blade design – Maximum blade stresses

11.16.1 Blade stresses are to be calculated using the backward and forward loads given in sub-Sections 11.9 and 11.10. The stresses are to be calculated with recognised and well documented FE-analysis or another acceptable alternative method. The stresses on the blade are not to exceed the allowable stresses, σ_{all} , for the blade material given below. The calculated blade stress for the maximum ice load is to comply with the following:

$$\sigma_{calc} < \sigma_{all} = \frac{\sigma_{ref}}{S}$$

where

$$S = 1,5$$

σ_{ref} = reference stress, defined as:

$$0,7\sigma_u$$

$$0,6\sigma_{0,2} + 0,4\sigma_u \text{ whichever is less}$$

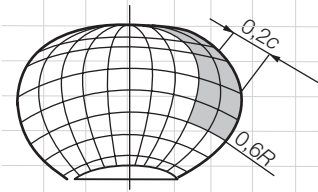

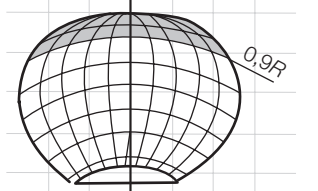

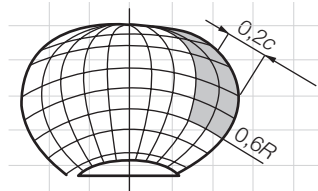

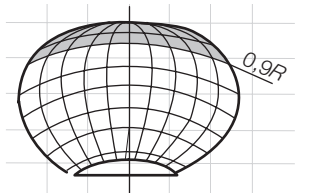

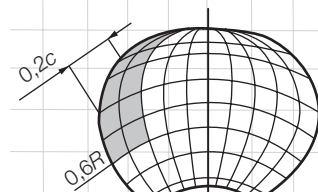

σ_u and $\sigma_{0,2}$ = representative values for the blade material.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 11

Table 2.11.4 Load cases for open propeller

Load case	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from $0,6R$ to the tip and from the leading edge to $0,2$ times the chord length.	
Load case 2	50% of F_b	Uniform pressure applied on the back of the blade (suction side) on the propeller tip area outside of $0,9R$ radius.	
Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from $0,6R$ to the tip and from the leading edge to $0,2$ times the chord length.	
Load case 4	50% of F_f	Uniform pressure applied on propeller face (pressure side) on the propeller tip area outside of $0,9R$ radius.	
Load case 5	60% of F_f or F_b whichever is the greater	Uniform pressure applied on propeller face (pressure side) to an area from $0,6R$ to the tip and from the trailing edge to $0,2$ times the chord length.	

11.17 Blade design – Blade edge thickness

11.17.1 The blade edge thicknesses, t_{ed} , and tip thickness t_{tip} , are to be greater than t_{edge} given by the following formula:

$$t_{edge} \geq x S S_{ice} \sqrt{\frac{3P_{ice}}{\sigma_{ref}}}$$

where

x = distance from the blade edge measured along the cylindrical sections from the edge and is to be 2,5 per cent of chord length, however not to be taken greater than 45 mm.

In the tip area (above $0,975R$ radius) x is to be taken as 2,5 per cent of $0,975R$ section length and is to be measured perpendicularly to the edge, however not to be taken greater than 45 mm.

S = safety factor

= 2,5 for trailing edges

= 3,5 for leading edges

= 5,0 for tip

S_{ice} = as given in 11.8

p_{ice} = ice pressure

= 16 MPa for leading edge and tip thickness

σ_{ref} = as given in 11.16.

11.17.2 The requirement for edge thickness is to be applied for leading edge and in case of reversible rotation open propellers also for the trailing edge. Tip thickness refers to the maximum measured thickness in the tip area above $0,975R$ radius. The edge thickness in the area between the position of maximum tip thickness and edge thickness at $0,975$ radius has to be interpolated between edge and tip thickness value and smoothly distributed.

11.18 Prime movers

11.18.1 The main engine is to be capable of being started and running the propeller with the CP in full pitch.

Table 2.11.5 Load cases for ducted propeller

Load case	Force	Loaded area	Right handed propeller blade seen from back
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from $0,6R$ to the tip and from the leading edge to $0,2$ times the chord length	
Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from $0,6R$ to the tip and from the leading edge to $0,5$ times the chord length	
Load case 5	60% of F_f or F_b	Uniform pressure applied on propeller face (pressure side) to an area from $0,6R$ to the tip and from the trailing edge to $0,2$ times the chord length	

11.18.2 Provisions are to be made for heating arrangements to ensure ready starting of the cold emergency power units at an ambient temperature applicable to the Polar class of the ship.

11.18.3 Emergency power units are to be equipped with starting devices with a stored energy capability of at least three consecutive starts at the design temperature in 11.18.2. The source of stored energy is to be protected to preclude critical depletion by the automatic starting system, unless a second independent means of starting is provided. A second source of energy is to be provided for an additional three starts within 30 min., unless manual starting can be demonstrated to be effective.

11.19 Machinery fastening loading accelerations

11.19.1 Essential equipment and main propulsion machinery supports are to be suitable for the accelerations as indicated in the following. Accelerations are to be considered acting independently.

11.19.2 The maximum longitudinal impact acceleration, a_l , at any point along the hull girder is to be taken as:

$$a_l = \left(\frac{F_{IB}}{\Delta} \right) \left\{ [1,1 \tan (\gamma + \phi)] + \frac{7H}{L} \right\} \text{ m/s}^2$$

where

F_{IB} = vertical impact force, defined in 10.19

H = distance from the waterline to the point being considered, in metres

L = length between perpendiculars, in metres

ϕ = maximum friction angle between steel and ice, normally taken as 10° , in degrees

γ = bow stem angle at waterline, in degrees

Δ = Displacement.

11.19.3 The combined vertical impact acceleration, a_v , at any point along the hull girder, is to be taken as:

$$a_v = 2,5 \left(\frac{F_{IB}}{\Delta} \right) F_x \text{ m/s}^2$$

where

F_x = 1,3 at the FP

= 0,2 at midships

= 0,4 at the AP

= 1,3 at the AP for vessels conducting icebreaking astern

= intermediate values are to be determined by linear interpolation.

Ice Operations – Ice Class

Part 8, Chapter 2

Section 11

11.19.4 The combined transverse impact acceleration, a_t , at any point along hull girder, is to be taken as:

$$a_t = 3F_i \left(\frac{F_x}{\Delta} \right) \text{ m/s}^2$$

where

- F_x = 1,5 at the FP
- = 0,25 at midships
- = 0,5 at the AP
- = 1,5 at the AP for vessels conducting icebreaking astern
- = intermediate values are to be determined by linear interpolation
- F_i = total force normal to shell plating in the bow area due to oblique ice impact, defined in 10.19.

11.20 Auxiliary systems

11.20.1 Machinery is to be protected from the harmful effects of ingestion or accumulation of ice or snow. Where continuous operation is necessary, means are to be provided to purge the system of accumulated ice or snow.

11.20.2 Means are to be provided to prevent damage due to freezing, to tanks containing liquids.

11.20.3 Vent pipes, intake and discharge pipes and associated systems are to be designed to prevent blockage due to freezing or ice and snow accumulation.

11.21 Sea inlets and cooling water systems

11.21.1 Cooling water systems for machinery that are essential for the propulsion and safety of the vessel, including sea chest inlets, are to be designed for the environmental conditions applicable to the ice class.

11.21.2 At least two sea chests are to be arranged as ice boxes for classes **PC1** to **PC5** inclusive. The calculated volume for each of the ice boxes is to be at least 1 m³ for every 750 kW of the total installed power. For **PC6** and **PC7**, there is to be at least one ice box located preferably near centreline.

11.21.3 Ice boxes are to be designed for an effective separation of ice and venting of air.

11.21.4 Sea inlet valves are to be secured directly to the ice boxes. The valves are to be a full bore type.

11.21.5 Ice boxes and sea bays are to have vent pipes and are to have shut off valves connected directly to the shell.

11.21.6 Means are to be provided to prevent freezing of sea bays, ice boxes, ship side valves and fittings above the load waterline.

11.21.7 Efficient means are to be provided to re-circulate cooling seawater to the ice box. The total sectional area of the circulating pipes is not to be less than the area of the cooling water discharge pipe.

11.21.8 Detachable gratings or manholes are to be provided for ice boxes. Manholes are to be located above the deepest load line. Access is to be provided to the ice box from above.

11.21.9 Openings in ship sides for ice boxes are to be fitted with gratings, or holes or slots in shell plates. The net area through these openings is to be not less than 5 times the area of the inlet pipe. The diameter of holes and width of slot in shell plating is to be not less than 20 mm. Gratings of the ice boxes are to be provided with a means of clearing. Clearing pipes are to be provided with screw-down type non-return valves.

11.22 Ballast tanks

11.22.1 Efficient means are to be provided to prevent freezing in fore and after peak tanks and wing tanks located above the waterline and where otherwise found necessary. See 2.1.3 and *The Provisional Rules for the Winterisation of Ships*, 3.2.1.

11.23 Ventilation system

11.23.1 The air intakes for machinery and accommodation ventilation are to be located on both sides of the ship.

11.23.2 Accommodation and ventilation air intakes are to be provided with means of heating.

11.23.3 The temperature of the inlet air provided to machinery from the air intakes is to be suitable for the safe operation of the machinery.

11.24 Alternative design

11.24.1 As an alternative a comprehensive design study may be submitted and may be requested to be validated by an agreed test programme.

COMMON STRUCTURAL RULES FOR DOUBLE HULL OIL TANKER

RULES

JULY 2009

COMMON STRUCTURAL RULES FOR DOUBLE HULL OIL TANKERS

Foreword

1. This version of the Rules is effective as of 1st July 2009.
2. This version incorporates rule changes made to the 1 July 2008 consolidated edition.
3. The Rules contain two parts, one part that is for information and does not constitute specific requirements and one part giving structural rules for double hull oil tankers of 150m or greater.
Subjects for information are given in *Section 1 – Introduction* and *Section 2 – Rule Principles*.
Specific rule requirements are given in *Sections 3 to 12* and the *Appendices*.

4. The following table provides a revision history of the Rules.

	Amendment Type / No.	Approval Date	Effective Date *	Reference Rule Edition
1	Corrigenda 1	7 Apr. 2006	1 Apr. 2006	1 Jan 2006 edition
2	Corrigenda 2	27 July 2006	1 Apr. 2006	1 Jan 2006 edition
3	Rule Change Notice 1	29 Sept.2006	1 Apr. 2007	1 Jan 2006 edition
4	Corrigenda 3	19 Nov 2007	1 Apr. 2006	1 Jan 2006 edition
5	Rule Change Notice 2	25 Feb 2008	1 July 2008	1 Jan 2006 edition
6	Corrigenda 1 (1 July 2008 consolidated edition)	2 July 2008	1 July 2008	1 July 2008 consolidated edition
7	Rule Change Notice 1 (1 July 2008 consolidated edition)	30 Jan 2009	1 July 2009	1 July 2008 consolidated edition

* For effective date, refer to the implementation statements of relevant Corrigenda / Rule Changes.

Note: When the word '(void)' appears in the text, it means that the concerned part has been deleted. This is to keep the numbering of the remainder unchanged.

Copyright in these Common Structural Rules is owned by each IACS Member as at 15 January 2006.

SECTION 1

INTRODUCTION

1 INTRODUCTION TO COMMON STRUCTURAL RULES FOR OIL TANKERS

1.1 General

1.1.1 Applicability

- 1.1.1.1 These Rules apply to double hull oil tankers of 150m length, L , and upward classed with the Society and contracted for construction⁽¹⁾ on or after 1 April 2006. The definition of the rule length, L , is given in *Section 4/1.1.1.1*.
- 1.1.1.2 Generally, for double hull tankers of less than 150m in length, L , the Rules of the individual Classification Society are to be applied.
- 1.1.1.3 Ships contracted for construction before the effective date of these Rules are to comply with the Rules of the individual Classification Society.

Note

The “contracted for construction” date means the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. For further details regarding the date of “contracted for construction”, see IACS *Procedural Requirement (PR) No. 29*.

1.2 Application of Individual Classification Rules

1.2.1 Regions of the ship which these Rules do not cover

- 1.2.1.1 For regions of the structure which these Rules do not cover, the relevant requirements of the individual Classification Society’s Rules are to be applied.

1.3 Guidance on Rule Structure

1.3.1 Framework

- 1.3.1.1 The Rules are structured in Sections giving instructions for detailed application and requirements which are applied in order to satisfy the Rule objectives. The acceptable procedures for the structural analysis required by the Rules are given in the Appendices.

1.3.2 Numbering and cross-references

- 1.3.2.1 The system for numbering of Sections and Sub-Sections is given in *Table 1.1.1*.

Table 1.1.1 Section Numbering		
Order	Levels	Example
1	Section name (displayed in the header)	SECTION 1 - INTRODUCTION
2	Sub-Section	1 INTRODUCTION TO THE COMMON STRUCTURAL...
3	Sub-Section 2	1.1 General
4	Sub-Section 3	1.1.1 Development of the rules
5	Paragraph number	1.1.1.1 An important part of the classification process is the development of rule...

- 1.3.2.2 The system for the numbering of Tables and Figures is given in *Table 1.1.2*.

Table 1.1.2 Numbering of Tables and Figures	
Table location in document	Example of numbering
Section 5, Sub-Section 1, 2 nd table in sub-section	Table 5.1.2
Section 1, Sub-Section 12, 5 th table in sub-section	Table 1.12.5
Section 10, Sub-Section 4, 3 rd table in sub-section	Table 10.4.3
Figure location in document	
Section 5, Sub-Section 1, 2 nd figure in sub-section	Figure 5.1.2
Section 1, Sub-Section 12, 5 th figure in sub-section	Figure 1.12.5
Section 10, Sub-Section 4, 3 rd figure in sub-section	Figure 10.4.3

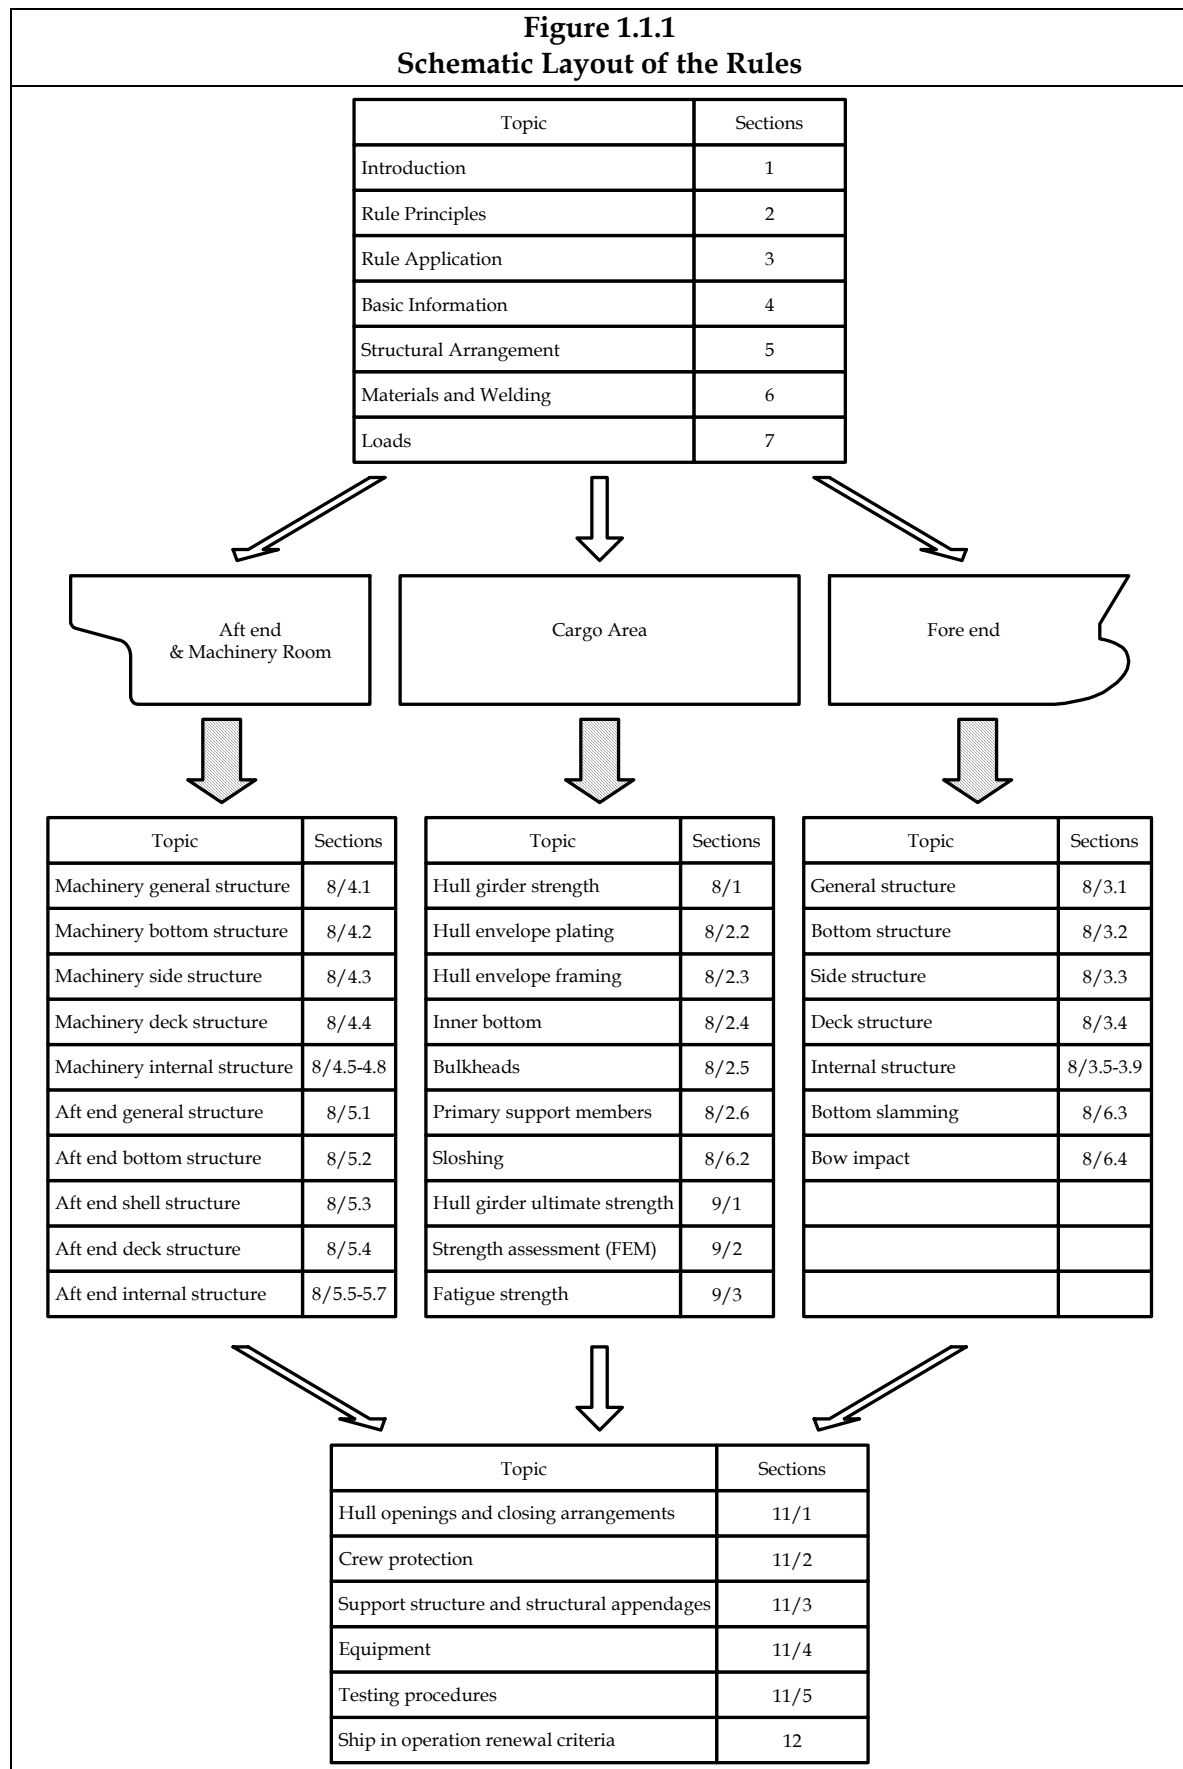

- 1.3.2.3 Cross-references are given in *italics* throughout the document.
- 1.3.2.4 Cross-references within a Section (local) are represented as a Sub-Section or Paragraph number, e.g. 4.2 or 4.2.1.1. See *Table 1.1.3*.
- 1.3.2.5 Cross-references outside a Section (global) are represented as Section no./Sub-Section or Paragraph number, e.g. *Section 4/2.1.1.3*. See *Table 1.1.3*.

1.3.3 General organization of the Rules

- 1.3.3.1 The general organisation of the Rules is shown in *Figure 1.1.1*

Figure 1.1.1
Schematic Layout of the Rules

SECTION 2

RULE PRINCIPLES

1 INTRODUCTION

1.1 Rule Principles

1.1.1 Rule objectives

- 1.1.1.1 The objectives of the Rules are to establish requirements to reduce the risks of structural failure in order to help improve the safety of life, environment and property and to provide adequate durability of the hull structure for the design life.

1.1.2 General

- 1.1.2.1 The sub-sections contain:

- (a) the General Assumptions; pertaining to the design, construction and operation of the ship and gives information on the responsibilities of Classification Societies, builders and owners
- (b) the Design Basis; which specifies the premises that the design principles of the Rules are based on, in terms of design parameters and assumptions about the ship operation
- (c) the Design Principles; which define the fundamental principles used for the structural requirements in the Rules with respect to loads, structural capacity and assessment criteria
- (d) the Application of the Design Principles; which describes how the design principles and methods are applied and what criteria are used to demonstrate that the structure meets the objective.

2 GENERAL ASSUMPTIONS

2.1 General

2.1.1 International and national regulations

- 2.1.1.1 Ships are to be designed, constructed and operated in compliance with the regulatory framework prescribed internationally by the International Maritime Organisation and implemented by National Administrations.
- 2.1.1.2 The Rules are based on the assumptions that all applicable statutory requirements are complied with.
- 2.1.1.3 The Rules incorporate the IACS unified requirements as shown in *Table 2.2.1*.

2.1.2 Classification Societies

- 2.1.2.1 Classification Societies develop and publish the standards for the hull structure and essential engineering systems. Classification Societies undertake an audit during design, construction and operation of a ship to confirm compliance with the classification requirements and the applicable international regulations when authorised by a National Administration.

Table 2.2.1 IACS Unified Requirements Applicable to Oil Tankers	
Number	Title
A1	<i>Equipment</i>
A2	<i>Shipboard fittings and supporting hull structures associated with towing and mooring on conventional vessels</i>
S1	<i>Requirements for Loading Conditions, Loading Manuals and Loading Instruments</i>
S2	<i>Definitions of ship's length L and block coefficient C_b</i>
S3	<i>Strength of end bulkheads of superstructures and deckhouses</i>
S4	<i>Criteria for use of high tensile steel with yield points of 315 N/mm² and 355 N/mm² (with respect to longitudinal strength)</i>
S5	<i>Calculation of midship section moduli for conventional ship for ship's scantlings</i>
S6	<i>Use of steel grades for various hull members – ships of 90m in length and above</i>
S7	<i>Minimum longitudinal strength Standards</i>
S11	<i>Longitudinal strength Standard</i>
S13	<i>Strength of bottom forward in oil tankers</i>
S14	<i>Testing procedures of Watertight Compartments</i>
S26	<i>Strength and securing of Small Hatches on the Exposed Fore Deck</i>
S27	<i>Strength Requirements for Fore Deck Fittings and Arrangements</i>

2.1.3 Responsibilities of Classification Societies, builders and owners

- 2.1.3.1 These Rules address the hull structural aspects of classification and do not include requirements related to the verification of compliance with the Rules during construction and operation. The verification of compliance with these Rules is the responsibility of all parties and requires that proper care and conduct is shown by all parties involved in its implementation. These responsibilities include:

(a) general aspects:

- relevant information and documentation involved in the design, construction and operation is to be communicated between all parties in a clear and efficient manner. The builder is responsible for providing design documentation according to requirements specified in the Rules. Other requirements for information and documentation are specified by the requirements and approval procedures of the individual Classification Societies
- quality systems are applied to the design, construction, operation and maintenance activities to assist compliance with the requirements of the Rules.

(b) design aspects:

- it is the responsibility of the owner to specify the intended use of the ship, and the responsibility of the builder to ensure that the operational capability of the design fulfils the owner's requirements as well as the structural requirements given in the Rules
- the builder shall identify and document the operational limits for the ship so that the ship can be safely and efficiently operated within these limits
- verification of the design is performed by the builder to check compliance with provisions contained in the Rules in addition to national and international regulations
- the design is performed by appropriately qualified, competent and experienced personnel
- the classification society is responsible for a technical review of the design plans and related documents for a ship to verify compliance with the appropriate classification rules.

(c) construction aspects:

- the builder is responsible for ensuring that adequate supervision and quality control is provided during the construction
- construction is to be carried out by qualified and experienced personnel
- workmanship, including alignment and tolerances, is to be in accordance with acceptable shipbuilding standards
- the Classification Society is responsible for surveying to verify that the construction and quality control are in accordance with the plans and procedures.

(d) operational aspects:

- the owner is to ensure that the operations personnel are aware of, and comply with, the operational limitations of the ship
- the owner is to provide operations personnel with sufficient training such that the ship is properly handled to ensure that the loads and resulting stresses imposed on the structure are minimised
- the owner is to ensure that the ship is maintained in good condition and in accordance with the Classification Society survey scheme and also in accordance with the international and national regulations and requirements
- the Classification Society is responsible for surveying to verify that the vessel maintains its condition of class in accordance with the Classification Society survey scheme.

3 DESIGN BASIS

3.1 General

3.1.1 The design basis

- 3.1.1.1 This Sub-Section specifies the design parameters and the assumptions about the ship operation that are used as the basis of the design principles of the Rules.
- 3.1.1.2 The Rules are applicable for ships in compliance with the specified design basis. Special consideration will be given to deviations from this design basis.
- 3.1.1.3 The design basis used for the design of each ship is to be documented and submitted to the Classification Society as part of the design review and approval. All deviations from the design basis are to be formally advised to the Classification Society.

3.1.2 Arrangement and layout

- 3.1.2.1 The Rules cover typical double hull tankers of greater than or equal to 150m in length and with arrangements as follows:
 - (a) engine room and deck house located aft of the cargo tank region, and
 - (b) in addition to the inner skin two longitudinal oil-tight bulkheads with no centreline longitudinal bulkhead, or
 - (c) in addition to the inner skin one centreline longitudinal oil-tight bulkhead.
- 3.1.2.2 The ship's structure is assumed to be:
 - (a) constructed of welded steel structures
 - (b) composed of stiffened plate panels
 - (c) longitudinally framed with full transverse bulkheads and intermediate web frames.
- 3.1.2.3 The typical arrangements covered by the Rules are shown in *Figure 2.3.1* and assume that the structural arrangements include:
 - (a) narrow double side structure and double bottom structure with breadth/depth in accordance with statutory requirements
 - (b) single deck ships
 - (c) side longitudinal, centreline longitudinal or transverse bulkheads of plane, corrugated or double skin construction
 - (d) the number and location of bulkheads are arranged to comply with the statutory requirements.

The cross sections shown in *Figure 2.3.1* are typical examples only and other variations of cross tie and web frame arrangements are also covered

3.1.2.4 The Rules assume the following hull form with respect to environmental loading:

- (a) full form ship with block coefficient (C_b) greater than 0.7
- (b) the ship length breadth ratio (L/B) greater than 5
- (c) ship breadth depth ratio (B/D) less than 2.5
- (d) the metacentric height (GM) not greater than $0.12B$ for homogeneously full load conditions, and $0.33B$ for ballast conditions.

3.1.3 Design life

3.1.3.1 A nominal design life of 25 years is assumed for selecting appropriate ship design parameters. The specified design life is the nominal period that the ship is assumed to be exposed to operating conditions. However, the ship's actual service life may be longer or shorter depending on the actual operating conditions and maintenance of the ship throughout its life cycle.

3.1.4 Design speed

3.1.4.1 The design maximum service speed is to be specified by the designer. The Rules assume that the ship is able to operate at this service speed on a continuous basis, but this does not relieve the responsibilities of the owner and personnel to properly

handle the ship and reduce speed or change heading in severe weather, see 2.1.3.1(d).

3.1.5 Operating conditions

- 3.1.5.1 The ship is to be capable of carrying the intended cargo with the necessary flexibility in operation to fulfil its design role. Specification of cargo loading conditions as required by the Rules and any additional cargo loading conditions required by the owner are the responsibility of the designer.
- 3.1.5.2 The Rules assume the following:
- (a) a minimum set of specified loading conditions as defined in the Rules are examined. These are to include both seagoing and harbour loading conditions
 - (b) in addition to the minimum set of specified loading conditions, all relevant additional loading conditions covering the intended ship's service which result in increased still water shear force, bending moments or increased local static loadings are to be submitted for review
 - (c) the Trim and Stability Booklet, Loading Manual and loading computer systems specify the operational limitations to the ship and these comply with the appropriate statutory and classification requirements
 - (d) all cargo tanks are from a local strength point of view including sloshing designed for unrestricted filling for a cargo density as specified in 3.1.8. Limitations to loading patterns resulting in full or empty adjacent tanks as specified in the Rules and the Loading Manual do however apply for primary support members and hull girder shear force and bending moments.

3.1.6 Operating draughts

- 3.1.6.1 The design operating draughts are to be specified by the designer and are to be used to derive the appropriate structural scantlings. All operational loading conditions in the Loading Manual are to comply with the specified design operating draughts. The following design operating draughts are as a minimum to be considered:
- (a) the maximum and minimum mean operational draughts
 - (b) maximum scantling draught for the assessment of structure
 - (c) minimum draughts forward for the assessment of bottom slamming, with and without ballast tanks in way filled
 - (d) maximum mean draught for a condition with all cargo tanks abreast empty
 - (e) maximum mean draught for a condition with empty centre or wing cargo tank.

3.1.7 External environment

- 3.1.7.1 To cover worldwide trading operations and also to deal with the uncertainty in the future trading pattern of the ship and the corresponding wave conditions that will be encountered, a severe wave environment is used for the design assessment. The rule requirements are based on a ship trading in the North Atlantic wave environment for its entire design life.
- 3.1.7.2 The effects of wind and current on the structure are considered to be negligible and hence are not explicitly included.
- 3.1.7.3 The Rules do not include the effects of ice.
- 3.1.7.4 The Rules assume that the structural assessment of hull strength members is valid for the following design temperatures:
- (a) lowest daily mean temperature in air is -15 °C

(b) lowest daily mean temperature in sea water is 0 °C

Ships operating for long periods in areas with lower daily mean air temperature may be subject to additional requirements as specified by the individual Classification Society.

3.1.8 Internal environment (cargo and water ballast tanks)

3.1.8.1 A specific gravity (SG) of 1.025, or a higher value if specified by the designer, is to be used for oil cargoes for the strength assessment of cargo tank structures.

3.1.8.2 For the fatigue assessment of cargo tank structures, a representative mean cargo density throughout the ship's life is to be used. The representative mean density is to be taken as 0.9 tonnes/m³ or the cargo density from the homogeneous full load condition at the full load design draught T_{full} , if this is higher.

(RCN 2, effective from 1 July 2008)

3.1.8.3 A SG of 1.025 is to be used for water ballast.

3.1.8.4 The Rules are based on the following design temperatures for the cargo:

(a) maximum cargo temperature is 80 °C

(b) minimum cargo temperature is 0 °C.

3.1.8.5 The design aspects and assumption upon which corrosion additions in the Rules are specified are as follows:

(a) the corrosion additions are based on a combination of experience and a statistical evaluation of historical corrosion measurements. The corrosion additions are based on the carriage of a mixture of crude and other oil products with various degrees of corrosive properties

(b) the corrosion additions are based on the design life, see 3.1.3.1

(c) ballast tanks are coated. Requirements for coating application and maintenance are excluded from the Rules.

3.1.8.6 The values for corrosion additions and wastage allowance are specified in *Section 6/3* and *Section 12* respectively.

3.1.9 Structural construction and inspection

3.1.9.1 The structural requirements included in the Rules are developed with the assumption that construction and repair will follow acceptable shipbuilding and repair standards and tolerances. The Rules may require that additional attention is paid during construction and repair of critical areas of the structure.

3.1.9.2 Tank strength and tightness testing are to be carried out as a part of the verification scheme.

3.1.9.3 The Rules define the renewal criteria for the individual structural items. The structural requirements included are developed on the assumption that the structure will be subject to periodical survey in accordance with individual Classification Society Rules and Regulations. All structural elements are to be arranged to allow access for inspection, see *Section 5/5*. It is assumed that close-up inspection of the critical areas will be carried out on a regular basis.

3.1.10 Owner's extras

3.1.10.1 Owner's specification of requirements above the general classification or statutory requirements may affect the structural design. Owner's extras may include requirements for:

- (a) vibration analysis
- (b) maximum percentage of high strength steel
- (c) additional scantling dimensions above that required by the Rules
- (d) additional design margin on the loads specified by the Rules, etc
- (e) improved fatigue resistance, in the form of a specified increase in design fatigue life or equivalent
- (f) combinations of cargo loading patterns and draughts exceeding the Rule specified conditions
- (g) higher cargo density for fatigue evaluation for ships intended to carry high density cargo in part load conditions on a regular basis.

Owner's extras are not covered by these Rules. Owner's extras that may affect the structural design are to be clearly specified in the design documentation.

4 DESIGN PRINCIPLES

4.1 Overall Principles

4.1.1 Introduction

4.1.1.1 This Sub-Section defines the underlying design principles of the Rules in terms of loads, structural capacity models and assessment criteria and also construction and in-service aspects.

4.1.2 General

4.1.2.1 The Rules are based on the following overall principles:

- (a) the safety of the structure can be demonstrated by addressing the potential structural failure mode(s) when the vessel is subjected to operational loads and environmental loads/conditions
- (b) the design complies with the design basis, see *Sub-Section 3*
- (c) the structural requirements are based on a consistent set of loads that represent typical worst possible loading scenarios
- (d) the structural requirements with respect to loads, capacity models and assessment criteria are presented in a modular format so that each component of the requirement is clearly identified.

4.1.2.2 The ship's structure is designed such that:

- (a) it has inherent redundancy. The ship's structure works in a hierarchical manner and, as such, failure of structural elements lower down in the hierarchy should not result in immediate consequential failure of elements higher up in the hierarchy
- (b) permanent deformations are minimised. Permanent deformations of local panel or individual stiffened plate members may be acceptable provided that this does not affect the structural integrity, containment integrity or the performance of structural or other systems
- (c) the incidence of in-service cracking is minimised, particularly in locations which; affect the structural integrity or containment integrity, affect the performance of structural or other systems or are difficult to inspect and repair
- (d) it has adequate structural redundancy to survive in the event that the structure is accidentally damaged; for example, minor impact leading to flooding of any compartment.

4.2 Loads

4.2.1 Load scenarios

4.2.1.1 The loads used for assessment of the structure covers the load scenarios encountered by the ship during operation at sea and in harbour.

4.2.2 Design load combinations

4.2.2.1 Design load combinations combine local and global load components to represent identified load scenarios. The design load combinations should be sufficiently severe and varied so as to encompass all scenarios that can reasonably occur during normal operation.

- 4.2.2.2 The design load combinations for the hull and structural members consider the most unfavourable combination of load effects in order to maintain a consistent safety level for all combinations.
- 4.2.2.3 The design load combinations are based on one of the following combinations of static and dynamic loads depending on the type of load and the load scenario being considered:
- (a) Static design load combinations (S)
covers application of all relevant static loads and typically covers load scenarios in harbour, tank testing or similar operations
 - (b) Static plus Dynamic design load combination (S+D)
covers application of all relevant static loads plus a realistic combination of simultaneously occurring dynamic load components and typically covers load scenarios for seagoing operations
 - (c) Impact design load combination
covers application of impact loads such as bottom slamming and bow impact encountered during seagoing operation. It is usually sufficient to ignore other static and dynamic load components in association with an impact load event.
 - (d) Sloshing design load combination
covers application of sloshing loads encountered during seagoing operations
 - (e) Fatigue design load
covers application of all relevant dynamic loads
 - (f) Accidental design load combination (A)
covers application of accidental loads where these loads are not considered as occurring during normal operations

4.2.3 Load categorisation

- 4.2.3.1 The design load combinations are composed of many different types of loads, which are categorised as shown in *Table 2.4.1*.

Table 2.4.1 Load Categorisations		
Operational Loads	Lightship weight	Steel weight and outfit Machinery and permanent equipment
	Buoyancy loads	Buoyancy of the ship
	Variable loads	Cargo Ballast water Stores and consumables Personnel Temporary equipment
	Other loads	Tug and berthing loads Towing loads Anchor and mooring loads Lifting appliance loads
Environmental loads	Cyclic loading due to wave action including inertia loads	Dynamic wave pressures
		Dynamic loads and dynamic tank pressures due to ship accelerations
	Impact loads or resonant loads	Wave impacts Bottom slamming Liquid sloshing in tanks Green sea loads
Accidental loads		Flooding of compartments
Deformation loads		Thermal loads Deformations due to construction

4.2.3.2 Operational loads generally are static loads. They are grouped into lightship weight, buoyancy loads, variable loads and other loads. The operational loads occur as a consequence of the operation and handling of the ship.

4.2.3.3 Environmental loads are dynamic loads due to external influences. The environmental loads covered by the Rules are loads due to wave action.

4.2.3.4 Accidental loads include loads that result as a consequence of an accident or operational mishandling of the ship. The accidental loads covered by the Rules are increased tank pressures due to flooding of compartments.

4.2.3.5 Deformation loads are caused by thermal loads and residual stresses. The load effects from deformation loads are not covered by the Rules.

4.2.4 Characteristic load values

4.2.4.1 The characteristic values of the load components that are applied in the Rules are dependant on the design load combination being considered. The characteristic loads are typical values and are given by:

- (a) for operational loads the characteristic loads are the expected or specified values
- (b) for environmental loads the characteristic load is typically a load value which has a low probability of occurrence, i.e. an 'extreme' value.

4.2.5 Operational loads

4.2.5.1 The characteristic values of the static sea pressure on the hull due to the buoyancy are based on the draught at the loading condition under consideration.

- 4.2.5.2 The characteristic values of the static tank pressure are based on the filling height and the specific gravity of the cargo/ballast, and include allowances for possible overpressure due to the height of air pipes, pressure relief valve settings and capacity of pumps.
- 4.2.5.3 The characteristic values of the loads due to personnel, stores and consumables, temporary equipment and permanent equipment are based on specified values.
- 4.2.5.4 The characteristic values for tug, berthing, towing and mooring loads are based on specified values.

4.2.6 Environmental loads

- 4.2.6.1 The Rule formulations for wave loads, as given in *Section 7/3*, are based on the envelope values calculated in accordance with 4.2.6.2 and calibrated with feedback from service experience and model tests.
- 4.2.6.2 The general principles for the derivation of the wave load values are:
- (a) the application of load values is consistent for all similar load scenarios
 - (b) the characteristic load value is selected to suit the purpose of the application of the load and the selected structural assessment method, e.g. for strength assessment the expected lifetime maximum load is applied while for fatigue assessment an average value representing the expected load history is applied
 - (c) load calculations are performed using 3-D linear hydrodynamic computational tools. The effects of speed are considered
 - (d) the derivation of characteristic wave loads is based on a long term statistical approach which includes representation of the wave environment (North Atlantic scatter diagram), probability of ship/wave heading and probability of load value exceedance based on IACS Rec. 34. All of which result in envelope values
 - (e) non-linear effects are considered for the expected lifetime maximum loads.
- 4.2.6.3 The combination of dynamic loads considers all simultaneously occurring dynamic load components. In deriving the simultaneously occurring loads, one particular load component is maximised or minimised and the relative magnitude of all simultaneously occurring dynamic load components is specified by the application of dynamic load combination factors (DLCF) based on the envelope load value. These dynamic load combination factors are based on the application of the equivalent design wave approach and are given as tabulated values.
- 4.2.6.4 The formulations of the load values for bottom slamming, bow impact loads and green sea loads take account of the following factors:
- (a) vessel draught
 - (b) hull form
 - (c) heading
 - (d) forward speed
 - (e) location of deck houses/superstructure
 - (f) geometry of structural elements.
- 4.2.6.5 A slamming impact load results in a transient dynamic response in the structure. The formulation of the impact loads considers the impact load as an equivalent static load acting on the associated exposed hull surface.
- 4.2.6.6 The effect of green water on the deck structure along the entire vessel's length is considered. The green water loads on fore and parallel mid bodies of a ship are

determined based on model tests, ship motion analysis and service experience. The green sea loads for the aft body are consistent with the derivation for the fore and mid body green sea loads.

4.2.7 Accidental loads

- 4.2.7.1 The accidental load scenarios cover loads acting on local structure as a consequence of flooding in accordance with the assumptions made in IMO regulations. This relates to the assessment of the watertight subdivision boundaries.
- 4.2.7.2 Only static loads corresponding to the draught in the flooded condition are considered.

4.2.8 Deformation loads

- 4.2.8.1 Thermal loads within the limits specified by the design basis are considered negligible. It is assumed that care is taken to account for, and allow for, expected thermal expansion.

4.3 Structural Capacity Assessment

4.3.1 General

- 4.3.1.1 The basic principle in structural design is to apply the defined design loads, identify possible failure modes and employ appropriate capacity models to determine the required structural scantlings.

4.3.2 Capacity models for strength

- 4.3.2.1 The strength assessment method is to be capable of analysing the failure mode in question to the required degree of accuracy. Several assessment methods may be applicable, even for the same failure modes.
- 4.3.2.2 The following aspects are the basis for selection of strength capacity models:
 - (a) whether the structural member is also assessed at a higher level in the hierarchy and/or at a later stage by more accurate methods or by more accurate response calculations
 - (b) simplified capacity models where some of the stress components are neglected are to always give conservative results
 - (c) appropriate methodology to assess the failure mode
 - (d) probability level of the load
 - (e) capability of response calculations to represent the physical behaviour of the structure up to the given load level
 - (f) complexity of structure
 - (g) complexity of loads
 - (h) criticality of the structural member. This will primarily have an impact on the assessment criteria, but needs to be considered in conjunction with selection of the appropriate methodology for structural assessment.
- 4.3.2.3 The structural capacity assessment methods are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods.
- 4.3.2.4 The formulae used to determine stresses, deformations and capacity are appropriate for the selected capacity assessment method and the type and magnitude of the design load set.

4.3.3 Capacity models for fatigue

- 4.3.3.1 The fatigue assessment method provides Rule requirements to safeguard structural details against fatigue failure.
- 4.3.3.2 The fatigue capacity model is based on a linear cumulative damage summation (Palmgren-Miner's rule) in combination with S-N curves, a characteristic stress range and an assumed long-term stress distribution curve.
- 4.3.3.3 The fatigue capacity assessment models are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads.

4.3.4 Net thickness approach

- 4.3.4.1 The philosophy behind the net thickness approach is to:
 - (a) provide a direct link between the thickness used for strength calculations during the new building stage and the minimum thickness accepted during the operational phase
 - (b) enable the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.
- 4.3.4.2 The net thickness approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the overall average corrosion of larger areas such as primary support members and the hull girder. Both the local and overall corrosion are used as a basis for the new building review and are to be confirmed during operation of the vessel.
- 4.3.4.3 The net thickness approach for the local corrosion is shown in *Figure 2.4.1 (a)* and is in terms of new building thicknesses, given by:
 - (a) the local strength requirements are given by the net thickness ($t_{net-req}$) after rounding
 - (b) the required gross thickness ($t_{grs-req}$) is given by adding the corrosion addition (t_{corr}) to the required rounded net thickness ($t_{net-req}$)
 - (c) the gross thickness (t_{grs}) is the actual thickness selected by the designer to fulfil the gross required thickness ($t_{grs-req}$) and is to be equal or greater than the required gross thickness ($t_{grs-req}$)
 - (d) the as built thickness is equal to the gross thickness (t_{grs}) plus any additional owners extra margin (t_{own})
 - (e) any additional thicknesses specified by the owner, as owners extra margin (t_{own}) are not to be included in the assessment of the required gross thickness ($t_{grs-req}$).

4.3.4.4 The net thickness approach for determining the local renewal thickness during the ship in operation phase is shown in *Figure 2.4.1 (b)* and is given by:

- (a) the thickness at which annual surveys are required, t_{annual} , is obtained by subtracting the total wastage allowance (t_{was}) and the owners extra margin (t_{own}) from the as-built thickness ($t_{as-built}$)
- (b) thickness at which renewal is required, t_{ren} , is obtained by subtracting the total wastage allowance (t_{was}), the thickness $t_{corr-2.5}$ and the owners extra margin (t_{own}) from the as-built thickness ($t_{as-built}$). Where $t_{corr-2.5}$ is the wastage allowance in reserve for corrosion occurring in the two and half years between Intermediate and Special surveys
- (c) the total wastage allowance given is the rule specified wastage allowance (t_{was}) plus the wastage allowance in reserve ($t_{corr-2.5}$) plus any additional owners extra margin (t_{own})
- (d) the rule specified wastage allowance (t_{was}) available before annual surveys are required is obtained by deducting the thickness $t_{corr-2.5}$ from the corrosion addition (t_{corr}).

The approach calls for a general 2.5 year survey interval when the gauged thickness is greater than the “thickness at which annual surveys are required” (t_{annual}), and a 1 year survey interval when the gauged thickness is less than the “thickness at which annual surveys are required” (t_{annual}).

4.3.4.5 The overall average corrosion for primary support members and the hull girder cross-section is given by deducting half the local corrosion addition ($0.5t_{corr}$) from all structural elements comprising the respective cross-sections.

4.3.4.6 The assessment of local scantlings is performed based on the hull girder stresses given by the net hull girder properties, e.g. based on a global overall average

corrosion of the hull girder, and the local stresses based on the net thickness of the local member under consideration, e.g. based on full local corrosion. It is assumed that the structure may corrode locally to the maximum allowed and that the hull girder may reduce to the maximum allowed overall hull girder corrosion.

- 4.3.4.7 The assessment of global (hull girder and primary support member) scantlings is based on the overall global corrosion, e.g. half the full local corrosion for all structural members simultaneously. The assumption is that the full local corrosion will not occur globally and hence a lesser average value of assumed corrosion is appropriate. Individual structural elements may corrode to the maximum corrosion addition and this is taken into account in the buckling assessment.
- 4.3.4.8 As fatigue is an accumulative assessment the scantlings and stresses used for the assessment are to be taken as the representative mean value over the design life. The mean corrosion over the design life is given as half the corrosion assumed for scantling strength assessment. Local stresses are thus calculated based on half the full local corrosion addition and hull girder stresses are calculated based on half the overall global corrosion. Half the global overall corrosion is found by deduction of one quarter of the full local corrosion addition of all structural elements simultaneously.
- 4.3.4.9 The actual amount of wastage allowed in service is taken as:
- (a) locally: the full corrosion addition less an amount for typical wastage between the survey periods
 - (b) globally: the full global overall corrosion addition less an amount for typical wastage between the survey periods. The global wastage is monitored in service by evaluating the current global characteristics of the vessel.

4.3.5 Intact structure

- 4.3.5.1 All strength calculations are based on the assumption that the structure is intact. The residual strength of the ship in a structurally damaged condition is not assessed.
- 4.3.5.2 No benefit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

4.4 Materials and Welding

4.4.1 Materials

- 4.4.1.1 The Rule requirements associated with the selection of materials for structural components is based on the location, design temperature (see 3.1.7.4 and 3.1.8.4), membrane, through thickness forces and criticality of the component. The requirements comply with *IACS UR S6*.
- 4.4.1.2 The Rule requirements are based on the assumption that the material is manufactured in accordance with the allowable under thickness rolling tolerances specified in *IACS UR W13*.

4.4.2 Welding

- 4.4.2.1 The Rule requirements for weld type, size and materials are based on the following considerations:
- (a) joint type
 - (b) criticality of the joint
 - (c) magnitude, type and direction of the stresses in the joint

- (d) material properties of the parent and weld material
- (e) weld gap size.

4.5 Assessment/Acceptance Criteria

4.5.1 Design methods

4.5.1.1 The criteria for the assessment of the scantlings are based on one of the following design methods:

- (a) Working Stress Design (WSD) method, also known as the permissible or allowable stress method
- (b) Partial safety Factor (PF) method, also known as Load and Resistance Factor Design (LRFD).

4.5.1.2 For both WSD and PF, two design assessment conditions and corresponding acceptance criteria are given. These conditions are associated with the probability level of the combined loads, A and B:

- (a) condition A is applicable to design load combinations based on 'expected' characteristic load values, typically covered by the static design load combinations
- (b) condition B is applicable to design load combinations based on 'extreme' characteristic load values, typically covered by the static + dynamic load combinations.

4.5.1.3 The WSD method has the following composition:

$$W_{stat} \leq \eta_1 R \quad \text{for condition A}$$

$$W_{stat} + W_{dyn} \leq \eta_2 R \quad \text{for condition B}$$

Where:

W_{stat} simultaneously occurring static loads (or load effects in terms of stresses)

W_{dyn} simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components

R characteristic structural capacity (e.g. yield stress or buckling capacity)

η_i permissible utilisation factor (resistance factor). The utilisation factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure

4.5.1.4 The PF method has the following composition:

$$\gamma_{stat-1} W_{stat} + \gamma_{dyn-1} W_{dyn} \leq \frac{R}{\gamma_R} \quad \text{for condition A}$$

$$\gamma_{stat-2} W_{stat} + \gamma_{dyn-2} W_{dyn} \leq \frac{R}{\gamma_R} \quad \text{for condition B}$$

Where:

γ_{stat-i} partial safety factor that accounts for the uncertainties related to static loads

W_{stat}	simultaneously occurring static loads (or load effects in terms of stresses)
γ_{dyn-i}	partial safety factor that accounts for the uncertainties related to dynamic loads
W_{dyn}	simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components
R	characteristic structural capacity (e.g. yield stress, ultimate hull girder stress)
γ_R	partial safety factor that accounts for the uncertainties related to structural capacity

- 4.5.1.5 The acceptance criteria for both the WSD method and PF method are calibrated for the various requirements such that consistent and acceptable safety level for all combinations of static and dynamic load effects are achieved.

4.6 Principle of Safety Equivalence

4.6.1 General

- 4.6.1.1 Novel designs deviating from the design basis or structural arrangements covered by the Rules will be subject to special consideration. The principle of equivalence is to be applied to the novel design, hence it must be demonstrated that the structural safety of the novel design is at least equivalent to that intended by the Rules.
- 4.6.1.2 The principle of equivalence may be applied to alternative calculation methods.
- 4.6.1.3 A systematic review process was undertaken in developing these Rules. This identified and evaluated the likely consequences of hazards due to operational and environmental influences on tanker structural configurations and arrangements covered by these Rules. For novel designs, dependent on the nature of the deviation, it may be necessary to conduct an independent systematic review to document equivalence with the Rules.

5 APPLICATION OF PRINCIPLES

5.1 Overview of the Application of Principles

5.1.1 General

5.1.1.1 This Sub-Section shows how the design principles described in *Sub-Section 4* have been applied in the development of the rule requirements.

5.2 Structural Design Process

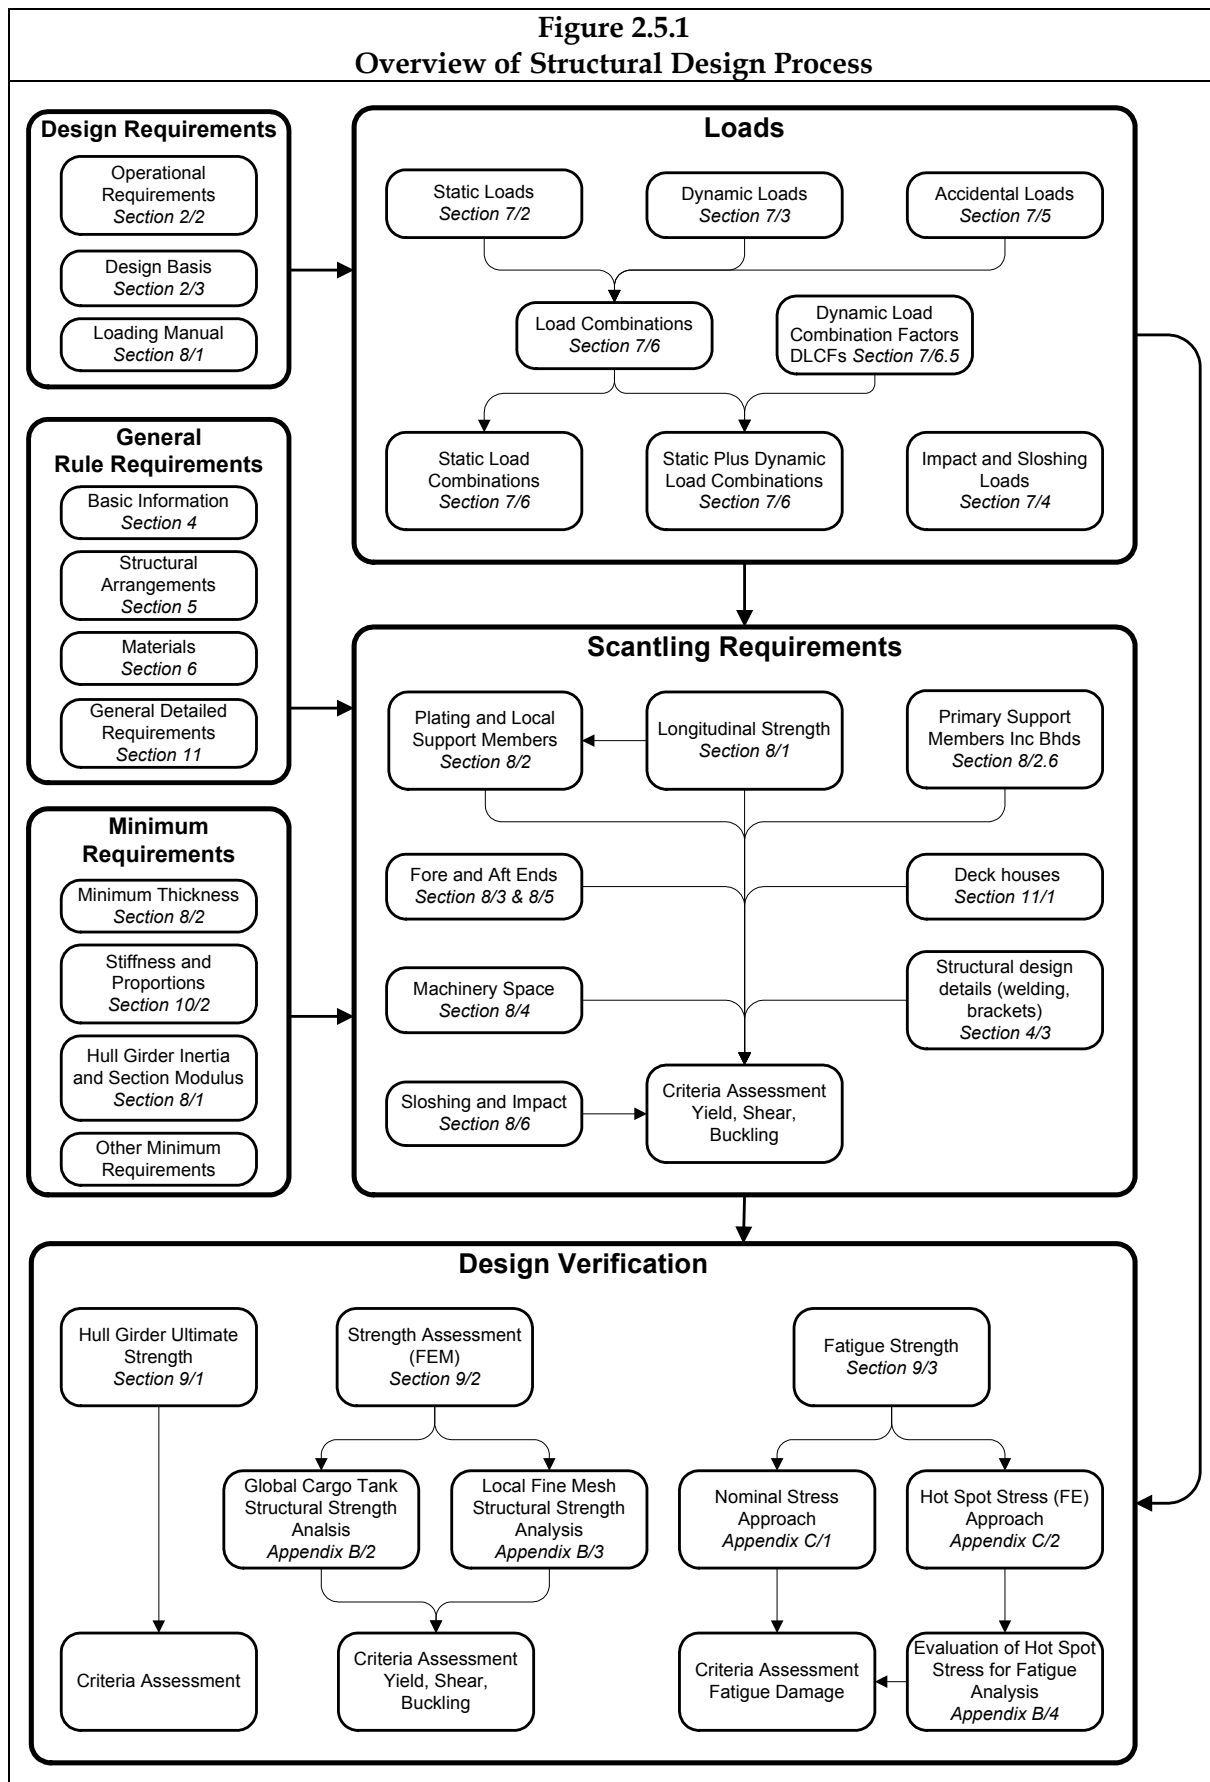

5.2.1 Overview of the structural design process

5.2.1.1 An overview of the structural design process applied in the Rules is shown in *Figure 2.5.1*.

5.2.1.2 The strength and acceptable safety of the hull and the structural elements is verified through the application of the following Rule requirements:

- (a) prescriptive scantling requirements
 - minimum requirements
 - load-capacity based requirements
- (b) design verification requirements based on load-capacity methods
 - hull girder ultimate strength
 - strength assessment using the Finite Element (FE) analysis
 - fatigue assessment

Figure 2.5.1
Overview of Structural Design Process

5.3 Minimum Requirements

5.3.1 General

5.3.1.1 The minimum requirements are usually in one of the following forms:

- (a) minimum thickness, which is independent of the yield stress, these are based on service experience and are usually expressed in the following format:

$$t = A + B L$$

Where:

A, B constants

L rule length, as defined in *Section 4/1.1.1.1*

- (b) minimum stiffness and proportion, which are based on prescriptive buckling requirements

5.4 Load-capacity Based Requirements

5.4.1 General

5.4.1.1 In general, the Working Stress Design (WSD) method is applied in the requirements, except for the hull girder ultimate strength criteria where the Partial safety Factor (PF) method is applied. The partial safety factor format is applied for this highly critical failure mode to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

5.4.1.2 The identified load scenarios are addressed by the Rules in terms of design loads, design format and acceptance criteria set, as given in *Table 2.5.3*. The table is schematic and only intended to give an overview.

5.4.1.3 The load scenarios addressed by the rules cover operations such as seagoing conditions, loading and unloading, tank testing conditions, ballast water exchange situations, special operations in harbour (e.g. propeller inspection afloat condition) and accidental flooding.

5.4.1.4 The design load combinations that represent the identified load scenarios are given in *Section 7/6* and are denoted by S (static loads), $S+D$ (static+dynamic loads), and A (accidental loads). In addition, the Rules address impact loads and sloshing loads as given in *Section 7/4* and fatigue loads as given in *Section 7/3*.

5.4.1.5 For the strength requirements, the considered loads cover the most severe operational loads that occur, hence the cargo tank finite element analysis and load-capacity based scantling requirements are based on rule loading conditions which simulate the worst possible loading conditions within the operating limits of the vessel.

5.4.1.6 For the fatigue requirements the considered loads cover an expected load history and representative loading conditions covering the ships' intended service are applied.

5.4.1.7 The acceptance criteria are categorised into three acceptance criteria sets. These are explained below and shown in *Tables 2.5.2* and *2.5.3*. The specific acceptance criteria set that is applied in the WSD rule requirements is dependent on the probability level of the characteristic combined load.

5.4.1.8 The acceptance criteria set AC1 is applied when the combined characteristic loads are frequently occurring, typically for the static design load combinations, but also applied for the sloshing design loads. This means that the loads occur on a frequent

or regular basis. The allowable stress for a frequent load is lower than for an extreme load to take into account effects of:

- (a) repeated yield
- (b) allowance for some dynamics
- (c) margins for operational mistakes.

5.4.1.9 The acceptance criteria set AC2 is typically applied when the combined characteristic loads are extreme values, e.g. typically for the static+dynamic design load combinations. High utilisation (η_i in *Table 2.5.1*) of the structural capacity (R_i in *Table 2.5.1*) is allowed in such cases because the considered loads are extreme loads with a low probability of occurrence.

5.4.1.10 The acceptance criteria set AC3 is typically applied for capacity formulations based on the plastic collapse models such as those that are applied to address bottom slamming and bow impact loads.

Table 2.5.1
Load Scenarios and Corresponding Rule Requirements

Load Scenarios		Rule Requirements			
Operation	Loads (that the vessel is exposed to and is to withstand)	Design Load Combination (specified in Section 7/6)		Design Format (specified in Sections 8 and 9) see Note 1	Acceptance Criteria Set (specified in Sections 8 and 9)
		Ref. no	Notation		
Seagoing operations					
Transit	Static and dynamic loads in heavy weather	1	S + D	1. $S_G + S_L + D_G + D_L \leq \eta_2 R_1$	AC2
				2. $\gamma_S S_G + \gamma_D D_G \leq R_2 / \gamma_{R2}$	AC2
	Impact loads in heavy weather	2	Impact	$S_L + D_{imp} \leq \eta_3 R_p$	AC3
	Internal sloshing loads	3	Sloshing	$S_G + D_{slh} \leq \eta_1 R_1$	AC1
	Cyclic wave loads	4	Fatigue	$DM \leq \sum \eta_i / N_i$	-
BWE by flow through or sequential methods	Static and dynamic loads in heavy weather	5	S + D	$S_G + S_L + D_G + D_L \leq \eta_2 R_1$	AC2
Harbour and sheltered operations					
Loading, unloading and ballasting	Typical maximum loads during loading, unloading and ballasting operations	6	S	$S_G + S_L \leq \eta_1 R_1$	AC1
Tank testing	Typical maximum loads during tank testing operations	7	S	$S_G + S_{L1} \leq \eta_1 R_1$	AC1
Special conditions in harbour	Typical maximum loads during special operations in harbour, e.g. propeller inspection afloat or dry-docking loading conditions	8	S	$S_G + S_L \leq \eta_1 R_1$	AC1
Accidental condition					
Accidental flooding	Typically maximum loads on internal watertight subdivision structure due to accidental flooding	9	A	for water tight boundaries 1. $S_L \leq \eta_2 R_1$	AC2
				for collision bulkhead 2. $S_L \leq \eta_1 R_1$	AC1
<u>Note</u> 1. The symbols defined in this column are defined in the text of 5.4					
Where:					
D_G	dynamic global load				
D_L	dynamic local load				
DM	cumulative fatigue damage ratio				
S_G	static global load				
S_L	static local load				
R_i	structural capacity				

5.4.2 Design loads for scantling requirements and strength assessment (FEM)

- 5.4.2.1 The structural assessment of compartment boundaries, e.g. bulkheads, is based on the worst possible loading, hence conditions are assessed with a full tank on one side and an empty tank on the other side. The situation with the tank content reversed is also considered. Similarly the shell envelope is assessed for conditions at the deepest draught without internal filling and at the lowest draught with internal filling.
- 5.4.2.2 The standard loading patterns to be used in the strength assessment (FEM) are given in *Appendix B, Tables B.2.3 and B.2.4* for tankers with two oil-tight longitudinal bulkheads and one centreline oil-tight longitudinal bulkhead respectively. The corresponding information for the scantling requirements is given in *Section 8*.
- 5.4.2.3 To ensure consistency of approach, standardised rule values for parameters such as GM , R_{roll} , T_{sc} and C_b , are applied to calculate the rule load values.
- 5.4.2.4 The probability level of the dynamic global and local loads (D_G , D_L and D_{imp} in *Table 2.5.1*) is 10^{-8} and are derived using the long term statistical approach specified in *4.2.6.2*.
- 5.4.2.5 The probability level of the sloshing loads (D_{slh} in *Table 2.5.1*) is 10^{-4} which is a load that occurs frequently.
- 5.4.2.6 The design load combinations corresponding to the identified load scenarios produce realistic design load sets suitable for the design and verification of the structural capability. Design load sets apply all the applicable simultaneously acting static and dynamic local load components (S_L and D_L in *Table 2.5.1*, which are usually pressure load components) and static and dynamic global load components (S_G and D_G in *Table 2.5.1*, which is usually hull girder bending moment) for the design of a particular or group of structural members. The relevant design load sets for the scantling requirements are given in *Sections 8/2 to 8/5*. The design load sets for the Finite Element analysis are referred to as load cases and are given in *Appendix B*.
- 5.4.2.7 The simultaneously occurring dynamic loads are specified by applying a dynamic load combination factor to the envelope dynamic load values given in *Section 7/3*. The dynamic load combination factors that define the dynamic load cases are given in *Section 7/6.4* for the structural strength assessment (FE) and in *Section 7/6.5* for the scantling requirements.
- 5.4.2.8 The dynamic load combination factors have been derived using the equivalent design wave approach to provide realistic simultaneously occurring dynamic loads components suitable for structural assessment.
- 5.4.2.9 For the determination of design loads for the hull girder ultimate strength requirement given in *Section 9/1*, the operational loads (i.e. ship loading conditions) and the environmental loads (i.e. hull girder wave bending moments) are maximised for sagging conditions for seagoing conditions. The characteristic value for the still water hull girder sagging bending moments M_{sw} is based on the maximum value from the seagoing conditions specified in *Section 8/1*. The characteristic value for the wave hull girder sagging bending moments M_{wv} is given in *Section 7/3*.

5.4.3 Design loads for fatigue requirements

- 5.4.3.1 For the fatigue requirements given in *Section 9/3* and *Appendix C*, the load assessment is based on the expected load history and an average approach is

applied. The expected load history for the design life is characterised by the 10^{-4} probability level of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding stresses.

5.4.3.2 The considered wave-induced loads include:

- (a) hull girder loads (i.e., vertical and horizontal bending moments)
- (b) dynamic wave pressures
- (c) dynamic tank pressures.

5.4.3.3 The fatigue analysis is calculated for two representative loading conditions covering the ship's intended operation. These two conditions are:

- (a) full load homogeneous conditions at design draught
- (b) normal ballast condition.

The proportion of the ship's sailing life in the full load condition is 50% and in ballast 50%. It is assumed that 15% of the ships' life is in harbour/sheltered water. It is consequently assumed that the ship will be sailing in open waters in full load condition for 42.5% of the ship's life and in the ballast condition for 42.5% of the ship's life.

5.4.3.4 The load values are based on actual parameters corresponding to the applied loading conditions, e.g. GM , C_b , etc., and the applicable draughts at amidships is used. The actual values are taken from specified loading conditions in the loading manual.

5.4.3.5 The simultaneously occurring dynamic loads are accounted for by combination of stresses due to the various dynamic load components. The stress combination procedure is given in *Appendix C*.

5.4.3.6 Still water loads and static sea and tank pressures from the actual loading conditions are used to determine the mean stress effect.

5.4.4 Structural response analysis

5.4.4.1 In general, the following approaches are applied for determination of the structural response to the applied design load combinations

- (a) Beam theory
 - used for prescriptive requirements
- (b) FE analysis
 - coarse mesh for cargo hold model
 - fine mesh for local models
 - very fine mesh for fatigue assessment

5.4.5 Structural capacity assessment

- 5.4.5.1 The considered failure modes in the Rules are yield (plastic deformation), buckling, brittle fracture and fatigue. Structural failure due to yield and buckling is primarily controlled by the strength requirements, brittle fracture is primarily controlled by the requirements for material selection and welding, and fatigue failure is primarily controlled by the high cycle fatigue requirements.
- 5.4.5.2 Generally, the capacity models applied in the prescriptive rules, i.e., the scantling requirements in *Section 8*, are based on simple beam theory and include elastic yield and plastic capacity models. The buckling capacity is assessed using simplified buckling capacity models or by a more theoretical non-linear analysis procedure.
- 5.4.5.3 The design verification requirements are based on a linear elastic finite element analysis, a detailed prescriptive fatigue assessment procedure and a simplified ultimate strength assessment procedure. There is also a finite element based fatigue assessment procedure for some structural members, such as the hopper knuckle.
- 5.4.5.4 The application of the net thickness approach to assess the structural capacity is specified in *Section 6/3.3*.

5.4.6 Acceptance criteria

- 5.4.6.1 The acceptance criteria applied in the working stress design requirements are given as acceptance criteria sets shown in *Tables 2.5.2* and *2.5.3*. There are slight variations within each set depending on the relative contribution of local and global loads, static and dynamic loads and the structural member being considered. The specific acceptance criteria are given in the detailed rule requirements in *Section 8* and *9/2*.

Table 2.5.2 Principal Acceptance Criteria - Rule Requirements						
	Plate panels and Local Support Members		Primary Support Members		Hull girder members	
Acceptance criteria set	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC1:	70-80% of yield stress	Control of stiffness and proportions. Usage factor typically 0.8	70-75% of yield stress	Control of stiffness and proportions. Pillar buckling	75% of yield stress	NA
AC2:	90-100% of yield stress	Control of stiffness and proportions. Usage factor typically 1.0	85% of yield stress	Control of stiffness and proportions. Pillar buckling	90-100% of yield stress	Usage factor typically 0.9
AC3:	Plastic criteria	Control of stiffness and proportions	Plastic criteria	Control of stiffness and proportions	NA	NA

Table 2.5.3			
Principal Acceptance Criteria - Design Verification - FE Analysis			
	Global cargo tank analysis		Local fine mesh analysis
Acceptance criteria set	Yield	Buckling	Yield
AC1:	60-80% of yield stress	Control of stiffness and proportions. Usage factor typically 0.8	local mesh as 136% of yield stress averaged stresses as global analysis
AC2:	80-100% of yield stress	Control of stiffness and proportions. Usage factor typically 1.0	local mesh as 170% of yield stress averaged stresses as global analysis

5.4.6.2 The purpose of applying different sets is to achieve a consistent and acceptable safety level for all combinations of static and dynamic loads and to account for different capacity models.

5.5 Materials

5.5.1 General

5.5.1.1 Higher material properties are selected for highly critical structural elements which are subjected to high loads in order to reduce the risk of propagation of brittle fracture.

5.6 Application of Rule Requirements

5.6.1 Minimum requirements

5.6.1.1 These specify the minimum scantling requirements which are to be applied irrespective of all other requirements, hence thickness below the minimum are not allowed.

5.6.2 Load based prescriptive requirements

5.6.2.1 These provide scantling requirements for all plating, local support members, most primary support members and the hull girder and cover all structural elements including deckhouses, foundations for deck equipment, etc.

5.6.2.2 In general, these requirements explicitly control one particular failure mode and hence several requirements may be applied to assess one particular structural member.

5.6.3 Design verification - hull girder ultimate strength

- 5.6.3.1 The requirements for the ultimate strength of the hull girder are based on a Partial safety Factor (PF) method, see 4.5. A safety factor is assigned to each of the basic variables, the still water bending moment, wave bending moment and ultimate capacity. The safety factors were determined using a structural reliability assessment approach, the long term load history distribution of the wave bending moment was derived using ship motion analysis techniques suitable for determining extreme wave bending moments.
- 5.6.3.2 The purpose of the hull girder ultimate strength verification is to demonstrate that one of most critical failure modes of a double hull tanker is controlled.

5.6.4 Design verification - global finite element analysis

- 5.6.4.1 The global finite element analysis is used to verify the scantlings given by the load-capacity based prescriptive requirements. The analysis is required because the prescriptive requirements do not take into account the complex interactions between the ship's structural components, complex local structural geometry, change in thicknesses and member section properties as well as the complex load regime with sufficient accuracy. Hence the global finite element analysis is necessary to verify the proposed scantlings.
- 5.6.4.2 A linear elastic three dimensional finite element analysis of the cargo region (a FE model length of three tanks is required) is carried out to assess and verify the structural response of the proposed hull girder and primary support members and assist in specifying the scantling requirements for the primary support members. The purpose with the finite element analysis is to verify that the stresses and buckling capability of the primary support members are within acceptable limits for the applied design loads.

5.6.5 Design verification - fatigue assessment

- 5.6.5.1 The fatigue assessment is required to verify that the fatigue life of critical structural details is adequate. A prescriptive fatigue requirement is applied to details such as end connections of longitudinal stiffeners using an SN curve approach based on geometric details, i.e. Class F, F2, etc. A hot spot fatigue assessment procedure using finite element analysis is applied to details such as the hopper knuckle. In both cases, the fatigue assessment method is based on the Palmgren-Miner linear damage model.

5.6.6 Relationship between the prescriptive scantling requirements and the strength assessment (FEM)

- 5.6.6.1 The prescriptive minimum requirements define the minimum acceptable scantlings. These may not to be reduced by any form of alternative calculations such as load-capacity prescriptive requirements or strength analysis such as FEM.
- 5.6.6.2 The section modulus and/or shear area of a primary support member and/or the cross sectional area of a primary support member cross tie may be reduced to 85% of the prescriptive requirements provided that the reduced scantlings comply with the strength assessment (FEM).
- 5.6.6.3 The philosophy is that a coarse approach should be more conservative than a detailed approach. Hence, the prescriptive requirements are generally more conservative than the corresponding requirements based on strength assessment (FEM).

SECTION 3

RULE APPLICATION

1 NOTATIONS

1.1 Notations

1.1.1 General

- 1.1.1.1 Ships fully complying with the requirements of these Rules and the specific requirements of the assigning Classification Society relating to construction, survey and equipment will be eligible to be assigned with character symbols and a ship type notation appropriate to the assigning Classification Society.
- 1.1.1.2 In addition to *1.1.1.1*, ships fully complying with the requirements of these Rules will also be assigned the notation **CSR**.

2 DOCUMENTATION, PLANS AND DATA REQUIREMENTS

2.1 Documentation and Data Requirements

2.1.1 Loading information

- 2.1.1.1 Loading guidance information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations is to be provided onboard the ship. The loading guidance information is to include an approved loading manual and loading computer system complying with the requirements given in *Sections 8/1.1.2 and 8/1.1.3* respectively.

2.1.2 Submission of calculation data and results

- 2.1.2.1 Where calculations have been carried out in accordance with the procedures given in the Appendices of these Rules, one copy of the following supporting information is to be submitted as applicable:
- (a) reference to the calculation procedure and technical program used
 - (b) a description of the structural modelling
 - (c) a summary of the analysis parameters including properties and boundary conditions
 - (d) details of the loading conditions and the means of applying loads
 - (e) a comprehensive summary of calculation results
 - (f) sample calculations where appropriate.
- 2.1.2.2 In general, submission of large volumes of input and output data associated with programs, such as finite element analysis, will not be required.
- 2.1.2.3 The responsibility for error free specification and input of program data and the subsequent correct transposal of output resides with the designer.

2.1.3 Use of computer software for rule calculations

- 2.1.3.1 In general, any rule computation program recognised by the Classification Society may be employed to determine scantlings according to these Rules provided the implementation given in 5.1 is complied with.
- 2.1.3.2 A computer program that has been demonstrated to produce reliable results to the satisfaction of the Classification Society is regarded as a recognised program. Where the computer programs employed are not supplied or recognised by the Classification Society, full particulars of the computer program, including example calculation output, are to be submitted. It is recommended that the designers consult the Classification Society on the suitability of the computer programs intended to be used prior to the commencement of any analysis work.

2.2 Submission of Plans and Supporting Calculations

2.2.1 General

- 2.2.1.1 In general, the main categories and lists of information required are given in 2.2.2. Additional requirements for some items are also given in subsequent sections as applicable.

- 2.2.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations. Additional copies may be required according to the individual Classification Society requirements.
- 2.2.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, materials, welding and loads imposed on the structure by equipment and systems as appropriate.
- 2.2.1.4 Plans are to include information related to the renewal thickness as specified in *Section 12*.

2.2.2 Plans and supporting calculations

2.2.2.1 In general, plans covering the following items are to be submitted:

- (a) main scantling plans:
- midship sections showing longitudinal and transverse structural members
 - construction profiles/plans showing all main longitudinal structural elements along the ships length including decks, inner bottom, bulkheads, double side stringers and double bottom girders
 - shell expansion
 - main oil-tight and watertight transverse bulkheads including primary support members
- (b) loading guidance information:
- preliminary loading manual
 - final loading manual
 - details of the design basis, see *Section 8/1.1.2*
 - test conditions for the loading instrument
- (c) detailed construction plans:
- cargo tank construction plans showing the variations in detail arrangements and scantlings of double bottom floors, double side webs and other transverse primary support members
 - fore end
 - aft end
 - engine room construction including the engine and thrust bearing seating
 - deckhouses and superstructures
- (d) detail design plans except where the information is already included on plans listed in (a) and (c):
- sternframe
 - hull penetration plans
 - welding
 - bilge keels
 - booklet of standard design details
 - anchoring and mooring equipment
 - pillar and girder support arrangements for decks
 - access arrangements through double bottom and side skin spaces in the cargo tank region
 - details and arrangements of openings and attachments to the hull structure for means of access for inspection purposes

- (e) plans detailing support structures except where the information is already included on plans listed in (a) to (d):
 - anchoring windlass and chain stopper
 - mooring winches
 - masts, derrick posts or cranes
 - emergency towing equipment
 - other deck equipment or fittings

2.2.2.2 The following supporting documents are to be submitted:

- (a) general arrangement
- (b) capacity plan
- (c) lines plan or equivalent
- (d) dry-docking plan, where developed
- (e) freeboard plan or equivalent, showing freeboards and items relative to the conditions of assignment

2.2.2.3 The following supporting calculations are to be submitted:

- (a) calculation of the equipment number.

2.2.2.4 Plans of items not covered by these Rules are to be submitted according to the individual Classification Society requirements.

2.2.3 Plans to be supplied onboard the ship

2.2.3.1 One copy of the following plans indicating the new-building and renewal thickness for each structural item:

- (a) main scantling plans as given in 2.2.2.1(a)
- (b) one copy of the final approved loading manual, see 2.1.1
- (c) one copy of the final loading instrument test conditions, see *Section 8/1.1.3*
- (d) detailed construction plans as given in 2.2.2.1(c)
- (e) welding
- (f) details of the extent and location of higher tensile steel together with details of the specification and mechanical properties, and any recommendations for welding, working and treatment of these steels
- (g) details and information on use of special materials, such as aluminium alloy, used in the hull construction.
- (h) towing and mooring arrangements plan, see *Section 11/3.1.6.16*

3 SCOPE OF APPROVAL

3.1 General

3.1.1 Rule application

- 3.1.1.1 Further to the information contained in *Section 1/1.1.2* and *Section 1/1.2.1*, the Rules cover the scantling requirements for the classification of new double hull tankers of 150m or greater in length.
- 3.1.1.2 The attention of owners, designers, and builders is directed to the regulations of international, national, canal, and other authorities dealing with those requirements which may affect structural aspects, in addition to or in excess of the classification requirements.
- 3.1.1.3 Other aspects of the structural design not covered by these Rules are to be addressed using the rules of the individual Classification Society.

3.2 Classification

3.2.1 General

- 3.2.1.1 The documentation, plans and data requirements specified in *Sub-Section 2* are to be submitted. Each individual Classification Society will review such documentation to verify compliance with the requirements.
- 3.2.1.2 An appropriate term to indicate that the plans, reports or documents have been reviewed for compliance with these Rules will be used according to the procedures of the individual Classification Society.

3.3 Requirements of National and International Regulations

3.3.1 Responsibility

- 3.3.1.1 It is the responsibility of the designer to ensure that the design complies with the current National and International regulations applicable to the vessel.
- 3.3.1.2 Classification Societies are not responsible for assessing compliance with International and National regulations as part of the general classification approval process. However, a Classification Society may enter into an agreement under which they are explicitly instructed to review and approve a vessel design for compliance with specified regulations. This approval may be accepted as proof of compliance on behalf of a Flag Administration provided the Classification Society has been designated as a suitable recognised by that Flag Administration in accordance with *SOLAS Regulations XI/1*.

3.3.2 Review procedure

- 3.3.2.1 When compliance is reviewed by the Flag Administration, the vessel is to be issued with certificates indicating compliance with National and International regulations by the Flag Administration. For ships with arrangements and equipment that are required to comply with the following requirements, and applicable amendments thereto, and where not issued by the Flag Administration, the applicable convention certificates are to be issued by the Classification Society or by an IACS member when authorised:
 - (a) *International Convention on Load Lines, 1966*

- (b) *International Convention for the Safety of Life at Sea, 1974*, and its Protocol of 1978
- (c) *International Convention for the Prevention of Pollution from Ships, 1973*, and as modified by the Protocol of 1978 relating thereto.

For dual class ships, convention certificates may be issued by either Classification Society with which the ship is classed, provided this is recognised in a formal dual class agreement with the Classification Societies classing the ship and that both societies are authorised by the Flag Administration.

4 EQUIVALENCE PROCEDURE

4.1 General

4.1.1 Rule applications

- 4.1.1.1 These Rules apply in general to double hull oil tankers of normal form, proportions, speed and structural arrangements. Relevant design parameters defining the assumptions made are given in *Section 2/3*.
- 4.1.1.2 The Rules are applicable to steel ships of welded construction. Other materials for use in hull construction will be specially considered.
- 4.1.1.3 Special consideration will be given to the application of the Rules incorporating design parameters which are outside the design basis of *Section 2/3*, for example:
 - (a) increased fatigue life
 - (b) increased corrosion additions
 - (c) increased cargo density.

4.1.2 Novel designs

- 4.1.2.1 Ships of novel design, i.e. those of unusual form, proportions, speed and structural arrangements outside those reflected in *Section 2/3.1.2* of these Rules will be specially considered according to the contents of this sub-section.
- 4.1.2.2 Information is to be submitted to the Classification Society to demonstrate that the structural safety of the novel design is at least equivalent to that intended by the Rules.
- 4.1.2.3 In such cases, the Classification Society is to be contacted at an early stage in the design process to establish the applicability of the Rules and additional information required for submission.
- 4.1.2.4 Dependent on the nature of the deviation, a systematic review may be required to document equivalence with the Rules.

4.1.3 Alternative calculation methods

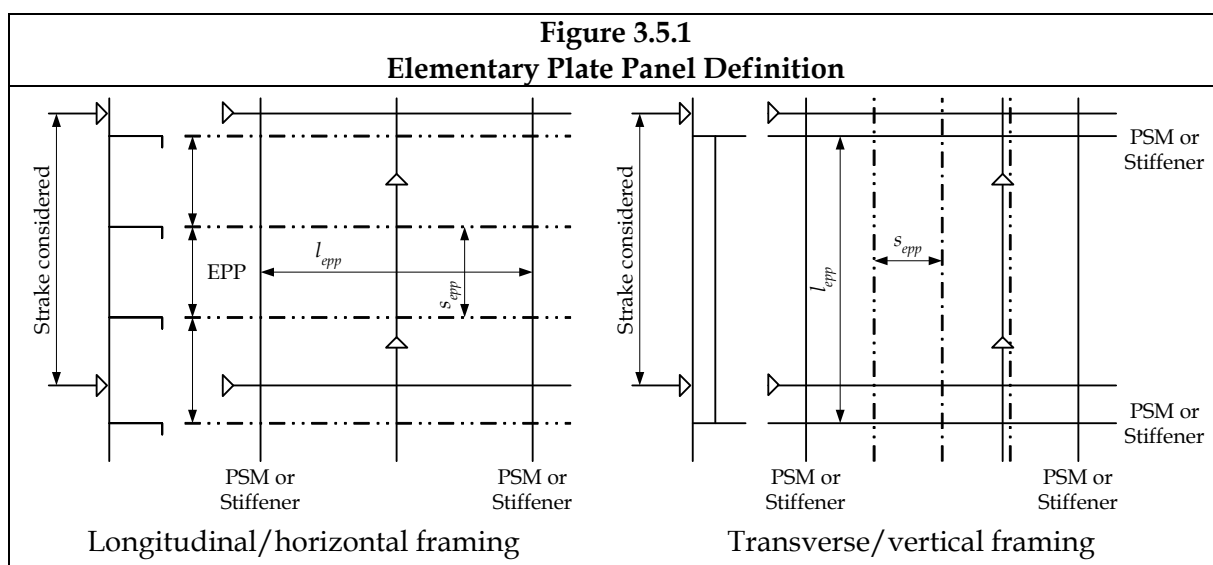

- 4.1.3.1 Where indicated in specific sections of the Rules, alternative calculation methods to those shown in the Rules may be accepted provided it is demonstrated that the scantlings and arrangements are of at least equivalent strength to those derived using the Rule calculation method.

5 CALCULATION AND EVALUATION OF SCANTLING REQUIREMENTS

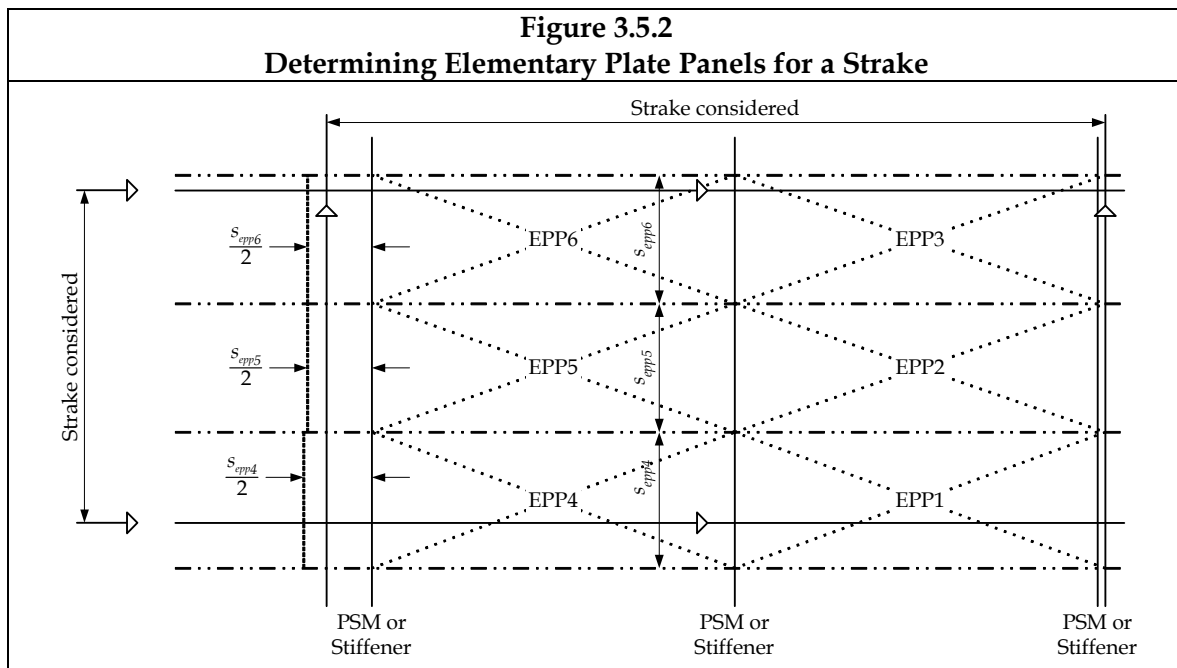

5.1 Determination of Scantling Requirements for Plates

5.1.1 Determination of scantlings of plate strakes - idealisation of plate panels

- 5.1.1.1 Scantlings of plate strakes are to be derived based on the idealisation of the as-built structure as a series of Elementary Plate Panels (EPP).
- 5.1.1.2 An EPP is the unstiffened part of the plating between stiffeners. The plate panel length, l_{epp} , and breadth, s_{epp} , of the EPP are defined in relation to the longest and shortest plate edges respectively, as shown in *Figure 3.5.1*.
- 5.1.1.3 For strength assessment, the idealisation of EPP may be different and take into account the mesh arrangement in the FEM model.

- 5.1.1.4 The required scantling of a plate strake is to be taken as the greatest value required for each EPP within that strake as given by:
- an EPP positioned entirely within the strake boundaries, e.g. EPP2 in *Figure 3.5.2*
 - an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the long edge of the EPP, e.g. EPP1, 3, 4 and 6 in *Figure 3.5.2*
 - an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the short edge of the EPP within more than half the EPP breadth, s_{epp} , from the edge, e.g. EPP1 and EPP2 in *Figure 3.5.3(a)*.

5.1.2 Determination of scantlings of elementary plate panels for scantling requirements

5.1.2.1 The required scantling of each elementary plate panel is to be calculated based on a Load Calculation Point (LCP) defined as:

- for longitudinal framing, at the mid length of the EPP measured along the global x -axis at its lower edge. For horizontal plating the load calculation point is to be taken at the outboard y -value of the EPP. See *Figure 3.5.3(a)*
- for transverse framing, at the mid length of the EPP measured along the global x -axis at the lower edge of strake. For horizontal plating the load calculation point is to be taken at the outboard y -value of the EPP. See *Figure 3.5.3(b)*
- for horizontal framing on vertical transverse structure, at the lower edge of the elementary plate panel at the point of outboard y -value of the EPP. See *Figure 3.5.3(c)*
- for vertical framing on vertical transverse structure, at the greatest y -value of the lower edge of the EPP or at the lower edge of strake. See *Figure 3.5.3(d)*

5.1.2.2 Both the local pressure and hull girder stress used for the calculation of the local scantling requirements are to be taken at the LCP.

5.1.3 Determination of scantlings of elementary plate panels for hull girder strength

5.1.3.1 The required scantlings of the elementary plate panels are to satisfy the hull girder bending and hull girder shear requirements of *Section 8/1*.

5.1.3.2 The required thickness of each elementary plate panel, with respect to buckling, is to be calculated based on stresses taken at the mid length of the EPP measured along the global x -axis.

5.1.3.3 The buckling evaluation is to be calculated using the stress distribution across the width of the panel defined with a reference stress taken at the edge with maximum stress and reduced stress at the other edge given as a fraction, Ψ , defined in *Table 10.3.1*, of the reference stress.

- 5.1.3.4 The required scantling of a plate strake is to be taken as the greatest value required for each EPP within that strake as given by:
- (a) an EPP positioned entirely within the strake boundaries, e.g. EPP2 in Figure 3.5.2
 - (b) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the long edge of the EPP, e.g. EPP 1, 3, 4 and 6 in Figure 3.5.2
 - (c) an EPP with a strake boundary weld seam bisecting it predominantly in the direction of the short edge of the EPP within more than half the EPP breadth, S_{EPP} , from the edge, e.g. EPP 1 and 2 in Figure 3.5.3(a).

5.1.4 Determination of scantlings of elementary plate panels for FEM strength assessment

- 5.1.4.1 The required scantlings of elementary plate panels are to be derived from the plate mesh element with maximum utilisation, see Section 9/2.

- (a) the average of the required scantling of all stiffeners within a group
 - (b) 90% of the maximum scantling required for any one stiffener within the group.
- The concept of grouping is not applicable to fatigue requirements as given in *Section 9/3* and *Appendix C*.

5.2.2 Determination of scantlings of stiffened panels for scantling requirements and fatigue

- 5.2.2.1 The required scantling of a stiffened panel is to be based on a pressure load calculation point defined as:
- (a) mid point of the overall span, l_{full} , of the stiffener between primary support members, see *Figure 3.5.4*
 - (b) at the connection of the stiffener to the plating.

- 5.2.2.2 For longitudinal and horizontal framing the design pressure is to be taken as the pressure at the mid point of the overall span.
- 5.2.2.3 For transverse and vertical framing the design pressure is to be taken as the greater of the following:

$$P_{ms} \quad \text{kN/m}^2$$

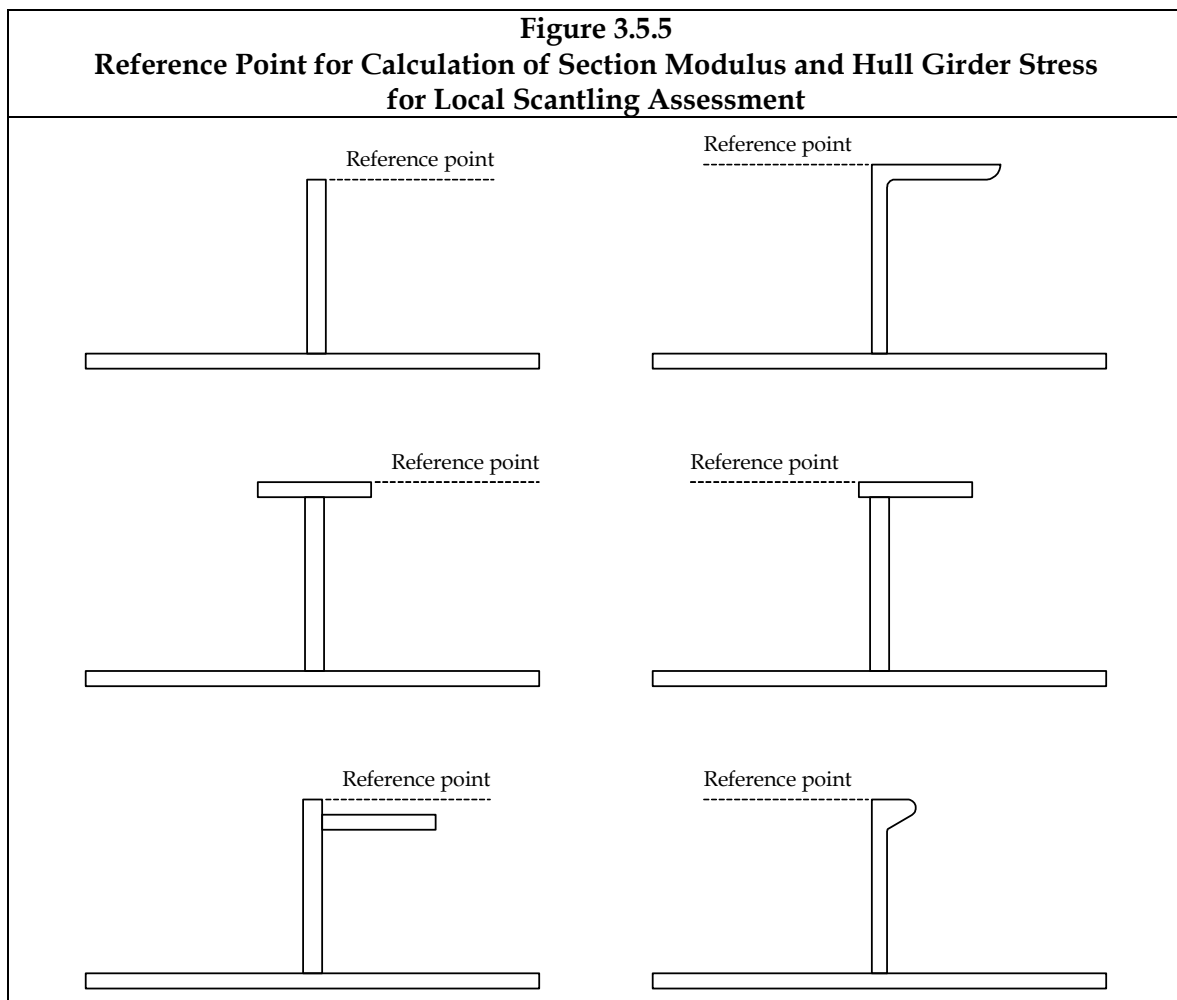

$$\frac{(P_{end-1} + P_{end-2})}{2} \quad \text{kN/m}^2$$

Where:

P_{ms}	calculated pressure at mid point of overall span, l_{full} , in kN/m ²
P_{end-1}	calculated pressure at 1 st end of overall span, in kN/m ²
P_{end-2}	calculated pressure at 2 nd end of overall span, in kN/m ²
l_{full}	overall span, in m, see <i>Figure 3.5.4</i>

5.2.2.4 The section modulus requirements given in these Rules relate to the reference point giving the minimum section modulus. In general, this will be on the outer surface of the faceplate. The reference point for calculation of section modulus for typical profiles is shown in *Figure 3.5.5*.

5.2.2.5 The hull girder stress used for calculation of local scantling requirements for stiffeners is to be taken at the reference point as shown in *Figure 3.5.5*

5.2.3 Determination of scantlings of stiffened panels for hull girder buckling strength

- 5.2.3.1 The required scantling of a stiffened panel, with respect to buckling, is to be based on the axial stress calculated at the attachment point of the stiffener to the plate and at the mid length of the stiffener measured along the global x-axis.
- 5.2.3.2 The required scantling as given in 5.2.3.1 applies to stiffeners outside of a distance s from the support, where s is the stiffener spacing.

5.2.4 Determination of scantlings of stiffened panels for FEM strength assessment

- 5.2.4.1 The required scantlings of the stiffened panel are to be based on the derivation of applied stresses in accordance with *Section 9/2*.

5.2.5 Shear area requirements of stiffeners

- 5.2.5.1 Requirements for the shear area and/or web thickness of stiffeners are given in *Section 8*.
- 5.2.5.2 The requirements in *Section 8* are to be calculated based on the load point defined in 5.2.2 and the effective span as given in *Section 4/2.1.2*.
- 5.2.5.3 The requirements in *Section 8* are to be evaluated against the actual shear area of the stiffener, based on the effective shear height of the stiffener as given in *Section 4/2.4.2* and based on the specified minimum yield of the stiffener.
- 5.2.5.4 The effect of brackets may be included in the calculation of the effective span, but no part of the bracket is to be included in the calculation of the actual shear area.

5.2.6 Bending requirements of stiffeners

- 5.2.6.1 Requirements for the section modulus and moment of inertia of stiffeners are given in *Section 8*.
- 5.2.6.2 The requirements in *Section 8* are to be calculated based on the load point defined in 5.2.1 and the effective span as given in *Section 4/2.1.1*.
- 5.2.6.3 The requirements in *Section 8* are to be evaluated against the actual section modulus/moment of inertia of the stiffener. The stiffener web and flanges are to be included in the calculation of actual sectional properties.
- 5.2.6.4 The effect of brackets may be included in the calculation of the effective span, but no part of the bracket is to be included in the calculation of section modulus/moment of inertia.
- 5.2.6.5 When the stiffener is of a higher strength material than the attached plate, the yield stress used for the calculation of the section modulus requirements in *Section 8* is in general not to be greater than 1.35 times the minimum specified yield stress of the attached plate. If the yield stress of the stiffener exceeds this limitation the following criterion is to be satisfied:

$$\sigma_{yd-stf} \leq (\sigma_{yd-plt} - |\sigma_{hg}|) \frac{Z_{net-plt}}{Z_{net}} + |\sigma_{hg}| \quad \text{N/mm}^2$$

Where:

- σ_{yd-stf} specified minimum yield stress of the material of the stiffener, in N/mm²
- σ_{yd-plt} specified minimum yield stress of the material of the attached plate, in

	N/mm ²
σ_{hg}	maximum hull girder stress of sagging and hogging (S+D), in N/mm ² , as defined in <i>Table 8.2.5</i> and <i>Table 8.4.3</i> for stiffeners in cargo tank region and machinery spaces respectively and not to be taken as less than $0.4 \sigma_{yd-plt}$
Z_{net}	net section modulus, in way of face plate/free edge of the stiffener, in cm ³
$Z_{net-plt}$	net section modulus, in way of the attached plate of stiffener, in cm ³

5.2.7 Evaluation of slanted stiffeners

- 5.2.7.1 The shear area and section modulus requirements for local support members are valid about an axis parallel to the plate flange. If the angle ϕ_w between the stiffener web and the attached plating is less than 75 degrees, see *Figure 4.2.14*, then the actual shear area and section modulus is to be adjusted in accordance with *Sections 4/2.4.2* and *2.4.3*. The angle between the stiffener web, ϕ_w , and the attached plating is not to be less than 50 degrees.

5.3 Calculation and Evaluation of Scantling Requirements for Primary Support Members

5.3.1 Load application point for primary support members

- 5.3.1.1 The design pressure for primary support members is generally taken at the mid point of the load area. The design pressures for the primary support members are defined for individual members as given in *Section 8*.

5.3.2 Shear requirements of primary support members

- 5.3.2.1 Requirements for shear area and/or web thickness of primary support members are given in *Section 8*.
- 5.3.2.2 These requirements are to be calculated based on the load point defined in *5.3.1* and the effective span as given in *Section 4/2.1.5*.
- 5.3.2.3 These requirements are to be evaluated against the actual shear area and the specified minimum yield of the web plate of the primary support member. The actual shear area of the primary support member is defined in *Section 4/2.5.1*. The effect of brackets may be included in the calculation of effective span, but are not to be included in the calculation of actual shear area.

5.3.3 Bending requirements of primary support members

- 5.3.3.1 Requirements for section modulus and moment of inertia of primary support members are given in *Section 8* and *Section 10*, respectively.
- 5.3.3.2 These requirements are to be calculated based on the load point defined in *5.3.1* and the effective span as given in *Section 4/2.1.4*.
- 5.3.3.3 These requirements are to be evaluated against the actual section modulus/moment of inertia of the primary support member. Web and flanges are included in the calculation of actual sectional properties. The effect of brackets may be included in calculation of effective span, but are not to be included in the calculation of section modulus/moment of inertia.
- 5.3.3.4 Where it is impracticable to fit a primary support member with the required web depth, then it is permissible to fit a member with reduced depth provided that the fitted member has equivalent moment of inertia or deflection to the required

member. The required equivalent moment of inertia is to be based on an equivalent section given by the effective width of plating at mid span with required plate thickness, web of required depth and thickness and face plate of sufficient width and thickness to satisfy the required mild steel section modulus. All other rule requirements, such as minimum thicknesses, slenderness ratio, section modulus and shear area, are to be satisfied for the member of reduced depth. The equivalent moment of inertia may be also demonstrated by an equivalent member having the same deflection as the required member.

5.4 Rounding of Calculated Thickness

5.4.1 Required gross thickness

- 5.4.1.1 The minimum required gross thickness of any member to be fitted at the new-building stage, exclusive of any owners' extras, is to be taken as the rounded net thickness required plus the appropriate corrosion addition.
- 5.4.1.2 The required net thickness is given by rounding the calculated net thickness to the nearest half millimetre. For example:
- (a) for $10.75 \leq t_{calc-net} < 11.25$ mm the Rule required thickness is 11mm
 - (b) for $11.25 \leq t_{calc-net} < 11.75$ mm the Rule required thickness is 11.5mm.

SECTION 4

BASIC INFORMATION

1 DEFINITIONS

1.1 Principal Particulars

1.1.1 L , rule length

- 1.1.1.1 L , the rule length, is the distance on the waterline at the scantling draught, from the forward side of the stem to the centreline of the rudder stock, in metres. L is not to be less than 96%, and need not be greater than 97%, of the extreme length on the summer load waterline. In ships with an unusual stern and bow arrangement the length, L , will be specially considered.

1.1.2 L_L , load line length

- 1.1.2.1 L_L , the load line length is defined in the *International Convention on Load Lines*.

1.1.3 Moulded breadth

- 1.1.3.1 B , the moulded breadth, is the maximum breadth of the ship, measured amidships to the moulded line of the frame, in metres.

1.1.4 Moulded depth

- 1.1.4.1 D , the moulded depth, is the vertical distance, in metres, amidships, from the moulded baseline to the moulded deck line of the uppermost continuous deck measured at deck at side. On vessels with a rounded gunwale, D is to be measured to the continuation of the moulded deck line.

1.1.5 Draughts

- 1.1.5.1 T , the draught in metres, is the summer load line draught for the ship in operation, measured from the moulded base line at amidships. Note this may be less than the maximum permissible summer load waterline draught.
- 1.1.5.2 T_{bal} , is the minimum design ballast draught, in metres, at which the strength requirements for the scantlings of the ship are met. The minimum design ballast draught is not to be greater than the minimum draught of ballast conditions including ballast water exchange operation, measured from the moulded base line at amidships, for any ballast loading condition in the loading manual including both departure and arrival conditions.
- 1.1.5.3 T_{bal-n} , the normal ballast draught in metres, is the draught at departure given for the normal ballast condition in the loading manual, measured from the moulded base line at amidships, see *Section 8/1.1.2.3*. The normal ballast condition is the ballast condition in compliance with condition specified in *Section 8/1.1.2.2 a)*.
- 1.1.5.4 T_{full} , the full load design draught in metres, is the draught at departure given for the homogeneous full load condition in the loading manual, measured from the moulded base line at amidships, see *Section 8/1.1.2.3*.
- 1.1.5.5 T_{scr} is the maximum design draught, in metres, at which the strength requirements for the scantlings of the ship are met.

1.1.6 Amidships

- 1.1.6.1 Amidships is to be taken as the middle of the rule length, L .

1.1.7 Moulded displacement

- 1.1.7.1 Δ , the moulded displacement, in tonnes, corresponding to the underwater volume of the ship, at draught T_{sc} , in sea water with a density of 1.025t/m³.

1.1.8 Maximum service speed

- 1.1.8.1 V , the maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest sea-going draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

1.1.9 Block coefficient

- 1.1.9.1 C_b , the block coefficient at the scantling draught, is defined as:

$$C_b = \frac{\nabla}{LB_{WL}T_{sc}}$$

Where:

∇	moulded displacement volume at the scantling draught, in m ³
L	rule length, as defined in 1.1.1.1
B_{WL}	moulded breadth measured amidships, in m, at the scantling draught waterline
T_{sc}	scantling draught, as defined in 1.1.5.5

- 1.1.9.2 C_{b-LC} , the block coefficient at considered loading condition, is defined as:

$$C_{b-LC} = \frac{\nabla_{LC}}{LB_{WL}T_{LC}}$$

Where:

∇_{LC}	moulded displacement volume at the T_{LC} , in m ³
L	rule length, as defined in 1.1.1.1
B_{WL}	moulded breadth measured amidships, in m, at the T_{LC}
T_{LC}	draught at amidships, in m, in the loading condition being considered.

1.1.10 Length between perpendiculars

- 1.1.10.1 L_{pp} , the length between perpendiculars, is the distance, in metres, on the scantling draught waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post.

1.1.11 The forward perpendicular

- 1.1.11.1 F.P., the forward perpendicular, is the perpendicular at the intersection of the scantling draught waterline with the fore side of the stem. The F.P. is the forward end of the rule length, L .

1.1.12 The aft perpendicular

- 1.1.12.1 A.P., the aft perpendicular, is the perpendicular at the aft end of the rule length, L , measured from the F.P.

1.1.13 Load line block coefficient

- 1.1.13.1 C_{bL} , the load line block coefficient, is defined in the *International Convention on Load Lines* as follows:

$$C_{bL} = \frac{\nabla_L}{L_L B T_L}$$

Where:

∇_L	moulded displacement volume at the moulded draught, T_L , in m^3
L_L	load line length, as defined in 1.1.2.1
B	moulded breadth, in m, as defined in 1.1.3.1
T_L	the moulded draught measured to the waterline at 85 per cent of the least moulded depth, in m

1.1.14 Deadweight

- 1.1.14.1 DWT, is the deadweight of the ship, in tonnes, floating in water with a specific gravity of 1.025, at the summer load line draught.

1.2 Position 1 and Position 2

1.2.1 Position 1

- 1.2.1.1 Position 1 is defined as any location upon exposed freeboard and raised quarterdecks, and exposed superstructure decks within the forward $0.25L_L$.

1.2.2 Position 2

- 1.2.2.1 Position 2 is defined as any location upon exposed superstructure decks abaft the forward $0.25L_L$.

1.3 Type 'A' and Type 'B' Freeboard Ships

1.3.1 ICLL definition

- 1.3.1.1 A Type 'A' or Type 'B' freeboard ship is as defined in the *International Convention on Load Lines*.

1.4 Coordinate System

1.4.1 Origin and orientation

- 1.4.1.1 The coordinate system used within these Rules is shown in *Figure 4.1.1*. Motions and displacements are considered positive in the forward, up and to port direction. Angular motions are considered positive in the clockwise direction about the x, y or z axis.

1.5 Naming Convention

1.5.1 Bulkhead nomenclature

1.5.1.1 Figures 4.1.2, 4.1.3 and 4.1.4 show the common structural nomenclature used within these Rules.

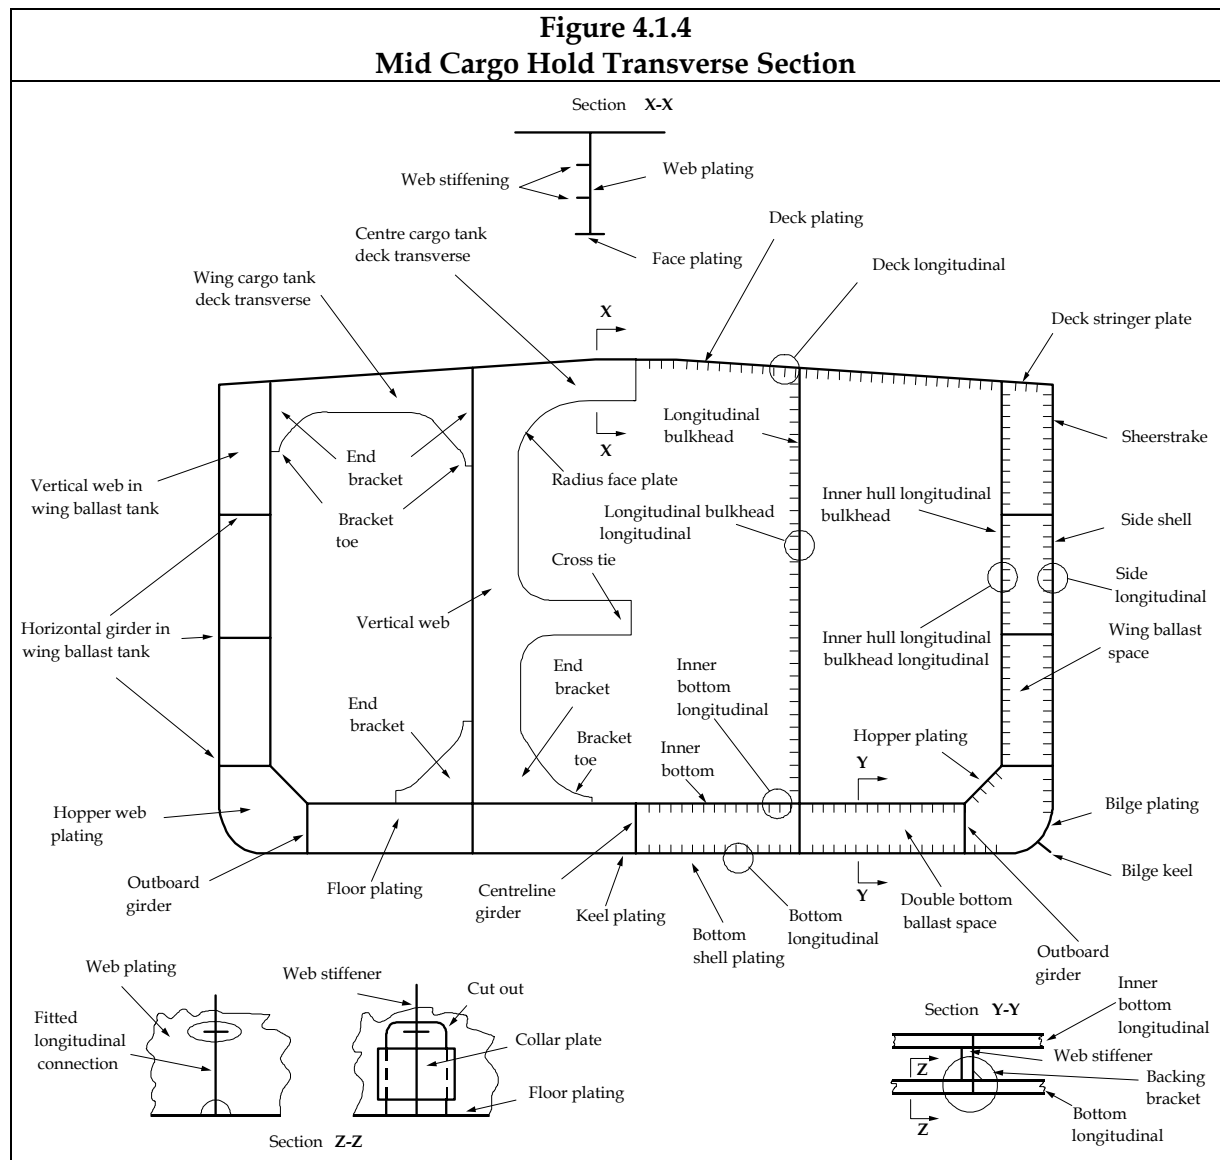

Figure 4.1.3
Flat Transverse Bulkhead Nomenclature

1.6 Symbols

1.6.1 General

1.6.1.1 The symbols and subscripts used within these Rules are defined locally. The principal particulars, as defined in 1.1, may be referred to within text without reference.

1.7 Units

1.7.1 General

1.7.1.1 The following units are used within these Rules. The units to be used within equations are given locally.

(a) General:

- dimensions/distances m
- primary spacings m
- secondary spacings mm
- area m²

• volume	m^3
• mass	t
• velocity	m/s
• acceleration	m/s^2
(b) Hull girder properties:	
• dimensions	m
• area	m^2
• section modulus	m^3
• moment of inertia	m^4
• moment of area	m^3
(c) Stiffener properties:	
• dimensions	mm
• area	cm^2
• section modulus	cm^3
• inertia	cm^4
• length/effective length	m
• span	m
(d) Plating dimensions:	
• breadth	mm
• length	m
• thickness	mm
(e) Loads:	
• pressures	kN/m^2
• loads	kN
• bending moment	kNm
• shear force	kN
(f) Miscellaneous:	
• yield strength	N/mm^2
• stress	N/mm^2
• deflections	mm
• modulus of elasticity	N/mm^2
• density	t/m^3
• displacement	t
• angle	deg
• calculated angle	rad
• period	s
• frequency	Hz
• ship speed	knots

1.8 Glossary

1.8.1 Definitions of terms

1.8.1.1 The terms in *Table 4.1.1* are used within these Rules to describe the items which their respective definitions describe.

Table 4.1.1 Definitions of Terms	
Terms	Definition
Accommodation deck	A deck used primarily for the accommodation of the crew
Accommodation ladder	A portable set of steps on a ship's side for people boarding from small boats or from a pier
Aft peak	The area aft of the aft peak bulkhead
Aft peak bulkhead	The first main transverse watertight bulkhead forward of the stern
Aft peak tank	The compartment in the narrow part of the stern aft of the aft peak bulkhead
Anchor	a device which is attached to anchor chain at one end and lowered into the sea bed to hold a ship in position; it is designed to grip the bottom when it is dragged by the ship trying to float away under the influence of wind and current; usually made of heavy casting or casting
Ballast tank	A compartment used for the storage of water ballast
Bay	The area between adjacent transverse frames or transverse bulkheads
Bilge keel	A piece of plate set perpendicular to a ship's shell along the bilges to reduce the rolling motion
Bilge plating	The area of curved plating between the bottom shell and side shell. To be taken as follows: From the start of the curvature at the lower turn of bilge on the bottom to the lesser of, the end of curvature at the upper turn of the bilge on the side shell or 0.2D above the baseline/local centreline elevation
Bilge strake	The lower strake of bilge plating
Boss	The boss of propeller is the central part to which propeller blades are attached and through which the shaft end passes
Bottom shell	The shell envelope plating forming the predominantly flat bottom portion of the shell envelope including the keel plate
Bow	The structural arrangement and form of the forward end of the ship
Bower Anchor	An anchor carried at the bow of the ship
Bracket	An extra structural component used to increase the strength of a joint between two structural members
Bracket toe	The narrow end of a tapered bracket
Breakwater	Inclined and stiffened plate structure on a weather deck to break and deflect the flow of water coming over the bow
Breast hook	A triangular plate bracket joining port and starboard side structural members at the stem
Bridge	An elevated superstructure having a clear view forward and at each side, and from which a ship is steered
Bulb profile	A stiffener utilising an increase in steel mass on the outer end of the web instead of a separate flange
Bulkhead	A structural partition wall sub-dividing the interior of the ship into compartments
Bulkhead deck	The uppermost continuous deck to which transverse watertight bulkheads and shell are carried
Bulkhead stool	The lower or upper base of a corrugated bulkhead

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Bulkhead structure	The transverse or longitudinal bulkhead plating with stiffeners and girders
Bulwark	The vertical plating immediately above the upper edge of the ship's side surrounding the exposed deck(s)
Bunker	A compartment for the storage of fuel oil used by the ship's machinery
Cable	A rope or chain attached to the anchor
Camber	The upward rise of the weather deck from both sides towards the centreline of the ship
Cargo tank bulkhead	A boundary bulkhead separating cargo tanks
Cargo area	The part of the ship that contains cargo tanks and cargo/slop tanks and adjacent areas including ballast tanks, fuel tanks, cofferdams, void spaces and also including deck areas throughout the entire length and breadth of the part of the ship over the mentioned spaces. It includes the collision bulkhead and the transverse bulkhead at the aft end of the cargo block.
Carlings	A stiffening member used to supplement the regular stiffening arrangement
Casing	The covering or bulkhead around or about any space for protection
Cellular construction	A structural arrangement where there are two closely spaced boundaries and internal diaphragm plates arranged in such a manner to create small compartments
Centreline girder	A longitudinal member located on the centreline of the ship
Chain	Connected metal rings or links used for holding anchor, fastening timber cargoes, etc.
Chain locker	A compartment usually at the forward end of a ship which is used to store the anchor chain
Chain pipe	A section of pipe through which the anchor chain enters or leaves the chain locker
Chain stopper	A device for securing the chain cable when riding at anchor as well as securing the anchor in the housed position in the hawse pipe, thereby relieving the strain on the windlass
Coaming	The vertical boundary structure of a hatch or skylight
Cofferdams	The spaces between two bulkheads or decks primarily designed as a safeguard against leakage of oil from one compartment to another
Collar plate	A patch used to, partly or completely, close a hole cut for a longitudinal stiffener passing through a transverse web
Collision bulkhead	The foremost main transverse watertight bulkhead
Companionway	A weathertight entrance leading from a ship's deck to spaces below
Compartment	An internal space bounded by bulkheads or plating
Confined space	A space identified by one of the following characteristics: limited openings for entry and exit, unfavourable natural ventilation or not designed for continuous worker occupancy
Corrugated bulkhead	A bulkhead comprised of plating arranged in a corrugated fashion
Cross ties	Large transverse structural members joining longitudinal bulkheads and used to support them against hydrostatic and hydrodynamic loads
Deck	A horizontal structure element that defines the upper or lower boundary of a compartment
Deck house	A structure on the freeboard or superstructure deck not extending from side to side of the ship
Deck structure	The deck plating with stiffeners, girders and supporting pillars

Table 4.1.1 (Continued) Definitions of Terms	
Terms	Definition
Deep tank	any tank which extends between two decks or the shell/inner bottom and the deck above or higher
Discharges	Any piping leading through the ship's sides for conveying bilge water, circulating water, drains etc.
Docking bracket	A bracket located in the double bottom to locally strengthen the bottom structure for the purposes of docking
Double bottom structure	The shell plating with stiffeners below the top of the inner bottom and other elements below and including the inner bottom plating
Doubler	Small piece of plate which is attached to a larger area of plate that requires strengthening in that location. Usually at the attachment point of a stiffener
Double skin member	Double skin member is defined as a structural member where the idealized beam comprises webs, with top and bottom flanges formed by attached plating
Duct keel	A keel built of plates in box form extending the length of the cargo tank. It is used to house ballast and other piping leading forward which otherwise would have to run through the cargo tanks
Enclosed superstructure	The superstructure with bulkheads forward and/or aft fitted with weather tight doors and closing appliances
Engine room bulkhead	A transverse bulkhead either directly forward or aft of the engine room
Face plate	The section of a stiffening member attached to the plate via a web and is usually parallel to the plated surface
Flange	The section of a stiffening member, typically attached to the web, but is sometimes formed by bending the web over. It is usually parallel to the plated surface
Flat bar	A stiffener comprising only of a web
Floor	A bottom transverse member
Forecastle	A short superstructure situated at the bow
Fore peak	The area of the ship forward of the collision bulkhead
Fore peak deck	A short raised deck extending aft from the bow of the ship
Freeboard deck	Generally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all exposed openings
Freeing port	An opening in the bulwarks to allow water shipped on deck to run freely overboard
Gangway	The raised walkway between superstructure, such as between the forecastle and bridge, or between the bridge and poop
Girder	A collective term for primary supporting structural members
Gudgeon	A block with a hole in the centre to receive the pintle of a rudder; located on the stern post, it supports and allows the rudder to swing
Gunwale	The upper edge of the ship's sides
Gusset	A plate, usually fitted to distribute forces at a strength connection between two structural members
Hatch ways	Openings, generally rectangular, in a ship's deck affording access into the compartment below
Hawse pipe	Steel pipe through which the hawser or cable of anchor passes, located in the ship's bow on either side of the stem, also known as spurling pipe
Hawser	Large steel wire or fibre rope used for towing or mooring
Hopper plating	Plating running the length of a compartment sloping between the inner bottom and vertical portion of inner hull longitudinal bulkhead
HP	Holland Profile

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Independent tank	A self supporting tank
Inner hull	The innermost plating forming a second layer to the hull of the ship
Intercostal	Longitudinal member between the floors or frames of a ship; it is non-continuous
JIS	Japanese industrial standard profile
Keel	The main structural member or backbone of a ship running longitudinal along centreline of bottom. Usually a flat plate stiffened by a vertical plate on its centreline inside the shell
Knuckle	A discontinuity in a structural member
Lightening hole	A hole cut in a structural member to reduce its weight
Limber hole	A small drain hole cut in a frame or plate to prevent water or oil from collecting
Local support members	Local support members are defined as local stiffening members which only influence the structural integrity of a single panel, e.g. deck beams
Longitudinal centreline bulkhead	A longitudinal bulkhead located on the centreline of the ship
Longitudinal hull girder structural members	Structural members that contribute to the longitudinal strength of the hull girder, including: deck, side, bottom, inner bottom, inner hull longitudinal bulkheads including upper sloped plating where fitted, hopper, bilge plate, longitudinal bulkheads, double bottom girders and horizontal girders in wing ballast tanks
Longitudinal hull girder shear structural members	Structural members that contribute to strength against hull girder vertical shear loads, including: side, inner hull longitudinal bulkheads, hopper, longitudinal bulkheads and double bottom girders
Manhole	A round or oval hole cut in decks, tanks, etc., for the purpose of providing access
Margin plate	The outboard strake of the inner bottom and when turned down at the bilge the margin plate (or girder) forms the outer boundary of the double bottom
Notch	A discontinuity in a structural member caused by welding
Oil fuel tank	A tank used for the storage of fuel oil
Pillar	A vertical support placed between decks where the deck is unsupported by the shell or bulkhead
Pintle	Vertical pin on a rudder's forward edge that enables the rudder to hang onto the stern post and swing when it fits into the gudgeon
Pipe tunnel	The void space running in the midships fore and aft lines between the inner bottom and shell plating forming a protective space for bilge, ballast and other lines extending from the engine room to the tanks
Poop	The space below an enclosed superstructure at the extreme aft end of a ship
Poop deck	The first deck above the shelter deck at the aft end of a ship
Primary support members	Members of the beam, girder or stringer type which ensure the overall structural integrity of the hull envelope and tank boundaries, e.g. double bottom floors and girders, transverse side structure, deck transverses, bulkhead stringers and vertical webs on longitudinal bulkheads
Rudder	A device, usually of an aerofoil or flat section, that is used to steer a ship. A common type has a vertical fin at the stern and is able to move from 35 degrees port to 35 degrees starboard; rudders are characterised by their area, aspect ratio, and shape

Table 4.1.1 (Continued) Definitions of Terms	
Terms	Definition
Scallop	A hole cut into a stiffening member to allow continuous welding of a plate seam
Scarfig bracket	A bracket used between two offset structural items
Scantlings	The physical dimensions of a structural item
Scupper	Any opening for carrying off water from a deck, either directly or through piping
Scuttle	A small opening in a deck or elsewhere, usually fitted with a cover or lid or a door for access to a compartment
Shedder plates	Slanted plates that are fitted to minimise pocketing of residual cargo in way of corrugated bulkheads
Sheer strake	The top strake of a ship's side shell plating
Shelf plate	A horizontal plate located on the top of a bulkhead stool
Shell envelope plating	The shell plating forming the effective hull girder
Side shell	The shell envelope plating forming the side portion of the shell envelope above the bilge plating
Single skin member	Single skin member is defined as a structural member where the idealized beam comprises a web, with a top flange formed by attached plating and a bottom flange formed by a face plate
Skylight	A deck opening fitted with or without a glass port light and serving as a ventilator for engine room, quarters, etc.
Slop tank	A tank in an oil tanker which is used to collect the oil and water mixtures from cargo tanks after tank washing
Spaces	Separate compartments including tanks
Stay	Bulwark and hatch coaming brackets
Stem	The piece of bar or plating at which a ship's outside plating terminates at forward end
Stern frame	The heavy strength member in single or triple screw ships, combining the rudder post
Stern tube	A tube through which the shaft passes to the propeller; and acts as an after bearings for the shafting and may be water or oil lubricated
Stiffener	A collective term for secondary supporting structural members
Stool	A structure supporting tank bulkheads
Strake	A course, or row, of shell, deck, bulkhead, or other plating
Strength deck	The uppermost continuous deck
Stringer	Horizontal girders linking vertical web frames
Stringer plate	The outside strake of deck plating
Superstructure	A decked structure on the freeboard deck extending for at least 92 percent of the breadth of the ship
Tank top	The horizontal plating forming the bottom of a cargo tank
Towing pennant	A long rope which is used to effect the tow of a ship
Transom	The structural arrangement and form of the aft end of the ship
Transverse ring	All transverse material appearing in a cross-section of the ship's hull, in way of a double bottom floor, vertical web and deck transverse girder
Transverse web frame	The primary transverse girders which join the ships longitudinal structure
Tripping bracket	A bracket used to strengthen a structural member under compression, against torsional forces
'Tween deck	An abbreviation of between decks, placed between the upper deck and the tank top in the cargo tanks

Table 4.1.1 (Continued)
Definitions of Terms

Terms	Definition
Ullage	The quantity represented by the unoccupied space in a tank
Void	An enclosed empty space in a ship
Wash bulkhead	A perforated or partial bulkhead in a tank
Watertight	Watertight means capable of preventing the passage of water through the structure under a head of water for which the surrounding structure is designed
Weather deck	A deck or section of deck exposed to the elements which has means of closing weathertight, all hatches and openings
Weathertight	Weathertight means that in any sea conditions water will not penetrate into the ship
Web	The section of a stiffening member attached perpendicular to the plated surface
Wind and water strakes	The strakes of a ship's side shell plating between the ballast and the deepest load waterline
Windlass	A machine for lifting and lowering the anchor chain
Wing tank	The space bounded by the inner hull longitudinal bulkhead and side shell

2 STRUCTURAL IDEALISATION

2.1 Definition of Span

2.1.1 Effective bending span of local support members

- 2.1.1.1 The effective bending span, l_{bdg} , of a stiffener is defined for typical arrangements in 2.1.1.3 to 2.1.1.7. Where arrangements differ from those shown in *Figure 4.2.1* through *Figure 4.2.8*, span definition may be specially considered.
- 2.1.1.2 The effective bending span may be reduced due to the presence of brackets, provided the brackets are effectively supported by the adjacent structure, otherwise the effective bending span is to be taken as the full length of the stiffener between primary member supports.
- 2.1.1.3 If the web stiffener is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full length between primary member supports unless a backing bracket is fitted, see *Figure 4.2.2*.
- 2.1.1.4 The effective bending span may only be reduced where brackets are fitted to the flange or free edge of the stiffener. Brackets fitted to the attached plating on the side opposite to that of the stiffener are not to be considered as effective in reducing the effective bending span.
- 2.1.1.5 The effective bending span, l_{bdg} , for stiffeners forming part of a double skin arrangement is to be taken as shown in *Figure 4.2.1*.
- 2.1.1.6 The effective bending span, l_{bdg} , for stiffeners forming part of a single skin arrangement is to be taken as shown in *Figure 4.2.2*.
- 2.1.1.7 For stiffeners supported by a bracket on one side of primary support members, the effective bending span is to be taken as the full distance between primary support members as shown in *Figure 4.2.2(a)*. If brackets are fitted on both sides of the primary support member, the effective bending span is to be taken as in *Figures 4.2.2(b), (c) and (d)*.

Figure 4.2.1
Effective Bending Span of Stiffeners Supported by Web Stiffeners
(Double Skin Construction)

Figure 4.2.2
Effective Bending Span of Stiffeners Supported by Web Stiffeners
(Single Skin Construction)

2.1.1.8 Where the face plate of the stiffener is continuous along the edge of the bracket, the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener, see Figure 4.2.3.

- 2.1.1.9 For the calculation of the span point, the bracket length is not to be taken greater than 1.5 times the length of the arm on the bulkhead or base.

2.1.2 Effective shear span of local support members

- 2.1.2.1 The effective shear span, l_{shr} , of a stiffener is defined for typical arrangements in 2.1.2.5 to 2.1.2.7. Effective bending span for other arrangements will be specially considered.
- 2.1.2.2 The effective shear span may be reduced due to the presence of brackets provided the brackets are effectively supported by the adjacent structure, otherwise the effective shear span is to be as the full length as given in 2.1.2.4.
- 2.1.2.3 The effective shear span may be reduced for brackets fitted on either the flange or the free edge of the stiffener, or for brackets fitted to the attached plating on the side opposite to that of the stiffener. If brackets are fitted at both the flange or free edge of the stiffener, and to the attached plating on the side opposite to that of the stiffener the effective shear span may be calculated using the longer effective bracket arm.
- 2.1.2.4 The effective shear span may be reduced by a minimum of $s/4000$ m at each end of the member, regardless of support detail, hence the effective shear span, l_{shr} , is not to be taken greater than:

$$l_{shr} \leq l - \frac{s}{2000} \quad \text{m}$$

Where:

l full length of the stiffener between primary support members, in m

s stiffener spacing, in mm, as defined in 2.2.1

- 2.1.2.5 The effective shear span, l_{shr} , for stiffeners forming part of a double skin arrangement is to be taken as shown in Figure 4.2.4.
- 2.1.2.6 The effective shear span, l_{shr} , for stiffeners forming part of a single skin arrangement is to be taken as shown in Figure 4.2.5.

Figure 4.2.4
Effective Shear Span of Stiffeners Supported by Web Stiffeners
(Double Skin Construction)

- 2.1.2.7 Where the face plate of the stiffener is continuous along the curved edge of the bracket, the effective shear span is to be taken as shown in *Figure 4.2.6*.
- 2.1.2.8 For curved and/or long brackets (high length/height ratio) the effective bracket length is to be taken as the maximum inscribed 1:1.5 bracket as shown in *Figure 4.2.4(c)* and *Figure 4.2.5(c)*.

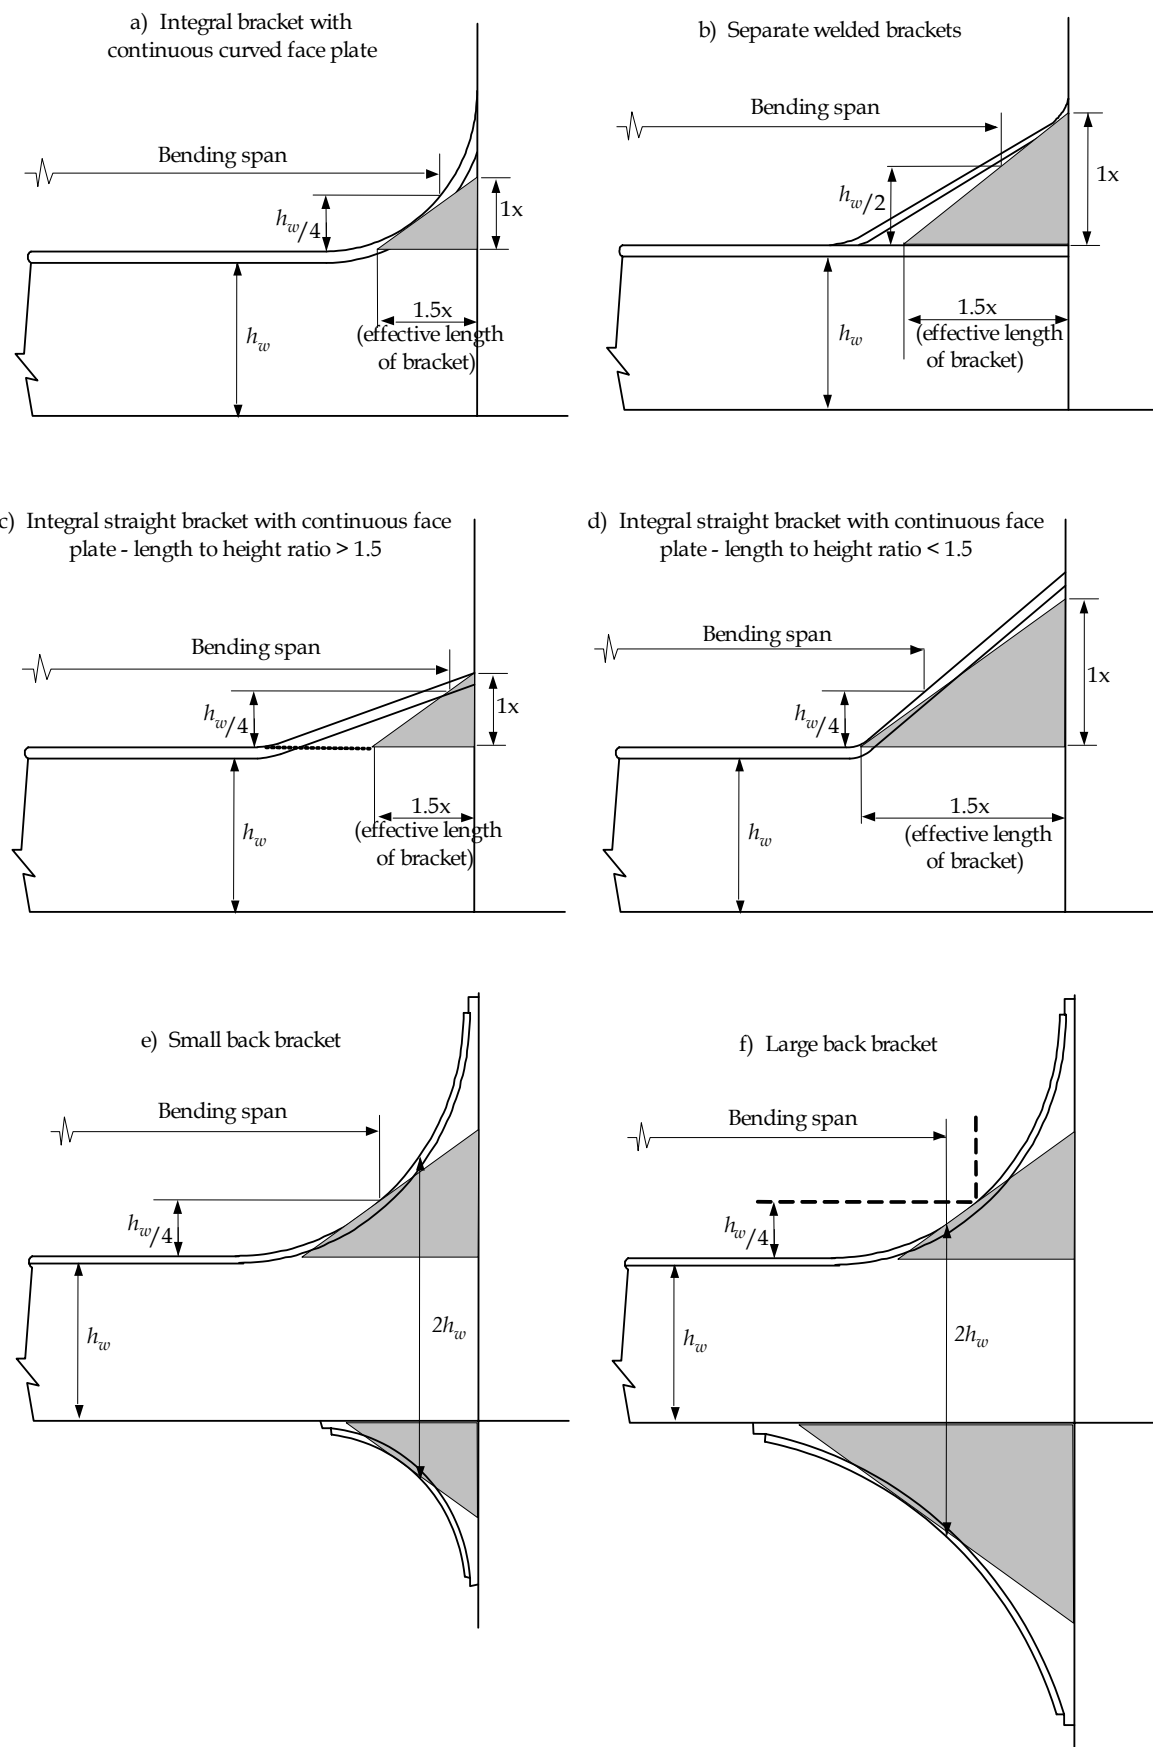

2.1.3 Effect of hull form shape on span of local support members

- 2.1.3.1 The full length of the stiffener between primary support members, l , is to be measured along the flange for stiffeners with a flange, and along the free edge for flat bar stiffeners. For curved stiffeners the span is defined as the chord length between span points. The calculation of the effective span is to be in accordance with requirements given in 2.1.1.

2.1.4 Effective bending span of primary support members

- 2.1.4.1 The effective bending span, l_{bdr} , of a primary support member may be taken as less than the full length of the member between supports provided that suitable end brackets are fitted.
- 2.1.4.2 For arrangements where the primary support member face plate is not carried continuously around the edge of the bracket, i.e. the bracket is welded to the primary support member, the span point at each end of the member, between which the effective bending span is measured, is to be taken at the point where the depth of end bracket measured from the face of the member is equal to one half the depth of the member, as shown in *Figure 4.2.7(b)*. The effective bracket used to define the span point is to be taken as given in 2.1.4.4.
- 2.1.4.3 For brackets where the face plate of the primary support member is continuous along the face of the bracket, i.e. the bracket is integral part of the primary support member, the span point is to be taken at the position where the depth of the bracket is equal to one quarter the depth of the member, see *Figures 4.2.7(a), (c) and (d)*. The effective bracket used to define the span point is to be taken as given in 2.1.4.4.
- 2.1.4.4 The effective bracket is defined as the maximum size of triangular bracket with a length to height ratio of 1.5 that just fits inside the as fitted bracket, for curved brackets the tangent point is to be used to define the fit, see *Figure 4.2.7* for examples.
- 2.1.4.5 For straight brackets with a length to height ratio greater than 1.5, the span point is to be taken to the effective bracket; for steeper brackets the span point is to be taken to the as fitted bracket.
- 2.1.4.6 For curved brackets the span point is to be measured taken to the fitted bracket at span positions above the tangent point between fitted bracket and effective bracket. For span positions below the tangent point the span point is to be measured to the effective bracket.
- 2.1.4.7 For arrangements where the primary support member face plate is carried on to the bracket and backing brackets are fitted the span point need not be taken greater than to the position where the total depth reaches twice the depth of the primary support member. Arrangements with small and large backing brackets are shown in *Figure 4.2.7(e) and (f)*.
- 2.1.4.8 For arrangements where the height of the primary support member is maintained and the face plate width is increased towards the support the effective bending span may be taken to a position where the face plate breadth reaches twice the nominal breadth.

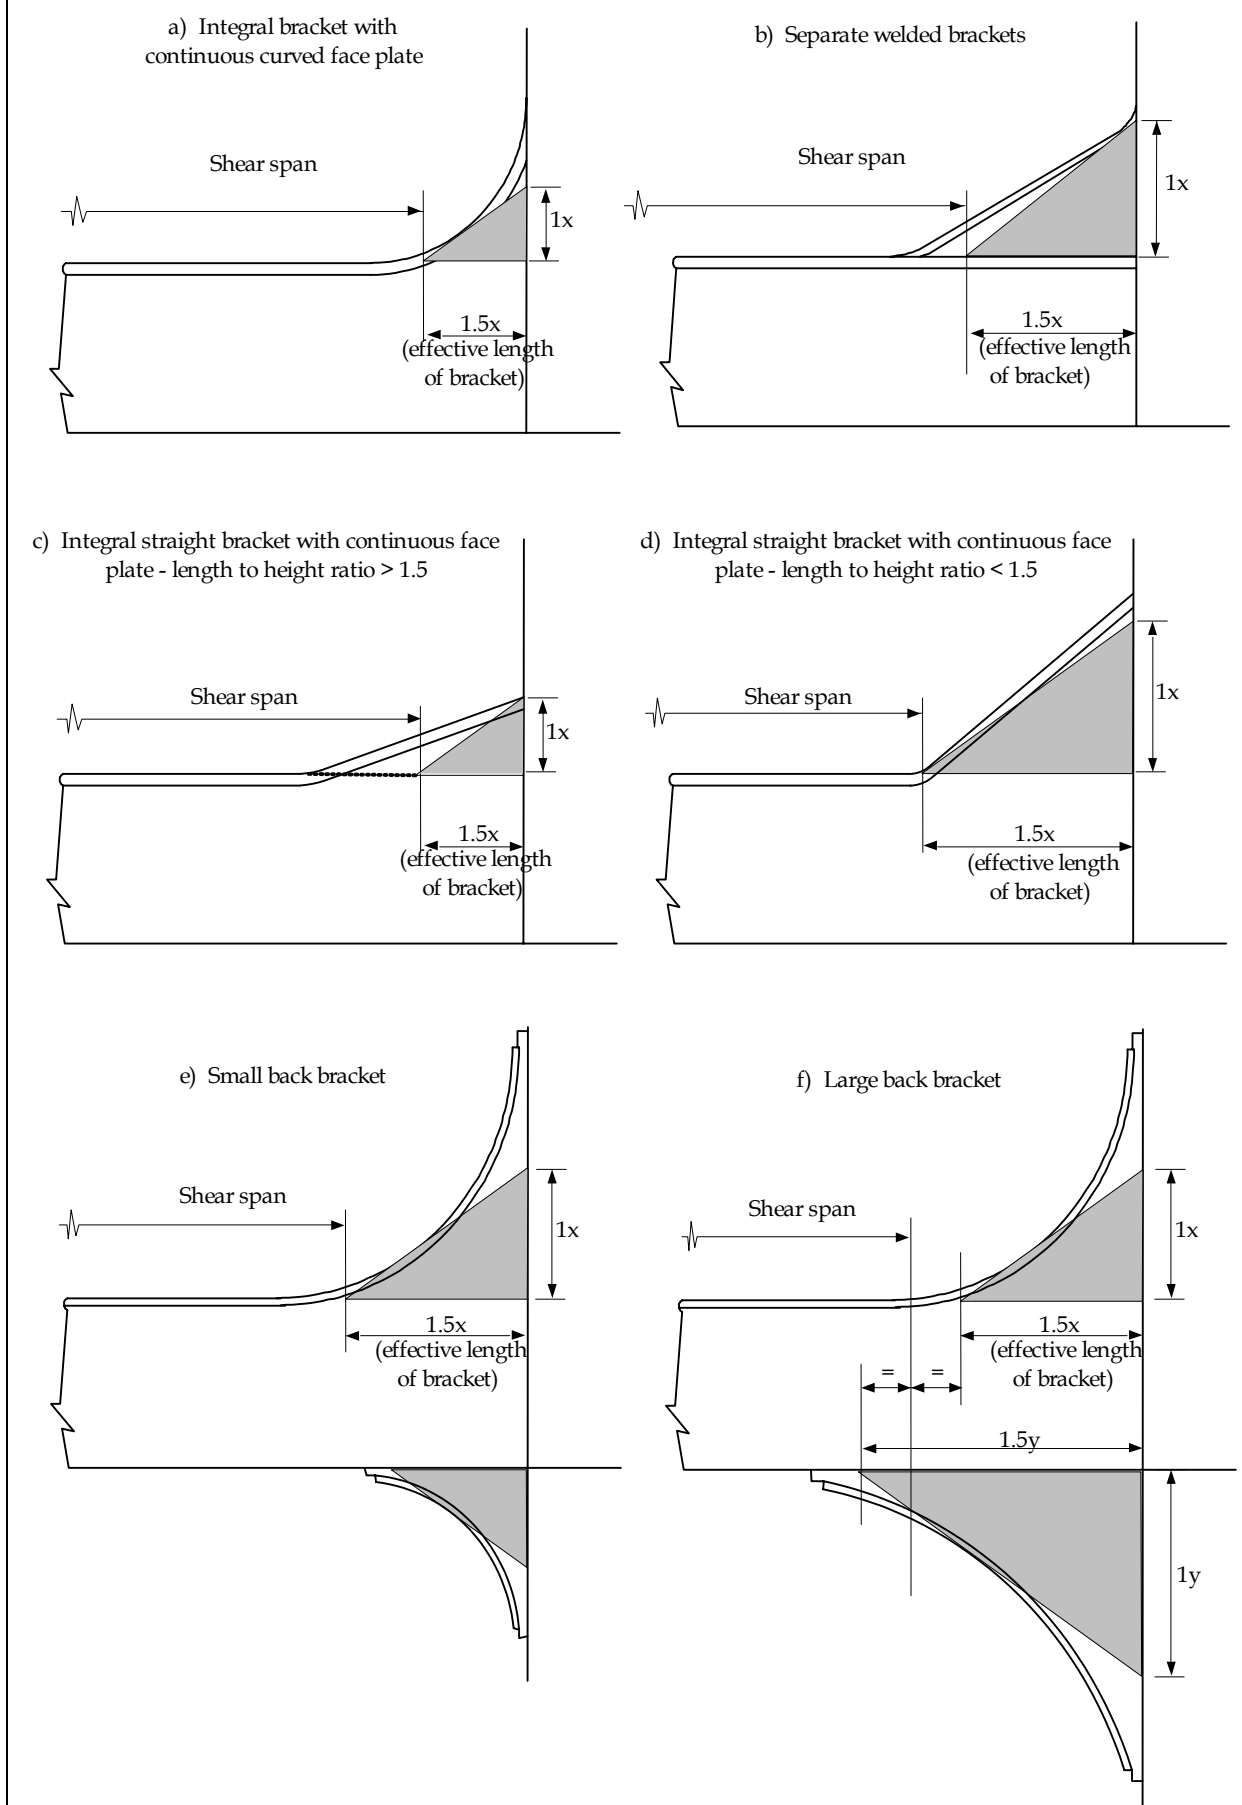

Figure 4.2.7
Effective Span of Primary Support Member for Bending Assessment

2.1.5 Effective shear span of primary support members

- 2.1.5.1 The span point at each end of the primary support member, between which the shear span is measured, is to be taken at the toe of the effective brackets supporting the member, where the toes of effective brackets are as shown in *Figure 4.2.8*. The effective bracket used to define the toe point is given in 2.1.4.4.
- 2.1.5.2 For arrangements where the effective backing bracket is larger than the effective bracket in way of face plate, the shear span is to be taken as the mean distance between toes of the effective brackets as shown in *Figure 4.2.8 (f)*.

Figure 4.2.8
Effective Span of Primary Support Member for Shear Assessment

2.2 Definition of Spacing and Supported Breadth

2.2.1 Supported load breadth of local support members

- 2.2.1.1 The mean of the stiffener spacings on each side is to be used for the calculation of the effective plate flange of stiffeners and the load breadth supported by a stiffener, s , see *Figure 4.2.9*.

2.2.2 Spacing and supporting load breadth of primary support members

- 2.2.2.1 Primary support member spacing, S , for the calculation of the effective plate flange of primary support members is to be taken as the mean spacing between adjacent primary support members, as shown in *Figure 4.2.9*.
- 2.2.2.2 Unless specifically defined elsewhere in the Rules, the loading breadth supported by a girder is defined as half the sum of the primary support member spacing on each side, see *Figure 4.2.9*.

2.2.3 Effective spacing of curved plating

- 2.2.3.1 For curved plating the stiffener spacing or the primary support member spacing, s or S , is to be measured on the mean chord between members.

2.3 Effective Breadth of Plating

2.3.1 Effective breadth of attached plate of local support members for strength evaluation

- 2.3.1.1 The effective breadth as defined in 2.3.1.2 is applicable to the scantling requirements of stiffeners as given in *Section 8*.
- 2.3.1.2 The effective breadth of the attached plate, b_{eff} , to be used for calculating the combined section modulus of the stiffener and attached plate is to be taken as the mean stiffener spacing, s , as given in 2.2.1. However, where the attached plate net thickness, t_{p-net} , is less than 8mm, the effective breadth is not to be taken greater than 600mm.

2.3.2 Effective breadth of attached plate and flanges of primary support members for strength evaluation

- 2.3.2.1 The effective breadths as defined in 2.3.2.2 to 2.3.2.4 are applicable to the scantling requirements of primary support members as given in *Section 8*.
- 2.3.2.2 At the end of the span where no effective end bracket is fitted, the effective breadth of attached plate, b_{eff} , for calculating the section modulus and/or moment of inertia of a primary support member is to be taken as:

$$b_{eff} = 0.67 S \sin \left[\frac{\pi}{6} \left(\frac{l_{bdg} \left(1 - \frac{1}{\sqrt{3}} \right)}{2S} \right) \right] \quad \text{m} \quad \text{for} \quad \left(\frac{l_{bdg} \left(1 - \frac{1}{\sqrt{3}} \right)}{2S} \right) \leq 3$$

$$b_{eff} = 0.67 S \quad \text{m} \quad \text{for} \quad \left(\frac{l_{bdg} \left(1 - \frac{1}{\sqrt{3}} \right)}{2S} \right) > 3$$

Where:

S mean spacing of primary support member as defined in 2.2.2 at position considered, in m

l_{bdg} effective bending span, as defined in 2.1.4, in m

Note $\sin()$ is to be calculated in radians

- 2.3.2.3 At mid span, the effective breadth of attached plate, b_{eff} , for calculating the section modulus and/or moment of inertia of a primary support member is to be taken as:

$$b_{eff} = S \sin \left[\frac{\pi}{18} \left(\frac{l_{bdg}}{S\sqrt{3}} \right) \right] \quad \text{m} \quad \text{for} \quad \left(\frac{l_{bdg}}{S\sqrt{3}} \right) \leq 9$$

$$b_{eff} = 1.0S \quad \text{m} \quad \text{for} \quad \left(\frac{l_{bdg}}{S\sqrt{3}} \right) > 9$$

Where:

S mean spacing of primary support member as defined in 2.2.2 at position considered, in m

l_{bdg} effective bending span, as defined in 2.1.4, in m

Note $\sin()$ is to be calculated in radians

- 2.3.2.4 At the end of the span where an effective end bracket is fitted, the effective breadth of attached plate, b_{eff} , for calculating the section modulus of a primary support member is to be taken as the mean values of those given by 2.3.2.2 and 2.3.2.3. A bracket is considered effective when the length as defined in *Figure 4.2.7* is equal or greater than $0.1l_{bdg}$.
- 2.3.2.5 The free flange of primary support members of single skin construction may generally be considered fully effective provided tripping bracket arrangements are fitted as required in *Section 10/2.3.3*. For curved face plates see 2.3.4.

2.3.3 Effective breadth of attached plate of local support members for fatigue strength evaluation

- 2.3.3.1 The effective breadths as defined in 2.3.3.2 and 2.3.3.3 are applicable to the fatigue strength evaluation of local support members as given in *Section 9/3* and *Appendix C*.
- 2.3.3.2 At the ends of the span and in way of end brackets and supports, the effective breadth of attached plating, b_{eff} , to be used for calculating the combined section modulus of the stiffener and attached plate is to be taken as:

$$b_{eff} = 0.67 s \sin \left[\frac{\pi}{6} \left(\frac{1000 l_{bdg} (1 - \frac{1}{\sqrt{3}})}{2s} \right) \right] \quad \text{mm} \quad \text{for} \left(\frac{1000 l_{bdg} (1 - \frac{1}{\sqrt{3}})}{2s} \right) \leq 3$$

$$b_{eff} = 0.67 s \quad \text{mm} \quad \text{for} \left(\frac{1000 l_{bdg} (1 - \frac{1}{\sqrt{3}})}{2s} \right) > 3$$

Where:

s stiffener spacing, in mm, as defined in 2.2.1

l_{bdg} effective bending span, as defined in 2.1.1, in m

Note $\sin()$ is to be calculated in radians

- 2.3.3.3 At mid span, the effective breadth of attached plate, b_{eff} , to be used for calculating the combined section modulus of the stiffener and attached plate is to be taken as:

$$b_{eff} = s \sin \left[\frac{\pi}{18} \left(\frac{1000 l_{bdg}}{s \sqrt{3}} \right) \right] \quad \text{mm} \quad \text{for} \left(\frac{1000 l_{bdg}}{s \sqrt{3}} \right) \leq 9$$

$$b_{eff} = 1.0 s \quad \text{mm} \quad \text{for} \left(\frac{1000 l_{bdg}}{s \sqrt{3}} \right) > 9$$

Where:

s stiffener spacing, in mm, as defined in 2.2.1

l_{bdg} effective bending span, as defined in 2.1.1, in m

Note $\sin()$ is to be calculated in radians

2.3.4 Effective area of curved face plates or attached plating of primary support members

2.3.4.1 The effective area as defined in 2.3.4.2 and 2.3.4.3 is applicable to primary support members as follows:

- (a) deriving the effective net area of curved face plates and curved attached plating for calculating the section modulus of primary support members for the scantling requirements in *Section 8*
- (b) deriving the effective net area of curved face plates, modelled by beam elements, for the strength assessment (FEM) in *Section 9/2* and *Appendix B*

2.3.4.2 The effective net area of curved face plates or attached plating of primary support members, $A_{eff-net50}$, is to be taken as:

$$A_{eff-net50} = C_f t_{f-net50} b_f \quad \text{mm}^2$$

Where:

- C_f flange efficiency coefficient as shown in *Figure 4.2.10*
- $$= C_{f1} \frac{\sqrt{r_f t_{f-net50}}}{b_1} \quad \text{but not to be taken greater than 1.0}$$
- $C_{f1} = \frac{0.643 (\sinh \beta \cosh \beta + \sin \beta \cos \beta)}{\sinh^2 \beta + \sin^2 \beta}$ for symmetrical and unsymmetrical face plates, see *Curve 1* in *Figure 4.2.10*
- $$= \frac{0.78 (\sinh \beta + \sin \beta)(\cosh \beta - \cos \beta)}{\sinh^2 \beta + \sin^2 \beta}$$
- for attached plating of box girders with two webs, see
- Curve 2*
- in
- Figure 4.2.10*
- $$= \frac{1.56 (\cosh \beta - \cos \beta)}{\sinh \beta + \sin \beta}$$
- for attached plating of box girders with multiple webs, see
- Curve 3*
- in
- Figure 4.2.10*
- $\beta = \frac{1.285 b_1}{\sqrt{r_f t_{f-net50}}} \quad \text{rad}$
- $b_1 = 0.5 (b_f - t_{w-net50})$ for symmetrical face plates
 $= b_f$ for unsymmetrical face plates
 $= s_w - t_{w-net50}$ for attached plating of box girders
- s_w spacing of supporting webs for box girders, in mm
- $t_{f-net50}$ net flange thickness
 $= t_{f-grs} - 0.5 t_{corr}$ mm
for calculation of C_f and β for unsymmetrical face plates $t_{f-net50}$ is not to be taken greater than $t_{w-net50}$
- t_{f-grs} gross flange thickness, in mm
- $t_{w-net50}$ net web plate thickness
 $= t_{w-grs} - 0.5 t_{corr}$ mm
- t_{w-grs} gross web thickness, in mm
- t_{corr} corrosion addition, as given in *Section 6/3.2*
- r_f radius of curved face plate or attached plating, in mm

b_f breadth of face plate or attached plating, in mm

2.3.4.3 The effective net area of curved face plates supported by radial brackets, or attached plating supported by cylindrical stiffeners, $A_{eff-net50}$, is given by:

$$A_{eff-net50} = \left(\frac{3r_f t_{f-net50} + C_f s_r^2}{3r_f t_{f-net50} + s_r^2} \right) t_{f-net50} b_f \quad \text{mm}^2$$

Where:

C_f as defined in 2.3.4.2

$t_{f-net50}$ net flange thickness, as defined in 2.3.4.2

s_r spacing of tripping brackets or web stiffeners or stiffeners normal to the web plating, in mm, see Figure 4.2.11

b_f breadth of face plate or attached plating, in mm, see Figure 4.2.11

r_f radius of curved face plate or attached plating, in mm, see Figure 4.2.11

2.3.4.4 The effective area given in 2.3.4.2 and 2.3.4.3 is only applicable to faceplates and attached plating of primary support members. This is not to be applied for the area of web stiffeners parallel to the face plate.

2.4 Geometrical Properties of Local Support Members

2.4.1 Calculation of net section properties for local support members

2.4.1.1 The net section modulus, moment of inertia and shear area properties of local support members are to be calculated using the net thicknesses of the attached plate, web and flange.

2.4.1.2 The description of the net dimensions for typical profiles is given in *Figure 4.2.12*.

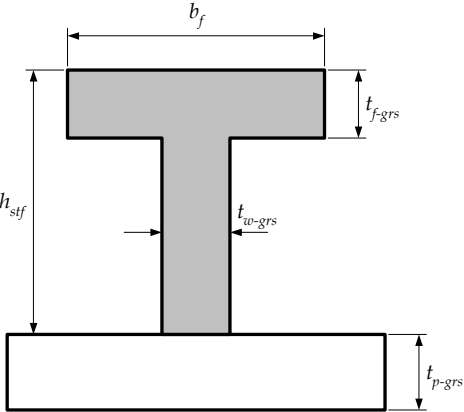

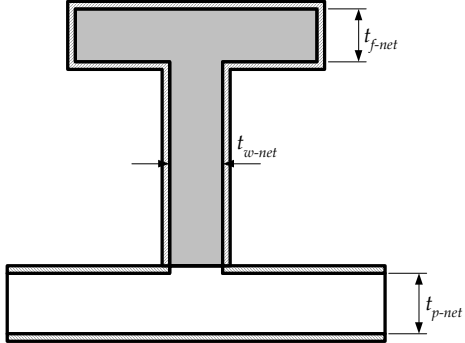

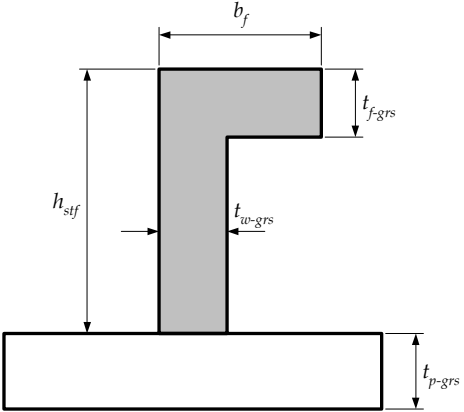

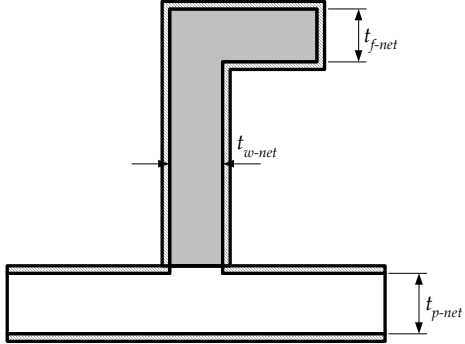

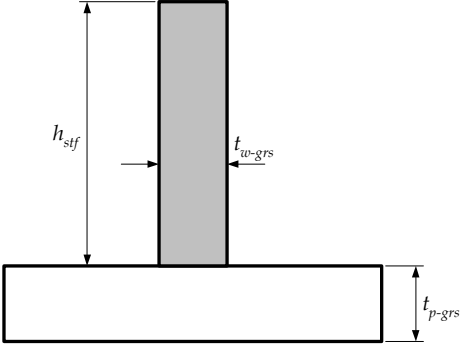

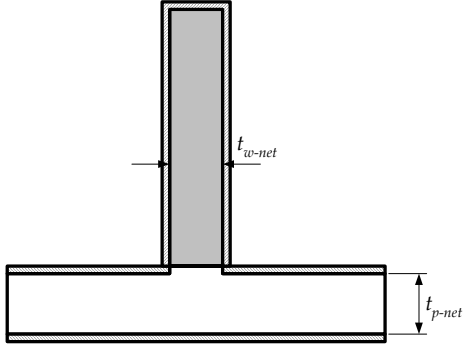

Figure 4.2.12 Net Sectional Properties of Local Support Members	
Profile	Reduction Methodology
	Local Support Members
 <p>T - Profile</p>	
 <p>L - Profile</p>	
 <p>Flat bar - Profile</p>	

Figure 4.2.12 (Continued)

L3 - Profile

Bulb Profile and Similar Profiles

The net cross-sectional area, the moment of inertia about the y -axis and the associated neutral axis position of the profile is to be determined assuming the corrosion magnitude $0.5t_{corr}$ deducted from the surface of the profile cross-section

2.4.1.5 (void) (RCN 2, effective from 1 July 2008)

Figure 4.2.13

Table 4.2.1**(void)** (RCN 2, effective from 1 July 2008)**Table 4.2.2****(void)** (RCN 2, effective from 1 July 2008)**2.4.2 Effective elastic sectional properties of local support members**

2.4.2.1 The net elastic shear area, $A_{shr-el-net}$, of local support members is to be taken as:

$$A_{shr-el-net} = \frac{(h_{stf} + t_{p-net}) t_{w-net} \sin \varphi_w}{100} \quad \text{cm}^2$$

Where:

h_{stf} stiffener height, including face plate, in mm. See also 2.4.1.2

t_{p-net} net thickness of attached plate, in mm

t_{w-net} net web thickness, in mm

φ_w angle between the stiffener web and attached plating, see Figure 4.2.14, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.2.2 The effective shear depth of stiffeners, d_{shr} , is to be taken as:

$$d_{shr} = (h_{stf} + t_{p-net}) \sin \varphi_w \quad \text{mm}$$

Where:

h_{stf} stiffener height, including face plate, in mm. See also 2.4.1.2

t_{p-net} net thickness of attached plate, in mm

φ_w angle between the stiffener web and attached plating, see Figure 4.2.14, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.2.3 The elastic net section modulus, $Z_{el-\varphi-net}$ of local support members is to be taken as:

$$Z_{el-\varphi-net} = Z_{stf-net} \sin \varphi_w \quad \text{cm}^3$$

Where:

$Z_{stf-net}$ net section modulus of corresponding upright stiffener, i.e. when φ_w is equal to 90 degrees, in cm³. See also 2.4.1.2

φ_w angle between the stiffener web and attached plating, see Figure 4.2.14, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.3 Effective plastic section modulus and shear area of stiffeners

2.4.3.1 The net plastic shear area, $A_{shr-pl-net}$, of local support members is to be taken as:

$$A_{shr-pl-net} = \frac{(h_{stf} + t_{p-net}) t_{w-net} \sin \varphi_w}{100} \quad \text{cm}^2$$

Where:

h_{stf} stiffener height, including face plate, in mm. See also 2.4.1.2

t_{p-net}	net thickness of attached plate, in mm
t_{w-net}	net web thickness, in mm
φ_w	angle between the stiffener web and the plate flange, see Figure 4.2.14, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

2.4.3.2 The effective net plastic section modulus, Z_{pl-net} , of local support members is to be taken as:

$$Z_{pl-net} = \frac{f_w d_w^2 t_{w-net} \sin \varphi_w}{2000} + \frac{(2\gamma - 1) A_{f-net} (h_{f-ctr} \sin \varphi_w - b_{f-ctr} \cos \varphi_w)}{1000} \quad \text{cm}^3$$

Where:

f_w	web shear stress factor = 0.75 for flanged profile cross-sections with $n = 1$ or 2 = 1.0 for flanged profile cross-sections with $n = 0$ and for flat bar stiffeners
n	number of moment effective end supports of each member = 0, 1 or 2 A moment effective end support may be considered where: (a) the stiffener is continuous at the support (b) the stiffener passes through the support plate while it is connected at it's termination point by a carling (or equivalent) to adjacent stiffeners (c) the stiffener is attached to a abutting stiffener effective in bending (not a buckling stiffener) or bracket. The bracket is assumed to be bending effective when it is attached to another stiffener (not a buckling stiffener).
d_w	depth of stiffener web, in mm: = $h_{stf} - t_{f-net}$ for T, L (rolled and built up) and L2 profiles = h_{stf} for flat bar and L3 profiles to be taken as given in Table 4.2.3 and Table 4.2.4 for bulb profiles
h_{stf}	stiffener height, in mm, see Figure 4.2.12
γ	= $0.25 (1 + \sqrt{3 + 12\beta})$

β	<p>= 0.5 for all cases, except L profiles without a mid span tripping bracket</p> $= \frac{10^6 t^2_{w-net} f_b l_f^2}{80 b_f^2 t_{f-net} h_{f-ctr}} + \frac{t_{w-net}}{2 b_f}$ <p>but not to be taken greater than 0.5 for L (rolled and built-up) profiles without a mid span tripping bracket</p>
A_{f-net}	<p>net cross-sectional area of flange, in mm²:</p> <p>= $b_f t_{f-net}$ in general</p> <p>= 0 for flat bar stiffeners</p>
b_f	<p>breadth of flange, in mm, see <i>Figure 4.2.12</i>. For bulb profiles, see <i>Table 4.2.3</i> and <i>Table 4.2.4</i></p>
b_{f-ctr}	<p>distance from mid thickness of stiffener web to the centre of the flange area:</p> <p>= $0.5(b_f - t_{w-grs})$ for rolled angle profiles</p> <p>= 0 for T profiles</p> <p>as given in <i>Table 4.2.3</i> and <i>Table 4.2.4</i> for bulb profiles</p>
h_{f-ctr}	<p>height of stiffener measured to the mid thickness of the flange:</p> <p>= $h_{stf} - 0.5 t_{f-net}$ for profiles with flange of rectangular shape except for L3 profiles</p> <p>= $h_{stf} - d_{edge} - 0.5 t_{f-net}$ for L3 profiles</p> <p>as given in <i>Table 4.2.3</i> and <i>Table 4.2.4</i> for bulb profiles</p>
d_{edge}	<p>distance from upper edge of web to the top of the flange, in mm. For L3 profiles, see <i>Figure 4.2.12</i></p>
f_b	<p>= 1.0 in general</p> <p>= 0.8 for continuous flanges with end bracket(s). A continuous flange is defined as a flange that is not sniped and continuous through the primary support member</p> <p>= 0.7 for non-continuous flanges with end bracket(s). A non-continuous flange is defined as a flange that is sniped at the primary support member or terminated at the support without aligned structure on the other side of the support</p>
l_f	<p>length of stiffener flange between supporting webs, in m, but reduced by the arm length of end bracket(s) for stiffeners with end bracket(s) fitted</p>
t_{f-net}	<p>net flange thickness, in mm</p> <p>= 0 for flat bar stiffeners</p> <p>as given in <i>Table 4.2.3</i> and <i>Table 4.2.4</i> for bulb profiles</p>
t_{w-net}	<p>net web thickness, in mm</p>
φ_w	<p>angle between the stiffener web and the plate flange, see <i>Figure 4.2.14</i>, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees</p>

Table 4.2.3
Characteristic Flange Data for HP Bulb Profiles (see Figure 4.2.15)

h_{stf} (mm)	d_w (mm)	b_{f-grs}^* (mm)	t_{f-grs}^* (mm)	b_{f-ctr} (mm)	h_{f-ctr} (mm)
200	171	40	14.4	10.9	188
220	188	44	16.2	12.1	206
240	205	49	17.7	13.3	225
260	221	53	19.5	14.5	244
280	238	57	21.3	15.8	263
300	255	62	22.8	16.9	281
320	271	65	25.0	18.1	300
340	288	70	26.4	19.3	318
370	313	77	28.8	21.1	346
400	338	83	31.5	22.9	374
430	363	90	33.9	24.7	402

Note

1. Characteristic flange data converted to net scantlings are given as:

$$b_f \cong b_{f-grs}^* + 2 t_{w-net}$$

$$t_{f-net} = t_{f-grs}^* - t_{corr}$$

$$t_{w-net} = t_{w-grs} - t_{corr}$$

Table 4.2.4
Characteristic Flange Data for JIS Bulb Profiles (see Figure 4.2.15)

h_{stf} (mm)	d_w (mm)	b_{f-grs}^* (mm)	t_{f-grs}^* (mm)	b_{f-ctr} (mm)	h_{f-ctr} (mm)
180	156	34	11.9	9.0	170
200	172	39	13.7	10.4	188

250	215	49	17.1	12.9	235

Note

1. Characteristic flange data converted to net scantlings are given as:

$$b_f \cong b_{f-grs}^* + 2 t_{w-net}$$

$$t_{f-net} = t_{f-grs}^* - t_{corr}$$

$$t_{w-net} = t_{w-grs} - t_{corr}$$

2.5 Geometrical Properties of Primary Support Members

2.5.1 Effective shear area of primary support members

2.5.1.1 For calculation of the shear area of primary support members the web height, h_w , is to be taken as the moulded height of the primary support member.

2.5.1.2 For single and double skin primary support members, the effective net shear area, $A_{shr-net50}$, is to be taken as:

$$A_{shr-net50} = 0.01 h_n t_{w-net50} \sin \phi_w \quad \text{cm}^2$$

Where:

h_n for a single skin primary support member, see Figure 4.2.16, the effective web height, in mm, is to be taken as the lesser of:

- (a) h_w
- (b) $h_{n3} + h_{n4}$
- (c) $h_{n1} + h_{n2} + h_{n4}$

for a double skin primary support member, the same principle is to be adopted in determining the effective web height.

h_w web height of primary support member, in mm

$h_{n1}, h_{n2},$ as shown in Figure 4.2.16

h_{n3}, h_{n4}

$t_{w-net50}$ net web thickness

$$= t_{w-grs} - 0.5 t_{corr} \quad \text{mm}$$

t_{w-grs}	gross web thickness, in mm
t_{corr}	corrosion addition, as given in Section 6/3.2, in mm
φ_w	angle between the web and attached plating, see Figure 4.2.14, in degrees. φ_w is to be taken as 90 degrees if the angle is greater than or equal to 75 degrees

(RCN 2, effective from 1 July 2008)

- 2.5.1.3 Where an opening is located at a distance less than $h_w/3$ from the cross-section considered, h_n is to be taken as the smaller of the net height and the net distance through the opening. See Figure 4.2.16.
- 2.5.1.4 Where a girder flange of a single skin primary support member is not parallel to the axis of the attached plating, the effective net shear area, $A_{shr-net50}$, is to be taken as:

$$A_{shr-net50} = 0.01 h_n t_{w-net50} + 1.3 A_{f-net50} \sin 2\theta \sin \theta \quad \text{cm}^2$$

Where:

$$\begin{aligned} A_{f-net50} & \text{ net flange/face plate area} \\ & = 0.01 b_f t_{f-net50} \quad \text{cm}^2 \end{aligned}$$

b_f	breadth of flange or face plate, in mm
$t_{f-net50}$	net flange thickness $= t_{f-grs} - 0.5t_{corr}$ mm
t_{f-grs}	gross flange thickness, in mm
t_{corr}	corrosion addition, as given in Section 6/3.2, in mm
θ	angle of slope of continuous flange, see Figure 4.2.17
$t_{w-net50}$	net web thickness, as defined in 2.5.1.2, in mm
h_n	effective web height, as defined in Figure 4.2.16, in mm

2.5.2 Effective section modulus of primary support members

2.5.2.1 The net section modulus of primary support members is to be calculated using the net thicknesses of the attached plate, web and face plate (or top attached plate for double skin girders), where the net thicknesses are to be taken as:

$t_{w-net50} = t_{w-grs} - 0.5t_{corr}$ mm, for the net web thickness

$t_{p-net50} = t_{p-grs} - 0.5t_{corr}$ mm, for the net lower attached plate thickness

$t_{f-net50} = t_{f-grs} - 0.5t_{corr}$ mm, for the net upper attached plate or face plate

Where:

t_{w-grs} gross web thickness, in mm

t_{p-grs} gross thickness of lower attached plate, in mm

t_{f-grs} gross thickness of upper attached plate or face plate, in mm

t_{corr} corrosion addition, as given in *Section 6/3.2*, in mm

Note

See 2.3.4 for curved face plates of primary support members

Where angle between the primary support member web and the plate flange is less than 75 degrees, the section modulus is to be directly calculated

(RCN 2, effective from 1 July 2008)

2.6 Geometrical Properties of the Hull Girder Cross-Section

2.6.1 Vertical hull girder section modulus

2.6.1.1 The effective vertical hull girder section modulus, Z_v , at any vertical distance, z , above the baseline is defined by:

$$Z_v = \frac{I_v}{|z - z_{NA}|} \quad \text{m}^3$$

where:

I_v vertical hull girder moment of inertia, of all longitudinally continuous members in cross section under consideration, after deduction of openings as given in 2.6.3, in m⁴

z distance from the structural member under consideration to the baseline, in m

z_{NA} distance from the baseline to the horizontal neutral axis of the hull girder cross-section, in m

2.6.1.2 For calculation of the vertical net hull girder section modulus for the strength assessment, $Z_{v-net50}$, required by *Section 8*, the vertical net hull girder moment of inertia and position of horizontal neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2*.

2.6.1.3 For calculation of vertical net hull girder section modulus for the fatigue assessment, $Z_{v-net75}$, required by *Section 9/3*, the vertical net hull girder moment of inertia and position of horizontal neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.25t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2*.

2.6.2 Horizontal hull girder section modulus

2.6.2.1 The effective horizontal hull girder section modulus, Z_h , at any transverse coordinate, y , is to be taken as:

$$Z_h = \frac{I_h}{|y - y_{NA}|} \quad \text{m}^3$$

where:

I_h horizontal hull girder moment of inertia, of all longitudinally continuous members in cross section under consideration, after deduction of openings as given in 2.6.3, in m⁴

y	transverse coordinate, in m
y_{NA}	distance from the centreline to the vertical neutral axis of the hull girder cross section, in m

2.6.2.2 For calculation of the horizontal net hull girder section modulus for the strength assessment, $Z_{h-net50}$, required by *Section 8*, the horizontal net hull girder moment of inertia and position of vertical neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2*.

2.6.2.3 For calculation of the horizontal net hull girder section modulus for fatigue assessment, $Z_{h-net75}$, as required in *Section 9/3*, the net horizontal hull girder moment of inertia and position of vertical neutral axis is to be calculated based on gross thickness minus the corrosion addition $0.25t_{corr}$ of all effective structural members comprising the hull girder section, where t_{corr} is as defined in *Section 6/3.2*.

2.6.3 Effective area for calculation of hull girder moment of inertia and section modulus

2.6.3.1 The effective hull girder sectional area includes all the longitudinally continuous structural members after deduction of openings. The structural members given in 2.6.3.2 are not to be included in the effective hull girder sectional area. The definition of openings to be deducted and deduction free openings are given in 2.6.3.4 – 2.6.3.9. The definition of effective area in way of non-continuous bulkheads and decks is given in 2.6.3.10.

2.6.3.2 The following structural members are not to be considered as effectively contributing to the hull girder sectional area as they do not provide sufficient structural continuity and are therefore to be excluded in the calculation:

- (a) superstructures which do not form a strength deck
- (b) deck houses
- (c) vertically corrugated bulkheads
- (d) bulwarks and gutter plates
- (e) bilge keels
- (f) sniped or non-continuous longitudinal stiffeners if the cross-section under consideration is closer than twice the height of the stiffener from the end of the stiffener.

2.6.3.3 The following definitions of opening are to be applied:

- (a) large openings are openings exceeding 2.5m in length and/or 1.2m in breadth, where the length is measured along the global x-axis of the ship as defined in *Figure 4.1.1*
- (b) small openings are openings that are not large openings i.e. manholes, lightening holes, etc.
- (c) isolated openings are openings spaced not less than 1m apart in the ship's transverse/vertical direction

2.6.3.4 Large openings and small openings that are not isolated are to be deducted from the sectional area used in the section modulus calculation.

2.6.3.5 Isolated small openings in longitudinal stiffeners or girders are to be deducted if their depth exceeds 25% of the web depth.

2.6.3.6 When several openings are located in or adjacent to the same cross-section, the total equivalent breadth of the combined openings, Σb_{ded} , is to be deducted, see 2.6.3.7 to 2.3.6.8 and *Figure 4.2.18*.

2.6.3.7 Isolated small openings need not be deducted provided that the sum of their breadths, or shadow area breadths, in one transverse section does not reduce the hull girder section modulus at deck or baseline by more than 3%. Alternatively isolated small openings need not to be deducted provided the total equivalent breadth of small openings, Σb_{sm} , is less than:

$$\Sigma b_{sm} = 0.06(B_{sect} - \Sigma b_{ded}) \quad \text{m}$$

Where:

Σb_{sm} total equivalent breadth of small openings, see *Figure 4.2.18*

$$= b_{sm1} + b_{sm2} + b_{sm3} \quad \text{m}$$

B_{sect} the breadth of the ship at the section being considered, in m

Σb_{ded} total equivalent breadth of combined openings specified in 2.6.3.7, in m

The effect of the shadow area of deductible openings is to be taken into account.

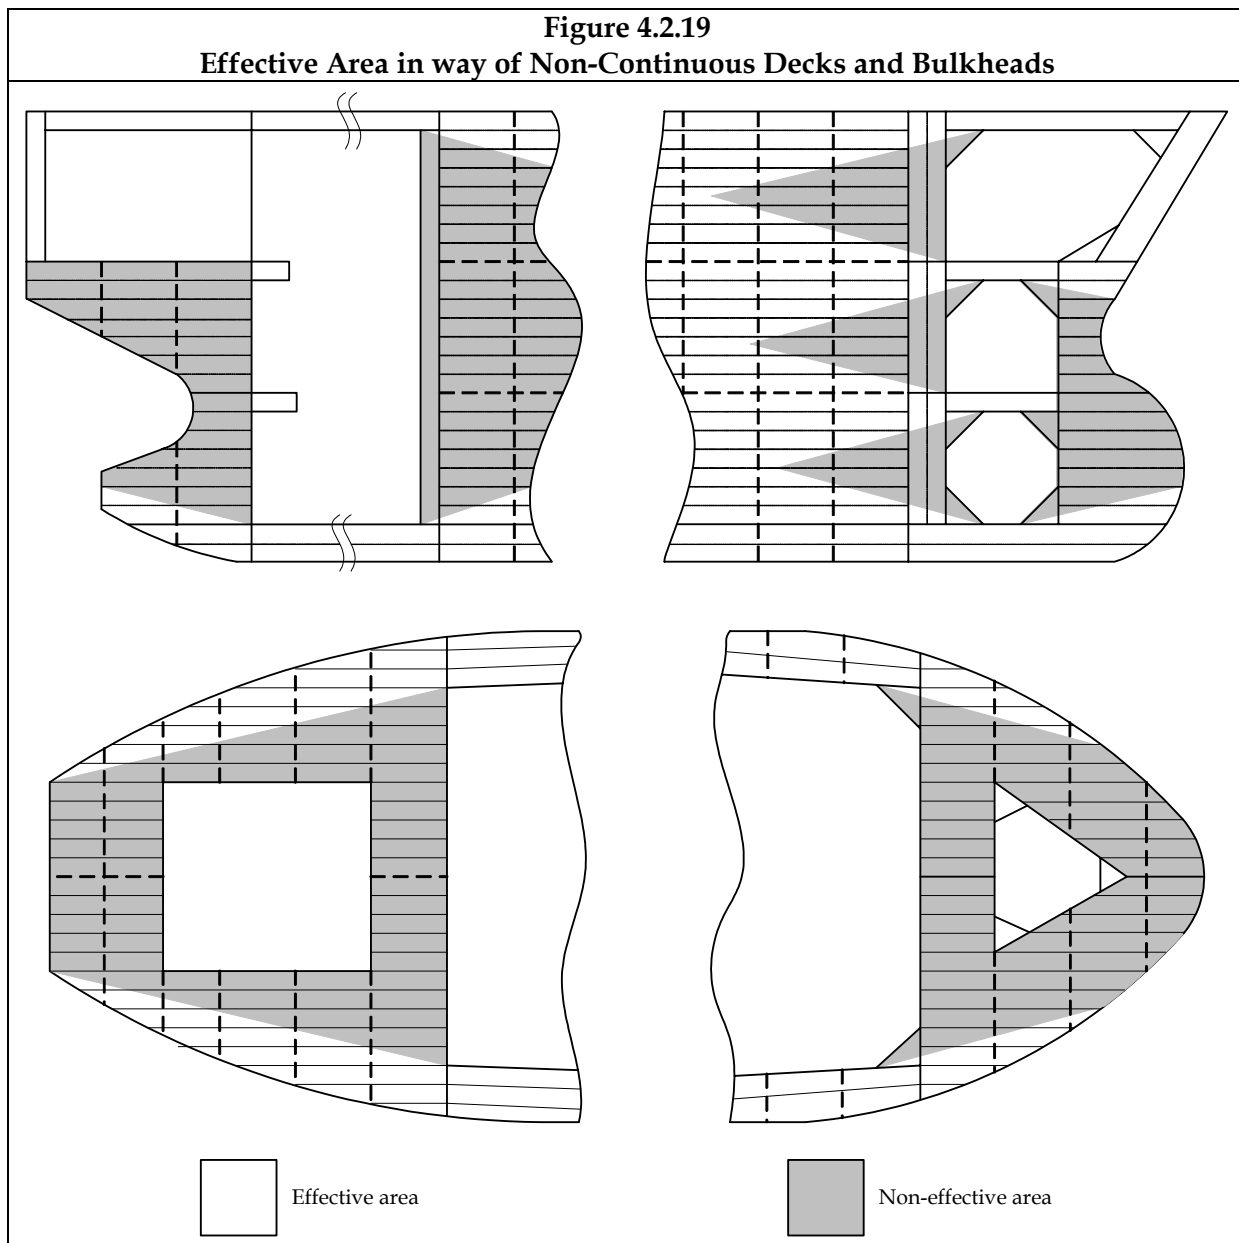

2.6.3.8 When calculating the total equivalent breadth of small openings, Σb_{sm} , each opening is assumed to have a longitudinal shadow area, see *Figure 4.2.18*. This shadow area is obtained by drawing two tangent lines with an angle of 15 degrees to the longitudinal axis of the ship.

2.6.3.9 Full or partial compensation of openings may be provided by increasing the sectional area of the plating, longitudinal stiffeners or girders, or other suitable structure. The compensation area is to extend well beyond the forward and aft end of the opening. Any local edge reinforcement of the opening is not to be included in the effective area of the hull girder section modulus calculations. Compensation is not necessary for openings which are not required to be deducted in accordance with 2.6.3.7.

2.6.3.10 When calculating the ineffective area in way of large openings and in way of non-continuous decks and longitudinal bulkheads, the effective area is to be taken as shown in *Figure 4.2.19*. The shadow area, which indicates the area that is not effective, is obtained by drawing two tangent lines with an angle of 15 degrees to the longitudinal axis of the ship.

Figure 4.2.18
Calculation of equivalent Breadth

2.6.4 Effective vertical hull girder shear area

- 2.6.4.1 The effective net hull girder vertical shear area includes the net plating area of the side shell including the bilge, the inner hull including the hopper side and the outboard girder under and the longitudinal bulkheads including the double bottom girders in line.
- 2.6.4.2 For calculation of the net hull girder vertical shear area, the net plating area is to be calculated based on the net thickness, t_{net50} , given by the gross thickness minus the corrosion addition $0.5t_{corr}$ of all effective structural members given in 2.6.4.1. Where t_{corr} is as defined in Section 6/3.2.
- 2.6.4.3 For longitudinal strength members forming the web of the hull girder which are inclined to the vertical, the area of the member to be included in the shear force calculation is to be based on the projected area onto the vertical plane. See Figure 4.2.20.
- 2.6.4.4 The calculation of the net effective shear area for vertical and horizontal corrugated bulkheads is to be based on the net effective equivalent thickness, $t_{cg-net50}$, given by:

$$t_{cg-net50} = \left[0.5(t_{w-grs} + t_{f-grs}) \frac{b_{cg}}{b_{w-cg} + b_{f-cg}} \right] - 0.5t_{corr} \quad \text{mm}$$

Where:

t_{w-grs} gross corrugation web thickness, in mm

t_{f-grs} gross corrugation flange thickness, in mm

b_{cg} projected length of one corrugation, in mm, as defined in Figure 4.2.20

b_{w-cg} breadth of corrugation web, in mm, as defined in Figure 4.2.20

b_{f-cg} breadth of corrugation flange, in mm, as defined in Figure 4.2.20

t_{corr} corrosion addition, as defined in Section 6/3.2

- 2.6.4.5 The equivalent net corrugation thickness, $t_{cg-net50}$, is only applicable for the calculation of the effective area, $A_{eff-net50}$, and shear force distribution factor, f_i , as defined in Section 8/1.3.2.2.

3 STRUCTURE DESIGN DETAILS

3.1 Standard Construction Details

3.1.1 Details to be submitted

- 3.1.1.1 A booklet of standard construction details is to be submitted for review. It is to include the following:
- (a) the proportions of built-up members to demonstrate compliance with established standards for structural stability, see Section 10
 - (b) the design of structural details which reduce the harmful effects of stress concentrations, notches and material fatigue; such as:
 - details of the ends, at the intersections of members and associated brackets
 - shape and location of air, drainage, and/or lightening holes
 - shape and reinforcement of slots or cut-outs for internals
 - elimination or closing of weld scallops in way of butts, 'softening' of bracket toes, reduction of abrupt changes of section or structural discontinuities
 - proportion and thickness of structural members to reduce fatigue response due to engine, propeller or wave induced cyclic stresses, particularly for higher strength steels.

3.2 Termination of Local Support Members

3.2.1 General

- 3.2.1.1 In general, structural members are to be effectively connected to adjacent structures to avoid hard spots, notches and stress concentrations.
- 3.2.1.2 Where a structural member is terminated, structural continuity is to be maintained by suitable back-up structure fitted in way of the end connection of frames, or the end connection is to be effectively extended with additional structure and integrated with an adjacent beam, stiffener, etc.
- 3.2.1.3 All types of stiffeners (longitudinals, beams, frames, bulkhead stiffeners) are to be connected at their ends. However, in special cases sniped ends may be permitted. Requirements for the various types of connections (bracketed, bracketless or sniped ends) are given in 3.2.3 to 3.2.5.

3.2.2 Longitudinal members

- 3.2.2.1 All longitudinals are to be kept continuous within the $0.4L$ amidships cargo tank region. In special cases, in way of large openings, foundations and partial girders, the longitudinals may be terminated, but end connection and welding is to be specially considered.
- 3.2.2.2 Where continuity of strength of longitudinal members is provided by brackets, the correct alignment of the brackets on each side of the primary support member is to be ensured, and the scantlings of the brackets are to be such that the combined stiffener/bracket section modulus and effective cross-sectional area are not less than those of the member.

3.2.3 Bracketed connections

3.2.3.1 At bracketed end connections, continuity of strength is to be maintained at the stiffener connection to the bracket and at the connection of the bracket to the supporting member. The brackets are to have scantlings sufficient to compensate for the non-continuous stiffener flange or non-continuous stiffener.

3.2.3.2 The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection, the section modulus is less than that required for the stiffener.

3.2.3.3 Minimum net bracket thickness, $t_{bkt-net}$, is to be taken as:

$$t_{bkt-net} = \left(2 + f_{bkt} \sqrt{Z_{rl-net}}\right) \left(\sqrt{\frac{\sigma_{yd-stf}}{\sigma_{yd-bkt}}}\right) \text{ mm, but is not to be less than 6mm and}$$

need not be greater than 13.5mm

Where:

f_{bkt} 0.2 for brackets with flange or edge stiffener

0.3 for brackets without flange or edge stiffener

Z_{rl-net} net rule section modulus, for the stiffener, in cm³. In the case of two stiffeners connected, it need not be taken as greater than that of the smallest connected stiffener

σ_{yd-stf} specified minimum yield stress of the material of the stiffener, in N/mm²

σ_{yd-bkt} specified minimum yield stress of the material of the bracket, in N/mm²

3.2.3.4 Brackets to provide fixity of end rotation are to be fitted at the ends of discontinuous local support members, except as otherwise permitted by 3.2.4. The end brackets are to have arm lengths, l_{bkt} , not less than:

$$l_{bkt} = c_{bkt} \sqrt{\frac{Z_{rl-net}}{t_{bkt-net}}} \text{ mm, but is not to be less than:}$$

- 1.8 times the depth of the stiffener web for connections where the end of the stiffener web is supported and the bracket is welded in line with the stiffener web or with offset necessary to enable welding, see *Figure 4.3.1(c)*
- 2.0 times for other cases, see *Figure 4.3.1(a), (b) and (d)*

Where:

c_{bkt} 65 for brackets with flange or edge stiffener

70 for brackets without flange or edge stiffener

Z_{rl-net} net rule section modulus, for the stiffener, in cm³. In the case of two stiffeners connected, it need not be taken as greater than that of the smallest connected stiffener

$t_{bkt-net}$ minimum net bracket thickness, as defined in 3.2.3.3

(RCN 2, effective from 1 July 2008)

Figure 4.3.1
Bracket Arm Length

Note:

- For stiffeners of configuration (b) that are not lapped, the bracket arm length l_{bkt} is not to be less than the stiffener height h_{stf} .
- For stiffener arrangements similar to (c) and (d) where the smaller attached stiffener, labelled as h_{stf} , is connected to a primary support member or bulkhead, the height of the bracket is not to be less than the height of the attached stiffener, h_{stf} .

(RCN 2, effective from 1 July 2008)

3.2.3.5 The proportions and edge stiffening of brackets are to be in accordance with the requirements of Section 10/2.4. Where an edge stiffener is required, the depth of stiffener web, d_w , is not to be less than:

$$d_w = 45 \left(1 + \frac{Z_{rl-net}}{2000} \right) \quad \text{mm, but is not to be less than 50mm}$$

Where:

Z_{rl-net} net rule section modulus, for the stiffener, in cm³. In the case of two stiffeners connected, it need not be taken as greater than that of the smallest connected stiffener

3.2.4 Bracketless connections

- 3.2.4.1 Local support members, for example longitudinals, beams, frames and bulkhead stiffeners forming part of the hull structure, are generally to be connected at their ends, in accordance with the requirements of 3.2.2 and 3.2.3.
- 3.2.4.2 Where alternative connections are adopted, the proposed arrangements will be specially considered.
- 3.2.4.3 The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint.

3.2.5 Sniped ends

- 3.2.5.1 Stiffeners with sniped ends may be used where dynamic loads are small and where the incidence of vibration is considered to be small, i.e. structure not in the stern area and structure not in the vicinity of engines or generators, provided the net thickness of plating supported by the stiffener, t_{p-net} , is not less than:

$$t_{p-net} = c_1 \sqrt{\left(1000l - \frac{s}{2}\right) \frac{sPk}{10^6}}$$

RCN 1 (effective from 1 July 2009)

Where:

- l stiffener span, in m
- s stiffener spacing, in mm, as defined in 2.2
- P design pressure for the stiffener for the design load set being considered, in kN/m². The design load sets and method to derive the design pressure are to be taken in accordance with the following criteria, which define the acceptance criteria set to be used:
- a) Table 8.2.5 in the cargo tank region
 - b) Section 8/3.9.2.2 in the area forward of the forward cargo tank, and in the aft end
 - c) Section 8/4.8.1.2 in the machinery space
- RCN 1 (effective from 1 July 2009)*

- k higher strength steel factor, as defined in Section 6/1.1.4
- c_1 coefficient for the design load set being considered, to be taken as:
- =1.2 for acceptance criteria set AC1
 - =1.1 for acceptance criteria set AC2
- RCN 1 (effective from 1 July 2009)*

- 3.2.5.2 Bracket toes and sniped end members are, in general, to be kept within 25mm of the adjacent member. The maximum distance is not to exceed 40mm unless the bracket or member is supported by another member on the opposite side of the plating. Special attention is to be given to the end taper by using a sniped end of not more than 30 degrees. The depth of toe or sniped end is, generally, not to exceed the thickness of the bracket toe or sniped end member, but need not be less than 15mm.
- 3.2.5.3 The end attachments of non-load bearing members may be snipe ended. The sniped end is to be not more than 30 degrees and is generally to be kept within 50mm of the adjacent member unless it is supported by a member on the opposite side of the plating. The depth of the toe is generally not to exceed 15mm.

3.2.6 Air and drain holes and scallops

- 3.2.6.1 Air, drain holes, scallops and block fabrication butts are to be kept at least 200mm clear of the toes of end brackets, end connections and other areas of high stress concentration measured along the length of the stiffener toward the mid-span and 50mm measured along the length in the opposite direction. See *Figure 4.3.2(b)*. In areas where the shear stress is less than 60 percent of the allowable limit, alternative arrangements may be accepted. Openings are to be well-rounded. *Figure 4.3.2(a)* shows some examples of air and drain holes and scallops. In general, the ratio of a/b , as defined in *Figure 4.3.2(a)*, is to be between 0.5 and 1.0. In fatigue sensitive areas further consideration may be required with respect to the details and arrangements of openings and scallops.

3.2.7 Special requirements

- 3.2.7.1 Closely spaced scallops or drain holes, i.e. where the distance between scallops/drain holes is less than twice the width b as shown in *Figure 4.3.2(a)*, are not permitted in longitudinal strength members or within 20% of the stiffener span measured from the end of the stiffener. Widely spaced air or drain holes may be permitted provided that they are of elliptical shape or equivalent to minimise stress concentration and are, in general, cut clear of the weld connection.

3.3 Termination of Primary Support Members

3.3.1 General

- 3.3.1.1 Primary support members are to be arranged to ensure effective continuity of strength. Abrupt changes of depth or section are to be avoided. Primary support members in tanks are to form a continuous line of support and, wherever possible, a complete ring system.
- 3.3.1.2 The members are to have adequate lateral stability and web stiffening, and the structure is to be arranged to minimise hard spots and other sources of stress concentration. Openings are to have well-rounded corners and are to be located considering the stress distribution and buckling strength of the panel.

3.3.2 End connection

- 3.3.2.1 Primary support members are to be provided with adequate end fixity by brackets or equivalent structure. The design of end connections and their supporting structure is to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member.
- 3.3.2.2 The ends of brackets are generally to be soft-toed. The free edges of the brackets are to be stiffened. Scantlings and details are given in 3.3.3.
- 3.3.2.3 Where primary support members are subject to concentrated loads additional strengthening may be required, particularly if these are out of line with the member web.

- 3.3.2.4 In general, ends of primary support members or connections between primary support members forming ring systems are to be provided with brackets. Bracketless connections may be applied provided that there is adequate support of the adjoining face plates.

3.3.3 Brackets

- 3.3.3.1 In general, the arm lengths of brackets connecting primary support members are not to be less than the web depth of the member, and need not be taken as greater than 1.5 times the web depth. The thickness of the bracket is, in general, not to be less than that of the girder web plate.
- 3.3.3.2 For a ring system where the end bracket is integral with the webs of the members and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained close to the mid point of the bracket and gradually tapered to the smaller face plates. Butts in face plates are to be kept well clear of the bracket toes.
- 3.3.3.3 Where a wide face plate abuts a narrower one, the taper is generally not to be greater than 1 in 4. Where a thick face plate abuts against a thinner one and the difference in thickness is greater than 4mm, the taper of the thickness is not to be greater than 1 in 3.
- 3.3.3.4 Face plates of brackets (typical brackets similar to those indicated in *Figure 4.2.7b*) are to have a net cross-sectional area, A_{f-net} , which is not to be less than:

$$A_{f-net} = l_{bkt-edge} t_{bkt-net} \quad \text{cm}^2$$

Where:

$l_{bkt-edge}$ length of free edge of bracket, in m. For brackets that are curved the length of the free edge may be taken as the length of the tangent at the midpoint of the free edge. If $l_{bkt-edge}$ is greater than 1.5m, 40 percent of the face plate area is to be in a stiffener fitted parallel to the free edge and a maximum 0.15m from the edge

$t_{bkt-net}$ minimum net bracket thickness, in mm, as defined in 3.2.3.3

3.3.4 Bracket toes

- 3.3.4.1 The toes of brackets are not to land on unstiffened plating. Notch effects at the toes of brackets may be reduced by making the toe concave or otherwise tapering it off. In general, the toe height is not to be greater than the thickness of the bracket toe, but need not be less than 15mm. The end brackets of large primary support members are to be soft-toed. Where any end bracket has a face plate, it is to be sniped and tapered at an angle not greater than 30°.
- 3.3.4.2 Where primary support members are constructed of higher strength steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates, which are welded onto the edge of primary support member brackets, are to be carried well around the radiused bracket toe and are to incorporate a taper not greater than 1 in 3. Where sniped face plates are welded adjacent to the edge of primary support member brackets, adequate cross-sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area, measured perpendicular to the face plate is to be not less than 60 percent of the full cross-sectional area of the face plate, see *Figure 4.3.3*.

3.4 Intersections of Continuous Local Support Members and Primary Support Members

3.4.1 General

- 3.4.1.1 Cut-outs for the passage of stiffeners through the web of primary support members, and the related collaring arrangements, are to be designed to minimize stress concentrations around the perimeter of the opening and on the attached web stiffeners.
- 3.4.1.2 Cut-outs in way of cross-tie ends and floors under bulkhead stools or in high stress areas are to be fitted with “full” collar plates, see *Figure 4.3.4*.
- 3.4.1.3 Lug type collar plates are to be fitted in cut-outs where required for compliance with the requirements of 3.4.3, and in areas of significant stress concentrations, e.g., in way of primary support member toes. See *Figure 4.3.5* for typical lug arrangements.
- 3.4.1.4 When, in the following locations, the calculated direct stress, σ_w , in the primary support member web stiffener according to 3.4.3.5 exceeds 80% of the permissible values a soft heel is to be provided in way of the heel of primary support member web stiffeners:
- (a) connection to shell envelope longitudinals below the scantling draught, T_{sc}
 - (b) connection to inner bottom longitudinals.

A soft heel is not required at the intersection with watertight bulkheads, where a back bracket is fitted or where the primary support member web is welded to the stiffener face plate. The soft heel is to have a keyhole, similar to that shown in *Figure 4.3.6(c)*.

3.4.2 Details of cut-outs

- 3.4.2.1 Cut-outs are to have rounded corners and the corner radii are to be as large as practicable, with a minimum of 20 percent of the breadth of the cut-out or 25mm, whichever is greater, but need not be greater than 50mm.

3.4.3 Connection between primary support members and intersecting stiffeners (local support members)

- 3.4.3.1 The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.
- 3.4.3.2 The total load, W , transmitted through the connection to the primary support member is given by:

$$W = P s \left(S - \frac{s}{2000} \right) 10^{-3} \quad \text{kN}$$

Where:

P design pressure for the stiffener for the design load set being considered, in kN/m². The design load sets, method to derive the design pressure and applicable acceptance criteria set are to be taken in accordance with the following criteria, which define the Acceptance Criteria Set to be used:

Table 8.2.5 in the cargo tank region

Section 8/3.9.2.2 in the area forward of the forward cargo tank

Section 8/3.9.2.2 in the aft end

Section 8/4.8.1.2 in the machinery space

Section 8/6.2.4.1 if subjected to sloshing loads

Section 8/6.3.5.1 if subjected to bottom slamming loads

Section 8/6.4.5.1 if subjected to bow impact loads

S primary support member spacing, in m, as defined in *Section 4/2.2*

s stiffener spacing, in mm, as defined in *Section 4/2.2*

For stiffeners having different primary support member spacing, S , and/or different pressure, P , at each side of the primary support member, the average load for the two sides is to be applied, e.g. vertical stiffeners at transverse bulkhead.

3.4.3.3 The load, W_1 , transmitted through the shear connection is to be taken as follows.

If the web stiffener is connected to the intersecting stiffener:

$$W_1 = W \left(\alpha_a + \frac{A_{1-net}}{4f_c A_{w-net} + A_{1-net}} \right) \quad \text{kN}$$

If the web stiffener is not connected to the intersecting stiffener:

$$W_1 = W$$

Where:

W the total load, in kN, as defined in 3.4.3.2

α_a panel aspect ratio, not to be taken greater than 0.25

$$= \frac{s}{1000S}$$

S primary support member spacing, in m

s stiffener spacing, in mm

A_{1-net} effective net shear area of the connection, to be taken as the sum of the components of the connection:

$$A_{1d-net} + A_{1c-net} \quad \text{cm}^2$$

in case of a slit type slot connections area, A_{1-net} , is given by:

$$A_{1-net} = 2l_d t_{w-net} 10^{-2} \quad \text{cm}^2$$

in case of a typical double lug or collar plate connection area, A_{1-net} , is given by:

$$A_{1-net} = 2f_1 l_c t_{c-net} 10^{-2} \quad \text{cm}^2$$

A_{1d-net} net shear connection area excluding lug or collar plate, as given by the following and *Figure 4.3.5*:

$$A_{1d-net} = l_d t_{w-net} 10^{-2} \quad \text{cm}^2$$

l_d length of direct connection between stiffener and primary support member web, in mm

t_{w-net} net web thickness of the primary support member, in mm

A_{1c-net} net shear connection area with lug or collar plate, given by the following and *Figure 4.3.5*:

$$A_{1c-net} = f_1 l_c t_{c-net} 10^{-2} \quad \text{cm}^2$$

l_c length of connection between lug or collar plate and primary support member, in mm

t_{c-net} net thickness of lug or collar plate, not to be taken greater than the net thickness of the adjacent primary support member web, in mm

f_1 shear stiffness coefficient:

= 1.0 for stiffeners of symmetrical cross section

= $140/w$ for stiffeners of asymmetrical cross section but is not to be taken as greater than 1.0

w the width of the cut-out for an asymmetrical stiffener, measured from the cut-out side of the stiffener web, in mm,

as indicated in *Figure 4.3.5*

A_{w-net} effective net cross-sectional area of the primary support member web stiffener in way of the connection including backing bracket where fitted, as shown in *Figure 4.3.6*, in cm^2 . If the primary support member web stiffener incorporates a soft heel ending or soft heel and soft toe ending, A_{w-net} is to be measured at the throat of the connection, as shown in *Figure 4.3.6*.

f_c the collar load factor defined as follows:
for intersecting stiffeners of symmetrical cross section:

$$= 1.85 \quad \text{for} \quad A_{w-net} \leq 14$$

$$= 1.85 - 0.0441(A_{w-net} - 14) \quad \text{for} \quad 14 < A_{w-net} \leq 31$$

$$= 1.1 - 0.013(A_{w-net} - 31) \quad \text{for} \quad 31 < A_{w-net} \leq 58$$

$$= 0.75 \quad \text{for} \quad A_{w-net} > 58$$
for intersecting stiffeners of asymmetrical cross section:

$$= 0.68 + 0.0172 \frac{l_s}{A_{w-net}}$$

where:

$l_s = l_c$ for a single lug or collar plate connection to the primary support member
 $= l_d$ for a single sided direct connection to the primary support member
 $=$ mean of the connection length on both sides, i.e., in the case of a lug or collar plus a direct connection,
 $l_s = 0.5(l_c + l_d)$

3.4.3.4 The load, W_2 , transmitted through the primary support member web stiffener is to be taken as follows.

If the web stiffener is connected to the intersecting stiffener:

$$W_2 = W \left(1 - \alpha_a - \frac{A_{1-net}}{4 f_c A_{w-net} + A_{1-net}} \right) \quad \text{kN}$$

If the web stiffener is not connected to the intersecting stiffener:

$$W_2 = 0$$

Where:

W the total load, in kN, as defined in 3.4.3.2

α_a panel aspect ratio

$$= \frac{s}{1000 S}$$

S primary support member spacing, in m

s stiffener spacing, in mm

A_{1-net} effective net shear area of the connection, in cm^2 , as defined in 3.4.3.3

f_c collar load factor, as defined in 3.4.3.3

A_{w-net} effective net cross-sectional area of the primary support

member web stiffener , in cm², as defined in 3.4.3.3

3.4.3.5 The values of A_{w-net} , A_{wc-net} and A_{1-net} are to be such that the calculated stresses satisfy the following criteria:

for the connection to the primary support member web stiffener away from the weld:

$$\sigma_w \leq \sigma_{perm}$$

for the connection to the primary support member web stiffener in way of the weld:

$$\sigma_{wc} \leq \sigma_{perm}$$

for the shear connection to the primary support member web:

$$\tau_w \leq \tau_{perm}$$

Where:

σ_w direct stress in the primary support member web stiffener at the minimum bracket area away from the weld connection:

$$= \frac{10W_2}{A_{w-net}} \quad \text{N/mm}^2$$

σ_{wc} direct stress in the primary support member web stiffener in way of the weld connection:

$$= \frac{10W_2}{A_{wc-net}} \quad \text{N/mm}^2$$

τ_w shear stress in the shear connection to the primary support member

$$= \frac{10W_1}{A_{1-net}} \quad \text{N/mm}^2$$

A_{w-net} effective net cross-sectional area of the primary support member web stiffener, in cm², as defined in 3.4.3.3

A_{wc-net} effective net area of the web stiffener in way of the weld as shown in *Figure 4.3.6*, in cm²

A_{1-net} effective net shear area of the connection, in cm², as defined in 3.4.3.3

W_1 load transmitted through the shear connection, in kN, as defined in 3.4.3.3

W_2 load transmitted through the web stiffener, in kN, as defined in 3.4.3.4

σ_{perm} permissible direct stress given in *Table 4.3.1* for the applicable acceptance criteria, see 3.4.3.2, in N/mm²

τ_{perm} permissible shear stress given in *Table 4.3.1* for the applicable acceptance criteria, see 3.4.3.2, in N/mm²

3.4.3.5 bis 1 When total load, W , is bottom slamming or bow impact loads the following criteria apply in lieu of 3.4.3.3-3.4.3.5.

$$0.9W \leq \frac{(A_{1-net}\tau_{perm} + A_{w-net}\sigma_{perm})}{10} \text{ kN}$$

A_{1-net} effective net shear area in cm^2 of the connection, as defined in 3.4.3.3.

A_{w-net} effective net cross sectional area in cm^2 of the primary support member web stiffener in way of the connection including backing bracket where fitted, as defined in 3.4.3.3.

σ_{perm} permissible direct stress given in Table 4.3.1 for AC-3, in N/mm^2

τ_{perm} permissible shear stress given in Table 4.3.1 for AC-3, in N/mm^2

RCN 1 (effective from 1 July 2009)

- 3.4.3.6 Where a backing bracket is fitted in addition to the primary support member web stiffener, it is to be arranged on the opposite side to, and in alignment with the web stiffener. The arm length of the bracket is to be not less than the depth of the web stiffener and its net cross-sectional area through the throat of the bracket is to be included in the calculation of A_{w-net} as shown in Figure 4.3.6.
- 3.4.3.7 Lapped connections of primary support member web stiffeners or tripping brackets to local support members are not permitted in the cargo tank region, e.g., lapped connections between transverse and longitudinal local support members.
- 3.4.3.8 Fabricated stiffeners having their face plate welded to the side of the web, leaving the edge of the web exposed, are not recommended for side shell and longitudinal bulkhead longitudinals. Where such sections are connected to the primary support member web stiffener, a symmetrical arrangement of connection to the transverse members is to be incorporated. This may be implemented by fitting backing brackets on the opposite side of the transverse web or bulkhead. In way of the cargo tank region, the primary support member web stiffener and backing brackets are to be butt welded to the intersecting stiffener web.
- 3.4.3.9 Where the web stiffener of the primary support member is parallel to the web of the intersecting stiffener, but not connected to it, the offset primary support member web stiffener may be located as shown in Figure 4.3.7. The offset primary support member web stiffener is to be located in close proximity to the slot edge. See also Figure 4.3.7. The ends of the offset web stiffeners are to be suitably tapered and softened.
- 3.4.3.10 Alternative arrangements will be specially considered on the basis of their ability to transmit load with equivalent effectiveness. Details of calculations made and/or testing procedures and results are to be submitted.
- 3.4.3.11 The size of the fillet welds is to be calculated according to Section 6/5 based on the weld factors given in Table 4.3.2. For the welding in way of the shear connection the size is not to be less than that required for the primary support member web plate for the location under consideration.

Table 4.3.1 Permissible Stresses for Connection between Stiffeners and Primary Support Members						
Item	Direct Stress, σ_{perm} , in N/mm ²			Shear Stress, τ_{perm} , in N/mm ²		
	Acceptance Criteria Set See 3.4.3.2			Acceptance Criteria Set See 3.4.3.2		
	AC1	AC2	AC3	AC1	AC2	AC3
Primary support member web stiffener	$0.83 \sigma_{yd}^{(3)}$	σ_{yd}	σ_{yd}	-	-	-
Primary support member web stiffener to intersecting stiffener in way of weld connection:						
double continuous fillet	$0.58 \sigma_{yd}^{(3)}$	$0.70 \sigma_{yd}^{(3)}$	σ_{yd}	-	-	-
partial penetration weld	$0.83 \sigma_{yd}^{(2)(3)}$	$\sigma_{yd}^{(2)}$	σ_{yd}	-	-	-
Primary support member stiffener to intersecting stiffener in way of lapped welding	$0.50 \sigma_{yd}$	$0.60 \sigma_{yd}$	σ_{yd}	-	-	-
Shear connection including lugs or collar plates:						
single sided connection	-	-	-	$0.71 \tau_{yd}$	$0.85 \tau_{yd}$	τ_{yd}
double sided connection	-	-	-	$0.83 \tau_{yd}$	τ_{yd}	τ_{yd}
Where:						
τ_{perm}	permissible shear stress, in N/mm ²					
σ_{perm}	permissible direct stress, in N/mm ²					
σ_{yd}	minimum specified material yield stress, in N/mm ²					
τ_{yd}	$\frac{\sigma_{yd}}{\sqrt{3}}$, in N/mm ²					
Note						
1. The stress computation on plate type members is to be performed on the basis of net thicknesses, whereas gross values are to be used in weld strength assessments, see 3.4.3.11.						
2. The root face is not to be greater than one third of the gross thickness of the primary support member stiffener.						
3. Allowable stresses may be increased by 5 percent where a soft heel is provided in way of the heel of the primary support member web stiffener.						

Table 4.3.2 Weld Factors for Connection between Stiffeners and Primary Support Members	
Item	Weld factor
Primary support member stiffener to intersecting stiffener	$0.6 \sigma_{wc} / \sigma_{perm}$ not to be less than 0.38
Shear connection inclusive lug or collar plate	0.38
Shear connection inclusive lug or collar plate, where the web stiffener of the primary support member is not connected to the intersection stiffener	$0.6 \tau_w / \tau_{perm}$ not to be less than 0.44
Where:	
τ_w	shear stress, as defined in 3.4.3.5
σ_w	as defined in 3.4.3.5
τ_{perm}	permissible shear stress, in N/mm ² , see Table 4.3.1
σ_{perm}	permissible direct stress, in N/mm ² see Table 4.3.1

Figure 4.3.5
Symmetric and Asymmetric Cut outs

Note

The details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance or recommendations.

Figure 4.3.6
Primary Support Member Web Stiffener Details

Where:

t_{ws-net} , $t_{ws1-net}$ and $t_{ws2-net}$

net thickness of the primary support member web stiffener/backing bracket, in mm

d_w , d_{w1} and d_{w2}

minimum depth of the primary support member web stiffener/backing bracket, in mm

d_{wc} , d_{wc1} and d_{wc2}

length of connection between the primary support member web stiffener/backing bracket and the local support stiffener, in mm

Note

Except where specific dimensions are noted for the details of the keyhole in way of the soft heel, see 3.4.1.4, the details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance or recommendations.

3.5 Openings

3.5.1 General

3.5.1.1 Openings are to have well rounded corners.

3.5.1.2 Manholes, lightening holes and other similar openings are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are to be avoided in high stress areas unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory. Examples of high stress areas include:

- (a) in vertical or horizontal diaphragm plates in narrow cofferdams/double plate bulkheads within one-sixth of their length from either end
- (b) in floors or double bottom girders close to their span ends
- (c) above the heads and below the heels of pillars.

Where larger openings than given by 3.5.2 or 3.5.3 are proposed, the arrangements and compensation required will be specially considered.

3.5.2 Manholes and lightening holes in single skin sections not requiring reinforcement

3.5.2.1 Openings cut in the web with depth of opening not exceeding 25 percent of the web depth and located so that the edges are not less than 40 percent of the web depth from the faceplate do not generally require reinforcement. The length of opening is not to be greater than the web depth or 60 percent of the local support member spacing, whichever is greater. The ends of the openings are to be equidistant from the corners of cut outs for local support members.

3.5.3 Manholes and lightening holes in double skin sections not requiring reinforcement

3.5.3.1 Where openings are cut in the web and are clear of high stress areas, reinforcement of these openings is not required provided that the depth of the opening does not exceed 50 percent of the web depth and is located so that the edges are well clear of cut outs for the passage of local support members.

3.5.4 Manholes and lightening holes requiring reinforcement

3.5.4.1 Manholes and lightening holes are to be stiffened as required by 3.5.4.2 and 3.5.4.3. The stiffening requirements of 3.5.4.2 and 3.5.4.3 may be modified where

alternative arrangements are demonstrated as satisfactory with regards to stress and stability, in accordance with analysis methods described in *Section 9/2*.

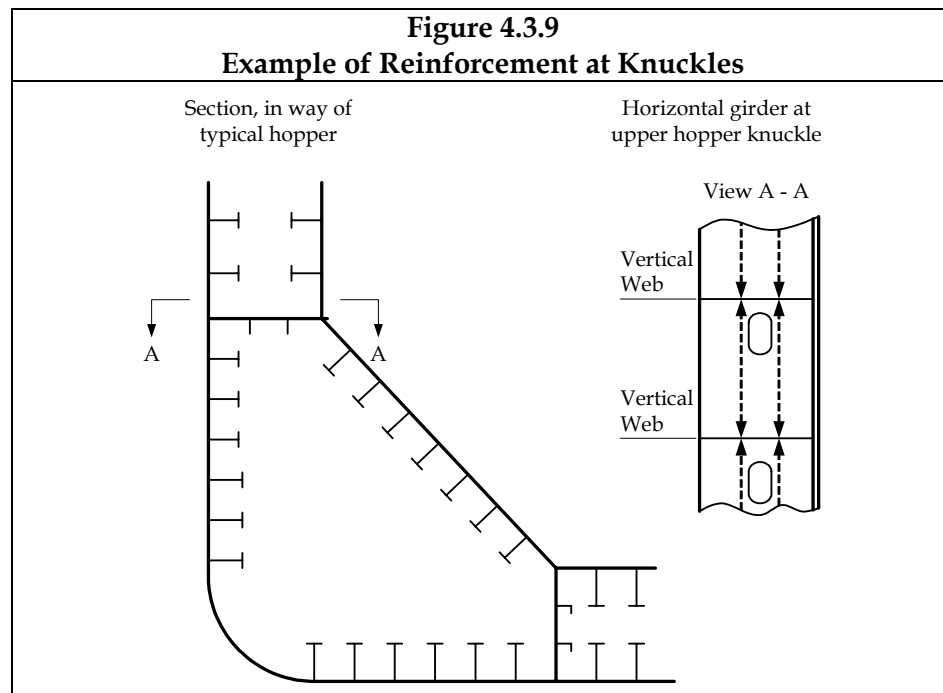

- 3.5.4.2 The web plate is to be stiffened at openings when the mean shear stress, as determined by application of the requirements of *Section 8* or *Section 9/2*, is greater than 50N/mm^2 for acceptance criteria set AC1 or greater than 60N/mm^2 for acceptance criteria set AC2. The stiffening arrangement is to ensure buckling strength as required by *Section 10* under application of the loading as required in *Section 8* or *Section 9/2*.
- 3.5.4.3 On members contributing to longitudinal strength, stiffeners are to be fitted along the free edges of the openings parallel to the vertical and horizontal axis of the opening. Stiffeners may be omitted in one direction if the shortest axis is less than 400mm, and in both directions if length of both axes is less than 300mm. Edge reinforcement may be used as an alternative to stiffeners. See *Figure 4.3.8*.

3.6 Local Reinforcement

3.6.1 Reinforcement at knuckles

- 3.6.1.1 Whenever a knuckle in a main member (shell, longitudinal bulkhead etc.) is arranged, adequate stiffening is to be fitted at the knuckle to transmit the transverse load. This stiffening, in the form of webs, brackets or profiles, is to be connected to the transverse members to which they are to transfer the load (in shear). See *Figure 4.3.9*.
- 3.6.1.2 In general, for longitudinal shallow knuckles, closely spaced carlings are to be fitted across the knuckle, between longitudinal members above and below the knuckle. Carlings or other types of reinforcement need not be fitted in way of shallow knuckles that are not subject to high lateral loads and/or high in-plane loads across the knuckle, such as deck camber knuckles.
- 3.6.1.3 Generally, the distance between the knuckle and the support stiffening described in 3.6.1.1 is not to be greater than 50mm.

3.6.2 Reinforcement for openings and attachments associated with means of access for inspection purposes

3.6.2.1 Local reinforcement is to be provided taking into account proper location and strength of all attachments to the hull structure for access for inspection purposes.

3.7 Fatigue Strength

3.7.1 General

3.7.1.1 Structural details are to be designed for compliance with the requirements of fatigue strength as specified in *Section 9/3*.

SECTION 5

STRUCTURAL ARRANGEMENT

1 GENERAL

1.1 Introduction

1.1.1 Scope

- 1.1.1.1 This section covers the general structural arrangement requirements for the ship, which are based on or derived from National and International regulations, see *Sections 2/2.1.1 and 3/3.3*.

2 WATERTIGHT SUBDIVISION

2.1 Watertight Bulkhead Arrangement

2.1.1 General

- 2.1.1.1 All ships are to be provided with watertight bulkheads arranged to subdivide the hull into watertight compartments in accordance with the following requirements.

2.1.2 Minimum number and disposition of watertight bulkheads

- 2.1.2.1 The following watertight bulkheads are to be fitted on all ships:
- (a) a collision bulkhead, see 2.2.1.1
 - (b) an aft peak bulkhead
 - (c) a bulkhead at each end of the machinery space.
- 2.1.2.2 The bulkheads in the cargo tank region are to be spaced at uniform intervals so far as practicable.
- 2.1.2.3 The applicable number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the requirements of National regulations.
- 2.1.2.4 The number of openings in watertight bulkheads is to be kept to a minimum. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. Additional requirements apply to collision bulkheads in *Section 8/3.6.2*.

2.2 Position of Collision Bulkhead

2.2.1 General

- 2.2.1.1 A collision bulkhead is to be fitted on all ships and is to extend to the freeboard deck. It is to be located between $0.05L_L$ or 10m, whichever is less, and $0.08L_L$ aft of the reference point, where the load line length, L_L , is as defined in *Section 4/1.1.2.1* and the reference point is as defined in 2.2.1.2. Proposals for location of the collision bulkhead aft of $0.08L_L$ will be specially considered.
- 2.2.1.2 For ships without bulbous bows the reference point is to be taken where the forward end of L_L coincides with the forward side of the stem, on the waterline which L_L is measured. For ships with bulbous bows, it is to be measured from the forward end of L_L a distance x forward; where x is to be taken as the lesser of the following:
- (a) half the distance, from the forward end of L_L and the extreme forward end of the bulb extension
 - (b) $0.015L_L$
 - (c) 3.0m.
- 2.2.1.3 In general, the collision bulkhead is to be in one plane, however, the bulkhead may have steps or recesses provided they are in compliance with the limits prescribed in 2.2.1.1 and 2.2.1.2.

2.3 Position of Aft Peak Bulkhead

2.3.1 General

- 2.3.1.1 An aft peak bulkhead, enclosing the stern tube and rudder trunk in a watertight compartment, is to be provided. Where the shafting arrangements make enclosure of the stern tube in a watertight compartment impractical, alternative arrangements will be specially considered. The aft peak bulkhead location on ships powered and/or controlled by equipment that do not require the fitting of a stern tube and/or rudder trunk will also be subject to special consideration.
- 2.3.1.2 The aft peak bulkhead may terminate at the first deck above the summer load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor.

3 DOUBLE HULL ARRANGEMENT

3.1 General

3.1.1 Protection of cargo tanks

- 3.1.1.1 Every tanker is to be provided with double bottom tanks and spaces, and double side tanks and spaces, in accordance with 3.2 and 3.3. The double bottom and double side tanks and spaces, protect the cargo tanks or spaces, and are not to be used for the carriage of oil cargoes.

3.1.2 Capacity of ballast tanks

- 3.1.2.1 The capacity of the segregated ballast tanks shall be so determined that the ship may operate safely on ballast voyages without recourse to the use of cargo tanks for water ballast. The capacity of ballast shall be at least such that, in any ballast condition at any part of the voyage, including the conditions consisting of lightweight plus segregated ballast only, the ships draught and trim can meet the requirements in 3.1.2.2 to 3.1.2.4.

- 3.1.2.2 The moulded draught amidships, T_{mid} , excluding any hogging or sagging correction, is not to be less than:

$$T_{mid} = 2.0 + 0.02L \quad \text{m}$$

Where:

L rule length, as defined in Section 4/1.1.1.1, in m

- 3.1.2.3 The draughts at the F.P. and A.P. are to correspond to those determined by the draught amidships, as given in 3.1.2.2, and in association with a trim by the stern not greater than $0.015L$ (m).
- 3.1.2.4 The draught at the A.P. is not to be less than that required to obtain full immersion of the propeller(s).

3.1.3 Limitation of size and arrangement of cargo tanks

- 3.1.3.1 Cargo tanks are to be of a size and arrangement that hypothetical oil outflow from side and bottom damage, anywhere in the length of the ship, is limited.

3.2 Double Bottom

3.2.1 Double bottom depth

- 3.2.1.1 The minimum double bottom depth, d_{db} , is to be taken as the lesser of:

$$d_{db} = \frac{B}{15} \quad \text{m, but not less than 1.0m}$$

$$d_{db} = 2.0 \quad \text{m}$$

Where:

B moulded breadth, in m, as defined in Section 4/1.1.3.1

3.3 Double Side

3.3.1 Double side width

3.3.1.1 The minimum double side width, w_{ds} , is to be taken as the lesser of:

$$w_{ds} = 0.5 + \frac{DWT}{20\,000} \quad \text{m, but not less than 1.0m}$$

$$w_{ds} = 2.0 \quad \text{m}$$

Where:

DWT deadweight of the ship, in tonnes, as defined in *Section 4/1.1.14.1*

4 SEPARATION OF SPACES

4.1 Separation of Cargo Tanks

4.1.1 General

- 4.1.1.1 The cargo pump room, cargo tanks, slop tanks and cofferdams are to be positioned forward of machinery spaces. Main cargo control stations, control stations, accommodation and service spaces are to be positioned aft of cargo tanks, slop tanks, and spaces which isolate cargo or slop tanks from machinery spaces, but not necessarily aft of the oil fuel bunker tanks and ballast tanks.

4.2 Cofferdam Spaces

4.2.1 General

- 4.2.1.1 Cofferdam spaces are to be kept gas-tight. Where applicable, access requirements to permit internal inspections, are to be in accordance with 5.3.

5 ACCESS ARRANGEMENTS

5.1 Access Into and Within Spaces in, and Forward of, the Cargo Tank Region

5.1.1 General

- 5.1.1.1 Access into and within spaces in, and forward of, the cargo tank region is to satisfy the *International Convention for the Safety of Life at Sea, 1974*, as amended, Chapter II-1, Part A-1, Regulation 3-6, as required by the Flag Administration, for details and arrangements of openings and attachments to the hull structure. This will be reviewed in conjunction with the structural requirements. In addition, the requirements of 5.1.1.2 to 5.1.1.5 are to be complied with.
- 5.1.1.2 Where a duct keel or pipe tunnel is fitted provision is to be made for at least two exits to the open deck arranged at a maximum distance from each other. The duct keel or pipe tunnel is not to pass into machinery spaces. The aft access may lead from the pump room to the duct keel. Where an aft access is provided from the pump room to the duct keel, the access opening from the pump room to the duct keel is to be provided with an oil-tight cover plate or a watertight door. Mechanical ventilation is to be provided and such spaces are to be sufficiently ventilated prior to entry. A notice board is to be fitted at each entrance to the pipe tunnel stating that before any attempt is made to enter, the ventilating fan must have been in operation for a sufficient period. In addition, the atmosphere in the tunnel is to be sampled by a gas monitor, and where an inert gas system is fitted in cargo tanks, an oxygen monitor is to be provided.
- 5.1.1.3 Where a watertight door is fitted in the pump room for access to the duct keel, the scantlings of the watertight door are to comply with the requirements of the individual Classification Society and the following additional requirements:
- (a) the watertight door is to be capable of being manually closed from outside the main pump room entrance, in addition to bridge operation. A means of indicating whether the door is open or closed is to be provided locally and on the bridge.
 - (b) a notice is to be affixed at each operating position to the effect that the watertight door is to be kept closed during normal operations of the ship, except when access to the pipe tunnel is required.
- 5.1.1.4 At least one horizontal access opening of 600mm by 800mm clear opening is to be fitted in each horizontal girder in the vertical wing ballast space and weather deck to assist in rescue operations. Where an opening of 600mm by 800mm is not permitted due to structural arrangements, a 600mm by 600mm clear opening will be accepted.
- 5.1.1.5 Special consideration will be given to any proposals to fit permanent repair/maintenance access openings with oil-tight covers in cargo tank bulkheads. Attention is drawn to the relevant National regulations concerning load line and oil outflow aspects of such arrangements.

SECTION 6

MATERIALS AND WELDING

1 STEEL GRADES

1.1 Hull Structural Steel

1.1.1 Scope

- 1.1.1.1 Materials used during construction are to comply with the Rules for Materials of the individual Classification Society. Use of other materials and the corresponding scantlings will be specially considered.

1.1.2 Strength

- 1.1.2.1 Steel having a specified minimum yield stress of 235N/mm² is regarded as normal strength hull structural steel. Steel having a higher specified minimum yield stress is regarded as higher strength hull structural steel.

1.1.3 Material grades

- 1.1.3.1 Material grades of hull structural steels are referred to as follows:

- (a) A, B, D and E denote normal strength steel grades
- (b) AH, DH and EH denote higher strength steel grades.

1.1.4 Higher strength steel factor

- 1.1.4.1 For the determination of hull girder section modulus, where higher strength hull structural steel is used, a higher strength steel factor, k is given in *Table 6.1.1*.

Table 6.1.1 Values of k	
Specified minimum yield stress, N/mm ²	k
235	1.00
265	0.93
315	0.78
340	0.74
355	0.72
390	0.68
<u>Note</u> 1. Intermediate values are to be calculated by linear interpolation.	

1.1.5 Through thickness property

- 1.1.5.1 Where tee or cruciform connections employ partial or full penetration welds, and the plate material is subject to significant tensile strain in a direction perpendicular to the rolled surfaces, consideration is to be given to the use of special material with specified through thickness properties, in accordance with the Rules for Materials of the individual Classification Society. These steels are to be designated on the approved plan by the required steel strength grade followed by the letter Z (e.g. EH36 Z).

1.1.6 Steel castings and forgings

- 1.1.6.1 Steel castings or forgings that are used for stern frames, rudder frames, rudder stocks, propeller shaft brackets and other major structural items are to be in accordance with the Rules for Materials of the individual Classification Society.

1.2 Application of Steel Materials

1.2.1 Selection of material grades

- 1.2.1.1 Steel materials for particular locations are not to be of lower grades than those given in *Table 6.1.2* for the material class given in *Table 6.1.3*.

1.2.2 Applicable thickness

- 1.2.2.1 For application of *Table 6.1.2* and *Table 6.1.3*, the steel grade is to correspond to the as-built thickness.

1.2.3 Operation in areas with low air temperature

- 1.2.3.1 For ships intended to operate for long periods in areas with a lowest daily mean air temperature below -15 degrees C (i.e. regular service during winter to Arctic or Antarctic waters) the materials in exposed structures will be specially considered.

Table 6.1.2 Material Grades			
Thickness, t in mm	Material Class		
	I	II	III
$t \leq 15$	A, AH	A, AH	A, AH
$15 < t \leq 20$	A, AH	A, AH	B, AH
$20 < t \leq 25$	A, AH	B, AH	D, DH
$25 < t \leq 30$	A, AH	D, DH	D, DH
$30 < t \leq 35$	B, AH	D, DH	E, EH
$35 < t \leq 40$	B, AH	D, DH	E, EH
$40 < t \leq 51$	D, DH	E, EH	E, EH

Table 6.1.3
Material Class or Grade of Structural Members

Structural member category	Material Class or Grade	
	Within 0.4L Amidships	Outside 0.4L
Secondary Longitudinal bulkhead strakes, other than those belonging to primary category Deck plating exposed to weather other than that belonging to primary or special category Side plating	Class I	Grade A ⁽⁸⁾ /AH
Primary Bottom plating including keel plate Strength deck plating, excluding that belonging to the special category ⁽¹⁰⁾ Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings Uppermost strake in longitudinal bulkheads ⁽¹⁰⁾ Vertical strake (hatch side girder) and upper sloped strake in top wing tank	Class II	Grade A ⁽⁸⁾ /AH
Special Sheer strake at strength deck ⁽¹⁾⁽²⁾⁽³⁾⁽¹⁰⁾ Stringer plate in strength deck ⁽¹⁾⁽²⁾⁽³⁾⁽¹⁰⁾ Deck strake at longitudinal bulkhead ⁽²⁾⁽⁴⁾⁽¹⁰⁾ Strength deck plating at outboard corners of cargo hatch openings Bilge strake ⁽²⁾⁽⁵⁾⁽⁶⁾ Continuous longitudinal hatch coamings	Class III	Class II (Class I outside 0.6L amidships)
Other Categories Plating for stern frames, rudder horns, rudders and shaft brackets ⁽⁷⁾ Strength members not referred to in above categories ⁽⁹⁾	– Grade A ⁽⁸⁾ /AH	Class II Grade A ⁽⁸⁾ /AH
Note 1. Not to be less than E/EH within 0.4L amidships in vessels with length, <i>L</i> , exceeding 250m. 2. Single strakes required to be of material class III or E/EH are, within 0.4L amidships, to have breadths not less than 800 + 5L mm, but need not be greater than 1800mm. 3. A radius gunwale plate may be considered to meet the requirements for both the stringer plate and the sheer strake, provided it extends generally 600mm inboard and vertically. 4. For tankers having a breadth, <i>B</i> , exceeding 70m, the centreline strake and the strakes in way of the longitudinal bulkheads port and starboard, are to be class III. 5. May be class II in vessels with a double bottom over the full breadth, <i>B</i> , and with a length, <i>L</i> , less than 150m. 6. To be not lower than D/DH within 0.6L amidships of vessels with length, <i>L</i> , exceeding 250m. 7. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) class III is to be applied. 8. Grade B/AH to be used for plate thickness more than 40mm. However, engine foundation heavy plates outside 0.6L amidships may be of Grade A/AH. 9. The material class used for reinforcement and the quality of material (i.e. whether normal or higher strength steel) used for welded attachments, such as spill protection bars and bilge keel, is to be similar to that of the hull envelope plating in way. Where attachments are made to round gunwale plates, special consideration will be given to the required grade of steel, taking account of the intended structural arrangements and attachment details. 10. The material class for deck plating, sheer strake and upper strake of longitudinal bulkhead within 0.4L amidships is also to be applied at structural breaks of the superstructure, irrespective of position.		

1.2.4 Guidance for repairs

- 1.2.4.1 Where materials are used in the construction, which are not in accordance with the Rules for Materials of the individual Classification Society, a set of plans showing the following information, for each material, is to be placed aboard the vessel in addition to those normally retained on the vessel:
- (a) material specification and applicable thickness
 - (b) welding procedure
 - (c) location and extent of application.

1.3 Aluminium Alloys

1.3.1 General

- 1.3.1.1 The use of aluminium alloys in superstructures, deckhouses, hatch covers, helicopter platforms, or other local components will be specially considered. A specification of the proposed alloys and their proposed method of fabrication is to be submitted for approval.
- 1.3.1.2 Details of the proposed method of joining any aluminium and steel structures are to be submitted for approval.
- 1.3.1.3 Material requirements and scantlings are to comply with the Rules for Materials of the individual Classification Society.

1.3.2 Incendiary sparking on impact with steel

- 1.3.2.1 Aluminium may, under certain circumstances give rise to incendiary sparking on impact with oxidized steel. A particular risk is where an aluminium component is dragged or rubbed against the uncoated steel structure creating a thin smear of aluminium on the surface. Subsequent high energy impact by a rusted component on that smear could generate an incendiary spark capable of igniting any surrounding inflammable gas. The following requirements are therefore to be complied with:
- (a) aluminium fittings in tanks used for the carriage of oil, and in cofferdams and pump rooms are to be avoided
 - (b) where fitted, aluminium fittings, units and supports, in tanks used for the carriage of oil, cofferdams and pump rooms are to satisfy the requirements of 2.1.2 for aluminium anodes
 - (c) the underside of heavy portable aluminium structures such as gangways, etc., is to be protected by means of a hard plastic or wood cover, or other approved means, in order to avoid the creation of smears. Such protection is to be permanently and securely attached to the structures.

2 CORROSION PROTECTION INCLUDING COATINGS

2.1 Hull Protection

2.1.1 General

- 2.1.1.1 All dedicated seawater ballast tanks are to have an efficient corrosion prevention system, as required by *SOLAS Reg. II-1/3-2*, see *Section 2/2.1.1*.
- 2.1.1.2 For ships contracted for construction on or after the date of IMO adoption of the amended *SOLAS Regulation II-1/3-2*, by which an IMO "Performance standard for protective coatings for ballast tanks and void spaces" will be made mandatory, the coatings of internal spaces subject to the amended *SOLAS Regulation* are to satisfy the requirements of the IMO performance standard.
- 2.1.1.3 Consistent with *IMO Resolution A.798(19)* and *IACS UI SC 122*, the selection of the coating system, including coating selection, specification, and inspection plan, are to be agreed between the shipbuilder, coating system supplier and the owner, in consultation with the Classification Society, prior to commencement of construction. The specification for the coating system for these spaces is to be documented and this documentation is to be verified by the Classification Society and is to be in full compliance with the coating performance standard.
- 2.1.1.4 The shipbuilder is to demonstrate that the selected coating system with associated surface preparation and application methods is compatible with the manufacturing processes and methods.
- 2.1.1.5 The shipbuilder is to demonstrate that the coating inspectors have proper qualification as required by the IMO standard.
- 2.1.1.6 The attending surveyor of the Classification Society will not verify the application of the coatings but will review the reports of the coating inspectors to verify that the specified shipyard coating procedures have been followed.
- 2.1.1.7 Where anodes are fitted in ballast tanks, ballast tank anode distribution drawings are to be submitted for approval. Such drawings are to include details of the connections to the hull, e.g. welding details.

2.1.2 Internal cathodic protection systems

- 2.1.2.1 When a cathodic protection system is to be fitted to steel structures in tanks used for liquid cargo with flash point below 60°C, a plan of the fitting arrangement is to be submitted for approval. The arrangements will be considered for safety against fire and explosion. This approval also applies to adjacent tanks.
- 2.1.2.2 Permanent anodes in tanks made of, or alloyed with magnesium are not acceptable, except in tanks solely intended for water ballast. Impressed current systems are not to be used in tanks due to the development of chlorine and hydrogen that can result in an explosion. Aluminium anodes are accepted, however, in tanks with liquid cargo with flash point below 60°C and in adjacent ballast tanks, aluminium anodes are to be located so a kinetic energy of not more than 275J is developed in the event of their loosening and becoming detached.
- 2.1.2.3 Aluminium anodes are to be located in such a way that they are protected from falling objects. They are not to be located under tank hatches or Butterworth openings unless protected by adjacent structure.

- 2.1.2.4 All anodes are to be attached to the structure in such a way that they will remain securely fastened both initially and during service. The following methods are acceptable:
- (a) steel core connected to the structure by continuous fillet welds of sufficient cross section
 - (b) attachment by properly secured through-bolts or other positive locking devices. Attachment by clamps fixed with setscrews is to be by approved means.
- 2.1.2.5 Anode steel cores bent and directly welded to the steel structure are to be of a material complying with the requirements for grade A of the Rules for Materials of the individual Classification Society.
- 2.1.2.6 Anodes are to be attached to stiffeners or aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.
- 2.1.2.7 Where cores or supports are welded to local support members or primary support members, they are to be kept clear of end supports, toes of brackets and similar stress raisers. Where they are welded to asymmetrical members, the welding is to be at least 25mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate, but well clear of the free edges. Generally, anodes are not to be fitted to a face plate of higher strength steel.
- 2.1.2.8 Tanks in which anodes are installed, are to have sufficient holes for the circulation of air to prevent gas from collecting in pockets.

2.1.3 Paint containing aluminium

- 2.1.3.1 Paint containing aluminium is not to be used in positions where cargo vapours may accumulate unless it has been shown by appropriate tests that the paint to be used does not increase the incendiary sparking hazard. Tests need not be performed for coatings with less than 10 percent aluminium by weight.

3 CORROSION ADDITIONS

3.1 General

3.1.1 Introduction

- 3.1.1.1 The required net thickness of steel structures is to be increased by the corrosion addition as specified in this Sub-Section.
- 3.1.1.2 The corrosion additions given in this Sub-Section are applicable to carbon-manganese steels, see 1.1. Application of corrosion additions for other materials, such as stainless steel, is to be in accordance with the requirements of the individual Classification Society.
- 3.1.1.3 The application of the corrosion additions in rule calculations is given in 3.3.

3.2 Local Corrosion Additions

3.2.1 General

- 3.2.1.1 The local corrosion additions, t_{corr} , for structural members are to be taken as:

$$t_{corr} = t_{was} + 0.5 \quad \text{mm}$$

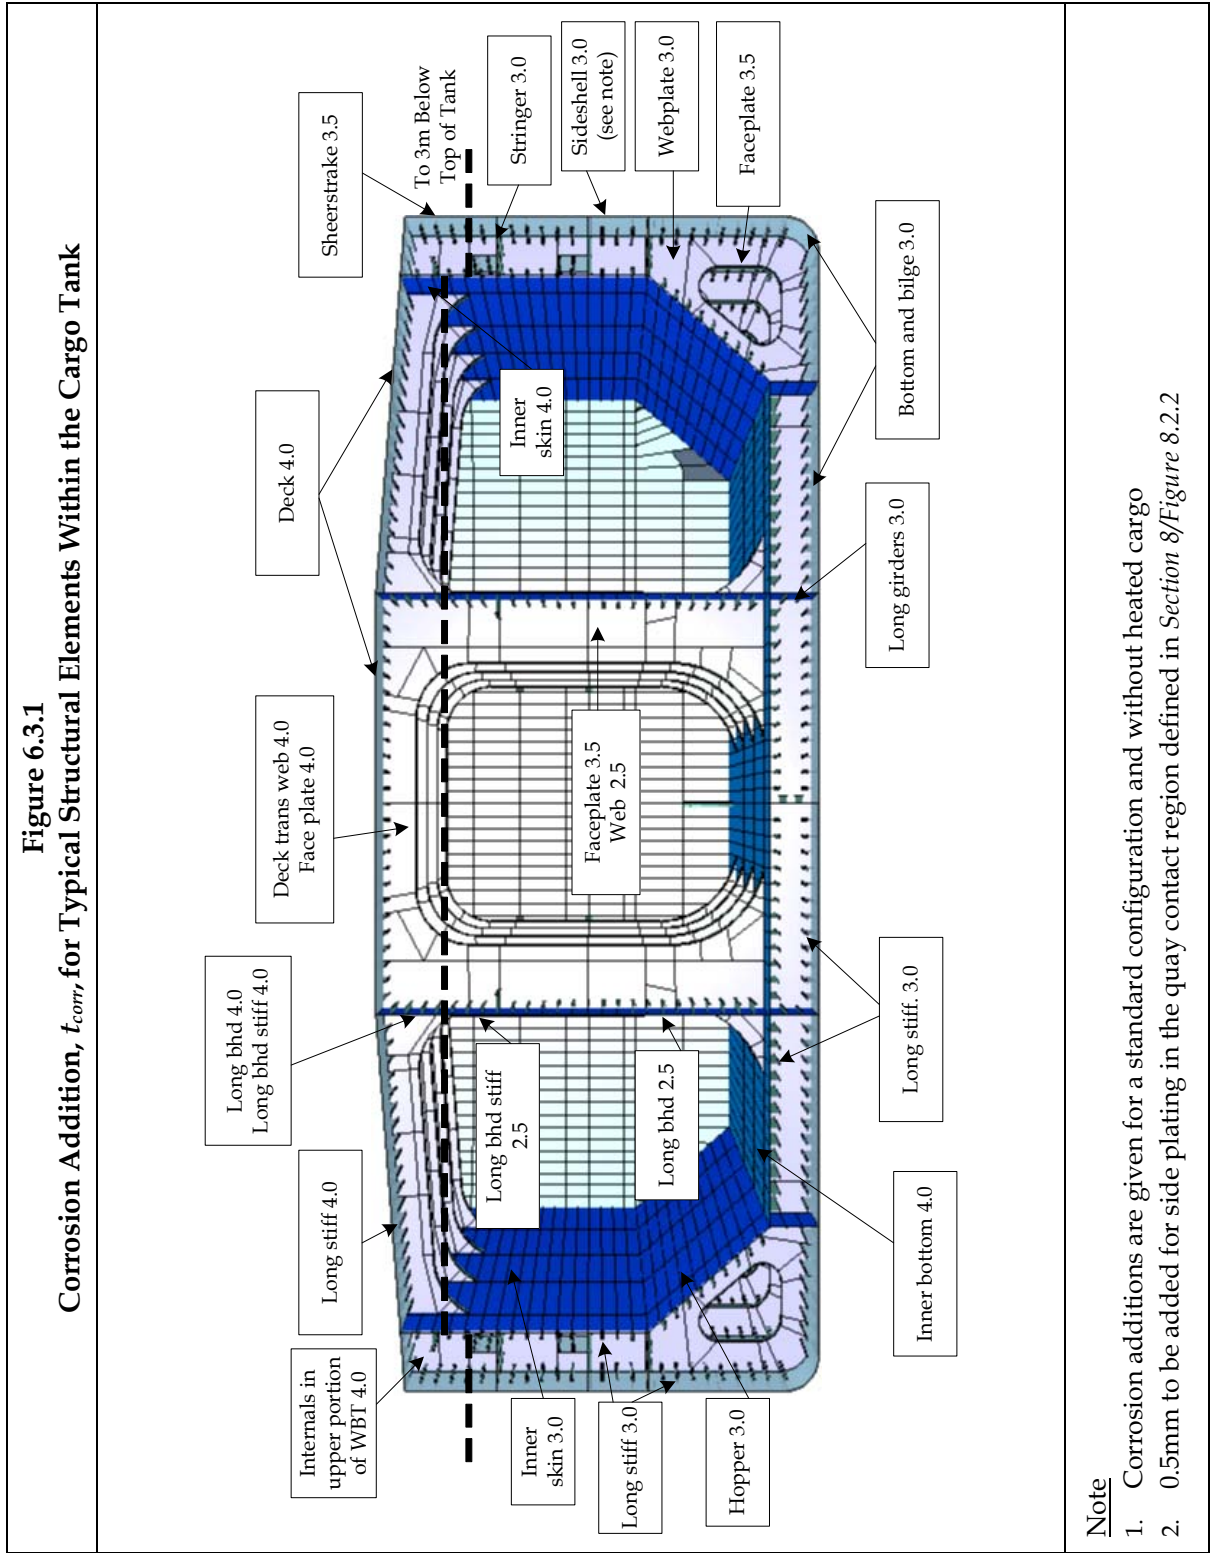

Where:

t_{was} total wastage allowance of the considered structural member,
in mm, as given in *Section 12/1.4.2.2*

- 3.2.1.2 The local corrosion additions, t_{corr} , for typical structural elements in the cargo tank region are given in *Table 6.3.1* and *Figure 6.3.1*.

Table 6.3.1 Corrosion Addition, t_{corr} , for Typical Structural Elements Within the Cargo Tank Region			
Category of contents			Corrosion Addition t_{corr} in mm
Internal members and plate boundary between spaces with the same category of contents			
In and between ballast water tanks	Face plate of PSM	Within 3m below top of tank ⁽¹⁾	4.5
		Elsewhere	3.5
	Other members	Within 3m below top of tank ⁽¹⁾	4.0
		Elsewhere	3.0
	Stiffeners on boundaries to heated cargo tanks	Within 3m below top of tank ⁽¹⁾	4.5
		Elsewhere	3.5
In and between cargo oil tanks	Face plate of PSM	Within 3m below top of tank ⁽¹⁾	4.0
		Elsewhere	3.5
	Other members	Within 3m below top of tank ⁽¹⁾	4.0
		Elsewhere	2.5
Exposed to atmosphere on both sides	Support members on deck		2.5
In and between void spaces	Spaces not normally accessed, e.g. access only via bolted manhole openings, pipe tunnels, etc.		2.0
In and between dry spaces	Internals of deckhouses, machinery spaces, pump room, store rooms, steering gear space, etc.		1.5
Plate boundary between spaces having a different category			
Boundary between ballast tank and cargo oil tank	Unheated cargo tank	Within 3m below top of tank ⁽¹⁾	4.0
		Inner bottom plating	4.0
		Elsewhere	3.0
	Heated cargo tank	Within 3m below top of tank ⁽¹⁾	4.5
		Inner bottom plating	4.5
		Elsewhere	3.5
Boundary between ballast tank and atmosphere or sea	Weather deck plating		4.0
	Other members ⁽²⁾	Within 3m below top of tank ⁽¹⁾	3.5
		Elsewhere	3.0
Boundary between ballast tank and void or dry space	Within 3m below top of tank ⁽¹⁾		3.0
	Elsewhere		2.5
Boundary between cargo tank and atmosphere	Weather deck plating		4.0
Boundary between cargo tank and void spaces	Within 3m below top of tank ⁽¹⁾		3.0
	Elsewhere		2.5
Boundary between cargo tank and dry spaces	Within 3m below top of tank ⁽¹⁾		3.0
	Elsewhere		2.0
Note			
1. Only applicable to cargo and ballast tanks with weather deck as the tank top			
2. 0.5mm to be added for side plating in the quay contact region defined in <i>Section 8/Figure 8.2.2</i>			
3. Heated cargo oil tanks are defined as cargo tanks arranged with any form of heating capability			

(RCN 1, effective from 1 April 2007)

3.3 Application of Corrosion Additions

3.3.1 General

- 3.3.1.1 The application of corrosion additions described in 3.3.2 to 3.3.7 is to be applied unless otherwise specified in the specific rule requirements.
- 3.3.1.2 Compliance with the Rules may be performed either by:
- (a) comparison of the proposed gross scantling with the gross required, in which case the applicable corrosion addition is added to the net requirement of the Rules
 - (b) comparison of the proposed net scantling with the net required, in which case the applicable corrosion addition is deducted from the gross proposed.
- Methods (a) and (b) are suitable for assessment of thickness. Method (b) is the most suitable for assessment of section properties, e.g. section modulus, area and moment of inertia.
- 3.3.1.3 The gross scantlings specified in 3.3.2 to 3.3.7 used to derive the net scantlings are to exclude any owner's extra thicknesses, see also *Section 2/4.3.4.3*.

3.3.2 Application for hull girder longitudinal strength calculations

- 3.3.2.1 The calculation of hull girder stresses for the assessment of longitudinal strength as given in *Section 8/1* is to be based on the net hull girder sectional properties calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross-section.
- 3.3.2.2 The local buckling capacity of plates and stiffeners subject to hull girder stresses are to be calculated based on the net scantlings, as given in *Section 8/1.4.2*. The net scantling is calculated by deducting the full corrosion addition, i.e. $-1.0t_{corr}$, from the gross thickness.

3.3.3 Application for scantling assessment of plates and local support members

- 3.3.3.1 The required gross thickness for plates and local support members are calculated by adding the full corrosion addition, i.e. $+1.0t_{corr}$, to the net thickness required in accordance with the scantling requirements in *Sections 4/3.4* and *8/2* to *8/7*.
- 3.3.3.2 The net sectional properties of local support members are calculated by deducting the full corrosion addition, i.e. $-1.0t_{corr}$, from the web, flange and attached plate gross thicknesses as described in *Section 4/2.4.1* and are to comply with required section modulus, moment of inertia and shear area as given in *Sections 4/3.4* and *8/2* to *8/7*.
- 3.3.3.3 The calculation of hull girder stresses for the strength assessment of members under combined local and global loading is to be based on the net hull girder sectional properties calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross-section.
- 3.3.3.4 The required minimum gross thickness of plates and local support members is calculated by adding the full corrosion addition, i.e. $+1.0t_{corr}$, to the minimum net thickness requirements given in *Section 8/2.1.5*.

3.3.4 Application of corrosion additions for scantling strength assessment of primary support members

- 3.3.4.1 The required gross thickness of primary support members is calculated by adding half the corrosion addition, i.e. $+0.5t_{corr}$, to the net thickness required in accordance with the strength requirements in *Section 8/2.6* and *8/3* to *8/7*.
- 3.3.4.2 The net sectional properties of primary support members are to be calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the web and flange gross thicknesses, and are to comply with the required section modulus, moment of inertia and area as given in *Section 8/2.6* and *8/3* to *8/7*.
- 3.3.4.3 The required minimum gross thickness of primary support members is calculated by adding the full corrosion addition, i.e. $+1.0t_{corr}$, to the minimum net thickness requirement given in *Section 8/2.1.6.1*.

3.3.5 Application of corrosion additions for hull girder ultimate strength analysis

- 3.3.5.1 The calculation of the hull girder ultimate capacity, M_u , as given in *Section 9/1*, is to be based on the net hull girder sectional properties calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross-section.
- 3.3.5.2 The buckling capacity of the structural elements used to derive the hull girder ultimate capacity is to be calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thicknesses of the plates and stiffener webs and flanges.

3.3.6 Application of corrosion additions for strength assessment by finite element analysis

- 3.3.6.1 For the cargo tank structural strength analysis, as given in *Section 9/2.2* and *Appendix B/2*, the finite element model is to be modelled with thicknesses calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness of all structural elements.
- 3.3.6.2 The local buckling capacity of plates and stiffeners are to be calculated by deducting the full corrosion addition, i.e. $-1.0t_{corr}$, from the gross thickness.
- 3.3.6.3 The local fine mesh structural strength analysis models, as given in *Section 9/2.3* and *Appendix B/3*, are to be modelled with thicknesses calculated by deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness. The specified fine mesh areas are to be modelled by deduction of the full corrosion addition, i.e. $-1.0t_{corr}$, from the gross thickness.

3.3.7 Application of corrosion additions for fatigue strength assessment

- 3.3.7.1 The calculation of hull girder stresses for the fatigue strength assessment, as given in *Section 9/3* and *Appendix C/1*, is to be based on the net fatigue hull girder sectional properties, calculated by deducting a quarter of the corrosion addition, i.e. $-0.25t_{corr}$, from the gross thickness of all structural elements comprising the hull girder cross section.
- 3.3.7.2 The calculation of stresses in local support members from lateral load for the fatigue strength assessment, as given in *Section 9/3* and *Appendix C/1*, are to be based on deducting half the corrosion addition, i.e. $-0.5t_{corr}$, from the stiffener web, flange and attached plate.
- 3.3.7.3 For hot spot stress (FE based) approach, as given in *Section 9/3* and *Appendix C/2*, the FE model of the hopper knuckle is to be modelled with thickness calculated by

deducting a quarter of the corrosion addition, i.e. $-0.25t_{corr}$, from the gross thicknesses. The very fine mesh areas are to be modelled by deduction of half the corrosion addition, i.e. $-0.5t_{corr}$, from the gross thickness.

- 3.3.7.4 As an alternative to 3.3.7.3, the hopper fatigue FE model may be made in accordance with requirements for FE strength model, i.e. all areas at $-0.5t_{corr}$, as described in 3.3.6.1. However the calculated stress range is then to be corrected by the factor f_{model} as described in *Appendix C/2.4.2.7*.

4 FABRICATION

4.1 General

4.1.1 Workmanship

- 4.1.1.1 All workmanship is to be of commercial marine quality and acceptable to the Surveyor. Welding is to be in accordance with the requirements of *Sub-Section 5*. Any defect is to be rectified to the satisfaction of the Surveyor before the material is covered with paint, cement or any other composition.

4.1.2 Fabrication standard

- 4.1.2.1 Structural fabrication is to be carried out, in accordance with '*IACS Recommendation 47, Shipbuilding and Repair Quality Standard for New Construction*' or a recognised fabrication standard which has been accepted by the Classification Society prior to the commencement of fabrication/construction.
- 4.1.2.2 The fabrication standard to be used during fabrication/construction is to be made available to the attending representative of the Classification Society, prior to the commencement of the fabrication/construction.
- 4.1.2.3 The fabrication standard is to include information, to establish the range and the tolerance limits, for the items specified as follows:
- (a) Cutting edge
 - the slope of the cut edge and the roughness of the cut edges
 - (b) Flanged longitudinals and brackets and built-up sections
 - the breadth of flange and depth of web, angle between flange and web, and straightness in plane of flange or at the top of face plate
 - (c) Pillars
 - the straightness between decks, and cylindrical structure diameter
 - (d) Brackets and small stiffeners
 - the distortion at the free edge line of tripping brackets and small stiffeners
 - (e) Sub-assembly stiffeners
 - details of snipe end of secondary face plates and stiffeners
 - (f) Plate assembly
 - for flat and curved blocks the dimensions (length and breadth), distortion and squareness, and the deviation of interior members from the plate
 - (g) Cubic assembly
 - in addition to the criteria for plate assembly, twisting deviation between upper and lower plates, for flat and curved cubic blocks
 - (h) Special assembly
 - the distance between upper and lower gudgeons, distance between aft edge of propeller boss and aft peak bulkhead, twist of stern frame assembly, deviation of rudder from shaft centreline, twist of rudder plate, and flatness, breadth and length of top plate of main engine bed. The final boring out of the propeller boss and stern frame, skeg or solepiece, and the fit-up and alignment of the rudder, pintles and axles, are to be carried out after completing the major part of the welding of the aft part of the ship. The

contacts between the conical surfaces of pintles, rudder stocks and rudder axles are to be checked before the final mounting.

- (i) Butt joints in plating
 - alignment of butt joint in plating
- (j) Cruciform joints
 - alignment measured on the median line and measured on the heel line of cruciform joints
- (k) Alignment of interior members
 - alignments of flange of T longitudinals, alignment of panel stiffeners, gaps in T joints and lap joints, and distance between scallop and cut outs for continuous stiffeners in assembly and in erection joints
- (l) Keel and bottom sighting
 - deflections for whole length of the ship, and for the distance between two adjacent bulkheads, cocking-up of fore body and of aft body, and rise of floor amidships
- (m) Dimensions
 - dimensions of length between perpendiculars, moulded breadth and depth at midship, and length between aft edge of propeller boss and main engine
- (n) Fairness of plating between frames
 - deflections between frames of shell, tank top, bulkhead, upper deck, superstructure deck, deck house deck and wall plating
- (o) Fairness of plating in way of frames
 - deflections of shell, tank top, bulkhead, strength deck plating and other structures measured in way of frames

4.2 Cold Forming

4.2.1 Special structural members

- 4.2.1.1 For highly stressed components of the hull girder where notch toughness is of particular concern (e.g. items required to be Class III in *Table 6.1.3*, such as radius gunwales and bilge strakes) the inside bending radius, in cold formed plating, is not to be less than 10 times the gross plate thickness for carbon-manganese steels (hull structural steels, see 1.1). The allowable inside bending radius may be reduced below 10 times the gross plate thickness, providing the additional requirements stated in 4.2.3 are complied with.

4.2.2 Other members

- 4.2.2.1 For main structural members, e.g. corrugated bulkheads and hopper knuckles, the inside bending radius, in cold formed plating, is not to be less than 4.5 times the gross plate thickness for carbon-manganese steels (hull structural steels, see 1.1). The allowable inside bending radius may be reduced below 4.5 times the gross plate thickness, providing the additional requirements stated in 4.2.3 are complied with.

4.2.3 Additional requirements

- 4.2.3.1 When steel is formed below 650°C with a radius of less than 10 or 4.5 times the gross plate thickness for special and other members, respectively, supporting data is

to be provided. As a minimum, the following additional requirements are to be complied with:

- (a) the steel is to be of grade D/DH or higher
- (b) the material is impact tested in the strain-aged condition and satisfies the requirements stated herein. The deformation is to be equal to the maximum deformation to be applied during production, calculated by the formula $t_{grs} / (2r_{bdg} + t_{grs})$, where t_{grs} is the gross thickness of the plate material and r_{bdg} is the bending radius. One sample is to be plastically strained at the calculated deformation or 5%, whichever is greater and then artificially aged at 250°C for one hour then subject to Charpy V-notch testing. The average impact energy after strain ageing is to meet the impact requirements specified for the grade of steel used.
- (c) 100% visual inspection of the deformed area is to be carried out. In addition, random checks by magnetic particle testing are to be carried out.

The bending radius is in no case to be less than twice the gross plate thickness.

4.3 Hot Forming

4.3.1 Temperature requirements

- 4.3.1.1 Steel is not to be formed between the upper and lower critical temperatures. If the forming temperature exceeds 650°C for as-rolled, controlled rolled, thermo-mechanical controlled rolled or normalised steels, or is not at least 28°C lower than the tempering temperature for quenched and tempered steels, mechanical tests are to be made to assure that these temperatures have not adversely affected both the tensile and impact properties of the steel. Where curve forming or fairing, by line or spot heating, is carried out in accordance with 4.3.2.1 these mechanical tests are not required.
- 4.3.1.2 Confirmation is required to demonstrate the mechanical properties after further heating meet the requirements specified by a procedure test using representative material, when considering further heating other than in 4.3.1.1 of thermo-mechanically controlled steels (TMCP plates) for forming and stress relieving.

4.3.2 Line or spot heating

- 4.3.2.1 Curve forming or fairing, by linear or spot heating, is to be carried out using approved procedures in order to ensure that the properties of the material are not adversely affected. Heating temperature, on the surface, is to be controlled so as not to exceed the maximum allowable limit applicable to the plate grade.

4.4 Welding

4.4.1 General

- 4.4.1.1 All welding is to be carried out by approved welders, in accordance with approved welding procedures, using approved welding consumables and is to comply with the Rules for Materials of the individual Classification Society.

4.4.2 Welding sequence

- 4.4.2.1 Consideration is to be given to the assembly sequence and the effect on the overall shrinkage of plate panels, assemblies, etc., resulting from the welding processes

employed. Welding is to proceed systematically, with each welded joint being completed in the correct sequence, without undue interruption.

4.4.2.2 Where practicable, welding is to commence at the centre of a joint and proceed outwards, or at the centre of an assembly and progress outwards towards the perimeter so that each part has freedom to move in one or more directions.

4.4.2.3 Generally, the welding of stiffener members, including transverses, frames, girders, etc., to welded plate panels by automatic processes is to be carried out in such a way as to minimize angular distortion of the stiffener.

4.4.3 Arrangements at junctions of welds

4.4.3.1 Welds are to be made flush in way of the faying surface where stiffening members, attached by continuous fillet welds, cross the completely finished butt or seam welds. Similarly, butt welds in webs of stiffening members are to be completed and made flush with the stiffening member before the fillet weld is made. The ends of the flush portion are to run out smoothly without notches or sudden changes of section. Where these conditions cannot be complied with, a scallop is to be arranged in the web of the stiffening member. Scallops are to be of a size, and in a position, that a satisfactory return weld can be made.

4.4.4 Leak stoppers

4.4.4.1 Where structural members pass through the boundary of a tank, leakage into the adjacent space could be hazardous or undesirable, and full penetration welding is to be adopted for the members for at least 150mm on each side of the boundary. Alternatively, a small scallop of suitable shape may be cut in the member close to the boundary outside of the compartment, and carefully welded all around.

5 WELD DESIGN AND DIMENSIONS

5.1 General

5.1.1 Scope

- 5.1.1.1 In general, weld sizes are based on the Rule gross thickness values.
- 5.1.1.2 Requirements for welding sequence, qualification of welders, welding procedures and welding consumables are given in 4.4.

5.1.2 Plans and specifications

- 5.1.2.1 Plans and/or specifications showing weld sizes and weld details are to be submitted for approval for each new construction project.
- 5.1.2.2 Where reductions in weld sizes are proposed the requirements given in 5.9 are to be applied and the following details are to be included in the welding specification:
 - (a) proposed weld gap size
 - (b) proposed welding consumable.

5.1.3 Tolerance requirements

- 5.1.3.1 The gaps between the faying surfaces of members being joined are to be kept to a minimum or in accordance with approved specification.
- 5.1.3.2 Where the gap between the members joined by fillet welds exceeds 2mm, the weld size is to be increased in accordance with 5.7.1.6.

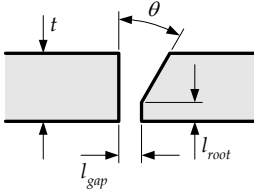

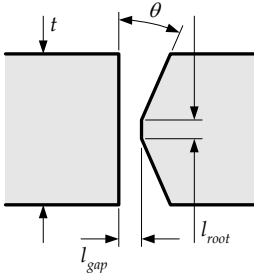

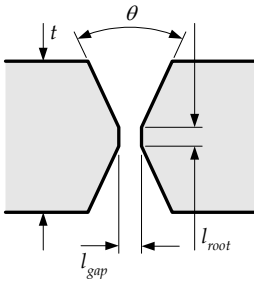

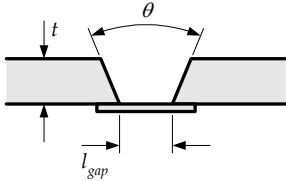

5.1.4 Special precautions

- 5.1.4.1 Welding is to be based on approved welding procedure specifications where small fillets are used to attach heavy plates or sections. Special precautions, such as the use of preheating, low-hydrogen electrodes or low-hydrogen welding processes, are accepted.
- 5.1.4.2 When heavy structural members are attached to relatively light plating, the weld size and sequence may require modification.

5.2 Butt Joints

5.2.1 General

- 5.2.1.1 Joints in the plate components of stiffened panel structures are generally to be joined by butt welds. Typical types of butt welds with corresponding edge preparation are shown in *Figure 6.5.1*.
- 5.2.1.2 All types of butt joints are to be welded from both sides. Before welding is carried out on the second side, unsound weld metal is to be removed at the root by a suitable method. Butt welding from one side will only be permitted for specific applications with an approved welding procedure specification.

<p align="center">Figure 6.5.1 Typical Butt Welds</p>
<p align="center">Single bevel butt</p> 
<p align="center">Double bevel butt</p> 
<p align="center">Double vee butt, uniform bevels</p> 
<p align="center">Single vee butt, one side welding with backing strip (temporary or permanent)</p> 
<p><u>Note</u></p> <ol style="list-style-type: none"> 1. The above figures are shown for guidance only. Actual details and dimensions are to be in accordance with a recognised fabrication standard. See 4.1.2.1

5.2.2 Thickness difference in butt welds

- 5.2.2.1 Abrupt change of section is to be avoided where plates of different thicknesses are butt welded.
- 5.2.2.2 Where plates to be joined differ in thickness by more than 4mm, a suitable transition taper is to be provided. The transition may be formed by tapering the thicker member, or by specifying a weld joint design which provides the required transition.
- 5.2.2.3 For the transverse butts in longitudinal strength members, the transition taper length is to be not less than three times the offset.
- 5.2.2.4 Differences in thickness greater than 4mm and without transition taper may be accepted for specific applications.

5.3 Tee or Cross Joints

5.3.1 General

- 5.3.1.1 The connection of primary support members and stiffener web/end connections and joints formed by plating abutting on another plate panel is generally to be made by fillet welds sized in accordance with 5.7 and *Figure 6.5.2*. Examples of other typical tee or cross joint weld arrangements are shown in *Figure 6.5.3*.
- 5.3.1.2 Where the connection is highly stressed or otherwise considered critical, a partial or full penetration weld is to be achieved by bevelling the edge of the abutting plate. See 5.3.4 and *Figure 6.5.3*.

Figure 6.5.2
Typical Tee or Cross Joint Fillet Welds

Note

1. The above figure is shown for guidance only. Actual details and dimensions are to be in accordance with a recognised fabrication standard. See 4.1.2.1.

Figure 6.5.3
Other Typical Tee and Cross Joint Welds

Small angle fillet

Single bevel tee with permanent backing

Double bevel tee symmetrical

Notes

1. The above figures are shown for guidance only. Actual details and dimensions are to be in accordance with a recognised fabrication standard. See 4.1.2.1.

5.3.2 Continuous welding

5.3.2.1 Continuous welding is to be adopted in the following locations:

- (a) all fillet welds where higher strength steel is used
- (b) boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings
- (c) boundaries of tanks and watertight compartments
- (d) all structures in ballast and fresh water tanks and the ballast and fresh water tank bulkhead stiffeners
- (e) all structures in the aft peak and the aft peak bulkhead stiffeners
- (f) all structures in the fore peak tank/void
- (g) all welding inside tanks intended for crude oil, petroleum products, chemicals, edible liquids or fresh water cargoes
- (h) welding in way of all end connections, including end brackets, lugs, scallops, and at the orthogonal connections with other members
- (i) all lap welds in the main hull
- (j) primary support members and stiffener members to bottom shell in the 0.3L forward region
- (k) flat bar longitudinals to plating
- (l) the attachment of minor fittings to higher strength steel plating and other connections or attachments.

5.3.3 Intermittent welding

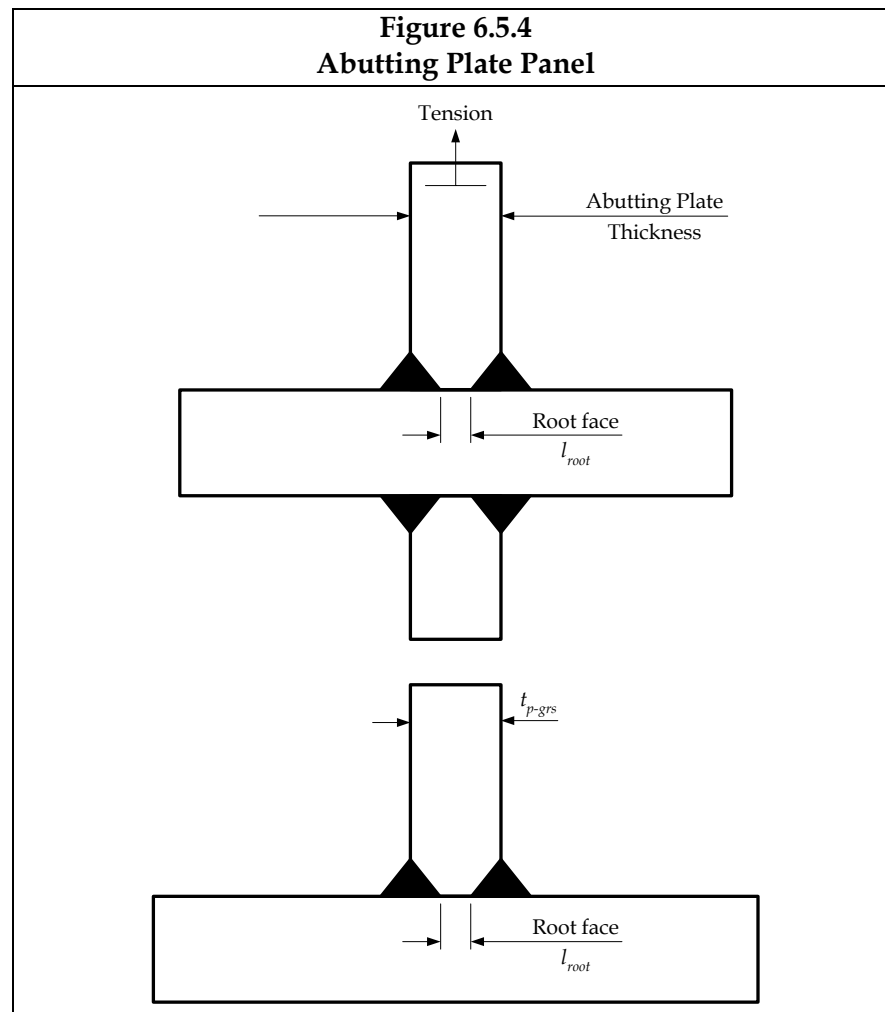

5.3.3.1 Where continuous welding is not required, intermittent welding may be applied.

5.3.3.2 Where beams, stiffeners, frames, etc, are intermittently welded and pass through slotted girders, shelves or stringers, there is to be a pair of matched intermittent welds on each side of every intersection. In addition, the beams, stiffeners and frames are to be efficiently attached to the girders, shelves and stringers.

5.3.4 Full or partial penetration corner or tee joints

5.3.4.1 Where high tensile stresses act through an intermediate plate (see *Figure 6.5.4*), increased fillet welds or penetration welds are to be used as required by 5.8. Examples of such structures are:

- (a) connection of hopper to inner hull
- (b) longitudinal/transverse bulkhead primary support member end connections to the double bottom
- (c) connection of corrugated bulkhead lower stool side plates to shelf plate and inner bottom/hopper tank
- (d) connections of gusset plates to corrugated bulkheads
- (e) connection of double bottom floors, lower hopper tank webs and double bottom girders below corrugated bulkhead flanges and gusset plates for corrugated bulkheads configured without lower stools
- (f) structural elements in double bottoms below bulkhead primary support members and stool plates.

- 5.3.4.2 Full or partial penetration welds, with maximum root face, $l_{root} = t_{p-grs}/3$, where l_{root} is the weld root face length and t_{p-grs} is the gross plate thickness, as shown in Figure 6.5.4, are to be used in the connection of hopper sloped plating to inner bottom.
- 5.3.4.3 Full penetration welds are to be used in the following connections:
- lower end of vertical corrugated bulkhead connections
 - lower end of gusset plates fitted to corrugated bulkheads
 - rudder horns and shaft brackets to shell structure
 - rudder side plating to rudder stock connection areas
 - edge reinforcements within $0.6L$ amidships to the strength deck, sheer strake, bottom and bilge plating, when the transverse dimensions of the opening exceeds 300mm, see Figure 6.5.5. Where collar plates are fitted in way of pipe penetrations, the collar plate is to be welded by a continuous fillet weld.
 - abutting plate panels with gross plate thickness, t_{p-grs} , as shown in Figure 6.5.4, less than or equal to 12mm, forming outer shell boundaries below the scantling draught, T_{sc} , including, but not limited to; sea chests, rudder trunks, and portions of transoms. For gross plate thickness, t_{p-grs} , greater than 12mm, partial penetration welding with a maximum root face length $l_{root} = t_{p-grs}/3$ is acceptable.
 - crane pedestals and associated bracketing and support structure, as required by Section 11/3.1.4.14.

5.4 Lapped Joints

5.4.1 General

- 5.4.1.1 Overlaps may be adopted for end connections where the connection is not subject to high tensile or compressive loading.
- 5.4.1.2 Where overlaps are adopted, the width of the overlap, w_{lap} , is not to be less than three times, but not greater than four times, the gross thickness of the thinner of the plates being joined. See *Figure 6.5.6*. Where the gross thickness of the thinner plate being joined has a thickness of 25mm or more the overlap will be subject to special consideration.
- 5.4.1.3 The overlaps for lugs and collars in way of cut-outs for the passage of stiffeners through webs and bulkhead plating are not to be less than three times the thickness of the lug but need not be greater than 50mm. The joints are to be positioned to allow adequate access for completion of sound welds.
- 5.4.1.4 The faying surfaces of lap joints are to be in close contact and both edges of the overlap are to have continuous fillet welds.

5.4.2 Overlapped end connections

- 5.4.2.1 Lapped end connections, where accepted by the Rules, are to have continuous welds on each edge with leg length, l_{leg} , as shown in *Figure 6.5.6*, such that the sum of the two leg lengths is not less than 1.5 times the gross thickness of the thinner plate.

5.4.3 Overlapped seams

- 5.4.3.1 Overlapped seams are to have continuous welds on both edges, of the sizes required by *Table 6.5.1* for the boundaries of tank or watertight bulkheads. Seams for plates with a gross thickness of 12.5mm or less, which are clear of tanks, may have one edge with intermittent welds in accordance with *Table 6.5.1* for watertight bulkhead boundaries.

5.5 Slot Welds

5.5.1 General

- 5.5.1.1 Slot welds may be specially approved for particular applications. Typical applications are indicated in 5.5.2 and 5.5.3, and typical arrangements are shown in *Figure 6.5.7*.
- 5.5.1.2 Slots are to be well-rounded and have a minimum slot length, l_{slot} , of 75mm and width, w_{slot} , of twice the gross plate thickness. Where used in the body of doublers and similar locations, such welds are in general to be spaced a distance, s_{slot} , of $2l_{slot}$ to $3l_{slot}$ but not greater than 250mm.

5.5.2 Closing plates

- 5.5.2.1 For the connection of plating to internal webs, where access for welding is not practicable, the closing plating may be attached by slot fillet welds to face plates fitted to the webs.
- 5.5.2.2 Slots are to be well rounded and have a minimum slot length, l_{slot} , of 90mm and a minimum width, w_{slot} , of twice the gross plate thickness. Slots cut in plating are to have smooth, clean and square edges and are in general to be spaced a distance, s_{slot} , not greater than 140mm. Slots are not to be filled with welding.

5.5.3 (void)

- 5.5.3.1 (void)

5.6 Stud Welds

5.6.1 General

- 5.6.1.1 Where permanent or temporary studs are to be attached by welding to main structural parts in areas subject to high stress, the proposed location of the studs is to be submitted for approval.

5.7 Determination of the Size of Welds

5.7.1 General

5.7.1.1 The following weld sizes are to be rounded to the nearest half millimetre.

5.7.1.2 The leg length, l_{leg} , as shown in *Figure 6.5.8*, of continuous, lapped or intermittent fillet welds, in association with the requirements of 5.7.2 to 5.7.5, is not to be taken as less than:

(a) $l_{leg} = f_1 t_{p-grs}$

(b) $l_{leg} = f_{yd} f_{weld} f_2 t_{p-grs} + t_{gap}$

(c) l_{leg} as given in *Table 6.5.2*

Where:

f_1 = 0.30 for double continuous welding
= 0.38 for intermittent welding

t_{p-grs} the gross plate thickness, in mm. Is generally to be taken as that of the abutting member (member being attached). See 5.7.1.5

f_{yd} correction factor taking into account the yield strength of the weld deposit:

$$= \left(\frac{1}{k} \right)^{0.5} \left(\frac{235}{\sigma_{weld}} \right)^{0.75} \text{ but is not to be taken as less than } 0.707$$

σ_{weld} minimum yield stress of the weld deposit, and is not to be less than:

305N/mm² for welding of normal strength steel

375N/mm² for welding of higher strength steels with yield strength of 265 to 355N/mm²

400 N/mm² for welding of higher strength steel with yield strength of 390N/mm²

See 5.9.4 for additional requirements that are to be applied where the weld size is determined based on a weld deposit yield strength that exceeds the specified minimum value

k higher strength steel factor, as defined in 1.1.4. k is to be based on the material of the abutting member

f_{weld} weld factor depending on the type of structural member, see 5.7.2, 5.7.3 and 5.7.5

f_2 correction factor for the type of weld:

1.0 for double continuous fillet

$\frac{s_{ctr}}{l_{weld}}$ for intermittent or chain welding

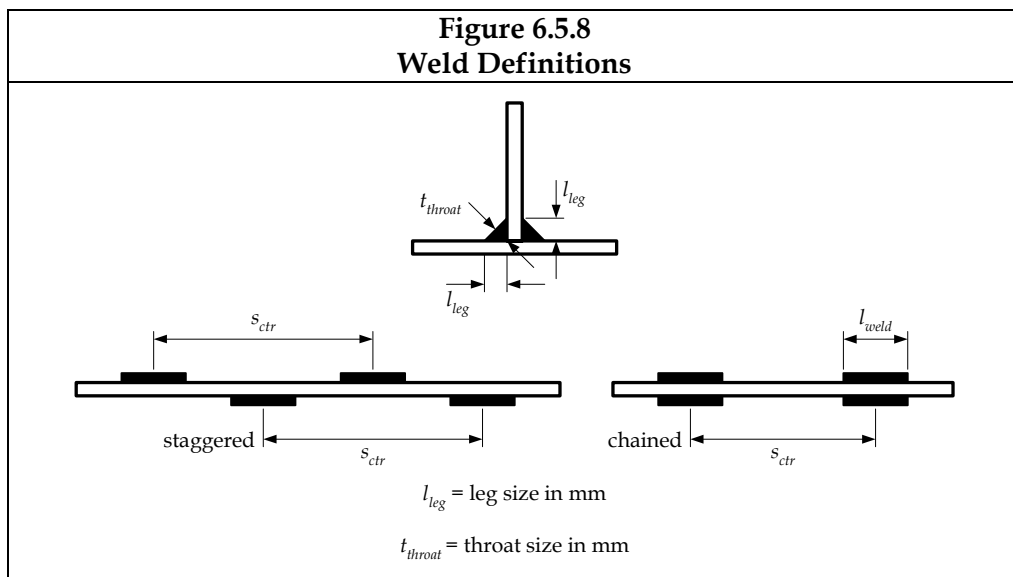

l_{weld} the actual length of weld fillet, clear of crater, in mm

s_{ctr} the distance between successive weld fillets, from centre to centre, in mm

t_{gap} allowance for weld gap (lesser gaps may be permitted, see 5.9.2):

$$\begin{aligned}
 &= 2.0\text{mm} && \text{for } t_{p-grs} > 6.5\text{mm} \\
 &= 2\left(1.25 - \frac{1}{f_2}\right)\text{mm} && \text{for } t_{p-grs} \leq 6.5\text{mm}
 \end{aligned}$$

- 5.7.1.3 The throat size is not to be less than $l_{leg}/\sqrt{2}$, where the leg length, l_{leg} , is as shown in *Figure 6.5.8*.
- 5.7.1.4 The leg size for matched fillet welds either side of an intersection with intermittent welding is not to be greater than $0.62t_{p-grs}$ or 6.5mm, whichever is the lesser.
- 5.7.1.5 Where the gross web thickness of the abutting longitudinal stiffener is greater than 15mm and exceeds the thickness of the table member (e.g. plating), the welding is to be double continuous and the leg length of the weld is to be not less than the greatest of the following:
- 0.3 times the gross thickness of the table member. The table member thickness used need not be greater than 30mm
 - 0.27 times the gross thickness of the abutting member plus 1.0mm. The leg size need not be greater than 8.0mm
 - as given by *Table 6.5.2* for stiffeners to plating.
- 5.7.1.6 Where the gap between members being joined exceeds 2mm and is not greater than 5mm, the weld leg size is to be increased by the amount of the opening in excess of 2mm. Where the opening between members is greater than 5mm, corrective measures are to be taken, in accordance with an approved welding procedure specification.

5.7.2 Welding of fillet joints of main structural components

- 5.7.2.1 General weld factors for the connections of the structural components of the hull are given in *Table 6.5.1*.
- 5.7.2.2 Where components of the hull form a part of a double skin primary support member the requirements of 5.7.4 are also to be applied.
- 5.7.2.3 Where high tensile stresses act through an intermediate plate (see *Figure 6.5.4*), increased fillet welds or penetration welds are to be used as required by 5.8.

5.7.3 Welding of primary support members

- 5.7.3.1 Weld factors for the connections of the web plating of primary support members are given in *Table 6.5.4*.
- 5.7.3.2 Where the minimum weld size is determined by the requirements of 5.7.1.2(b) the weld connections to shell, decks or bulkheads are to take account of the material lost in the cut out where stiffeners pass through the member. In cases where the web plating and the width of the notch exceeds 15 percent of the stiffener spacing, the size of the weld leg length is to be multiplied by:

$$\frac{0.85s}{l_w}$$

Where:

s stiffener spacing, in mm

l_w length of web plating between notches, in mm, see *Figure 6.5.9*

5.7.4 Welding of end connections of primary support members

- 5.7.4.1 Welding of end connections of primary support members (i.e. transverse frames and girders) is to be such that the weld area, A_{weld} , is to be equivalent to the Rule gross cross-sectional area of the member. In terms of weld leg length, l_{leg} , this is to be taken as by:

$$l_{leg} = 1.41 f_{yd} \frac{h_w t_{p-grs}}{l_{dep}} \quad \text{mm}$$

Where:

h_w web height of primary support member, in mm, see *Figure 6.5.10*

t_{p-grs} rule gross thickness of the primary support member, in mm

l_{dep} total length of deposit of weld metal, in mm. Generally this can be taken as twice l_{weld} shown in *Figure 6.5.10* for a double continuous fillet weld

f_{yd} correction factor taking into account the yield strength of the weld deposit, as defined in 5.7.1.2

In no case is the size of weld to be less than that calculated in accordance with 5.7.1.2, using a minimum weld factor, f_l , of 0.48 in tanks or 0.38 elsewhere.

Figure 6.5.10
End Connection of Primary Support Members

Note

1. The length l_{weld} is the length of the welded connection. The total length of the weld deposit l_{dep} is, for double continuous fillet welds, twice the length of the welded connection l_{weld}

5.7.5 Welding at the ends of stiffeners

- 5.7.5.1 Welding of longitudinals to plating is to be double continuous at the ends of the longitudinals. In way of transverses the length of the double continuous weld is to be equal the depth of the longitudinal, or the depth of the end bracket, whichever is greater.
- 5.7.5.2 For deck longitudinals, a matched pair of welds is required at the intersection of longitudinals with transverses.
- 5.7.5.3 The welding of stiffener (i.e. longitudinals, beams and bulkhead stiffeners) end connections is to be not less than as required by Table 6.5.5. Where two requirements are given, the greater is to be complied with. The area of weld, A_{weld} , indicated in Table 6.5.5, is to be applied to each arm of the bracket or lapped connection.
- 5.7.5.4 Where a longitudinal strength member is cut at a primary support structure and the continuity of strength is provided by brackets, the weld area, A_{weld} , based on the effective throat times the length of the weld, is to be not less than the gross cross-sectional area of the member. If the longitudinal strength member is of high strength steel, the weld area, A_{weld} , is to be multiplied by f_{yd} , the correction factor taking into account the yield strength of the weld deposit as defined in 5.7.1.2.

- 5.7.5.5 Where the stiffener member passes through, and is supported by the web of a primary support member, the weld connection is to be in accordance with the requirements of *Section 4/3.4.3.11*.
- 5.7.5.6 Where intermittent welding is permitted, unbracketed stiffeners of shell, watertight and oil-tight bulkheads, and house fronts are to have double continuous welds for one-tenth of their length at each end. Unbracketed stiffeners of non-tight structural bulkheads, deck house sides and aft ends are to have a pair of matched intermittent welds at each end.

5.8 Weld for Structures Subject to High Tensile Stresses

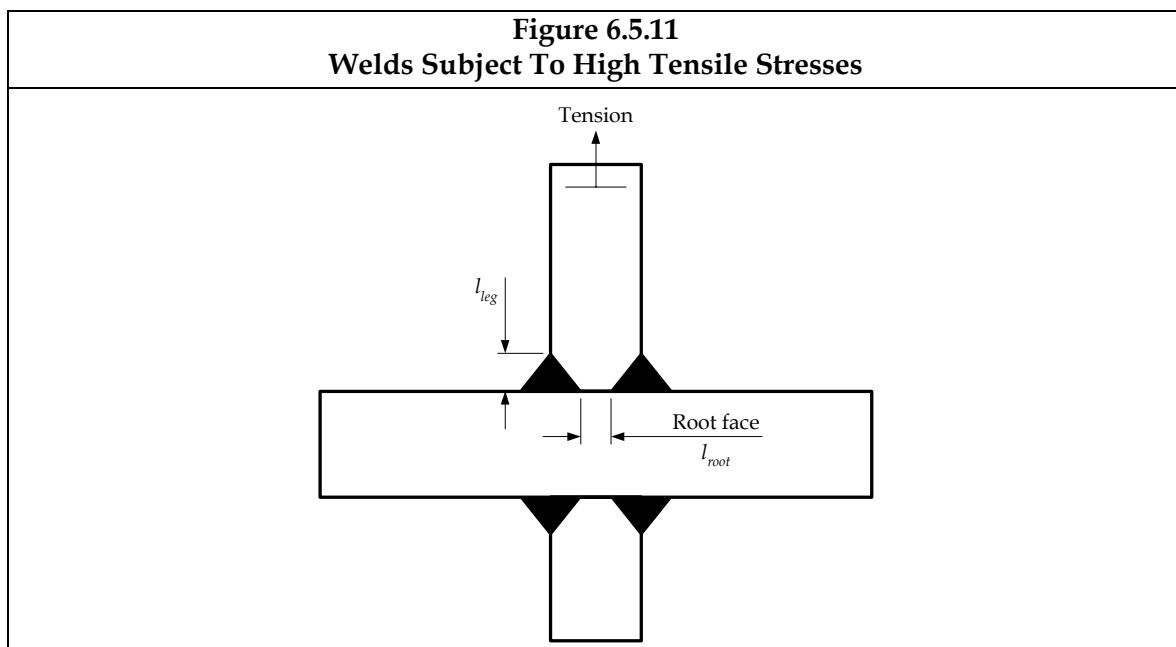

5.8.1 Minimum leg size

- 5.8.1.1 Where high tensile stresses act through an intermediate plate, see *Figure 6.5.11*, the minimum leg length, l_{leg} , of double continuous welds is to be taken as:

$$l_{leg} = 1.92 \left(\frac{235}{\sigma_{weld}} \right)^{0.75} \left[0.2 + \left(\frac{\sigma}{270} - 0.25 \right) \frac{l_{root}}{t_{p-grs}} \right] t_{p-grs} + 2.0 \quad \text{mm}$$

Where:

- σ maximum tensile stress in plate being attached, in N/mm²
- l_{root} root face length, in mm
- t_{p-grs} gross thickness of plate being attached, in mm
- σ_{weld} as defined in 5.7.1.2, where σ_{weld} is limited to the maximum value permitted by the limits imposed on correction factor taking into account the yield strength of the weld deposit, f_{yd} , as defined in 5.7.1.2

5.9 Reduced Weld Size

5.9.1 General

- 5.9.1.1 Reduction in fillet weld sizes that are required by 5.7 may be specially approved in accordance with either 5.9.2, 5.9.3 or 5.9.4.
- 5.9.1.2 Where any of the methods for reduction of the weld size are adopted, the specific requirements giving justification for the reduction are to be indicated on the drawings. The drawings are to document the weld design and dimensioning requirements for the reduced weld leg length and the required weld leg length given by 5.7 without the permitted leg length reduction. Also, notes are to be added to the drawings to describe the difference in the two leg lengths and the requirements for their application.

5.9.2 Controlled gaps

- 5.9.2.1 Where quality control facilitates working to a gap between members of 1mm or less, a reduction in fillet weld leg size of 0.5mm is permitted.

5.9.3 Deep penetration welding

- 5.9.3.1 Where an approved automatic deep penetration procedure is used and quality control facilitates are working to a gap between members of 1mm or less, the weld factors given in *Tables 6.5.1, 6.5.2(c) and (d), 6.5.4 and 6.5.5* may be reduced by 15 percent. Reductions of up to 20 percent, but not more than the fillet weld leg size of 1.5mm, will be accepted provided that the Shipyard is able to consistently meet the following requirements:
- (a) the welding is performed to a suitable process selection confirmed by welding procedure tests covering both minimum and maximum root gaps
 - (b) the penetration at the root is at least the same amount as the reduction into the members being attached
 - (c) demonstrate that an established quality control system is in place.

5.9.4 Controlled welding consumables

- 5.9.4.1 Where quality control systems are in place which ensure that the grade of welding consumable used is higher than the minimum required for the particular strength steel being welded, the welding consumables that are used may have a weld deposit material yield strength that is greater than the minimums specified in 5.7.1.2 and the size of the weld may be determined based on the yield strength of the higher grade welding consumable.

5.10 End Connections of Pillars and Cross Ties

5.10.1 Effective weld area

- 5.10.1.1 The end connections of pillars and cross ties are to have an effective fillet weld area (weld throat multiplied by weld length) not less than:

$$A_{weld} = f_3 \left(\frac{235}{\sigma_{weld}} \right)^{0.75} A_{grs} P \quad \text{cm}^2$$

Where:

A_{grs} gross cross-sectional area, for the pillar or cross tie, in m²

P	design pressure load, for the structure under consideration, in kN/m^2
σ_{weld}	minimum yield stress of the deposit, as given in 5.7.1.2, where σ_{weld} is limited to the maximum value permitted by the limits imposed on f_{yd} in 5.7.1.2
f_3	= 0.05 when pillar or cross tie is in compression only = 0.14 when pillar or cross tie is in tension

5.11 Alternatives

5.11.1 General

5.11.1.1 The foregoing are considered minimum requirements for electric-arc welding in hull construction, but alternative methods, arrangements and details will be specially considered for approval.

5.11.1.2 The leg length limits given in *Table 6.5.2* are to be complied with in all cases.

Table 6.5.1 Weld Factors		
Items	Weld Factor	Remarks
	f_{weld}	
(1) General application		except as required by items 2-11
Watertight boundaries	0.43	
Non-tight plate boundaries	0.18	
Strength deck plating to shell	see Table 6.5.3	
Other decks to shell and bulkheads (except where forming tank boundaries)	0.30	generally continuous
Stiffeners to plating (clear of end connections)	0.13	in dry spaces
	0.18	in tanks
Stiffeners to plating for 0.1 span at ends	0.21	or extent of end bracket if greater
Panel stiffeners	0.13	
Overlapped welds generally	0.36	
Longitudinals, with gross web thickness greater than 15mm, to plating	see 5.7.1.5	t_{p-grs} as defined in 5.7.1.5
(2) Bottom construction in cargo tank region		(1)
Non-tight centre girder: to keel	0.30	
to inner bottom	0.28	no scallops
Non-tight boundaries of floors and girders	0.15	mid half span
	0.24	end quarters span
Floors and girder to inner bottom in way of: vertical primary supporting members	0.43	(1)
Connection between floors and girders	0.36	(1)
End connection of floors and girders	0.43	(1)
Docking brackets	0.30

Deck machinery seats to deck	0.20	
Mooring equipment seats	0.43	
(11) Miscellaneous fittings and equipment		
Rings for access hole type covers to ship	0.43	
Frames of shell and weathertight doors	0.43	
Stiffening of shell and weathertight doors	0.24	
Ventilators, air pipes, etc., coaming to deck	0.43	
Ventilators, etc., fittings	0.24	
Scuppers and discharge to deck	0.55	
Bulwark stays to deck	0.24	
Bulwark attachment to deck	0.43	
Guard rails, stanchions, etc., to deck	0.43	
Bilge keel ground bars to shell	see Table 11.3.1	
Bilge keels to ground bars	see Table 11.3.1	
Fabricated anchors	full penetration	
Note 1. The weld size is to be increased for areas with high tensile stress, see 5.8. 2. Unbracketed stiffeners and webs of hatch covers are to be welded continuously to the plating and to the face plate for a length, at the ends, equal to the end depth of the member. 3. Weld factors are minimum values.		

Table 6.5.2 Leg Size	
Item	Minimum Leg Size ⁽¹⁾ , mm
(a) Gross plate thickness $t_{p-grs} \leq 6.5\text{mm}$ ⁽⁵⁾	
Hand or automatic welding	4.0
Automatic deep penetration welding	4.0
(b) Gross plate thickness $t_{p-grs} > 6.5\text{mm}$ ⁽⁵⁾	
Hand or automatic welding	4.5
Automatic deep penetration welding	4.0
(c) Welds within 3m below top of ballast and cargo tanks ^{(2) (4)}	6.5
(d) All welds in cargo tank region, except in (c) ⁽⁴⁾	6.0
Note 1. In all cases, the limiting value is to be taken as the greatest of the applicable values given above. 2. Only applicable to cargo and ballast tanks with weather deck as the tank top. 3. See 5.9 for provisions to reduce minimum leg size. 4. A reduction to 5.5mm leg size for the secondary structural elements such as carling, buckling stiffeners and tripping brackets may be applied without additional gap control. 5. For superstructure and deck houses, the minimum leg length may be taken as 3.5mm.	

(RCN 2, effective from 1 July 2008)

Table 6.5.3
Weld Connection of Strength Deck Plating to Sheer Strake

Stringer gross plate thickness, in mm	Weld type
$t_{p-grs} \leq 15$	Double continuous fillet weld with a leg size of $0.60 t_{p-grs} + 2.0\text{mm}$
$15 < t_{p-grs} \leq 20$	Single vee preparation to provide included angle of 50° with root face length $l_{root} < t_{p-grs} / 3$ in conjunction with a continuous fillet weld with a weld factor of 0.35 or Double vee preparation to provide included angle of 50° with root face length $l_{root} < t_{p-grs} / 3$
$t_{p-grs} > 20$	Double vee preparation to provide included angle of 50° with root face length $l_{root} < t_{p-grs} / 3$, but not to be greater than 10mm

Where t_{p-grs} = gross thickness of stringer plate, in mm

Note

1. Welding procedure, including joint preparation, is to be specified and approved for individual builders.
2. Where structural members pass through the boundary of a tank a leak stopper is to be arranged in accordance with 4.4.4.
3. Alternative connections will be specially considered.

Table 6.5.4 Connection of Primary Support Members						
Primary Support Member gross face area, in cm ²		Position ⁽¹⁾	Weld factor, f_{weld}			
Greater than	Not greater than		In tanks		In dry spaces	
			To face plate	To plating	To face plate	To plating
30.0	30.0	At ends	0.20	0.26	0.20	0.20
		Remainder	0.12	0.20	0.12	0.15
65.0	65.0	At ends	0.20	0.38	0.20	0.20
		Remainder	0.12	0.26	0.12	0.15
95.0	95.0	At ends	0.42	0.59 ⁽³⁾	0.20	0.30
		Remainder	0.30 ⁽²⁾	0.42	0.15	0.20
130.0	130.0	At ends	0.42	0.59 ⁽³⁾	0.30	0.42
		Remainder	0.30 ⁽²⁾	0.42	0.20	0.30
		At ends	0.59	0.59 ⁽³⁾	0.42	0.59 ⁽³⁾
		Remainder	0.42	0.42	0.30	0.42
Note						
1. The weld factors 'at ends' are to be applied for 0.2 times the overall length of the member from each end, but at least beyond the toe of the member end brackets. On vertical webs, the increased welding may be omitted at the top, but is to extend at least 0.3 times overall length from the bottom.						
2. Weld factor 0.38 to be used for cargo tanks.						
3. Where the web plate thickness is increased locally to meet shear stress requirements, the weld size may be based on the gross web thickness clear of the increased area, but is to be not less than weld factor of 0.42 based on the increased gross thickness.						
4. In regions of high stress, see 5.3.4, 5.7.4 and 5.8.						

Table 6.5.5 Stiffener End Connection Welds		
Connection	Weld area, A_{weld} , in cm ²	Weld Factor, f_{weld} ⁽¹⁾
(1) Stiffener welded direct to plating	$0.25A_{stf-grs}$ or 6.5 cm ² whichever is the greater	0.38
(2) Bracketless connection of stiffeners, stiffener lapped to bracket or bracket lapped to stiffener:		
(a) in dry space	$1.2\sqrt{Z_{grs}}$	0.26
(b) in tank	$1.4\sqrt{Z_{grs}}$	0.38
(c) main frame to tank side bracket in 0.15L forward	as (a) or (b)	0.38
(3) Bracket welded to face of stiffener and bracket connection to plating	—	0.38
Where:		
$A_{stf-grs}$	gross cross sectional area of the stiffener, in cm ²	
A_{weld}	weld area, in cm ² , and is calculated as total length of weld, in cm, times throat thickness, in cm (Where the gap exceeds 2mm the weld size is to be increased. See 5.7.1.6)	
Z_{grs}	the gross section modulus required, in cm ³ , of the stiffener on which the scantlings of the bracket are based	
<u>Note</u>		
1. For minimum weld fillet sizes, see Table 6.5.2.		

SECTION 7

LOADS

1 INTRODUCTION

1.1 General

1.1.1 Application

1.1.1.1 This section provides in detail the loads and load combinations for the scantling calculations. The loads cover load scenarios in harbour and at sea, see *Section 2/5.4*, dividing the loads into static load components, dynamic load components, sloshing loads and impact loads.

1.2 Definitions

1.2.1 Coordinate system

1.2.1.1 The applied coordinate system x, y, z is as defined in *Section 4/1.4.1.1*.

1.2.1.2 The direction of the incident waves are specified by the angle β between the x -axis and the propagating wave direction as shown in *Figure 7.1.1*. Examples given:

- (a) head sea is waves propagating in the negative x -direction,
- (b) beam sea is waves propagating in the positive or negative y -direction,
- (c) oblique sea is waves propagating in a direction between head and beam sea (or following and beam sea), and
- (d) following sea is waves propagating in positive x -direction.

1.2.2 Sign conventions

1.2.2.1 Positive motions, as shown in *Figure 7.1.2*, are defined as:

- (a) positive surge is translation along positive x -axis (forward)
- (b) positive sway is translation along positive y -axis (towards port side of vessel)
- (c) positive heave is translation along positive z -axis (upwards)
- (d) positive roll is starboard down and port side up
- (e) positive pitch is bow down and stern up
- (f) positive yaw is bow rotating towards portside of vessel and stern towards starboard side.

Figure 7.1.2
Definition of Positive Motions

Note

1. This figure shows the rotation axis and not the coordinate system.

1.2.2.2 Positive accelerations are defined as:

- (a) positive longitudinal acceleration is acceleration along positive x -axis (forward)
- (b) positive transverse acceleration is acceleration along positive y -axis (towards portside of vessel)
- (c) positive vertical acceleration is acceleration along positive z -axis (upwards).

1.2.2.3 The sign convention of positive vertical hull girder shear force is shown in Figure 7.1.3.

Figure 7.1.3
Positive Vertical Shear Force

1.2.2.4 The sign conventions of positive hull girder bending moments are shown in Figures 7.1.4 and 7.1.5, and are defined as:

- (a) positive vertical bending moment is a hogging moment and negative vertical bending moment is a sagging moment
- (b) positive horizontal bending moment is tension on the starboard side and compression on the port side.

Figure 7.1.4
Positive Vertical Bending Moment

2 STATIC LOAD COMPONENTS

2.1 Static Hull Girder Loads

2.1.1 Permissible hull girder still water bending moment

- 2.1.1.1 The designer is to provide the permissible hull girder hogging and sagging still water bending moment limits for seagoing, $M_{sw-perm-sea}$, and harbour/sheltered water operations, $M_{sw-perm-harb}$.
- 2.1.1.2 The permissible hull girder hogging and sagging still water bending moment limits are to be given at each transverse bulkhead in the cargo area, at the middle of cargo tanks, at the collision bulkhead, at the engine room forward bulkhead and at the midpoint between the fwd and aft engine room bulkhead.
- 2.1.1.3 The permissible hull girder hogging and sagging still water bending moment envelope is given by linear interpolation between values at the longitudinal positions given in 2.1.1.2.
- 2.1.1.4 The permissible hull girder hogging and sagging still water bending moment envelopes are to be included in the loading manual as required in Section 8/1.1.2.
- 2.1.1.5 The permissible hull girder hogging and sagging still water bending moment envelopes for seagoing operations, $M_{sw-perm-sea}$, are to envelop the minimum hull girder hogging and sagging still water bending moments given in 2.1.2.1 and 2.1.2.2 and the most severe hogging and sagging hull girder still water bending moments calculated for any seagoing loading condition given in the loading manual. The requirements for the loading conditions are given in Section 8/1.1.2.
- 2.1.1.6 The permissible hull girder hogging and sagging still water bending moment envelopes for harbour/sheltered water operation, $M_{sw-perm-harb}$, are to envelop the minimum hull girder hogging and sagging still water bending moments given in 2.1.2.3 and the most severe hogging and sagging hull girder still water bending moments calculated for any harbour/sheltered water loading condition given in the loading manual and are not to be less than the permissible envelopes for seagoing operation, $M_{sw-perm-sea}$.

Guidance note:

It is recommended that, for initial design, the permissible hull girder hogging and sagging still water bending moment envelopes are at least 5% above the hull girder still water bending moment envelope from the loading conditions in the loading manual, to account for growth and design margins during the design and construction phase of the ship.

2.1.2 Minimum hull girder still water bending moment

- 2.1.2.1 The minimum hull girder hogging and sagging still water bending moment for seagoing operations, $M_{sw-min-sea-mid}$, at amidships is to be taken as:

for hogging:

$$M_{sw-min-sea-mid} = f_{sea} (Z_{v-min} \sigma_{perm-sea} 10^3 - M_{wv-hog}) \quad \text{kNm}$$

which is identical to

$$M_{sw-min-sea-mid} = 0.01 C_{wv} L^2 B(11.97 - 1.9C_b) \quad \text{kNm}$$

for sagging:

$$M_{sw-min-sea-mid} = f_{sea} (Z_{v-min} \sigma_{perm-sea} 10^3 + M_{wv-sag}) \quad \text{kNm}$$

which is identical to

$$M_{sw-min-sea-mid} = -0.05185 C_{wv} L^2 B (C_b + 0.7) \quad \text{kNm}$$

Where:

f_{sea}	-0.85 for sagging 1.0 for hogging
Z_{v-min}	rule minimum hull girder section modulus as given in Section 8/1.2.2.2, in m ³
$\sigma_{perm-sea}$	allowable seagoing hull girder bending stress at midships, as defined in Section 8/1.2.3.2, in N/mm ²
M_{wv-hog}	envelope values of hogging vertical wave bending moment at midships as defined in 3.4.1.1, in kNm
M_{wv-sag}	envelope values of sagging vertical wave bending moment at midships as defined in 3.4.1.1, in kNm
C_{wv}	wave coefficient, as defined in 3.4.1.1
L	rule length, , in m, as defined in Section 4/1.1.1.1
B	moulded breadth, in m, as defined in Section 4/1.1.3.1, in m
C_b	block coefficient, as defined in Section 4/1.1.9.1

2.1.2.2 The minimum hull girder hogging and sagging still water bending moment for seagoing operations, $M_{sw-min-sea}$, at any longitudinal position is to be taken as:

$$M_{sw-min-sea} = f_{sw} M_{sw-min-sea-mid} \quad \text{kNm}$$

Where:

f_{sw}	1.0 within 0.4L amidships 0.15 at 0.1L from A.P. or F.P. 0 at A.P. and F.P. intermediate f_{sw} values are to be obtained by linear interpolation, see Figure 7.2.1
----------	--

2.1.2.3 The minimum hull girder hogging and sagging still water bending moment for harbour/sheltered water operations, $M_{sw-min-harb}$, at any longitudinal position is to be taken as:

$$M_{sw-min-harb} = 1.25 M_{sw-min-sea} \quad \text{kNm}$$

Where:

$M_{sw-min-sea}$	corresponding minimum hull girder hogging and sagging still water bending moment for seagoing operation at the section under consideration, see 2.1.2.1 and 2.1.2.2
------------------	---

2.1.3 Still water shear force

- 2.1.3.1 The designer is to provide the permissible hull girder positive and negative still water shear force limits for seagoing, $Q_{sw-perm-sea}$, and harbour/sheltered water operations, $Q_{sw-perm-harb}$.
- 2.1.3.2 The permissible hull girder positive and negative still water shear force limits are to be given at each transverse bulkhead in the cargo area, at the middle of cargo tanks, at the collision bulkhead and at the engine room forward bulkhead.
- 2.1.3.3 The permissible hull girder positive and negative still water shear force envelope is given by linear interpolation between values at the longitudinal positions given in 2.1.3.2.
- 2.1.3.4 The permissible hull girder positive and negative still water shear force envelopes are to be included in the loading manual as required in *Section 8/1.1.2*.
- 2.1.3.5 The permissible hull girder positive and negative still water shear force envelopes for seagoing operation, $Q_{sw-perm-sea}$, are to envelope the minimum hull girder positive and negative still water shear forces given in 2.1.4.1, 2.1.4.2 and the most severe positive and negative hull girder still water shear forces for any seagoing loading condition given in the loading manual. The requirements for the loading conditions are given in *Section 8/1.1.2*.
- 2.1.3.6 The permissible hull girder positive and negative still water shear force envelopes for harbour operation, $Q_{sw-perm-harb}$, are to envelop the minimum hull girder positive and negative still water shear forces given in 2.1.4.3, 2.1.4.4 and the most severe positive and negative hull girder still water shear forces for any harbour/sheltered water loading condition given in the loading manual and are not to be less than the permissible envelopes for seagoing operation, $Q_{sw-perm-sea}$.

Guidance note:

It is recommended that, for initial design, the permissible hull girder still water shear force envelopes are at least 10% above the hull girder shear force envelope from the loading conditions in the loading manual, to account for growth and design margins during the design and construction phase of the ship.

2.1.4 Minimum hull girder still water shear force

2.1.4.1 For ships with two longitudinal bulkheads, the minimum hull girder positive and negative still water shear force for seagoing operation, $Q_{sw-min-sea}$, in way of transverse bulkheads between centre cargo tanks, is to be taken as:

$$Q_{sw-min-sea} = \pm \max \left\{ \begin{array}{l} 0.225 \rho g B_{local} l_{tk} T_{sc} \\ 0.5 \rho g [0.98 (V_{CT} + 2V_{ST}) - 0.7 B_{local} l_{tk} T_{sc}] \end{array} \right\} \text{ kN}$$

and taken as the maximum value of $Q_{sw-min-sea}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m ³
g	acceleration due to gravity, 9.81 m/s ²
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in Section 4/1.1.5.5
V_{CT}	volume of centre cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m ³
V_{ST}	volume of side cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m ³

2.1.4.2 For ships with centreline longitudinal bulkhead, the minimum hull girder positive and negative still water shear force for seagoing operation, $Q_{sw-min-sea}$, in way of transverse bulkheads between cargo tanks is to be taken as:

$$Q_{sw-min-sea} = \pm 0.4 \rho g B_{local} l_{tk} T_{sc} \text{ kN}$$

and taken as the maximum value of $Q_{sw-min-sea}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m ³
g	acceleration due to gravity, 9.81 m/s ²
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in Section 4/1.1.5.5

- 2.1.4.3 For ships with two longitudinal bulkheads, the minimum hull girder positive and negative still water shear force for harbour/sheltered water operation, $Q_{sw-min-harb}$, in way of transverse bulkheads between centre cargo tanks, is to be taken as:

$$Q_{sw-min-harb} = \pm \max \left\{ \begin{array}{l} 0.275 \rho g B_{local} l_{tk} T_{sc} \\ 0.5 \rho g [0.98 (V_{CT} + 2V_{ST}) - 0.6 B_{local} l_{tk} T_{sc}] \end{array} \right\} \text{ kN}$$

and taken as the maximum value of $Q_{sw-min-harb}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m ³
g	acceleration due to gravity, 9.81 m/s ²
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in Section 4/1.1.5.5
V_{CT}	volume of centre cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m ³
V_{ST}	volume of side cargo tank, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration, in m ³

- 2.1.4.4 For ships with centreline longitudinal bulkhead, the minimum hull girder positive and negative still water shear force for harbour/sheltered water operation, $Q_{sw-min-harb}$, in way of transverse bulkheads between cargo tanks, is to be taken as:

$$Q_{sw-min-harb} = \pm 0.45 \rho g B_{local} l_{tk} T_{sc} \text{ kN}$$

and taken as the maximum value of $Q_{sw-min-harb}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead

Where:

ρ	density of cargo/sea water, not to be taken less than 1.025 tonnes/m ³
g	acceleration due to gravity, 9.81 m/s ²
B_{local}	local breadth at T_{sc} at the middle length of the tank under consideration, in m
l_{tk}	length of cargo tank under consideration, taken at the forward or aft side of the transverse bulkhead under consideration, in m
T_{sc}	scantling draught, in m, as defined in Section 4/1.1.5.5

2.2 Local Static Loads

2.2.1 General

2.2.1.1 The following static loads are considered:

- (a) static sea pressure
- (b) static tank pressure
- (c) tank overpressure
- (d) static deck load

2.2.2 Static sea pressure

2.2.2.1 The static sea pressure, P_{hys} , is to be taken as:

$$P_{hys} = \rho_{sw}g(T_{LC} - z) \quad \text{kN/m}^2$$

Where:

- z vertical coordinate of load point, in m, and is not to be greater than T_{LC} , see Figure 7.2.2
- ρ_{sw} density of sea water, 1.025tonnes/m³
- T_{LC} draught in the loading condition being considered, in m
- g acceleration due to gravity, 9.81m/s²

2.2.3 Static tank pressure

2.2.3.1 The static tank pressure, P_{in-tk} , is to be taken as:

$$P_{in-tk} = \rho g z_{tk} \quad \text{kN/m}^2$$

Where:

- z_{tk} vertical distance from highest point of tank, excluding small

hatchways, to the load point, see *Figure 7.2.3*, in m

ρ density of liquid in the tank, is not to be taken as less than 0.9 for liquid cargo for fatigue strength
1.025 otherwise
see *Section 2/3.1.8*, in tonnes/m³

g acceleration due to gravity, 9.81m/s²

2.2.3.2 The static tank pressure, P_{in-air} , in the case of overfilling or filling during flow through ballast water exchange, is to be taken as:

$$P_{in-air} = \rho_{sw} g z_{air} \quad \text{kN/m}^2$$

Where:

z_{air} vertical distance from top of air pipe or overflow pipe to the load point, whichever is the lesser, see *Figure 7.2.3*, in m
 $= z_{tk} + h_{air}$

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

h_{air} height of air pipe or overflow pipe, in m, is not to be taken less than 0.76m above highest point of tank, excluding small hatchways. For tanks with tank top below the weather deck the height of air-pipe or overflow pipe is not to be taken less than 0.76m above deck at side unless a lesser height is approved by the flag Administration. See also *Figure 7.2.3*.

2.2.3.3 The added overpressure due to sustained liquid flow through air pipe or overflow pipe in the case of overfilling or filling during flow through ballast water exchange, P_{drop} , is to be taken as 25 kN/m². Additional calculations may be required where piping arrangements may lead to a higher pressure drop, for example long pipes or arrangements such as bends and valves.

2.2.3.4 The pressure, $P_{in-flood}$, in compartments and tanks in a flooded or damaged condition is to be taken as:

$$P_{in-flood} = \rho_{sw} g z_{flood} \quad \text{kN/m}^2$$

Where:

z_{flood} vertical distance from the load point to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations or to freeboard deck if the damage waterline is not given, in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

2.2.3.5 The tank testing pressure, $P_{in-test}$, is to be taken as the greater of the following, see also the testing requirements in *Table 11.5.1*:

$$P_{in-test} = \rho_{sw} g z_{test} \quad \text{kN/m}^2$$

$$P_{in-test} = \rho_{sw} g z_{tk} + P_{valve} \quad \text{kN/m}^2$$

Where:

z_{test} vertical distance to the load point, is to be taken as the greater of the following, in m:

- (a) top of overflow
- (b) 2.4 m above top of tank

z_{tk} vertical distance from highest point of tank, excluding small hatchways, to the load point, see *Figure 7.2.3*, in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

P_{valve} setting of pressure relief valve, if fitted, is not to be taken less than 25kN/m²

2.2.4 Static deck pressure from distributed loading

2.2.4.1 The pressure on decks and inner bottom, P_{stat} , is to be taken as:

$$P_{stat} = P_{deck} \quad \text{kN/m}^2$$

Where:

P_{deck} uniformly distributed pressure on lower decks and decks within superstructures, including platform decks in the main engine room and for other spaces with heavy machinery components, in kN/m². P_{deck} is not to be taken less than 16kN/m². Design pressures for decks of deck houses are provided in *Section 11/1.4*.

2.2.5 Static deck loads from heavy units

- 2.2.5.1 The scantlings of structure in way of heavy units of cargo and equipment are to consider gravity forces acting where the mass is 20 tonnes or greater. The load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, F_{stat} , is to be taken as:

$$F_{stat} = m_{un}g \quad \text{kN}$$

Where:

m_{un} mass of unit, in tonnes

g acceleration due to gravity, 9.81m/s²

3 DYNAMIC LOAD COMPONENTS

3.1 General

3.1.1 Basic components

- 3.1.1.1 Formulas for ship motions and accelerations are given in this sub-section.
- 3.1.1.2 Formulas for the envelope value of the basic dynamic load components are also given. The basic load components are:
- (a) vertical wave bending moment and shear force
 - (b) horizontal wave bending moment
 - (c) dynamic wave pressure
 - (d) dynamic tank pressures.

3.1.2 Envelope load values

- 3.1.2.1 The envelope loads for scantling requirements and strength assessment are given at a 10^{-8} probability level, while the envelope loads for fatigue strength are given at a 10^{-4} probability level.
- 3.1.2.2 For scantling requirements and strength assessments, correction factors to account for non-linear effects and operational considerations in heavy weather are given.
- 3.1.2.3 For fatigue strength a factor adjusts the envelope load from a 10^{-8} probability level to a 10^{-4} probability level. A speed correction factor is applicable where appropriate.
- 3.1.2.4 The envelope value is the long term value, at a given probability level, taking into consideration the effect of all wave headings.

3.1.3 Metacentric height and roll radius of gyration

- 3.1.3.1 The metacentric height, GM , and roll radius of gyration, $r_{roll-gyr}$, associated with the rule loading conditions or specified draughts are specified in *Table 7.3.1*.

Table 7.3.1 GM and $r_{roll-gyr}$			
	T_{LC}	GM	$r_{roll-gyr}$
Loaded at deep draught	between $0.9T_{sc}$ and T_{sc}	$0.12B$	$0.35B$
Loaded on reduced draught	$0.6T_{sc}$	$0.24B$	$0.40B$
In ballast	T_{bal}, T_{bal-n}	$0.33B$	$0.45B$
Where:			
B	moulded breadth, in m, as defined in <i>Section 4/1.1.3.1</i>		
T_{LC}	draught in the loading condition being considered, in m		
T_{sc}	scantling draught, in m, as defined in <i>Section 4/1.1.5.5</i>		
T_{bal}	minimum design ballast draught, in m, as defined in <i>Section 4/1.1.5.2</i>		
T_{bal-n}	normal ballast draught, in m, as defined in <i>Section 4/1.1.5.3</i>		

- 3.1.3.2 For the optional loading conditions, GM is to be taken as the corrected metacentric height given in the loading manual. Where GM for optional loaded or gale/emergency ballast conditions is not specified, GM is to be taken as $0.12B$ for mean draught greater or equal to $0.9T_{sc}$, and $0.24B$ for mean draught equal or less than $0.6T_{sc}$. For optional loading conditions with a mean draught other than the

values defined, GM is to be obtained by linear interpolation based on values for $0.6T_{sc}$ and $0.9T_{sc}$.

- 3.1.3.3 $r_{roll-gyr}$ for optional loaded or gale/emergency ballast conditions is, unless provided based on the loading manual, to be taken as $0.35B$ for mean draught greater or equal to $0.9T_{sc}$, and $0.4B$ for mean draught equal or less than $0.6T_{sc}$. For optional loading conditions with a mean draught other than the values defined above, $r_{roll-gyr}$ may be obtained by linear interpolation based on values for $0.6T_{sc}$ and $0.9T_{sc}$.
- 3.1.3.4 For the loading conditions used for fatigue strength, GM is to be taken as the corrected metacentric height given in the loading manual. If not available, GM is to be taken as specified in *Table 7.3.1* for ballast condition and according to the procedure described in 3.1.3.2 for full load condition. $r_{roll-gyr}$ is, unless based on the loading condition, to be taken as specified in *Table 7.3.1* for ballast condition and according to the procedure described in 3.1.3.3 for full load condition.

3.2 Motions

3.2.1 General

- 3.2.1.1 The envelope values for ship motions are given at a 10^{-8} probability level.

3.2.2 Roll motion

- 3.2.2.1 The natural roll period, U_{roll} , is to be taken as:

$$U_{roll} = \frac{2.30r_{roll-gyr}}{\sqrt{GM}} \quad \text{secs}$$

Where:

GM metacentric height, in m, as defined in 3.1.3

$r_{roll-gyr}$ roll radius of gyration, in m, as defined in 3.1.3

- 3.2.2.2 The roll angle, θ , is to be taken as:

$$\theta = \frac{50}{B + 75} (1.25 - 0.025U_{roll}) f_{bk} \quad \text{rads}$$

Where:

f_{bk} 1.2 for ships without bilge keels

1.0 for ships with bilge keels

B moulded breadth, in m, as defined in *Section 4/1.1.3.1*

U_{roll} roll period, in secs, as defined in 3.2.2.1

3.2.3 Pitch motion

- 3.2.3.1 The characteristic pitch period, U_{pitch} , is to be taken as:

$$U_{pitch} = f_V \sqrt{0.6 \frac{2\pi}{g} (1 + f_T) L} \quad \text{s}$$

Where:

$$f_V = 1.0 + \frac{V_0}{V} \left(\frac{L}{525} - 0.67 \right)$$

$$f_T = \frac{T_{LC}}{T_{sc}}$$

V_0	vessel speed, in knots, is to be taken as: 0 for scantling requirements and strength assessment 0.75V for fatigue strength
V	maximum service speed, in knots, as defined in <i>Section 4/1.1.8.1</i>
T_{sc}	scantling draught, in m, as defined in <i>Section 4/1.1.5.5</i>
T_{LC}	draught in the loading condition being considered, in m
L	rule length, in m, as defined in <i>Section 4/1.1.1.1</i>

3.2.3.2 The pitch angle, φ , is to be taken as:

$$\varphi = 960 \left(\frac{V_1}{C_b} \right)^{0.25} \frac{1}{L} \frac{\pi}{180} \quad \text{radians}$$

Where:

V_1	vessel speed, in knots. Is to be taken as V , but not to be taken as less than 10
V	maximum service speed, in knots, as defined in <i>Section 4/1.1.8.1</i>
C_b	block coefficient, as defined in <i>Section 4/1.1.9.1</i>
L	rule length, in m, as defined in <i>Section 4/1.1.1.1</i>

3.3 Ship Accelerations

3.3.1 General

3.3.1.1 The envelope values for combined translatory accelerations due to motion in six degrees of freedom are given. The transverse and longitudinal components of acceleration include the component of gravity due to roll and pitch.

3.3.2 Common acceleration parameter

3.3.2.1 The common acceleration parameter, a_0 , is to be taken as:

$$a_0 = (1.58 - 0.47C_b) \left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2} \right)$$

Where:

C_b	block coefficient, as defined in <i>Section 4/1.1.9.1</i>
L	rule length, in m, as defined in <i>Section 4/1.1.1.1</i>

3.3.3 Vertical acceleration

3.3.3.1 The envelope vertical acceleration, a_v , at any position, is to be taken as:

$$a_v = f_{prob} \sqrt{a_{heave}^2 + a_{pitch-z}^2 + a_{roll-z}^2} \quad \text{m/s}^2$$

Where:

a_{heave} vertical acceleration due to heave, is to be taken as:
 $= f_V a_0 g \quad \text{m/s}^2$

$a_{pitch-z}$ vertical acceleration due to pitch, is to be taken as:
 $= \left(0.3 + \frac{L}{325} \right) \phi \left(\frac{2\pi}{U_{pitch}} \right)^2 |x - 0.45L| \quad \text{m/s}^2$

a_{roll-z} vertical acceleration due to roll, is to be taken as:
 $= 1.2\theta \left(\frac{2\pi}{U_{roll}} \right)^2 |y| \quad \text{m/s}^2$

a_0 common acceleration parameter, as defined in 3.3.2.1

g acceleration due to gravity, 9.81m/s²

ϕ pitch angle, in rads, as defined in 3.2.3.2

U_{pitch} pitch period, in secs, as defined in 3.2.3.1

L rule length, in m, as defined in Section 4/1.1.1.1

θ roll angle, in rads, as defined in 3.2.2.2

U_{roll} roll period, in secs, as defined in 3.2.2.1

x longitudinal coordinate, in m

y transverse coordinate, in m

f_{prob} as defined in 3.3.3.2 and 3.3.3.3 as appropriate

f_V as defined in 3.3.3.2 and 3.3.3.3 as appropriate

3.3.3.2 For scantling requirements and strength assessment:

f_{prob} is to be taken as 1.0

f_V is to be taken as 1.0

3.3.3.3 For fatigue strength:

f_{prob} is to be taken as 0.45

$$f_V = \left(\frac{C_{b-LC}}{C_b} \right)^2 \left(1.2 - \frac{L}{1000} \right)$$

Where:

C_{b-LC} block coefficient for considered loading condition, as defined in Section 4/1.1.9.2

C_b block coefficient, as defined in Section 4/1.1.9.1

L rule length, in m, as defined in Section 4/1.1.1.1

3.3.4 Transverse acceleration

3.3.4.1 The envelope transverse acceleration, a_t , at any position, is to be taken as:

$$a_t = f_{prob} \sqrt{a_{sway}^2 + (g \sin\theta + a_{roll-y})^2} \quad \text{m/s}^2$$

Where:

a_{sway} transverse acceleration due to sway and yaw, is to be taken as:

$$= 0.3ga_0 \quad \text{m/s}^2$$

a_{roll-y} transverse acceleration due to roll, is to be taken as:

$$= \theta \left(\frac{2\pi}{U_{roll}} \right)^2 R_{roll} \quad \text{m/s}^2$$

θ roll angle, in rads, as defined in 3.2.2.2

U_{roll} roll period, in secs, as defined in 3.2.2.1

$$R_{roll} = z - \left(\frac{D}{4} + \frac{T_{LC}}{2} \right) \text{ or } z - \left(\frac{D}{2} \right), \text{ whichever is the greater, in m}$$

g acceleration due to gravity, 9.81m/s²

a_0 common acceleration parameter, as defined in 3.3.2.1

T_{LC} draught in the loading condition being considered, in m

D moulded depth, as defined in Section 4/1.1.4.1

z vertical coordinate, in m

f_{prob} as defined in 3.3.4.2 or 3.3.4.3 as appropriate

3.3.4.2 For scantling requirements and strength assessment:

f_{prob} is to be taken as 1.0

3.3.4.3 For fatigue strength:

f_{prob} is to be taken as 0.5

3.3.5 Longitudinal acceleration

3.3.5.1 The envelope longitudinal acceleration, a_{lng} , at any position, is to be taken as:

$$a_{lng} = 0.7 f_{prob} \sqrt{a_{surge}^2 + \left(\frac{L}{325} (g \sin \varphi + a_{pitch-x}) \right)^2}$$

Where:

a_{surge} longitudinal acceleration due to surge, is to be taken as:
 $= 0.2ga_0 \quad \text{m/s}^2$

$a_{pitch-x}$ longitudinal acceleration due to pitch, is to be taken as:
 $= f_V \varphi (2\pi / U_{pitch})^2 R_{pitch} \quad \text{m/s}^2$

φ pitch angle, in rads, as defined in 3.2.3.2

U_{pitch} pitch period, in secs, as defined in 3.2.3.1

R_{pitch} pitch radius and is to be taken as the greater of

$$z - \left(\frac{D}{4} + \frac{T_{LC}}{2} \right) \text{ or } z - \left(\frac{D}{2} \right), \text{ in m}$$

g acceleration due to gravity, 9.81m/s²

a_0 common acceleration parameter, as defined in 3.3.2.1

T_{LC} draught in the loading condition being considered, in m

D moulded depth, in m, as defined in Section 4/1.1.4.1

L rule length, in m, as defined in Section 4/1.1.1.1

z	vertical coordinate, in m
f_{prob}	as defined in 3.3.5.2 and 3.3.5.3 as appropriate
f_V	as defined in 3.3.5.2 and 3.3.5.3 as appropriate

3.3.5.2 For scantling requirements and strength assessment:

f_{prob}	is to be taken as 1.0
f_V	is to be taken as 1.0

3.3.5.3 For fatigue strength:

f_{prob}	is to be taken as 0.5
f_V	is to be taken as 1.7

3.4 Dynamic Hull Girder Loads

3.4.1 Vertical wave bending moment

3.4.1.1 The envelope hogging and sagging vertical wave bending moments, M_{wv-hog} and M_{wv-sag} , are to be taken as:

$$\begin{aligned} M_{wv-hog} &= f_{prob} 0.19 f_{wv-v} C_{wv} L^2 B C_b \\ M_{wv-sag} &= -f_{prob} 0.11 f_{wv-v} C_{wv} L^2 B (C_b + 0.7) \end{aligned} \quad \text{kNm}$$

Where:

f_{wv-v} distribution factor for vertical wave bending moment along the vessel length, see 3.4.1.2 or 3.4.1.3 as appropriate

C_{wv} wave coefficient to be taken as:

$$\begin{aligned} &= 10.75 - \left(\frac{300 - L}{100} \right)^{\frac{3}{2}} && \text{for } 150 \leq L \leq 300 \\ &= 10.75 && \text{for } 300 < L \leq 350 \\ &= 10.75 - \left(\frac{L - 350}{150} \right)^{\frac{3}{2}} && \text{for } 350 < L \leq 500 \end{aligned}$$

L rule length, in m, as defined in Section 4/1.1.1.1

B moulded breadth, in m, as defined in Section 4/1.1.3.1

C_b block coefficient, as defined in Section 4/1.1.9.1

3.4.1.2 For scantling requirements and strength assessment:

f_{wv-v} distribution factor for vertical wave bending moment along the vessel length, is to be taken as:

0.0	at A.P.
1.0	for $0.4L$ to $0.65L$ from A.P.
0.0	at F.P.

intermediate values to be obtained by linear interpolation, see Figure 7.3.1

f_{prob} is to be taken as 1.0

L rule length, in m, as defined in Section 4/1.1.1.1

3.4.1.3 For fatigue strength:

f_{wv-v}	distribution factor for vertical wave bending moment along the vessel length, is to be taken as:
0.0	at A.P.
0.1	at 0.1L from A.P.
1.0	for 0.4L to 0.65L from A.P.
0.1	at 0.9L from A.P.
0.0	at F.P.
	intermediate values to be obtained by linear interpolation, see Figure 7.3.2
f_{prob}	is to be taken as 0.5
L	rule length, in m, as defined in Section 4/1.1.1.1

3.4.2 Horizontal wave bending moment

3.4.2.1 The envelope horizontal wave bending moment, M_{wv-h} , is to be taken as:

$$M_{wv-h} = f_{prob} \left(0.3 + \frac{L}{2000} \right) f_{wv-h} C_{wv} L^2 T_{LC} C_b \quad \text{kNm}$$

Where:

f_{wv-h} distribution factor for wave horizontal bending moment along the vessel length, see 3.4.2.2 or 3.4.2.3 as appropriate

C_{wv} wave coefficient, as defined in 3.4.1.1

L rule length, in m, as defined in Section 4/1.1.1.1

T_{LC} draught in the loading condition being considered, in m

C_b block coefficient, as defined in Section 4/1.1.9.1

3.4.2.2 For scantling requirements and strength assessment:

f_{wv-h} distribution factor for wave horizontal bending moment along the vessel length, is to be taken as:

0.0 at A.P.

1.0 for $0.4L$ to $0.65L$ from A.P.

0.0 at F.P.

intermediate values to be obtained by linear interpolation, see Figure 7.3.1

f_{prob} is to be taken as 1.0

L rule length, in m, as defined in Section 4/1.1.1.1

3.4.2.3 For fatigue strength:

f_{wv-h} distribution factor for wave horizontal bending moment along the vessel length, is to be taken as:

0.0 at A.P.

0.1 at $0.1L$ from A.P.

1.0 for $0.4L$ to $0.65L$ from A.P.

0.1 at $0.9L$ from A.P.

0.0 at F.P.

intermediate values to be obtained by linear interpolation, see Figure 7.3.2

f_{prob} is to be taken as 0.5

L rule length, in m, as defined in Section 4/1.1.1.1

3.4.3 Vertical wave shear force

3.4.3.1 The envelope positive and negative vertical wave shear forces, Q_{wv-pos} and Q_{wv-neg} , are to be taken as:

$$\begin{aligned} Q_{wv-pos} &= 0.3 f_{qvw-pos} C_{wv} L B (C_b + 0.7) \\ Q_{wv-neg} &= -0.3 f_{qvw-neg} C_{wv} L B (C_b + 0.7) \end{aligned} \quad \text{kN}$$

Where:

$f_{qvw-pos}$ distribution factor for positive vertical wave shear force along the vessel length and is to be taken as:

0.0 at A.P.

$1.59 \frac{C_b}{(C_b + 0.7)}$ for $0.2L$ to $0.3L$ from A.P.

0.7 for $0.4L$ to $0.6L$ from A.P.

1.0 for $0.7L$ to $0.85L$ from A.P.

0.0 at F.P.

$f_{qvw-neg}$ distribution factor for negative vertical wave shear force along the vessel length and is to be taken as:

0.0 at A.P.

0.92 for $0.2L$ to $0.3L$ from A.P.

0.7 for $0.4L$ to $0.6L$ from A.P.

$1.73 \frac{C_b}{(C_b + 0.7)}$ for $0.7L$ to $0.85L$ from A.P.

0.0 at F.P.

intermediate values of $f_{qvw-pos}$ and $f_{qvw-neg}$ are to be obtained by linear interpolation, see Figure 7.3.3 and Figure 7.3.4 respectively.

C_{wv} wave coefficient, as defined in 3.4.1.1

L rule length, in m, as defined in Section 4/1.1.1.1

B moulded breadth, in m, as defined in Section 4/1.1.3.1

C_b block coefficient, as defined in Section 4/1.1.9.1

3.5 Dynamic Local Loads

3.5.1 General

- 3.5.1.1 This section provides the envelope values for dynamic wave pressure, dynamic tank pressure, green sea load and dynamic deck loads.
- 3.5.1.2 The envelope dynamic wave pressures are given in 3.5.2
- 3.5.1.3 The envelope green sea load given in 3.5.3 only applies to scantling requirements and strength assessment. The green sea load for fatigue strength is to be taken as 0.
- 3.5.1.4 The envelope dynamic tank pressure is a combination of the inertial components due to vertical, transverse and longitudinal acceleration. The envelope dynamic tank pressure components are given in 3.5.4.
- 3.5.1.5 The envelope dynamic deck loads are given in 3.5.5 and 3.5.6.

3.5.2 Dynamic wave pressure

- 3.5.2.1 The envelope dynamic wave pressure, P_{ex-dyn} , is to be taken as the greater of the following:

$$P_1 = 2f_{prob}f_{nl-P1} \left[\left(P_{11} + \frac{135B_{local}}{4(B+75)} - 1.2(T_{LC} - z) \right) f_1 + \frac{135B_{local}}{4(B+75)} f_2 \right] \quad \text{kN/m}^2$$

$$P_2 = 26f_{prob}f_{nl-P2} \left[\left(\frac{B_{local}}{8} \theta + f_T C_b \frac{0.25B_{local} + 0.8C_{wv}}{14} \left(0.7 + \frac{2z}{T_{LC}} \right) \right) f_1 + \left(\frac{B_{local}}{8} \theta + f_T C_b \frac{0.25B_{local}}{14} \left(0.7 + \frac{2z}{T_{LC}} \right) \right) f_2 \right] \quad \text{kN/m}^2$$

Where:

B_{local} local breadth at the waterline, for considered draught, not to be taken less than $0.5B$, in m

θ roll angle, in rads, as defined in 3.2.2.2

$$P_{11} = (3f_s + 0.8)C_{wv}$$

- C_{wv} wave coefficient, as defined in 3.4.1.1
 L rule length, in m, as defined in Section 4/1.1.1.1
 B moulded breadth, in m, as defined in Section 4/1.1.3.1
 T_{LC} draught in the loading condition being considered, in m
 T_{sc} scantling draught, in m, as defined in Section 4/1.1.5.5
 C_b block coefficient, as defined in Section 4/1.1.9.1

$$f_1 = f_{lng} - \frac{f_{lng}}{f_v} f_2 + f_2$$

$$f_2 = 0.25 f_v \left(\frac{4|y|}{B_{local}} - 1 \right) \quad \text{for } |y| < 0.25 B_{local}$$

$$= f_v \left(\frac{4|y|}{B_{local}} - 1 \right) \quad \text{for } |y| \geq 0.25 B_{local}$$

$$f_T = \frac{T_{LC}}{T_{sc}}$$

$$f_s = C_b + \frac{1.33}{\sqrt{C_b}} \quad \text{at, and aft of A.P.}$$

$$= C_b \quad \text{between } 0.2L \text{ and } 0.7L \text{ from A.P.}$$

$$= C_b + \frac{1.33}{C_b} \quad \text{at, and forward of F.P.}$$

intermediate values to be obtained by linear interpolation

$$f_{lng} = 1.0 \quad \text{at, and aft of A.P.}$$

$$= 0.7 \quad \text{for } 0.2L \text{ to } 0.7L \text{ from A.P.}$$

$$= 1.0 \quad \text{at, and forward of F.P.}$$

intermediate values to be obtained by linear interpolation

- y transverse coordinate, in m
 z vertical coordinate, in m

f_{nl-P1} , f_{nl-P2} , f_{prob} , and f_v are given in 3.5.2.2 for scantling requirements and strength assessment application and in 3.5.2.3 for fatigue strength.

- 3.5.2.2 For scantling requirements and strength assessment, the envelope maximum dynamic wave pressure, P_{ex-max} , see Figure 7.3.5, and minimum dynamic wave pressure, P_{ex-min} , see Figure 7.3.6, are to be taken as:

$$P_{ex-max} = P_{ex-dyn} \quad \text{kN/m}^2 \quad \text{below still waterline}$$

$$= P_{WL} - 10(z - T_{LC}) \quad \text{kN/m}^2 \quad \text{for } T_{LC} < z \leq T_{LC} + \frac{P_{WL}}{10}$$

$$= 0 \quad \text{kN/m}^2 \quad \text{for } z > T_{LC} + \frac{P_{WL}}{10}$$

$$P_{ex-min} = -P_{ex-dyn} \quad \text{kN/m}^2 \quad \text{below still waterline}$$

$$= 0 \quad \text{kN/m}^2 \quad \text{above still waterline}$$

$$P_{ex-min} \text{ is not to be taken as less than } -\rho_{sw}g(T_{LC} - z)$$

Where:

- P_{ex-dyn} envelope dynamic wave pressure, in kN/m^2 , as defined in 3.5.2.1 with:
- $$f_{prob} = 1.0$$
- $$f_{nl-P1} = 0.9$$
- $$f_{nl-P2} = 0.65$$
- $$f_V = 1.0$$
- P_{WL} pressure at waterline, to be taken as P_{ex-dyn} at still waterline, in kN/m^2
- T_{LC} draught in the loading condition being considered, in m
- ρ_{sw} density of sea water, 1.025 tonnes/m^3
- z vertical coordinate, in m

Figure 7.3.5
Transverse Distribution of Maximum Dynamic Wave Pressure
for Scantling Requirements and Strength Assessment

3.5.2.3 The dynamic wave pressure pseudo-amplitude (half range), P_{ex-amp} , for fatigue strength, see Figure 7.3.7, is to be taken as:

$$\begin{aligned}
 P_{ex-amp} &= 0 \quad \text{kN/m}^2 && \text{for } z \geq T_{LC} + h_{WL} \text{ or } D, \text{ whichever is the lesser} \\
 &= 0.5 P_{WL} \quad \text{kN/m}^2 && \text{at still waterline} \\
 &= P_{ex-dyn} \quad \text{kN/m}^2 && \text{for } z \leq T_{LC} - h_{WL} \text{ or } 0, \text{ whichever is the greater}
 \end{aligned}$$

Intermediate values between the still waterline and $z = T_{LC} - h_{WL}$ to be obtained by linear interpolation

Where:

h_{WL} dynamic wave pressure head at the still waterline, is to be taken as:
 $= P_{WL}/10 \quad \text{m}$

P_{WL} pressure at waterline, and is to be taken as P_{ex-max} at still waterline, in kN/m^2

P_{ex-max} envelope maximum dynamic wave pressure is to be taken as the greater of P_1 and P_2 , in kN/m^2

T_{LC} draught in the loading condition being considered, in m

D moulded depth, in m, as defined in Section 4/1.1.4.1

P_1 as defined in 3.5.2. , in kN/m^2 , with:

$$f_{prob} = 0.5$$

$$f_{nl-P1} = 1.0$$

$$f_V = \begin{cases} 1.0 & \text{at, and aft of } 0.7L \\ 1.5 & \text{at, and forward of F.P.} \end{cases}$$

intermediate values of f_V to be obtained by linear interpolation

P_2 as defined in 3.5.2.1, in kN/m², with:

$$f_{prob} = 0.5$$

$$f_{nl-P2} = 1.0$$

$$f_V = 1.0$$

z vertical coordinate, in m

3.5.3 Green sea load

3.5.3.1 The envelope green sea load on the weather deck, P_{wdk} , is to be taken as the greater of the following:

$$P_{wdk} = f_{1-dk} (f_{op} P_{1-WL} - 10z_{dk-T}) \quad \text{kN/m}^2$$

$$P_{wdk} = 0.8 f_{2-dk} (P_{2-WL} - 10z_{dk-T}) \quad \text{kN/m}^2$$

$$P_{wdk} = 34.3 \quad \text{kN/m}^2$$

Where:

$$f_{1-dk} = 0.8 + \frac{L}{750}$$

$$f_{2-dk} = 0.5 + \frac{|y|}{B_{wdk}}$$

$$f_{op} = \begin{cases} 1.0 & \text{at and forward of } 0.2L \text{ from A.P.} \\ 0.8 & \text{at and aft of A.P.} \end{cases}$$

intermediate values to be obtained by linear interpolation

P_{1-WL}	P_1 pressure at still waterline for considered draught, in kN/m ² , see 3.5.2.1
P_{2-WL}	P_2 pressure at still waterline for considered draught, in kN/m ² , see 3.5.2.1
z_{dk-T}	distance from the deck to the still waterline at the applicable draught for the loading condition being considered, in m
B_{wdk}	local breadth at the weather deck, in m
L	rule length, in m, as defined in Section 4/1.1.1.1
y	transverse coordinate of load point, in m

3.5.4 Dynamic tank pressure

3.5.4.1 The envelope dynamic tank pressure, P_{in-v} , due to vertical tank acceleration is to be taken as:

$$P_{in-v} = \rho a_v (z_0 - z) \quad \text{kN/m}^2 \quad \text{for strength assessment and scantling requirements}$$

$$P_{in-v} = \rho a_v |z_0 - z| \quad \text{kN/m}^2 \quad \text{for fatigue strength}$$

Where:

ρ	density of liquid in the tank, in tonnes/m ³ , and is not to be taken as less than: 0.9 for cargo tanks for fatigue strength 1.025 otherwise, see Section 2/3.1.8
a_v	envelope vertical acceleration, in m/s ² , as defined in 3.3.3.1, and is to be taken at tank centre of gravity
z	vertical coordinate of load point, in m
z_0	vertical coordinate of reference point, see 6.3.7 for scantling requirements and strength assessment, and 3.5.4.5 for fatigue strength, in m

3.5.4.2 The envelope dynamic tank pressure, P_{in-t} , due to transverse acceleration is to be taken as:

$$P_{in-t} = f_{ull-t} \rho a_t (y_0 - y) \quad \text{kN/m}^2 \quad \text{for strength assessment and scantling requirements}$$

$$P_{in-t} = \rho a_t |y_0 - y| \quad \text{kN/m}^2 \quad \text{for fatigue strength}$$

Where:

ρ	density of liquid in the tank, in tonnes/m ³ , and is not to be taken as less than: 0.9 for cargo tanks for fatigue strength 1.025 otherwise, see Section 2/3.1.8
--------	---

f_{ull-t}	factor to account for ullage in cargo tanks, and is to be taken as:
0.67	for cargo tanks, including cargo tanks designed for filling with water ballast
1.0	for ballast and other tanks
a_t	envelope transverse acceleration, in m/s^2 , as defined in 3.3.4.1, and is to be taken at tank centre of gravity
y	transverse coordinate of load point, in m
y_0	transverse coordinate of reference point, see 6.3.7 for scantling requirements and strength assessment, and 3.5.4.5 for fatigue strength, in m

3.5.4.3 The envelope dynamic tank pressure, P_{in-lng} , due to longitudinal acceleration is to be taken as:

$$P_{in-lng} = f_{ull-lng} \rho a_{lng} (x_0 - x) \quad \text{for strength assessment and scantling requirements}$$

$$P_{in-lng} = \rho a_{lng} |x_0 - x| \quad \text{kN/m}^2 \quad \text{for fatigue strength}$$

Where:

ρ	density of tank liquid, in tonnes/ m^3 , and is not to be taken as less than: 0.9 for cargo tanks for fatigue strength 1.025 otherwise, see Section 2/3.1.8
$f_{ull-lng}$	factor to account for ullage in cargo tanks, and is to be taken as: 0.62 for cargo tanks, including cargo tanks designed for filling with water ballast 1.0 for ballast and other tanks
a_{lng}	envelope longitudinal acceleration, in m/s^2 , as defined in 3.3.5.1, and is to be taken at tank centre of gravity
x	longitudinal coordinate of load point, in m
x_0	longitudinal coordinate of reference point, see 6.3.7 for scantling requirements and strength assessment, and 3.5.4.5 for fatigue strength, in m

3.5.4.4 For scantling requirements and strength assessment the simultaneous acting dynamic tank pressure, P_{in-dyn} , is to be taken as the summation of the components for the considered dynamic load case, see 6.3.7.

3.5.4.5 For fatigue strength the dynamic tank pressure amplitude, P_{in-amp} , on a tank boundary with adjacent tank empty, is to be taken as:

$$P_{in-amp} = f_v P_{in-v} + f_{ull-t} f_t P_{in-t} + f_{ull-lng} f_{lng} P_{in-lng} \quad \text{kN/m}^2$$

Where:

P_{in-v}	envelope dynamic tank pressure due to vertical acceleration, in kN/m^2 , as defined in 3.5.4.1
P_{in-t}	envelope dynamic tank pressure due to transverse acceleration, in kN/m^2 , as defined in 3.5.4.2

P_{in-lng}	envelope dynamic tank pressure due to longitudinal acceleration, in kN/m ² , as defined in 3.5.4.3
f_{ull-t}	factor to account for ullage in cargo tanks, not to be taken less than 0.0 nor greater than 1.0 $= \frac{ z_0 - z + h_{roll}}{2h_{roll}} \quad \text{for cargo tanks}$ $= 1.0 \quad \text{for ballast tanks}$
$f_{ull-lng}$	factor to account for ullage in cargo tanks, not to be taken less than 0.0 nor greater than 1.0 $= \frac{ z_0 - z + h_{pitch}}{2h_{pitch}} \quad \text{for cargo tanks}$ $= 1.0 \quad \text{for ballast tanks}$
h_{roll}	roll height $= \frac{b_{fs} f_{prob} \theta}{2}$
h_{pitch}	pitch height $= \frac{l_{fs} f_{prob} \varphi}{2}$
f_{prob}	is to be taken as 0.5
θ	roll angle, in rads, as defined in 3.2.2.2
φ	pitch angle, in secs, as defined in 3.2.3.2
b_{fs}	tank breadth at the top of the tank, see <i>Figure 7.3.8</i> , in m
l_{fs}	tank length at the top of the tank, in m
x_0	longitudinal coordinate of reference point, and is to be taken as the middle of tank length at the top of the tank, in m
y_0	transverse coordinate of reference point, and is to be taken as the middle of tank breadth at the top of the tank, see <i>Figure 7.3.8</i> , in m
z_0	vertical coordinate of reference point, and is to be taken as the highest point of the tank, excluding small hatchways, see <i>Figure 7.3.8</i> , in m
f_v	pressure combination factor, as given in <i>Table 7.3.2</i>
f_t	pressure combination factor, as given in <i>Table 7.3.2</i>
f_{lng}	pressure combination factor, as given in <i>Table 7.3.2</i>

3.5.4.6 For fatigue strength the dynamic tank pressure amplitude, P_{in-amp} , on a longitudinal tank boundary with adjacent tank full, is to be taken as:

$$P_{in-amp} = f_v |P_{in-v-tk1} - P_{in-v-tk2}| + f_t |f_{ull-t-tk1} P_{in-t-tk1} + f_{ull-t-tk2} P_{in-t-tk2}| + f_{lng} |f_{ull-lng-tk1} P_{in-lng-tk1} - f_{ull-lng-tk2} P_{in-lng-tk2}| \quad \text{kN/m}^2$$

Where:

$P_{in-v-tk1}$	dynamic tank pressure due to vertical acceleration in tank 1, in kN/m ²
$P_{in-v-tk2}$	dynamic tank pressure due to vertical acceleration in tank 2, in kN/m ²

- P_{in-tk1} dynamic tank pressure due to transverse acceleration in tank 1, in kN/m^2
- P_{in-tk2} dynamic tank pressure due to transverse acceleration in tank 2, in kN/m^2
- $P_{in-lng-tk1}$ dynamic tank pressure due to longitudinal acceleration in tank 1, in kN/m^2
- $P_{in-lng-tk2}$ dynamic tank pressure due to longitudinal acceleration in tank 2, in kN/m^2
- $f_{ull-t-tk1}$ factor to account for ullage for tank 1, as defined in 3.5.4.5
- $f_{ull-t-tk2}$ factor to account for ullage for tank 2, as defined in 3.5.4.5
- $f_{ull-lng-tk1}$ factor to account for ullage for tank 1, as defined in 3.5.4.5
- $f_{ull-lng-tk2}$ factor to account for ullage for tank 2, as defined in 3.5.4.5
- f_v pressure combination factor, as given in Table 7.3.2
- f_t pressure combination factor, as given in Table 7.3.2
- f_{lng} pressure combination factor, as given in Table 7.3.2

Tank 1 and 2 are adjacent tanks with common longitudinal boundary

Table 7.3.2 Pressure Combination Factors for Fatigue Assessment		
	Cargo tanks	Ballast tanks
f_v	0.9	0.9
f_t	0.9	0.6
f_{lng}	0.4	0.4

3.5.4.7 For fatigue strength by hot spot stress (FE) approach, the dynamic tank pressure amplitudes due to vertical, transverse and longitudinal accelerations, illustrated in Figure 7.3.9 are to be taken as:

$$P_{in-v} = \rho a_v (z_0 - z) \quad \text{in kN/m}^2$$

$$P_{in-t} = f_{ull-t} \rho a_t (y_0 - y) \quad \text{in kN/m}^2$$

$$P_{in-lng} = f_{ull-lng} \rho a_{lng} (x_0 - x) \quad \text{in kN/m}^2$$

Where:

ρ	density of liquid in the tank, in tonnes/m ³ , and is not to be taken as less than: 0.9 for cargo tanks 1.025 otherwise, see Section 2/3.1.8
f_{ull-t}	factor to account for ullage in cargo tanks, as defined in 3.5.4.5
$f_{ull-lng}$	factor to account for ullage in cargo tanks, as defined in 3.5.4.5
x	longitudinal coordinate of load point, in m
y	transverse coordinate of load point, in m
z	vertical coordinate of load point, in m
x_0	longitudinal coordinate of reference point, and is to be taken as the middle of the tank length at the top of the tank, in m
y_0	transverse coordinate of reference point, and is to be taken as the middle of the tank breadth at the top of the tank, in m
z_0	vertical coordinate of reference point, and is to be taken as the highest point in the tank, in m
a_v	envelope vertical acceleration, in m/s ² , as defined in 3.3.3.1, at tank centre of gravity
a_t	envelope transverse acceleration, in m/s ² , as defined in 3.3.4.1, at tank centre of gravity
a_{lng}	envelope longitudinal acceleration, in m/s ² , as defined in 3.3.5.1, at tank centre of gravity

3.5.5 Dynamic deck pressure from distributed loading

3.5.5.1 The envelope dynamic deck pressure, $P_{deck-dyn}$, on decks, inner bottom and hatch covers is to be taken as:

$$P_{deck-dyn} = P_{deck} \frac{a_v}{g} \quad \text{kN/m}^2$$

Where:

a_v envelope vertical acceleration, in m/s^2 , as defined in 3.3.3.1

P_{deck} uniformly distributed pressure on lower decks and decks within superstructure, in kN/m^2 , as defined in 2.2.4.1

g acceleration due to gravity, 9.81 m/s^2

3.5.6 Dynamic loads from heavy units

3.5.6.1 The envelope dynamic deck loads, F_v , F_t , F_{lng} acting vertically, transversely and longitudinally on supporting structures and securing systems for heavy units of cargo, equipment or structural components are to be taken as:

$$F_v = m_{un} a_v \quad \text{kN}$$

$$F_t = m_{un} a_t \quad \text{kN}$$

$$F_{lng} = m_{un} a_{lng} \quad \text{kN}$$

Where:

m_{un} mass of unit, in tonnes

a_v envelope vertical acceleration, in m/s^2 , as defined in 3.3.3.1, at centre of gravity of considered unit

a_t envelope transverse acceleration, in m/s^2 , as defined in 3.3.4.1,

a_{lng} at centre of gravity of considered unit
envelope longitudinal acceleration, in m/s^2 , as defined in
3.3.5.1, at centre of gravity of considered unit

4 SLOSHING AND IMPACT LOADS

4.1 General

4.1.1 Load Components

4.1.1.1 Sloshing pressures in tanks, and bow impact and bottom slamming pressures are given in this sub-section.

4.2 Sloshing Pressure in Tanks

4.2.1 Application and limitations

4.2.1.1 The sloshing pressures given in 4.2.2 to 4.2.4 are pressures induced by free movement of the tank liquids as a result of ship motions.

4.2.1.2 The given pressures do not include the effect of impact pressures due to high velocity impacts with tank boundaries or internal structures. For tanks with a maximum effective sloshing breadth, b_{slh} , greater than $0.56B$ or a maximum effective sloshing length, l_{slh} , greater than $0.13L$ at any filling height from $0.05h_{max}$ to $0.95h_{max}$, an additional impact assessment is to be carried out in accordance with the individual Classification Society procedures. The effective sloshing lengths and breadths, l_{slh} and b_{slh} , are calculated using the equations in 4.2.2.1 and 4.2.3.1 respectively.

4.2.2 Sloshing pressure due to longitudinal liquid motion

4.2.2.1 The sloshing pressure in way of transverse tight and wash bulkheads due to longitudinal liquid motion, $P_{slh-lng}$, for a particular filling height, is to be taken as:

$$P_{slh-lng} = \rho g l_{slh} f_{slh} \left[0.4 - \left(0.39 - \frac{1.7l_{slh}}{L} \right) \frac{L}{350} \right] \quad \text{kN/m}^2$$

Where:

ρ density of liquid in the tank, in tonnes/m³, and is not to be taken as less than 1.025

l_{slh} effective sloshing length, at considered filling height as given in 4.2.2.3 and 4.2.2.4 for transverse tight bulkheads and transverse wash bulkheads respectively, in m

$$f_{slh} = 1 - 2 \left(0.7 - \frac{h_{fill}}{h_{max}} \right)^2$$

L rule length, in m, as defined in Section 4/1.1.1.1

h_{fill} filling height, measured from inner bottom, in m, see Figure 7.4.1

h_{max} maximum tank height excluding small hatchways, measured from inner bottom, in m, see Figure 7.4.1

g acceleration due to gravity, 9.81 m/s²

4.2.2.2 The sloshing pressure due to longitudinal liquid motion, $P_{slh-lng}$, is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling heights from $0.05h_{max}$ to $0.95h_{max}$, in $0.05h_{max}$ increments.

4.2.2.3 For calculation of sloshing pressures in way of transverse tight bulkheads, the effective sloshing length, l_{slh} , is to be taken as:

$$l_{slh} = \frac{(1 + n_{wash-t} \alpha_{wash-t})(1 + f_{wf} \alpha_{wf}) l_{tk-h}}{(1 + n_{wash-t})(1 + f_{wf})} \quad \text{m}$$

Where:

n_{wash-t} number of transverse wash bulkheads in the tank

α_{wash-t} transverse wash bulkhead coefficient,

$$= \frac{A_{opn-wash-t}}{A_{tk-t-h}}$$

see Figure 7.4.1

α_{wf} transverse web frame coefficient,

$$= \frac{A_{opn-wf-h}}{A_{tk-t-h}}$$

see Figure 7.4.2

for tanks with changing shape along the length and/or with web frames of different shape the transverse web frame coefficient, α_{wf} , may be taken as the weighted average of all web frame locations in the tank given as

$$= \frac{\sum_{i=1}^n \frac{A_{opn-wf-h-i}}{A_{tk-t-h-i}}}{n_{wf}}$$

$A_{opn-wash-t}$ total area of openings in the transverse section in way of the wash bulkhead below the considered filling height, in m²

A_{tk-t-h} total transverse cross sectional area of the tank below the considered filling height, in m²

$A_{opn-wf-h}$ the total area of openings in the transverse section in way of the web frame below the considered filling height, in m²

f_{wf} factor to account for number of transverse web frames and transverse wash bulkheads in the tank:
 $= n_{wf} / (1 + n_{wash-t})$

n_{wf} number of transverse web frames, excluding wash bulkheads, in the tank

l_{tk-h} length of cargo tank, at considered filling height, in m

4.2.2.4 For calculation of sloshing pressures in way of transverse wash bulkheads, the effective sloshing length, l_{slh} , is to be taken as:

$$l_{slh} = \frac{[1 + (n_{wash-t} - 1)\alpha_{wash-t}](1 + f_{wf}\alpha_{wf})l_{tk-h}}{(1 + n_{wash-t})(1 + f_{wf})} \quad \text{m}$$

Where:

n_{wash-t} number of transverse wash bulkheads in the tank

α_{wash-t} transverse wash bulkhead coefficient,

$$= \frac{A_{opn-wash-t}}{A_{tk-t-h}}$$

see Figure 7.4.1

α_{wf} transverse web frame coefficient,

$$= \frac{A_{opn-wf-h}}{A_{tk-t-h}}$$

see Figure 7.4.2

for tanks with changing shape along the length and/or with web frames of different shape the transverse web frame coefficient, α_{wf} , may be taken as the weighted average of all web frame locations in the tank given as

$$= \frac{\sum_{i=1}^n \frac{A_{opn-wf-h-i}}{A_{tk-t-h-i}}}{n_{wf}}$$

$A_{opn-wash-t}$ the total area of openings in the transverse section in way of the wash bulkhead below the considered filling height, in m²

A_{tk-t-h} total transverse cross sectional area of the tank below the considered filling height, in m²

$A_{opn-wf-h}$ the total area of openings in the transverse section in way of the web frame below the considered filling height, in m²

f_{wf} factor to account for number of transverse web frames and transverse wash bulkheads in the tank:
 $= n_{wf} / (1 + n_{wash-t})$

n_{wf} number of transverse web frames, excluding wash bulkheads, in the tank

l_{tk-h} length of cargo tank, at considered filling height, in m

4.2.2.5 For tanks with internal web frames the sloshing pressure acting on a web frame adjacent to a transverse tight or wash bulkhead, P_{slh-wf} , provided it is located within 0.25 l_{slh} from the bulkhead, is to be taken as:

$$P_{slh-wf} = P_{slh-lng} \left(1 - \frac{s_{wf}}{l_{slh}} \right)^2 \quad \text{kN/m}^2$$

Where:

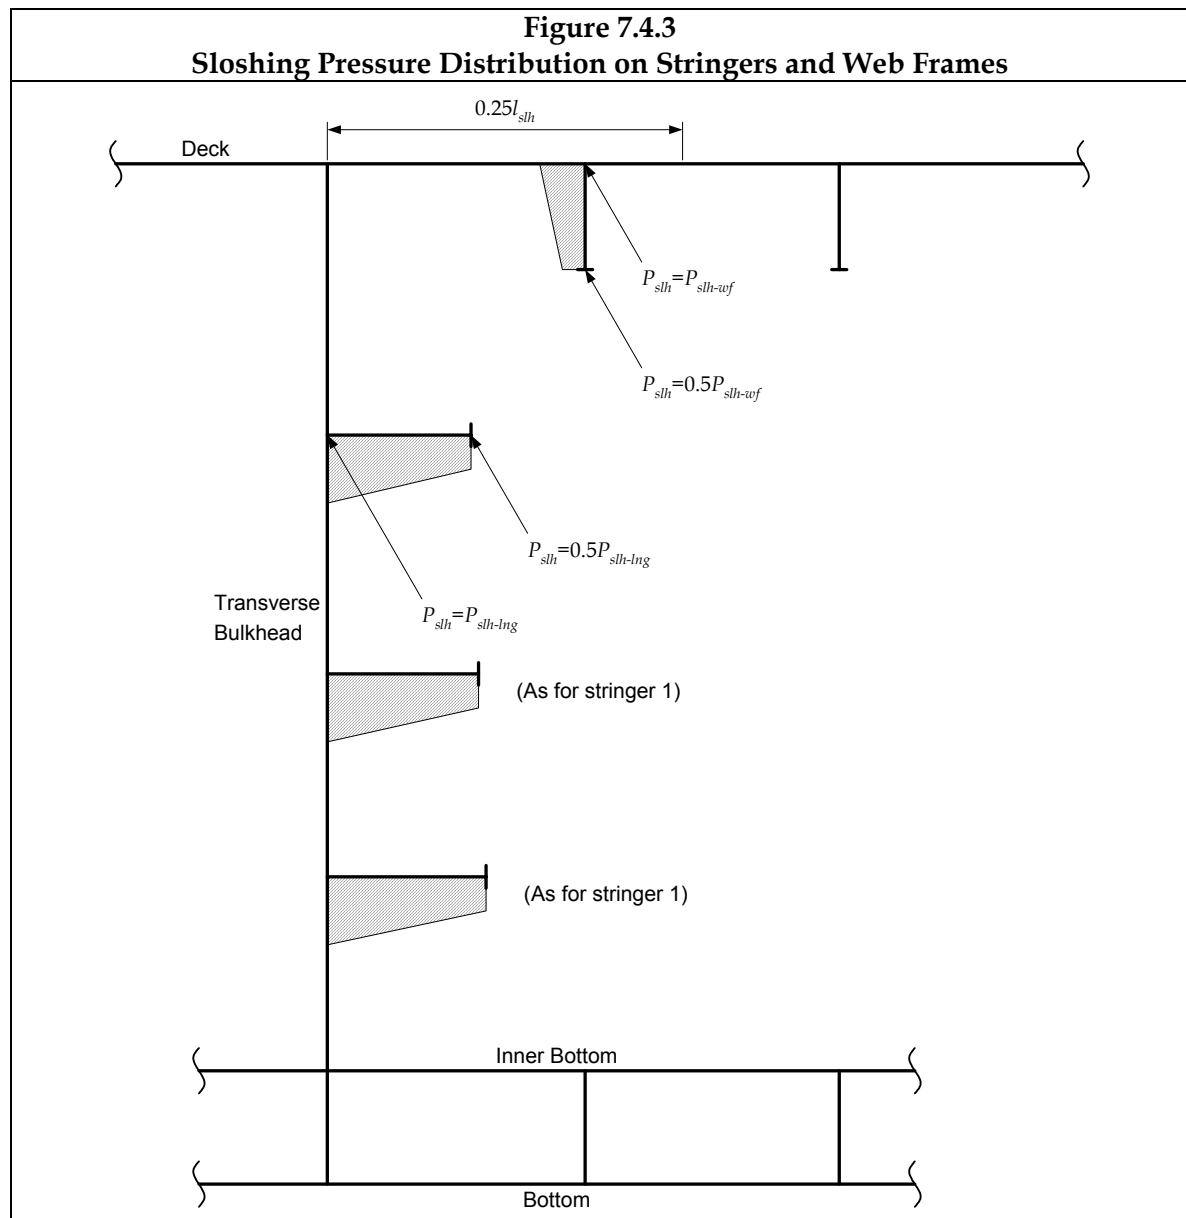

$P_{slh-lng}$ sloshing pressure acting on bulkhead due to longitudinal liquid motion, as given in 4.2.2.1

s_{wf} distance from bulkhead to web frame under consideration, in m

l_{slh} effective sloshing length, at considered filling height as defined in 4.2.2.3 and 4.2.2.4 for transverse tight and wash bulkheads respectively, in m

The distribution of pressure across the web frame is given in Figure 7.4.3.

4.2.2.6 For tanks with internal bulkhead stringers and/or web frames, the distribution of sloshing pressure, P_{slh} , across these members is shown in Figure 7.4.3.

4.2.3 Sloshing pressure due to transverse liquid motion

4.2.3.1 The sloshing pressure in way of longitudinal tight and wash bulkheads due to transverse liquid motion, P_{slh-t} , for a particular filling height, is to be taken as:

$$P_{slh-t} = 7\rho g f_{slh} \left(\frac{b_{slh}}{B} - 0.3 \right) GM^{0.75} \quad \text{kN/m}^2$$

Where:

ρ density of liquid in the tank, in tonnes/m³, and is not to be taken as less than 1.025

b_{slh} effective sloshing breadth, see 4.2.3.3 and 4.2.3.4 for longitudinal tight bulkheads and longitudinal wash bulkheads respectively, not to be taken less than $0.3B$, in m.

GM metacentric height, is to be taken as $0.33B$ for calculation of sloshing pressures in ballast tanks and $0.24B$ for calculation of sloshing pressure in cargo tanks

$$f_{slh} = 1 - 2 \left(0.7 - \frac{h_{fill}}{h_{max}} \right)^2$$

B moulded breadth, in m, as defined in Section 4/1.1.3.1

h_{fill} filling height, measured from inner bottom, in m, see Figure 7.4.1

h_{max} maximum tank height excluding small hatchways, measured from inner bottom, in m, see Figure 7.4.1

g acceleration due to gravity, 9.81m/s²

4.2.3.2 The sloshing pressure due to transverse liquid motion, P_{slh-t} , is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling heights from $0.05h_{max}$ to $0.95h_{max}$, in $0.05h_{max}$ increments.

4.2.3.3 For calculation of sloshing pressures in way of longitudinal tight bulkheads the effective sloshing breadth, b_{slh} , is to be taken as:

$$b_{slh} = \frac{(1 + n_{wash-lng} \alpha_{wash-lng})(1 + f_{grd} \alpha_{grd}) b_{tk-h}}{(1 + n_{wash-lng})(1 + f_{grd})} \quad \text{m}$$

Where:

$n_{wash-lng}$ number of longitudinal wash bulkheads in the tank

$\alpha_{wash-lng}$ longitudinal wash bulkhead coefficient

$$= \frac{A_{opn-wash-lng}}{A_{tk-lng-h}}$$

α_{grd} girder coefficient

$$= \frac{A_{opn-grd-h}}{A_{tk-lng-h}}$$

$A_{opn-wash-lng}$ total area of openings in the longitudinal section in way of the wash bulkhead below the considered filling height, in m²

$A_{tk-lng-h}$ total longitudinal cross sectional area of the tank below the considered filling height, in m²

$A_{opn-grd-h}$ total area of openings in the longitudinal section below the considered filling height, in m²

f_{grd} factor to account for longitudinal girders and longitudinal wash bulkheads in the tank:
 $= n_{grd} / (1 + n_{wash-lng})$

n_{grd} number of longitudinal girders, excluding longitudinal wash bulkheads, in the tank

b_{tk-h} tank breadth at considered filling height, in m

4.2.3.4 For calculation of sloshing pressures in way of longitudinal wash bulkheads the effective sloshing breadth, b_{slh} , is to be taken as:

$$b_{slh} = \frac{[1 + (n_{wash-lng} - 1) \alpha_{wash-lng}](1 + f_{grd} \alpha_{grd}) b_{tk-h}}{(1 + n_{wash-lng})(1 + f_{grd})} \quad \text{m}$$

Where:

$n_{wash-lng}$	number of longitudinal wash bulkheads in the tank
$\alpha_{wash-lng}$	longitudinal wash bulkhead coefficient $= \frac{A_{opn-wash-lng}}{A_{tk-lng-h}}$
α_{grd}	girder coefficient $= \frac{A_{opn-grd-h}}{A_{tk-lng-h}}$
$A_{opn-wash-lng}$	total area of openings in the longitudinal section in way of the wash bulkhead below the considered filling height, in m ²
$A_{tk-lng-h}$	total longitudinal cross sectional area of the tank below the considered filling height, in m ²
$A_{opn-grd-h}$	total area of openings in the longitudinal section below the considered filling height, in m ²
f_{grd}	factor to account for longitudinal girders and longitudinal wash bulkheads in the tank: $= n_{grd} / (1 + n_{wash-lng})$
n_{grd}	number of longitudinal girders, excluding longitudinal wash bulkheads, in the tank
b_{tk-h}	tank breadth at considered filling height, in m

- 4.2.3.5 For tanks with internal longitudinal girders or webframes, the sloshing pressure on the girder/webframe adjacent to a longitudinal wash bulkhead, $P_{slh-grd}$, provided it is located within $0.25b_{slh}$ from the bulkhead, is to be taken as:

$$P_{slh-grd} = P_{slh-t} \left(1 - \frac{s_{grd}}{b_{slh}} \right)^2 \quad \text{kN/m}^2$$

Where:

P_{slh-t}	sloshing pressure acting on bulkhead due to transverse liquid motion, in kN/m ² , see 4.2.3.1
s_{grd}	distance from longitudinal bulkhead to longitudinal girder being considered, in m
b_{slh}	effective sloshing breadth, see 4.2.3.3 and 4.2.3.4 for longitudinal tight bulkheads and longitudinal wash bulkheads respectively, in m

- 4.2.3.6 For tanks with internal longitudinal stringers and or girders/webframes, the distribution of sloshing pressure across these members is shown in *Figure 7.4.4*.

g	acceleration due to gravity, 9.81 m/s ²
f_{slm}	longitudinal slamming distribution factor, see <i>Figure 7.4.5</i> , is to be taken as: 0 at 0.5L 1 at $[0.175 - 0.5(C_{bl} - 0.7)]L$ from F.P. 1 at $[0.1 - 0.5(C_{bl} - 0.7)]L$ from F.P. 0.5 at, and forward of F.P. intermediate values to be obtained by linear interpolation.
C_{bl}	block coefficient, C_b , as defined in <i>Section 4/1.1.9.1</i> , but not to be taken less than 0.7 or greater than 0.8 slamming coefficient for empty ballast tanks
C_{slm-mt}	$= 5.95 - 10.5 \left(\frac{T_{FP-mt}}{L} \right)^{0.2}$ slamming coefficient for full ballast tanks
$C_{slm-full}$	$= 5.95 - 10.5 \left(\frac{T_{FP-full}}{L} \right)^{0.2}$
c_1	is to be taken as: 0 for $L \leq 180\text{m}$ $= -0.0125(L - 180)^{0.705}$ for $L > 180\text{m}$
T_{FP-mt}	design slamming ballast draught at F.P. with ballast tanks within the bottom slamming region empty as defined in 4.3.2.3, in m
$T_{FP-full}$	design slamming ballast draught at F.P. with ballast tanks within the bottom slamming region full as defined in 4.3.2.4, in m
c_{av}	dynamic load coefficient, to be taken as 1.25
L	rule length, in m, as defined in <i>Section 4/1.1.1.1</i>
z_{ball}	vertical distance from tank top to load point, in m

4.3.2.2 The designer is to provide the design slamming draughts T_{FP-mt} and $T_{FP-full}$.

4.3.2.3 The design slamming draught at the F.P., T_{FP-mt} , is not to be greater than the minimum draught at the F.P. indicated in the loading manual for all seagoing conditions wherein the ballast tanks within the bottom slamming region are empty. This includes any loading conditions with tanks inside the bottom slamming region that use the “sequential” ballast water exchange method.

4.3.2.4 The design slamming draught at the F.P., $T_{FP-full}$, is not to be greater than the minimum draught at the F.P. indicated in the loading manual for any seagoing conditions wherein the ballast tanks within the bottom slamming region are full. This includes any loading condition with tanks inside the bottom slamming region that use the “flow-through” ballast water exchange method.

4.3.2.5 The loading guidance information is to clearly indicate the design slamming draughts and the ballast water exchange method used for each ballast tank, see *Section 8/1.1*.

4.4 Bow Impact Loads

4.4.1 Application and limitations

4.4.1.1 The bow impact pressure applies to the side structure in the area forward of $0.1L$ aft of F.P. and between the waterline at draught T_{bal} and the highest deck at side.

4.4.2 Bow impact pressure

4.4.2.1 The bow impact pressure, P_{im} , is to be taken as:

$$P_{im} = 1.025 f_{im} c_{im} V_{im}^2 \sin \gamma_{wl} \quad \text{kN/m}^2$$

Where:

f_{im} 0.55 at $0.1L$ aft of F.P.
 0.9 at $0.0125L$ aft of F.P.
 1.0 at and forward of F.P.

intermediate values to be obtained by linear interpolation

V_{im} impact speed, in m/s
 $= 0.514 V_{fwd} \sin \alpha_{wl} + \sqrt{L}$

V_{fwd} forward speed, in knots
 $= 0.75V$ but is not to be taken as less than 10

V service speed, in knots, as defined in Section 4/1.1.8.1

α_{wl} local waterline angle at the position considered, but is not to be taken as less than 35 degrees, see Figure 7.4.6.

γ_{wl} local bow impact angle measured normal to the shell from the horizontal to the tangent line at the position considered but is not to be less than 50 degrees, see Figure 7.4.6.

c_{im}	1.0	for positions between draughts T_{bal} and T_{sc}
	$= \sqrt{1 + \cos^2 \left[90 \frac{(h_{fb} - 2h_o)}{h_{fb}} \right]}$	for positions above draught T_{sc}
h_{fb}	vertical distance from the waterline at draught T_{sc} to the highest deck at side, see <i>Figure 7.4.6</i> , in m	
h_o	vertical distance from the waterline at draught T_{sc} to the position considered, see <i>Figure 7.4.6</i> , in m	
L	rule length, in m, as defined in <i>Section 4/1.1.1.1</i>	
T_{sc}	scantling draught, in m, as defined in <i>Section 4/1.1.5.5</i>	
T_{bal}	minimum design ballast draught, in m, for the normal ballast condition as defined in <i>Section 4/1.1.5.2</i>	
WL_j	waterline at the position considered, see <i>Figure 7.4.6</i>	

Guidance Note

Where local bow impact angle measured normal to the shell, γ_{wl} , is not available, this angle may be taken as:

$$\gamma_{wl} = \tan^{-1} \left(\frac{\tan \beta_{pl}}{\cos \alpha_{wl}} \right)$$

Where

β_{pl} local body plan angle at the position considered from the horizontal to the tangent line, but is not to be less than 35 degrees

Figure 7.4.6
Definition of Bow Geometry

5 ACCIDENTAL LOADS

5.1 Flooded Condition

5.1.1 Local Pressure

- 5.1.1.1 The pressure in compartments and tanks in flooded condition or damaged condition is to be taken as $P_{in-flood}$, see 2.2.3.4.

6 COMBINATION OF LOADS

6.1 General

6.1.1 Application

6.1.1.1 The design load combinations S , $S + D$, and A are to be used for scantling calculations for the scantling requirements and strength assessment (by FEM). design load combinations are defined in *Section 2/4.2.2* and the relevant loads and load combination are to be taken as given in 6.2.

6.1.1.2 The dynamic loads, D , consist of several dynamic load cases. For each dynamic load case, the envelope load values as given in *Sub-Section 3* are multiplied with dynamic load combination factors to give simultaneously acting dynamic loads. The procedures for calculating the simultaneously acting dynamic loads are given in 6.3. The dynamic load combination factors are given in 6.4 for strength assessment (by FEM) and in 6.5 for scantling requirements.

6.2 Design Load Combination

6.2.1 General

6.2.1.1 The design load combinations are given in *Table 7.6.1*.

Table 7.6.1 Design Load Combinations				
Design Load Combination		S	S + D	A
Load components				
$M_{v-total}$		$M_{sw-harb}$	$M_{sw-sea} + M_{wv}$	-
$M_{h-total}$		-	M_h	-
Q		$Q_{sw-harb}$	$Q_{sw-sea} + Q_{wv}$	-
P_{ex}	Weather Deck	-	$P_{wdk-dyn}$	-
	Hull envelope	P_{hys}	$P_{hys} + P_{wv-dyn}$	-
P_{in}	Ballast tanks (BWE with sequential filling method)	the greater of a) $P_{in-test}$ b) $P_{in-air} + P_{drop}$	$P_{in-tk} + P_{in-dyn}$	$P_{in-flood}$
	Ballast tanks (BWE with flow-through method)	the greater of a) $P_{in-test}$ b) $P_{in-air} + P_{drop}$	$P_{in-air} + P_{drop} + P_{in-dyn}$	$P_{in-flood}$
	Cargo tanks including cargo tanks designed for filling with water ballast	the greater of a) $P_{in-test}$ b) $P_{in-tk} + P_{valve}$	$P_{in-tk} + P_{in-dyn}$	-
	Other tanks with liquid filling	the greater of a) $P_{in-test}$ b) P_{in-air}	$P_{in-tk} + P_{in-dyn}$	$P_{in-flood}$
	Watertight boundaries	-	-	$P_{in-flood}$
P_{dk}	Internal decks for dry spaces	P_{stat}	$P_{stat} + P_{dk-dyn}$	-
	Decks for heavy units	F_{stat}	$F_{stat} + F_{dk-dyn}$	-

Table 7.6.1 (Continued)
Design Load Combinations

Note:		
1. Separate load requirements may be specified in strength assessment (FEM) and scantling requirements.		
Where:		
$M_{v-total}$	design vertical bending moment, in kNm	
$M_{sw-perm-harb}$	permissible hull girder hogging and sagging still water bending moment envelopes for harbour/sheltered water operation, in kNm	see 2.1.1
$M_{sw-perm-sea}$	permissible hull girder hogging and sagging still water bending moment envelopes for seagoing operation, in kNm	see 2.1.1
M_{wv}	vertical wave bending moment for a considered dynamic load case, in kNm	see 6.3.2.1
$M_{h-total}$	design horizontal bending moment, in kNm	
M_h	horizontal wave bending moment for a considered dynamic load case, in kNm	see 6.3.3.1
Q	design vertical shear force, in kN	
$Q_{sw-perm-harb}$	permissible hull girder positive and negative still water shear force limits for harbour/sheltered water operation, in kN	see 2.1.3
$Q_{sw-perm-sea}$	permissible hull girder positive and negative still water shear force limits for seagoing operation, in kN	see 2.1.3
Q_{wv}	vertical wave shear force for a considered dynamic load case, in kN	see 6.3.4.1
P_{ex}	design sea pressure, in kN/m ²	
P_{hys}	static sea pressure at considered draught, in kN/m ²	see 2.2.2.1
P_{wv-dyn}	dynamic wave pressure for a considered dynamic load case, in kN/m ²	see 6.3.5
$P_{wdk-dyn}$	green sea load for a considered dynamic load case, in kN/m ²	see 6.3.6
P_{in}	design tank pressure, in kN/m ²	
$P_{in-test}$	tank testing pressure, in kN/m ²	see 2.2.3.5
P_{in-air}	static tank pressure in the case of overfilling or filling during flow through ballast water exchange, in kN/m ²	see 2.2.3.2
P_{drop}	added overpressure due to liquid flow through air pipe or overflow pipe, in kN/m ²	see 2.2.3.3
P_{valve}	setting of pressure relief valve, in kN/m ²	see 2.2.3.5
P_{in-tk}	static tank pressure, in kN/m ²	see 2.2.3.1
P_{in-dyn}	dynamic tank pressure for a considered dynamic load case, in kN/m ²	see 6.3.7
$P_{in-flood}$	pressure in compartments and tanks in flooded or damaged condition, in kN/m ²	see 2.2.3.4
P_{stat}	static pressure on decks and inner bottom, in kN/m ²	see 2.2.4.1
P_{dk}	design deck pressure, in kN/m ²	
P_{dk-dyn}	dynamic deck pressure on decks, inner bottom and hatch covers for a considered dynamic load case, in kN/m ²	see 6.3.8.1
F_{stat}	load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, in kN	see 2.2.5.1
F_{dk-dyn}	dynamic load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, in kN	see 6.3.8.2

6.3 Application of Dynamic Loads

6.3.1 Heading correction factor and dynamic load combination factors

6.3.1.1 The heading correction factor, f_{β} , is to be taken as:

$$f_{\beta} = \begin{cases} 0.8 & \text{for beam sea dynamic load cases} \\ 1.0 & \text{for all other dynamic load cases} \end{cases}$$

6.3.1.2 The dynamic load combination factors used for the calculations of the simultaneously acting dynamic loads, are to be taken as given in *Table 7.6.2* for strength assessment by FEM, see 6.4. Dynamic load factors are to be taken as given in *Table 7.6.4* to *Table 7.6.9* for scantling assessment, see 6.5.

6.3.2 Vertical wave bending moment for a considered dynamic load case

6.3.2.1 The simultaneously acting vertical wave bending moment, M_{wv} , is to be taken as:

$$M_{wv} = f_{\beta} f_{mv} M_{wv-hog} \quad \text{kNm} \quad \text{for } f_{mv} \geq 0$$

$$M_{wv} = -f_{\beta} f_{mv} M_{wv-sag} \quad \text{kNm} \quad \text{for } f_{mv} < 0$$

Where:

M_{wv-hog} hogging vertical wave bending moment, in kNm, as defined in 3.4.1.1

M_{wv-sag} sagging vertical wave bending moment, in kNm, as defined in 3.4.1.1

f_{mv} dynamic load combination factor for vertical wave bending moment for considered dynamic load case, see 6.3.1.2

f_{β} heading correction factor, as defined in 6.3.1.1

6.3.3 Horizontal wave bending moment for a considered dynamic load case

6.3.3.1 The simultaneously acting horizontal wave bending moment, M_h , is to be taken as:

$$M_h = f_{\beta} f_{mh} M_{wv-h} \quad \text{kNm}$$

Where:

M_{wv-h} horizontal wave bending moment, in kNm, as defined in 3.4.2

f_{mh} dynamic load combination factor for horizontal wave bending moment for considered dynamic load case, see 6.3.1.2

f_{β} heading correction factor, as defined in 6.3.1.1

6.3.4 Vertical wave shear force for a considered dynamic load case

6.3.4.1 The simultaneously acting vertical wave shear force, Q_{wv} , is to be taken as:

$$Q_{wv} = f_{\beta} f_{qv} Q_{wv-pos} \quad \text{kN} \quad \text{for } f_{qv} \geq 0$$

$$Q_{wv} = -f_{\beta} f_{qv} Q_{wv-neg} \quad \text{kN} \quad \text{for } f_{qv} < 0$$

Where:

Q_{wv-pos} envelope positive vertical wave shear force, in kN, as defined in 3.4.3

Q_{wv-neg} envelope negative vertical wave shear force, in kN, as defined in 3.4.3

f_{qv} dynamic load combination factor for vertical wave shear force for considered dynamic load case, see 6.3.1.2

f_{β} heading correction factor, as defined in 6.3.1.1

6.3.5 Dynamic wave pressure distribution for a considered dynamic load case

6.3.5.1 The simultaneously acting dynamic wave pressure, P_{wv-dyn} , for the port and starboard side within the cargo tank region for a considered dynamic load case is to be taken as follows, but not to be less than $-\rho_{sw}g(T_{LC} - z)$ below still waterline or less than 0 above still waterline:

$$P_{wv-dyn} = P_{ctr} + \frac{|y|}{0.5B_{local}}(P_{bilge} - P_{ctr}) \quad \text{between centreline and start of bilge}$$

$$P_{wv-dyn} = P_{bilge} + \frac{z}{T_{LC}}(P_{WL} - P_{bilge}) \quad \text{between end of bilge and still waterline}$$

$$P_{wv-dyn} = P_{WL} - 10(z - T_{LC}) \quad \text{for side-shell above still waterline}$$

intermediate values of P_{wv-dyn} around the bilge are to be obtained by linear interpolation along the vertical distance

Where:

P_{ctr} dynamic wave pressure at bottom centreline, to be taken as:
 $= f_{ctr} P_{ex-max} \quad \text{kN/m}^2$

P_{bilge} dynamic wave pressure at $z = 0$ and $y = B_{local}/2$, to be taken as:
 $= f_{bilge} P_{ex-max} \quad \text{kN/m}^2$

P_{WL} dynamic wave pressure at waterline, to be taken as:
 $= f_{WL} P_{ex-max} \quad \text{kN/m}^2$

P_{ex-max} envelope maximum dynamic wave pressure, in kN/m^2 , as defined in 3.5.2.2

f_{WL} dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see 6.3.1.2

f_{bilge} dynamic load combination factor for dynamic wave pressure at bilge for considered dynamic load case, see 6.3.1.2

f_{ctr} dynamic load combination factor for dynamic wave pressure at centreline for considered dynamic load case, see 6.3.1.2

B_{local} local breadth at waterline for considered draught, in m

T_{LC} draught in the loading condition being considered, in m

y transverse coordinate, in m

z vertical coordinate, in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

6.3.5.2 The simultaneously acting dynamic wave pressure for the port and starboard side outside the cargo region, P_{wv-dyn} , for a considered dynamic load case is to be obtained by linear interpolation between P_{ctr} and P_{WL} , but not to be taken less than $-\rho_{sw}g(T_{LC} - z)$ below still waterline or less than 0 above still waterline.

$$P_{wv-dyn} = P_{ctr} + \frac{z}{T_{LC}}(P_{WL} - P_{ctr}) \quad \text{between bottom centreline and still waterline}$$

$$P_{wv-dyn} = P_{WL} - 10(z - T_{LC}) \quad \text{above still waterline}$$

Where:

P_{ctr} dynamic wave pressure at bottom centreline, and is to be taken as:
 $f_{ctr} P_{ex-max}$ kN/m²

P_{WL} dynamic wave pressure at still waterline, and is to be taken as:
 $f_{WL} P_{ex-max}$ kN/m²

P_{ex-max} envelope maximum dynamic wave pressure, in kN/m², as defined in 3.5.2.2

f_{WL} dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see 6.3.1.2

f_{ctr} dynamic load combination factor for dynamic wave pressure at centreline for considered dynamic load case, see 6.3.1.2

T_{LC} draught in the loading condition being considered, in m

z vertical coordinate, in m

ρ_{sw} density of sea water, 1.025tonnes/m³

g acceleration due to gravity, 9.81m/s²

6.3.5.3 Figure 7.6.1 to Figure 7.6.3 illustrates simultaneously acting dynamic wave pressures.

6.3.6 Green sea load for a considered dynamic load case

6.3.6.1 The simultaneously acting green sea load on the weather deck, $P_{wdk-dyn}$, for strength assessment is obtained by linear interpolation between P_{wdk-pt} and $P_{wdk-stb}$:

The green sea load at the port side, P_{wdk-pt} , is to be taken as the greater of:

$$P_{wdk-pt} = f_{1-dk} (f_{WL} f_{op} P_{1-WL} - 10z_{dk-T}) \quad \text{kN/m}^2$$

$$P_{wdk-pt} = 0.8 (f_{WL} P_{2-WL} - 10z_{dk-T}) \quad \text{kN/m}^2$$

P_{wdk-pt} is not to be taken as less than 34.3 kN/m² when $f_{WL} = 1.0$ and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

The green sea load at the starboard side, $P_{wdk-stb}$, is to be taken as the greater of:

$$P_{wdk-stb} = f_{1-dk} (f_{WL} f_{op} P_{1-WL} - 10 z_{dk-T}) \quad \text{kN/m}^2$$

$$P_{wdk-stb} = 0.8 (f_{WL} P_{2-WL} - 10 z_{dk-T}) \quad \text{kN/m}^2$$

$P_{wdk-stb}$ is not to be taken as less than 34.3 kN/m² when $f_{WL} = 1.0$ and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

P_{wdk-pt} and $P_{wdk-stb}$ are not to be taken as less than 0.

Where:

$$f_{1-dk} = 0.8 + \frac{L}{750}$$

$$f_{op} = 1.0 \quad \text{at and forward of } 0.2L \text{ from A.P.}$$

$$= 0.8 \quad \text{at and aft of A.P.}$$

intermediate values to be obtained by linear interpolation

$$P_{1-WL} \quad P_1 \text{ pressure at still waterline for considered draught, in kN/m}^2, \text{ see 3.5.2.1}$$

$$P_{2-WL} \quad P_2 \text{ pressure at still waterline for considered draught, in kN/m}^2, \text{ see 3.5.2.1}$$

$$f_{WL} \quad \text{dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see 6.3.1.2}$$

$$z_{dk-T} \quad \text{distance from the deck to the still waterline at the applicable draught for the loading condition being considered, in m}$$

$$L \quad \text{rule length, in m, as defined in Section 4/1.1.1.1}$$

6.3.6.2 The simultaneously acting green sea load on the weather deck, $P_{wdk-dyn}$, for scantling requirements is to be taken as the greater of:

$$P_{wdk-dyn} = f_{1-dk} (f_{WL} f_{op} P_{1-WL} - 10 z_{dk-T}) \quad \text{kN/m}^2$$

but is not to be taken as less than 34.3 kN/m² when $f_{WL} = 1.0$ and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

$$P_{wdk-dyn} = 0.8 f_{2-dk} (f_{WL} P_{2-WL} - 10 z_{dk-T}) \quad \text{kN/m}^2$$

but is not to be taken as less than 34.3 kN/m² when $f_{WL} = 1.0$ and $f_{2-dk} = 1.0$ and the ship's draught used in the design load case is greater or equal to $0.9T_{sc}$

$$P_{wdk-dyn} = 0$$

Where:

$$f_{1-dk} = 0.8 + \frac{L}{750}$$

$$f_{2-dk} = 0.5 + \frac{|y|}{B_{wdk}}$$

$$f_{op} = 1.0 \quad \text{at and forward of } 0.2L \text{ from A.P.}$$

$$= 0.8 \quad \text{at and aft of A.P.}$$

intermediate values to be obtained by linear interpolation

$$P_{1-WL} \quad P_1 \text{ pressure at still waterline for considered draught, in kN/m}^2$$

P_{2-WL}	P_2 pressure at still waterline for considered draught, in kN/m ²
f_{WL}	dynamic load combination factor for dynamic wave pressure at still waterline for considered dynamic load case, see 6.3.1.2
y	transverse coordinate, in m
z_{dk-T}	distance from the deck at side to the still waterline at the applicable draught for the loading condition being considered, in m
B_{wdk}	local breadth at the weather deck, in m
L	rule length, in m, as defined in Section 4/1.1.1.1

6.3.7 Dynamic tank pressure for a considered dynamic load case

6.3.7.1 The simultaneously acting dynamic tank pressure, P_{in-dyn} , for tanks in the cargo region, is to be taken as:

$$P_{in-dyn} = f_{\beta} (f_v P_{in-v} + f_t P_{in-t} + f_{lng} P_{in-lng}) \quad \text{kN/m}^2$$

Where:

P_{in-v} envelope dynamic tank pressure due to vertical acceleration as defined in 3.5.4.1 with reference point z_0 taken as:

(a) top of tank

(b) top of air pipe/overflow for ballast tanks designed for BWE by flow-through method

see Figure 7.6.4, in kN/m²

P_{in-t} envelope dynamic tank pressure due to transverse acceleration as defined in 3.5.4.2 with reference point y_0 taken as:

(a) tank top towards port side for $f_t > 0$

(b) tank top towards starboard side for $f_t < 0$

see Figure 7.6.5, in kN/m²

P_{in-lng} envelope dynamic tank pressure due to longitudinal acceleration as defined in 3.5.4.3 with reference point x_0 taken as:

(a) forward bulkhead for $f_{lng} > 0$

(b) aft bulkhead of the tank for $f_{lng} < 0$

see Figure 7.6.6, in kN/m²

f_v dynamic load combination factor for vertical acceleration for considered dynamic load case. f_v is to be taken as appropriate to the tank location, see 6.3.1.2

f_t dynamic load combination factor for transverse acceleration for considered dynamic load case, see 6.3.1.2

f_{lng} dynamic load combination factor for longitudinal acceleration for considered dynamic load case. f_{lng} is to be taken as most appropriate dependent on tank location, see 6.3.1.2

f_{β} heading correction factor, as defined in 6.3.1.1

x_0 longitudinal coordinate of reference point, in m

y_0	transverse coordinate of reference point, in m
z_0	vertical coordinate of reference point, in m

Note

1. For a non-parallel tank, y_0 should be selected from either forward or aft bulkhead corresponding to the reference point x_0 . If the longitudinal load combination factor $f_{lng} = 0$, y_0 should be selected from the bulkhead with the greater breadth.
2. The vertical, transverse and longitudinal acceleration is to be taken at the centre of gravity of the tank under consideration.

6.3.7.2 The simultaneously acting dynamic tank pressure for tanks outside the cargo region, P_{in-dyn} , is to be taken as:

$$P_{in-dyn} = f_{\beta} (f_{v-mid} P_{in-v} + |f_t P_{in-t}| + |f_{lng} P_{in-lng}|) \quad \text{kN/m}^2$$

Where:

P_{in-v}	envelope dynamic wave pressure due to vertical acceleration as given in 3.5.4.1 with reference point z_0 taken as: (a) top of tank (b) top of air pipe for ballast tanks design for BWE by flow through see Figure 7.6.5, in kN/m ²
P_{in-t}	envelope dynamic tank pressure due to transverse acceleration as given in 3.5.4.2 using $(y_0 - y)$ as extreme breadth of tank, in kN/m ²
P_{in-lng}	envelope dynamic tank pressure due to longitudinal acceleration as given in 3.5.4.3 using $(x_0 - x)$ as extreme length of tank, in kN/m ²
f_{v-mid}	dynamic load combination factor for vertical acceleration for considered dynamic load case, see 6.3.1.2
f_t	dynamic load combination factor for transverse acceleration for considered dynamic load case, see 6.3.1.2
f_{lng}	dynamic load combination factor for longitudinal acceleration for considered dynamic load case, see 6.3.1.2
f_{β}	heading correction factor, as defined in 6.3.1.1
x_0	longitudinal coordinate of reference point, in m
y_0	transverse coordinate of reference point, in m
z_0	vertical coordinate of reference point, in m

Figure 7.6.4
Dynamic Tank Pressure in Cargo Tank (Left) and Ballast Tank (Right) due to Positive and Negative Vertical Tank Acceleration

Note

For ballast tank which is designed for ballast water exchange by flow-through method, reference point z_0 is to be taken as top of air pipe/overflow of the tank.

Figure 7.6.6
Dynamic Tank Pressure in Tanks due to Positive and Negative Longitudinal Acceleration

6.3.8 Dynamic deck loads for a considered dynamic load case

6.3.8.1 The simultaneously acting dynamic deck load for uniformly distributed load, P_{dk-dyn} , on the enclosed upper deck, where a forecandle or poop is fitted, and also on all lower decks, is to be taken as:

$$P_{dk-dyn} = f_{\beta} f_{v-mid} P_{deck-dyn} \quad \text{kN/m}^2$$

Where:

$P_{deck-dyn}$ envelope dynamic deck pressure on decks, inner bottom and hatch covers, in kN/m², as defined in 3.5.5.1

f_{v-mid} dynamic load combination factor for vertical acceleration for considered dynamic load case, see 6.3.1.2

f_{β} heading correction factor, as defined in 6.3.1.1

6.3.8.2 The simultaneously acting dynamic vertical force for heavy units, F_{dk-dyn} , acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, is to be taken as:

$$F_{dk-dyn} = f_{\beta} f_{v-mid} F_v \quad \text{kN}$$

Where:

F_v	envelope vertical dynamic load from heavy units, in kN, as defined in 3.5.6
f_{v-mid}	dynamic load combination factor for vertical acceleration for the considered dynamic load case, see <i>Table 7.6.2</i> and <i>Table 7.6.4</i> to <i>7.6.9</i>
f_β	heading correction factor, as defined in 6.3.1.1

6.4 Dynamic Load Cases and Dynamic Load Combination Factors for Strength Assessment

6.4.1 General

- 6.4.1.1 For strength assessment (FEM) the dynamic load cases given in *Table 7.6.2* are to be applied in accordance with the requirements of *Appendix B* for Design Load Combination *S + D*. The simultaneously acting dynamic load cases are to be derived using the dynamic load combination factors given in *Table 7.6.2*.

Table 7.6.2
Dynamic Load Cases for Strength Assessment (by FEM)

Wave direction			Head sea				Beam sea		Oblique sea	
Max response			M_{wv} (Sagging)	M_{wv} (Hogging)	Q_{wv} (Sagging)	Q_{wv} (Hogging)	a_v		M_{wv-h} (Hogging)

	P_{bilge}	f_{bilge}	-0.3	0.3	0.1	-0.1	0.4	1.0	0.0	0.4
	P_{ctr}	f_{ctr}	-0.7	0.7	0.3	-0.3	0.9	0.9	0.5	0.5

Where:

Symbols are as defined in 3.3, 6.3.5.1, Table 7.6.1 and below:

- f_{v-mid} dynamic load combination factor associated with the vertical acceleration of a centre cargo and ballast tank
 f_{v-pt} dynamic load combination factor associated with the vertical acceleration of a port cargo and side ballast tank
 f_{v-stb} dynamic load combination factor associated with the vertical acceleration of a starboard cargo and side ballast tank

Note:

1. Load parameters and locations to be used for the calculations are to be taken as specified in *Appendix B/2.4.1*

6.5 Dynamic Load Cases and Dynamic Load Combination for Scantling Requirements

6.5.1 General

- 6.5.1.1 For the scantling requirements the dynamic load cases are to be applied in accordance with the design load sets given in *Table 8.2.7* through *Table 8.2.9* for the design load combination $S + D$. The simultaneously acting dynamic load cases are to be derived using the dynamic load combination factors given in *Table 7.6.4* to *Table 7.6.9*.
- 6.5.1.2 The Dynamic Load Combination Factor (DLCF) table to be used depends on the longitudinal position being considered and is specified in *Figure 7.6.7* and *Table 7.6.3*.
- 6.5.1.3 Each dynamic load case in the DLCF tables maximises one or more dynamic load components. The minimised dynamic load components are to be calculated by multiplying all the dynamic load combination factors for a dynamic load case by -1.0. The scantling requirements are to be evaluated for all maximised and minimised dynamic load cases.
- 6.5.1.4 Load parameters to be used for the calculations are to be taken as specified in *Table 8.2.8* and *Table 8.2.9*.

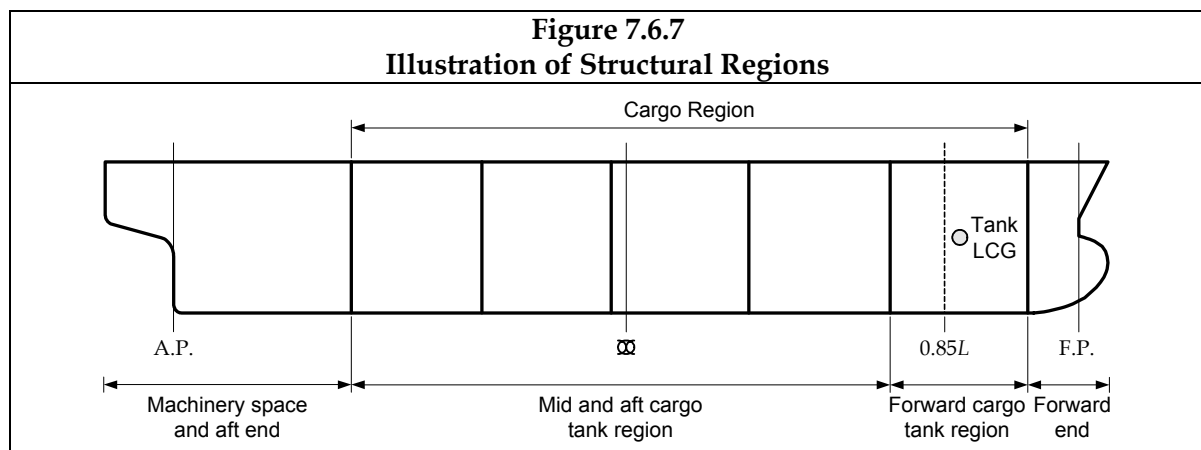

Table 7.6.3 Dynamic Load Combination Factor Tables used for Structural Region and Loading Condition				
Structural region	Machinery Space and Aft End	Mid and aft cargo tank region	Forward cargo tank region	Forward end
Applicable for tanks and spaces	aft of aftmost cargo tank	where the tank LCG is aft of 0.85L	where the tank LCG is at or forward of 0.85L	forward of foremost bulkhead
Loaded DLCF	<i>Table 7.6.8</i>	<i>Table 7.6.4</i>	<i>Table 7.6.6</i>	<i>Table 7.6.8</i>
Ballast DLCF	<i>Table 7.6.9</i>	<i>Table 7.6.5</i>	<i>Table 7.6.7</i>	<i>Table 7.6.9</i>

SECTION 8

SCANTLING REQUIREMENTS

1 LONGITUDINAL STRENGTH

1.1 Loading Guidance

1.1.1 General

- 1.1.1.1 All ships are to be provided with loading guidance information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations. The loading guidance information is to include an approved Loading Manual and Loading Computer System complying with the requirements given in 1.1.2 and 1.1.3 respectively.
- 1.1.1.2 The loading guidance information is to be based on the final data of the ship.
- 1.1.1.3 Modifications resulting in changes to the main data of the ship (lightship weight, buoyancy distribution, tank volumes or usage, etc), require the Loading Manual to be updated and re-approved, and subsequently the Loading Computer System to be updated and re-approved. However, new loading guidance need not be re-submitted provided that the resulting draughts, still water bending moments and shear forces do not differ from the originally approved data by more than 2%.
- 1.1.1.4 The loading guidance is to be prepared in a language understood by the users. If this language is not English, a translation into English shall be included. When applicable a document translating the language of the input and output data for the Loading Computer System into English is to be provided.
- 1.1.1.5 The loading guidance information is to include the following statement, to ensure the crew are aware of the operational limitations for minimum draught forward:
The scantlings are approved for a minimum draught forward, at F.P. In sea conditions where slamming is likely to occur, the forward draught is not to be less than the following:
- (a) ...m with double bottom ballast tanks No(s)... filled, or
 - (b) ...m with double bottom ballast tanks No(s)... empty

1.1.2 Loading Manual

- 1.1.2.1 The Loading Manual is a document that:
- (a) describes the loading conditions on which the design and approval of the ship has been based for seagoing- and harbour/sheltered water operation
 - (b) describes the results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional and lateral loads
 - (c) describes relevant operational limitations as given in 1.1.2.7.
- 1.1.2.2 The following loading conditions and design loading and ballast conditions upon which the approval of the hull scantlings is based are, as a minimum, to be included in the Loading Manual:
- (a) Seagoing conditions including both departure and arrival conditions
 - homogeneous loading conditions including a condition at the scantling draft (homogeneous loading conditions shall not include filling of dry and clean ballast tanks)
 - a normal ballast condition where:
 - the ballast tanks may be full, partially full or empty. Where partially full options are exercised, the conditions in 1.1.2.5 are to be complied with
 - all cargo tanks are to be empty including cargo tanks suitable for the carriage of water ballast at sea

- the propeller is to be fully immersed, and
- the trim is to be by the stern and is not to exceed $0.015L$, where L is as defined in *Section 4/1.1.1*
- a heavy ballast condition where:
 - the draught at the forward perpendicular is not to be less than that for the normal ballast condition
 - ballast tanks in the cargo tank region or aft of the cargo tank region may be full, partially full or empty. Where the partially full options are exercised, the conditions in 1.1.2.5 are to be complied with
 - the fore peak water ballast tank is to be full. If upper and lower fore peak tanks are fitted, the lower is required to be full. The upper fore peak tank may be full, partially full or empty.
 - all cargo tanks are to be empty including cargo tanks suitable for the carriage of water ballast at sea
 - the propeller is to be fully immersed
 - the trim is to be by the stern and is not to exceed $0.015L$, where L is as defined in *Section 4/1.1.1*
- any specified non-uniform distribution of loading
- conditions with high density cargo including the maximum design cargo density, when applicable
- mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions
- conditions covering ballast water exchange procedures with the calculations of the intermediate conditions just before and just after ballasting and/or deballasting any ballast tank
- (b) Harbour/sheltered water conditions
 - conditions representing typical complete loading and unloading operations
 - docking condition afloat
 - propeller inspection afloat condition, in which the propeller shaft centre line is at least $D_{prop}/4$ above the waterline in way of the propeller, where D_{prop} is the propeller diameter
- (c) Additional design conditions
 - a design ballast condition in which all segregated ballast tanks in the cargo tank region are full and all other tanks are empty including fuel oil and fresh water tanks.

Guidance Note

The design condition specified in (c) is for assessment of hull strength and is not intended for ship operation. This condition will also be covered by the *IMO 73/78 SBT* condition provided the corresponding condition in the Loading Manual only includes ballast in segregated ballast tanks in the cargo tank region.

(RCN 1, effective from 1 April 2007) (RCN 2, effective from 1 July 2008)

- 1.1.2.3 The calculation for the departure conditions are to be based on full tanks according to the applicable stability regulations for filling of tanks; note bunker tanks are not to be taken less than 95% full and other consumables are to be taken at 100% capacity. Arrival conditions are to be based on 10% of the maximum capacity of bunker, fresh water and stores.

- 1.1.2.4 Where the amount and disposition consumables at any intermediate stage of the voyage are considered more severe than of those described in 1.1.2.3, calculations for such intermediate conditions are also to be submitted for approval.
- 1.1.2.5 Ballast loading conditions involving partially filled peak and/or other ballast tanks in any departure, arrival or intermediate condition are not permitted to be used as design loading conditions unless, for all filling levels between empty and full, the resulting stress levels are within the stress and buckling acceptance criteria. For design purposes this criteria will be satisfied if the stress levels are within the stress and buckling acceptance criteria for loading conditions with the appropriate tanks full, empty and partially filled at intended level in any departure, arrival or intermediate condition. The corresponding full, empty and partially filled tank conditions are to be considered as design conditions for calculation of the still water bending moment and shear force, but these do not need to comply with propeller immersion and trim requirements as specified in 1.1.2.2(a). Where multiple ballast tanks are intended to be partially filled, all combinations of full, empty or partially filled at intended levels for those tanks are to be investigated. These requirements are not applicable to ballast water exchange using the sequential method.
(RCN 2, effective from 1 July 2008)
- 1.1.2.6 In cargo loading conditions, the requirements for partially filled ballast tanks as specified in 1.1.2.5 are applicable to the peak ballast tanks only.
(RCN 2, effective from 1 July 2008)
- 1.1.2.7 The Loading Manual is to include the design basis and operational limitations upon which the approval of the hull scantlings are based. The information listed in Table 8.1.1 is to be included in the Loading Manual.
- 1.1.2.8 The approval of the hull scantlings is based on the rule defined loading patterns and the loading conditions given in the Loading Manual.

Table 8.1.1 Design Parameters	
Parameter	
Permissible limits of still water bending moments (seagoing operation and harbour/sheltered water operation)	
Permissible limits of still water shear forces (seagoing operation and harbour/sheltered water operation)	
Scantling draught, T_{sc}	
Design minimum ballast draught at midships, T_{bal}	
Design slamming draught forward with forward double bottom ballast tanks filled, $T_{FP-full}$	
Design slamming draught forward with forward double bottom ballast tanks empty, T_{FP-mt}	
Maximum allowable cargo density	
Maximum cargo density in any loading condition in Loading Manual	
Description of the ballast exchange operations including any limitations	
Design speed	

- 1.1.2.9 The following additional loading conditions are to be included in the Loading Manual if the ship is specifically approved and intended to be operated in such conditions:
- (a) sea-going ballast conditions including water ballast carried in one or more cargo tanks which are intended for use in emergency situations as allowed by MARPOL Regulation 13. (Ship approved for loading pattern A8 of *Table B.2.3* or B7 of *Table B.2.4*)
 - (b) seagoing loading conditions where the net static upward load on the double bottom exceeds that given with the combination of an empty cargo tank and a mean ship's draught of $0.9T_{sc}$
 - (c) seagoing loading conditions with cargo tanks less than 25% full with the combination of mean ship's draught greater than $0.9T_{sc}$
 - (d) seagoing loading conditions where the net static downward load on the double bottom exceeds that given with the combination of a full cargo tank at a cargo density of 1.025 tonnes/m³ and a mean ship's draught of $0.6T_{sc}$
 - (e) for ships arranged with cross ties in the centre cargo tank , seagoing loading conditions showing a non-symmetric loading pattern where the difference in filling level between corresponding port and starboard wing cargo tanks exceeds 25% of the filling height in the wing cargo tank (Ship approved for loading pattern A7 of *Table B.2.3*)
- 1.1.2.10 This sub-section is not intended to prevent any other loading conditions to be included in the Loading Manual, nor is it intended to replace in any way the required Loading Manual/Instrument.
- 1.1.2.11 A tanker may in actual operation be loaded differently from the design loading conditions specified in the Loading Manual, provided limitations for longitudinal and local strength as defined in the Loading Manual and Loading Instrument onboard and applicable stability requirements are not exceeded.

1.1.3 Loading computer system

- 1.1.3.1 The loading computer system, is to be a system, which unless stated otherwise is digital and that can easily and quickly ascertain whether operational limitations are exceeded for any loading condition.
- 1.1.3.2 The loading computer system is to be approved based on the Rules of the individual Classification Society.
- 1.1.3.3 The loading computer system is to be capable of producing any specific loading condition and verify that these comply with all the operational limitations given in 1.1.2.2, and provide plots including input and output.
- 1.1.3.4 If any of the operational limitations are not checked, the user is to be properly informed when using the system, and by the plots provided, so that each such item is verified by other means. The loading computer system is as a minimum to verify that the following are satisfied:
- (a) draught limitations
 - (b) still water bending moments and shear forces are reported at the specified locations/read-out points.
- 1.1.3.5 The final test conditions for the loading computer are to be based on conditions given in the final Loading Manual. The test conditions are subject to approval and the shear forces and bending moments calculated by the loading computer system, at each read out point, are to be within $0.02Q_{sw-perm}$ or $0.02M_{sw-perm}$ of the results given

in the loading manual, where $Q_{sw-perm}$ and $M_{sw-perm}$ are the assigned permissible shear force and bending moment at each read out point respectively.

- 1.1.3.6 Before a loading computer system is accepted, all relevant aspects of the computer, including but not limited to the following, are to be demonstrated to the Surveyor:
- (a) verification that the final data of the ship has been used
 - (b) verification that the relevant limits for all read-out points are correct
 - (c) that the operation of the system after installation onboard, is in accordance with the approved test conditions
 - (d) that the approved test conditions are available onboard
 - (e) that an operational manual is available onboard.

1.2 Hull Girder Bending Strength

1.2.1 General

- 1.2.1.1 The net vertical hull girder section modulus, $Z_{v-net50r}$, is to be equal to or greater than the requirements given by 1.2.2.2 and 1.2.3.2. The net vertical hull girder moment of inertia, $I_{v-net50r}$, as defined in Section 4/2.6.1.1 is to be equal to or greater than the requirement given by 1.2.2.1.
- 1.2.1.2 Scantlings of all continuous longitudinal members of the hull girder based on moment of inertia and section modulus requirement in 1.2.2.1 and 1.2.2.2 are to be maintained within 0.4L midships.
- 1.2.1.3 The hull girder section modulus requirements in 1.2.3 apply along the full length of the hull girder, from A.P. to F.P.
- 1.2.1.4 Structural members included in the hull girder section modulus are to satisfy the buckling criteria given in 1.4.

1.2.2 Minimum requirements

- 1.2.2.1 At the midship cross section the net vertical hull girder moment of inertia about the horizontal neutral axis, $I_{v-net50r}$, is not to be less than the rule minimum vertical hull girder moment of inertia, I_{v-minr} , defined as:

$$I_{v-min} = 2.7C_{wv}L^3B(C_b + 0.7) \cdot 10^{-8} \quad \text{m}^4$$

Where:

- C_{wv} wave coefficient as defined in Table 8.1.2
- L rule length, in m, as defined in Section 4/1.1.1.1
- B moulded breadth, in m, as defined in Section 4/1.1.3.1
- C_b block coefficient, as defined in Section 4/1.1.9.1 but is not to be taken as less than 0.70

Table 8.1.2 Wave Coefficient C_{wv}	
rule length	C_{wv}
$150 \leq L \leq 300$	$10.75 - [(300 - L) / 100]^{3/2}$
$300 < L < 350$	10.75
$350 \leq L \leq 500$	$10.75 - [(L - 350) / 150]^{3/2}$

- 1.2.2.2 At the midship cross section the net vertical hull girder section modulus, Z_{v-min} , at the deck and keel is not to be less than the rule minimum hull girder section modulus, Z_{v-min} , defined as:

$$Z_{v-min} = 0.9kC_{wv}L^2B(C_b + 0.7) \cdot 10^{-6} \quad \text{m}^3$$

Where:

k	higher strength steel factor, as defined in Section 6/1.1.4
C_{wv}	wave coefficient as defined in Table 8.1.2
L	rule length, in m, as defined in Section 4/1.1.1.1
B	moulded breadth, in m, as defined in Section 4/1.1.3.1
C_b	block coefficient, as defined in Section 4/1.1.11.1 but is not to be taken as less than 0.70

- 1.2.2.3 The net hull girder section modulus at keel, $Z_{v-net50-kl}$, is to be calculated in accordance with Section 4/2.6.1.2 and taking z at the keel.

- 1.2.2.4 The net hull girder section modulus at deck, $Z_{v-net50-dk}$, is to be calculated in accordance with Section 4/2.6.1.2 and taking z at the effective deck height, see 1.2.2.5.

- 1.2.2.5 The effective deck height from the horizontal neutral axis for the hull girder section modulus, Z_{dk-eff} , is to be taken as:

$$Z_{dk-eff} = Z_{dk-side} - Z_{NA-net50} \quad \text{m}$$

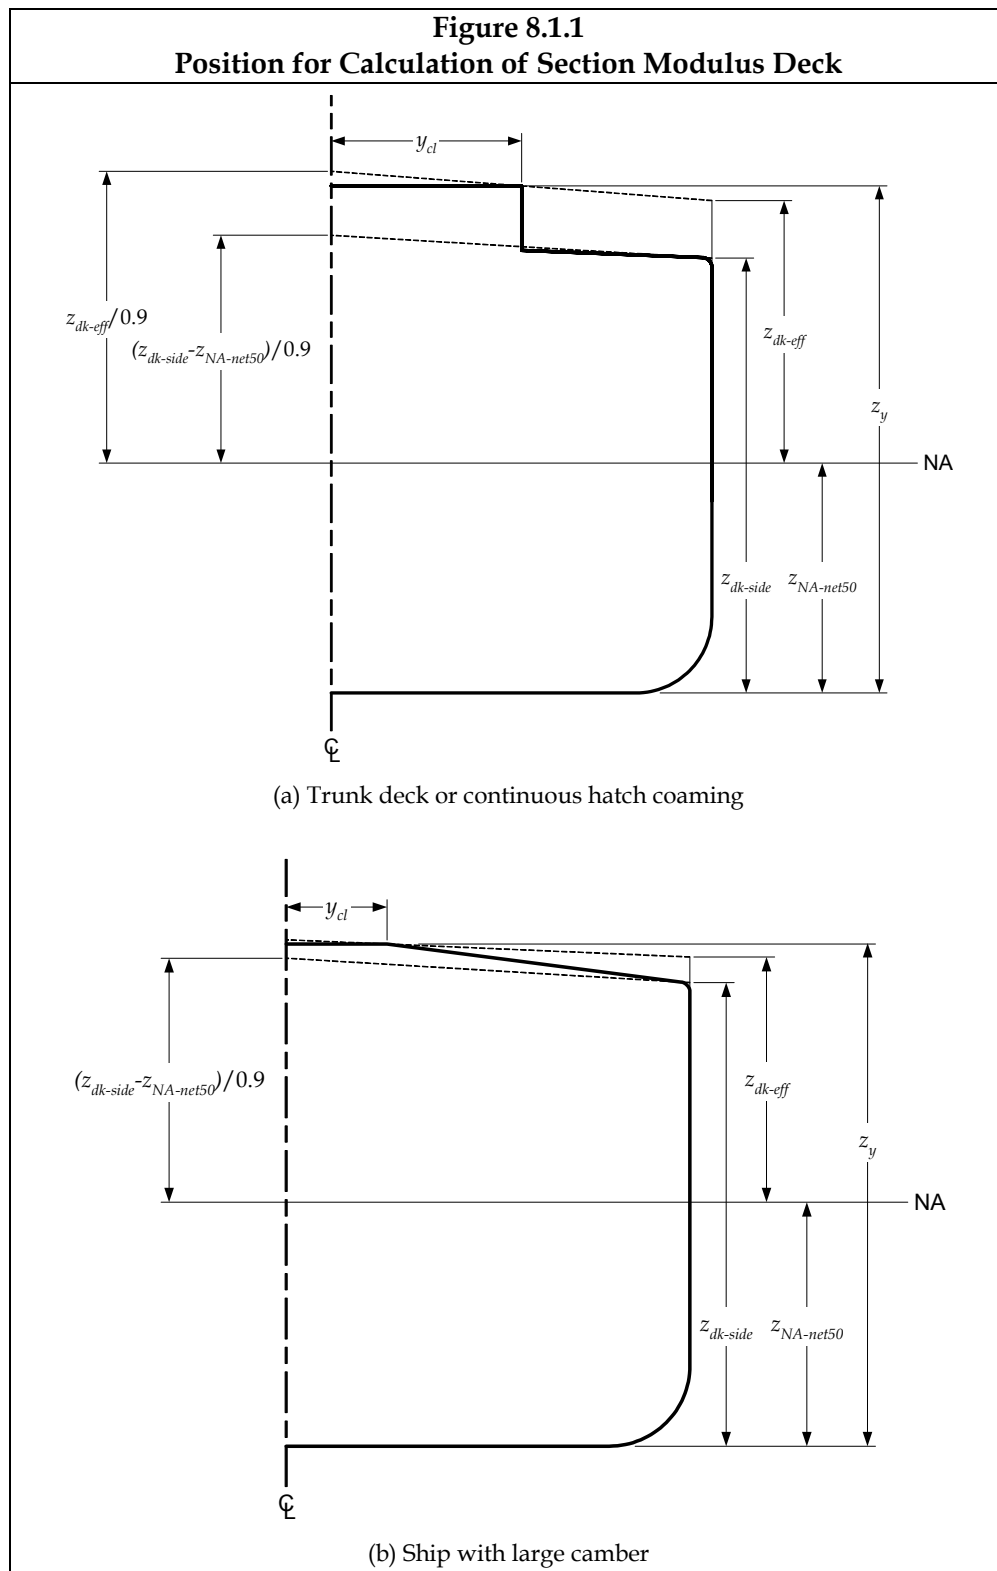

When no effective longitudinal strength members are positioned above a line extending from moulded deck line at side to a position $(Z_{dk-side} - Z_{NA-net50})/0.9$ from the neutral axis at the centreline

$$Z_{dk-eff} = (Z_y - Z_{NA-net50}) \left(0.9 + 0.2 \frac{y_{cl}}{B} \right) \quad \text{m}$$

When any effective longitudinal strength members are positioned above a line extending from moulded deck line at side to a position $(Z_{dk-side} - Z_{NA-net50})/0.9$ from the neutral axis at the centreline

Where:

Z_y	distance from the baseline to top of the continuous strength member at a distance y from the centreline, in m, giving the largest value of Z_{dk-eff} , see Figure 8.1.1
$Z_{NA-net50}$	distance from baseline to horizontal neutral axis, in m, see Figure 8.1.1
y_{cl}	distance from the top of the continuous strength member to the centreline of the ship, in m, giving the largest value of Z_{dk-eff} , see Figure 8.1.1
B	moulded breadth, in m, as defined in Section 4/1.1.3.1
$Z_{dk-side}$	distance from the baseline to the moulded deck line at side, in m, see Figure 8.1.1

1.2.3 Hull girder requirement on total design bending moment

- 1.2.3.1 The net vertical hull girder section modulus requirement as defined in 1.2.3.2 is to be assessed for both hogging and sagging conditions.
- 1.2.3.2 The net hull girder section modulus about the horizontal neutral axis, $Z_{v-net50}$, is not to be less than the rule required hull girder section modulus, Z_{v-req} , based on the

permissible still-water bending moment and design wave bending moment defined as:

$$Z_{v-req} = \frac{|M_{sw-perm} + M_{wv-v}|}{\sigma_{perm}} 10^{-3} \quad \text{m}^3$$

Where:

$M_{sw-perm}$ permissible hull girder hogging or sagging still water bending moment as given in *Table 8.1.3*, in kNm

M_{wv-v} hogging or sagging vertical wave bending moment, in kNm as given in *Table 8.1.3*

σ_{perm} permissible hull girder bending stress as given in *Table 8.1.3*, in N/mm²

Table 8.1.3
Loads and Corresponding Acceptance Criteria for Hull Girder Bending Assessment

Design load combination	Still water bending moment, $M_{sw-perm}$	Wave bending moment, M_{wv-v}	Permissible hull girder bending stress, $\sigma_{perm}^{(1)}$	
(S)	$M_{sw-perm-harb}$	0	143/k	within 0.4L amidships
			105/k	at and forward of 0.9L from A.P. and at and aft of 0.1L from A.P.
(S + D)	$M_{sw-perm-sea}$	M_{wv-v}	190/k	within 0.4L amidships
			140/k	at and forward of 0.9L from A.P. and at and aft of 0.1L from A.P.

Where:

$M_{sw-perm-harb}$ permissible hull girder hogging and sagging still water bending moment for harbour/sheltered water operation, in kNm, as defined in *Section 7/2.1.1*

$M_{sw-perm-sea}$ permissible hull girder hogging and sagging still water bending moment for seagoing operation, in kNm, as defined in *Section 7/2.1.1*

M_{wv-v} hogging and sagging vertical wave bending moments, in kNm, as defined in *Section 7/3.4.1*

M_{wv-v} is to be taken as:

M_{wv-hog} for assessment with respect to hogging vertical wave bending moment

M_{wv-sag} for assessment with respect to sagging vertical wave bending moment

k higher strength steel factor, as defined in *Section 6/1.1.4*

Note

1. σ_{perm} is to be linearly interpolated between values given.

1.3 Hull Girder Shear Strength

1.3.1 General

1.3.1.1 The hull girder shear strength requirements apply along the full length of the hull girder, from A.P to F.P.

1.3.2 Assessment of hull girder shear strength

1.3.2.1 The net hull girder shear strength capacity, $Q_{v-net50}$, as defined in 1.3.2.2 is not to be less than the required vertical shear force, Q_{v-req} , as indicated in the following:

$$Q_{v-req} = Q_{sw-perm} + Q_{wv} \quad \text{kN}$$

Where:

$Q_{sw-perm}$ permissible hull girder positive or negative still water shear force as given in Section 7/2.1.3, in kN

Q_{wv} vertical wave positive or negative shear force as defined in Section 7/3.4.3, in kN

1.3.2.2 The permissible positive and negative still water shear forces for seagoing and harbour/sheltered water operations, $Q_{sw-perm-sea}$ and $Q_{sw-perm-harb}$ are to satisfy:

$$Q_{sw-perm} \leq Q_{v-net50} - Q_{wv-pos} \quad \text{kN}$$

for maximum permissible positive shear force

$$Q_{sw-perm} \geq -Q_{v-net50} - Q_{wv-neg} \quad \text{kN}$$

for minimum permissible negative shear force

Where:

$Q_{sw-perm}$ permissible hull girder still water shear force as given in Table 8.1.4, in kN

$Q_{v-net50}$ net hull girder vertical shear strength to be taken as the minimum for all plate elements that contribute to the hull girder shear capacity

$$= \frac{\tau_{ij-perm} t_{ij-net50}}{1000 q_v} \quad \text{kN}$$

$\tau_{ij-perm}$ permissible hull girder shear stress, τ_{perm} , as given in Table 8.1.4, in N/mm², for plate ij

Q_{wv-pos} positive vertical wave shear force, in kN, as defined in Table 8.1.4

Q_{wv-neg} negative vertical wave shear force, in kN, as defined in Table 8.1.4

$t_{ij-net50}$ equivalent net thickness, t_{net50} , for plate ij , in mm. For longitudinal bulkheads between cargo tanks, t_{net50} is to be taken as $t_{sfc-net50}$ and t_{str-k} as appropriate, see 1.3.3.1 and 1.3.4.1

t_{net50} net thickness of plate, in mm

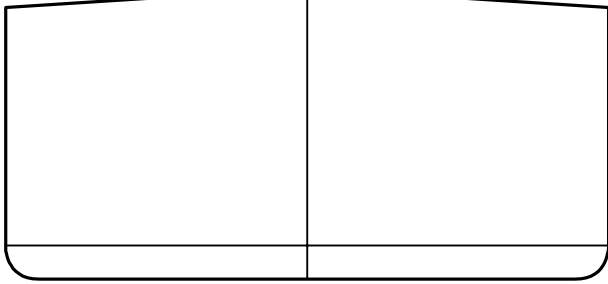

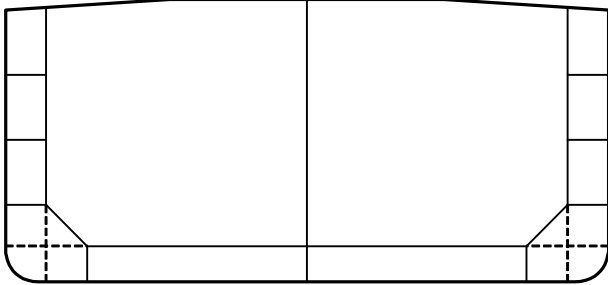

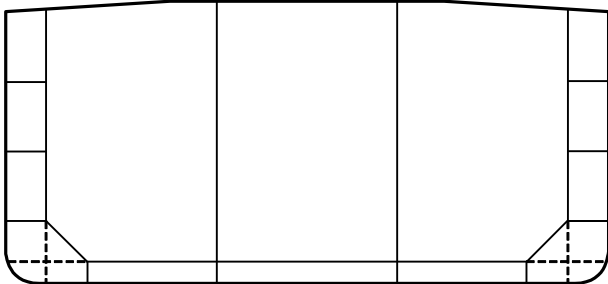

$$= t_{grs} - 0.5 t_{corr}$$

t_{grs} gross plate thickness, in mm. The gross plate thickness for corrugated bulkheads is to be taken as the minimum of t_{w-grs} and t_{f-grs} , in mm

t_{w-grs} gross thickness of the corrugation web, in mm

t_{f-grs}	gross thickness of the corrugation flange, in mm
t_{corr}	corrosion addition, in mm, as defined in <i>Section 6/3.2</i>
q_v	unit shear flow per mm for the plate being considered and based on the net scantlings. Where direct calculation of the unit shear flow is not available, the unit shear flow may be taken equal to: $= f_i \left(\frac{q_{1-net50}}{I_{v-net50}} \right) \cdot 10^{-9} \quad \text{mm}^{-1}$
f_i	shear force distribution factor for the main longitudinal hull girder shear carrying members being considered. For standard structural configurations f_i is as defined in <i>Figure 8.1.2</i>
$q_{1-net50}$	first moment of area, in cm ² , about the horizontal neutral axis of the effective longitudinal members between the vertical level at which the shear stress is being determined and the vertical extremity, taken at the section being considered. The first moment of area is to be based on the net thickness, t_{net50}
$I_{v-net50}$	net vertical hull girder section moment of inertia, in m ⁴ , as defined in <i>Section 4/2.6.1.1</i>

Table 8.1.4 Loads and Corresponding Acceptance Criteria for Hull Girder Shear Assessment			
Design load combination	Still water shear force, $Q_{sw-perm}$	Vertical wave shear force, Q_{wv}	Permissible shear stress, τ_{perm}
Harbour/sheltered water operations (S)	$Q_{sw-perm-harb}$	0	105/k for plate ij
Seagoing operations (S + D)	$Q_{sw-perm-sea}$	Q_{wv}	120/k for plate ij
Where:			
$Q_{sw-perm-harb}$	permissible positive or negative hull girder still water shear force for harbour operation, in kN, as defined in <i>Section 7/2.1.3</i>		
$Q_{sw-perm-sea}$	permissible positive or negative hull girder still water shear force for seagoing operation, in kN, as defined in <i>Section 7/2.1.3</i>		
Q_{wv}	positive or negative vertical wave shear, in kN, as defined in <i>Section 7/3.4.3</i> . Q_{wv} is to be taken as: Q_{wv-pos} for assessment with respect to maximum positive permissible still water shear force Q_{wv-neg} for assessment with respect to minimum negative permissible still water shear force		
plate ij	for each plate j , index i denotes the structural member of which the plate forms a component		
k	higher strength steel factor, as defined in <i>Section 6/1.1.4</i>		

Figure 8.1.2 Shear Force Distribution Factors	
Hull configuration	f_i factors
Outside cargo region (no longitudinal bulkhead) 	Side shell $f_1 = 0.5$
Outside cargo region (centreline bulkhead) 	Side shell $f_1 = 0.231 + 0.076 \frac{A_{1-net50}}{A_{3-net50}}$ Longitudinal bulkhead $f_3 = 0.538 - 0.152 \frac{A_{1-net50}}{A_{3-net50}}$
One centreline bulkhead 	Side shell $f_1 = 0.055 + 0.097 \frac{A_{1-net50}}{A_{2-net50}} + 0.020 \frac{A_{2-net50}}{A_{3-net50}}$ Inner hull $f_2 = 0.193 - 0.059 \frac{A_{1-net50}}{A_{2-net50}} + 0.058 \frac{A_{2-net50}}{A_{3-net50}}$ Longitudinal bulkhead $f_3 = 0.504 - 0.076 \frac{A_{1-net50}}{A_{2-net50}} - 0.156 \frac{A_{2-net50}}{A_{3-net50}}$
Two longitudinal bulkheads 	Side shell $f_1 = 0.028 + 0.087 \frac{A_{1-net50}}{A_{2-net50}} + 0.023 \frac{A_{2-net50}}{A_{3-net50}}$ Inner hull $f_2 = 0.119 - 0.038 \frac{A_{1-net50}}{A_{2-net50}} + 0.072 \frac{A_{2-net50}}{A_{3-net50}}$ Longitudinal bulkhead $f_3 = 0.353 - 0.049 \frac{A_{1-net50}}{A_{2-net50}} - 0.095 \frac{A_{2-net50}}{A_{3-net50}}$
Where: i index for the structural member under consideration: 1, for the side shell 2, for the inner hull 3, for the longitudinal bulkhead $A_{i-net50}$ net area as defined in Section 4/2.6.4 and based on deduction of $0.5t_{corr}$ of the structural member, i , at one side of the section under consideration. The area $A_{3-net50}$ for the centreline bulkhead is not to be reduced for symmetry around the centreline.	

1.3.3 Shear force correction for longitudinal bulkheads between cargo tanks

1.3.3.1 For longitudinal bulkheads between cargo tanks the effective net plating thickness of the plating above the inner bottom, $t_{sfc-net50}$ for plate ij , used for calculation of hull girder shear strength, $Q_{v-net50}$, is to be corrected for local shear distribution and is given by:

$$t_{sfc-net50} = t_{grs} - 0.5t_{corr} - t_{\Delta} \quad \text{mm}$$

Where:

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in Section 6/3.2

t_{Δ} thickness deduction for plate ij , in mm, as defined in 1.3.3.2

1.3.3.2 The vertical distribution of thickness reduction for shear force correction is assumed to be triangular as indicated in Figure 8.1.3. The thickness deduction, t_{Δ} , to account for shear force correction is to be taken as:

$$t_{\Delta} = \frac{\delta Q_3}{h_{blk} \tau_{ij-perm}} \left(1 - \frac{x_{blk}}{0.5l_{tk}} \right) \left(2 - \frac{2(z_p - h_{db})}{h_{blk}} \right) \quad \text{mm}$$

Where:

δQ_3 shear force correction for longitudinal bulkhead as defined in 1.3.3.3 and 1.3.3.5 for ships with one or two longitudinal bulkheads respectively, in kN.

l_{tk} length of cargo tank, in m

h_{blk} height of longitudinal bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead, as shown in Figure 8.1.3

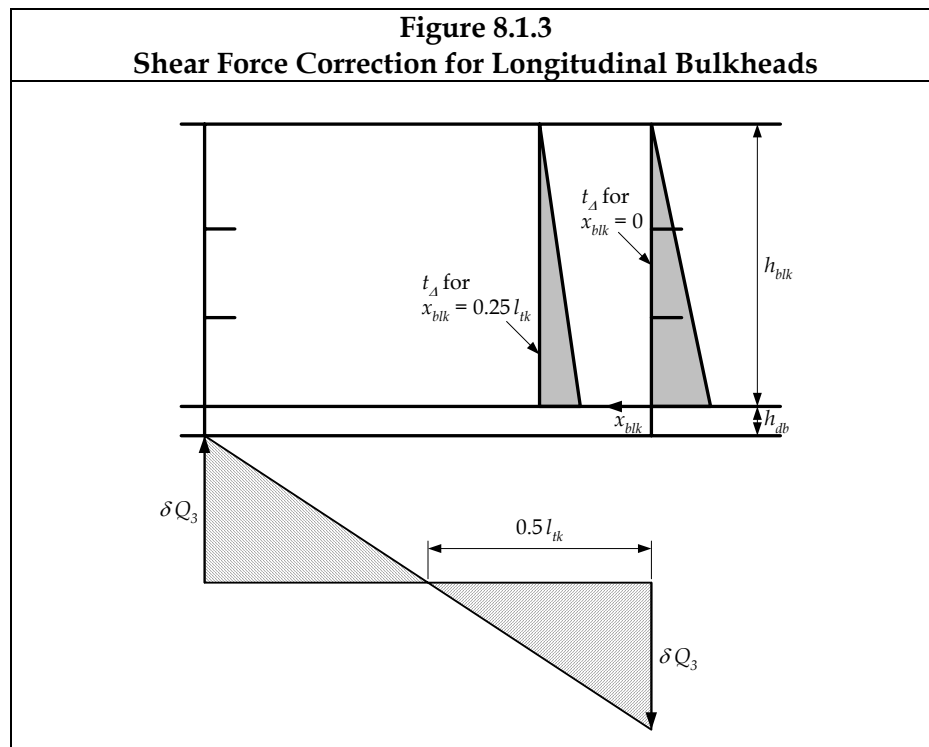

x_{blk} the minimum longitudinal distance from section considered to the nearest cargo tank transverse bulkhead, in m. To be taken positive and not greater than $0.5l_{tk}$

z_p the vertical distance from the lower edge of plate ij to the base line, in m. Not to be taken as less than h_{db}

h_{db} height of double bottom, in m, as shown in Figure 8.1.3

$\tau_{ij-perm}$ permissible hull girder shear stress, τ_{perm} , in N/mm² for plate ij
 $= 120/k_{ij}$

k_{ij} higher strength steel factor, k , for plate ij as defined in Section 6/1.1.4

- 1.3.3.3 For ships with a centreline bulkhead between the cargo tanks, the shear force correction in way of transverse bulkhead, δQ_3 , is to be taken as:

$$\delta Q_3 = 0.5 K_3 F_{db} \quad \text{kN}$$

Where:

K_3 correction factor, as defined in 1.3.3.4

F_{db} maximum resulting force on the double bottom in a tank, in kN, as defined in 1.3.3.7

- 1.3.3.4 For ships with a centreline bulkhead between the cargo tanks, the correction factor, K_3 , in way of transverse bulkheads is to be taken as:

$$K_3 = \left[0.40 \left(1 - \frac{1}{1+n} \right) - f_3 \right]$$

Where:

n number of floors between transverse bulkheads

f_3 shear force distribution factor, see Figure 8.1.2

- 1.3.3.5 For ships with two longitudinal bulkheads between the cargo tanks, the shear force correction, δQ_3 , is to be taken as:

$$\delta Q_3 = 0.5 K_3 F_{db} \quad \text{kN}$$

Where:

K_3 correction factor, as defined in 1.3.3.6

F_{db} maximum resulting force on the double bottom in a tank, in kN, as defined in 1.3.3.7

- 1.3.3.6 For ships with two longitudinal bulkheads between the cargo tanks, the correction factor, K_3 , in way of transverse bulkhead is to be taken as:

$$K_3 = \left[0.5 \left(1 - \frac{1}{1+n} \right) \left(\frac{1}{r+1} \right) - f_3 \right]$$

Where:

- n number of floors between transverse bulkheads
- r ratio of the part load carried by the wash bulkheads and floors from longitudinal bulkhead to the double side and is given by:

$$r = \frac{1}{\left[\frac{A_{3-net50}}{A_{1-net50} + A_{2-net50}} + \frac{2 \times 10^4 b_{80} (n_s + 1) A_{3-net50}}{l_{tk} (n_s A_{T-net50} + R)} \right]}$$

Note: for preliminary calculations, r may be taken as 0.5

- l_{tk} length of cargo tank, between transverse bulkheads in the side cargo tank, in m

- b_{80} 80% of the distance from longitudinal bulkhead to the inner hull longitudinal bulkhead, in m, at tank mid length

- $A_{T-net50}$ net shear area of the transverse wash bulkhead, including the double bottom floor directly below, in the side cargo tank, in cm², taken as the smallest area in a vertical section. $A_{T-net50}$ is to be calculated with net thickness given by $t_{grs} - 0.5t_{corr}$

- $A_{1-net50}$ net area, as shown in Figure 8.1.2, in m²

- $A_{2-net50}$ net area, as shown in Figure 8.1.2, in m²

- $A_{3-net50}$ net area, as shown in Figure 8.1.2, in m²

- f_3 shear force distribution factor, as shown in Figure 8.1.2

- n_s number of wash bulkheads in the side cargo tank

- R total efficiency of the transverse primary support members in the side tank

$$R = \left(\frac{n - n_s}{2} - 1 \right) \frac{A_{Q-net50}}{\gamma} \quad \text{cm}^2$$

$$\gamma = 1 + \frac{300 b_{80}^2 A_{Q-net50}}{I_{psm-net50}}$$

- $A_{Q-net50}$ net shear area, in cm², of a transverse primary support member in the wing cargo tank, taken as the sum of the net shear areas of floor, cross ties and deck transverse webs.

$A_{Q-net50}$ is to be calculated using the net thickness given by $t_{grs} - 0.5t_{corr}$. The net shear area is to be calculated at the mid span of the members.

- $I_{psm-net50}$ net moment of inertia for primary support members, in cm⁴, of a transverse primary support member in the wing cargo tank, taken as the sum of the moments of inertia of transverses and cross ties. It is to be calculated using the net thickness given by $t_{grs} - 0.5t_{corr}$. The net moment of inertia is to be calculated at the mid span of the member including an attached plate width equal to the primary support member spacing

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

1.3.3.7 The maximum resulting force on the double bottom in a tank, F_{db} , is to be taken as:

$$F_{db} = g |W_{CT} + W_{CWBT} - \rho_{sw} b_2 l_{tk} T_{mean}| \quad \text{kN}$$

Where:

W_{CT} weight of cargo, in tonnes, as defined in *Table 8.1.5*

W_{CWBT} weight of ballast, in tonnes, as defined in *Table 8.1.5*

b_2 breadth, in m, as defined in *Table 8.1.5*

l_{tk} length of cargo tank, between watertight transverse bulkheads in the wing cargo tank, in m

T_{mean} draught at the mid length of the tank for the loading condition considered, in m.

g acceleration due to gravity, 9.81 m/s²

ρ_{sw} density of sea water, 1.025 tonnes/m³

Table 8.1.5 Design Conditions for Double Bottoms			
Structural Configuration	W_{CT}	W_{CWBT}	b_2
Ships with one longitudinal bulkhead	weight of cargo in cargo tanks, in tonnes, using a minimum specific gravity of 1.025 tonnes/m ³	weight of ballast between port and starboard inner sides, in tonnes	maximum breadth between port and starboard inner sides at mid length of tank, in m, as shown in <i>Figure 8.1.4</i>
Ships with two longitudinal bulkheads	weight of cargo in the centre tank, in tonnes, using a minimum specific gravity of 1.025 tonnes/m ³	weight of ballast below the centre cargo tank, in tonnes	maximum breadth of the centre cargo tank at mid length of tank, in m, as shown in <i>Figure 8.1.4</i>

1.3.3.8 The maximum resulting force on the double bottom in a tank, F_{db} , is in no case to be less than that given by the rule minimum conditions given in *Table 8.1.6*.

Table 8.1.6 Rule Minimum Conditions for Double Bottoms		
Structural Configuration	Positive/negative force, F_{db}	Minimum condition
Ships with one longitudinal bulkhead	Max positive net vertical force, F_{db+}	$0.9T_{sc}$ and empty cargo and ballast tanks
	Max negative net vertical force, F_{db-}	$0.6T_{sc}$ and full cargo tanks and empty ballast tanks
Ships with two longitudinal bulkheads	Max positive net vertical force, F_{db+}	$0.9T_{sc}$ and empty cargo and ballast tanks
	Max negative net vertical force, F_{db-}	$0.6T_{sc}$ and full centre cargo tank and empty ballast tanks

1.3.4 Shear force correction due to loads from transverse bulkhead stringers

1.3.4.1 In way of transverse bulkhead stringer connections, within areas as specified in Figure 8.1.6, the equivalent net thickness of plate used for calculation of the hull girder shear strength, t_{str-k} , where the index k refers to the identification number of the stringer, is not to be taken greater than:

$$t_{str-k} = t_{sfc-net50} \left(1 - \frac{\tau_{str}}{\tau_{ij-perm}} \right) \quad \text{mm}$$

Where:

$t_{sfc-net50}$ effective net plating thickness, in mm, as defined in 1.3.3.1 and calculated at the transverse bulkhead for the height corresponding to the level of the stringer

$\tau_{ij-perm}$ permissible hull girder shear stress, τ_{perm} , for plate ij
 $= 120/k_{ij} \text{ N/mm}^2$

k_{ij}	higher strength steel factor, k , for plate ij as defined in Section 6/1.1.4
τ_{str}	$= \frac{Q_{str-k}}{l_{str} t_{sfc-net50}} \quad \text{N/mm}^2$
l_{str}	connection length of stringer, in m, see Figure 8.1.5
Q_{str-k}	shear force on the longitudinal bulkhead from the stringer in loaded condition with tanks abreast full $= 0.8 F_{str-k} \left(1 - \frac{z_{str} - h_{db}}{h_{bhd}} \right) \quad \text{kN}$
F_{str-k}	total stringer supporting force, in kN, as defined in 1.3.4.2
h_{db}	the double bottom height, in m, as shown in Figure 8.1.6
h_{blk}	height of bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead, as shown in Figure 8.1.6
z_{str}	the vertical distance from baseline to the considered stringer, in m.

1.3.4.2 The total stringer supporting force, F_{str-k} , in way of a longitudinal bulkhead is to be taken as:

$$F_{str-k} = \frac{P_{str} b_{str} (h_k + h_{k-1})}{2} \quad \text{kN}$$

Where:

P_{str}	pressure on stringer, in kN/m ² , to be taken as: $10h_{tt}$
h_{tt}	the height from the top of the tank to the midpoint of the load area between $h_k/2$ below the stringer and $h_{k-1}/2$ above the stringer, in m
h_k	the vertical distance from the considered stringer to the stringer below. For the lowermost stringer, it is to be taken as 80 % of the average vertical distance to the inner bottom, in m
h_{k-1}	the vertical distance from the considered stringer to the stringer above. For the uppermost stringer, it is to be taken as 80 % of the average vertical distance to the upper deck, in m
b_{str}	load breadth acting on the stringer, in m, see Figure 8.1.7 and 8.1.8

Figure 8.1.6
Region for Stringer Correction, t_{ij} , for a Tanker with Three Stringers

Figure 8.1.7
Load Breadth of Stringers for Ships with a Centreline Bulkhead

- 1.3.4.3 Where reinforcement is provided to meet the above requirement, the reinforced area based on t_{str-k} is to extend longitudinally for the full length of the stringer connection and a minimum of one frame spacing forward and aft of the bulkhead. The reinforced area shall extend vertically from above the stringer level and down to $0.5h_k$ below the stringer, where h_k the vertical distance from the considered stringer to the stringer below is as defined in 1.3.4.2. For the lowermost stringer the plate thickness requirement t_{str-k} is to extend down to the inner bottom, see Figure 8.1.6.

Figure 8.1.8
Load Breadth of Stringers for Ships with Two Inner Longitudinal Bulkheads

Notes

1. b_{stk} is the breadth of wing cargo tank, in m.
2. b_{ctr} is the breadth of centre cargo tank, in m.

1.4 Hull Girder Buckling Strength

1.4.1 General

- 1.4.1.1 These requirements apply to plate panels and longitudinals subject to hull girder compression and shear stresses. These stresses are to be based on the permissible values for still water bending and shear forces given in Section 7/2.1, and wave bending moments and shear forces given in Section 7/3.4.

- 1.4.1.2 The hull girder buckling strength requirements apply along the full length of the ship, from A.P to F.P.
- 1.4.1.3 For the purposes of assessing the hull girder buckling strength in this sub-section, the following are to be considered separately:
- (a) axial hull girder compressive stress to satisfy requirements in 1.4.2.6 and 1.4.2.8
 - (b) hull girder shear stress to satisfy requirements in 1.4.2.7.

1.4.2 Buckling assessment

- 1.4.2.1 The buckling assessment of plate panels and longitudinals is to be determined according to *Section 10/3.1* with hull girder stresses calculated on net hull girder sectional properties.
- 1.4.2.2 The buckling strength for the buckling assessment is to be derived using local net scantlings, t_{net} , as follows:

$$t_{net} = t_{grs} - 1.0t_{corr} \quad \text{mm}$$

Where:

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

- 1.4.2.3 The hull girder compressive stress due to bending, $\sigma_{hg-net50}$, for the buckling assessment is to be calculated using net hull girder sectional properties and is to be taken as the greater of the following:

$$\sigma_{hg-net50} = \left| \frac{(z - z_{NA-net50}) (M_{sw-perm-sea} + M_{wv-v})}{I_{v-net50}} \right| 10^{-3} \quad \text{N/mm}^2$$

$$\sigma_{hg-net50} = \frac{30}{k} \quad \text{N/mm}^2$$

Where:

$M_{sw-perm-sea}$ permissible still water bending moment for seagoing operation, in kNm, as defined in *Section 7/2.1.1*, with signs as given in 1.4.2.4

M_{wv-v} hogging and sagging vertical wave bending moments, in kNm, as defined in *Section 7/3.4.1*, with signs as given in 1.4.2.4

M_{wv-v} is to be taken as:

M_{wv-hog} for assessment with the hogging still water bending moment

M_{wv-sag} for assessment with the sagging still water bending moment

z distance from the structural member under consideration to the baseline, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral, in m, see *Figure 8.1.1*

$I_{v-net50}$ net vertical hull girder section moment of inertia, in m⁴, as defined in *Section 4/2.6.1.1*

k higher strength steel factor, as defined in *Section 6/1.1.4.1*

1.4.2.4 The sagging bending moment values of $M_{sw-perm-sea}$ and M_{wv-v} are to be taken for members above the neutral axis. The hogging bending moment values are to be taken for members below the neutral axis.

1.4.2.5 The design hull girder shear stress for the buckling assessment, $\tau_{hg-net50}$, is to be calculated based on net hull girder sectional properties and is to be taken as:

$$\tau_{hg-net50} = \left(Q_{sw-perm-sea} + Q_{wv} \left(\frac{1000q_v}{t_{ij-net50}} \right) \right) \text{ N/mm}^2$$

Where:

$Q_{sw-perm-sea}$ positive and negative still water permissible shear force for seagoing operation, in kN, as defined in Section 7/2.1.3

Q_{wv} positive or negative vertical wave shear, in kN, as defined in Section 7/3.4.3.

Q_{wv} is to be taken as:

Q_{wv-pos} for assessment with the positive permissible still water shear force

Q_{wv-neg} for assessment with the negative permissible still water shear force

$t_{ij-net50}$ net thickness for the plate ij , in mm
 $= t_{ij-grs} - 0.5t_{corr}$

t_{ij-grs} gross plate thickness of plate ij , in mm. The gross plate thickness for corrugated bulkheads is to be taken as the minimum of t_{w-grs} and t_{f-grs} , in mm

t_{w-grs} gross thickness of the corrugation web, in mm

t_{f-grs} gross thickness of the corrugation flange, in mm

t_{corr} corrosion addition, in mm, as defined in Section 6/3.2

q_v unit shear per mm for the plate being considered as defined in 1.3.2.2

Note

1. Maximum of the positive shear (still water + wave) and negative shear (still water + wave) is to be used as the basis for calculation of design shear stress
2. All plate elements ij that contribute to the hull girder shear capacity are to be assessed. See also Table 8.1.4 and Figure 8.1.2

1.4.2.6 The compressive buckling strength, of plate panels, is to satisfy the following criteria:

$$\eta \leq \eta_{allow}$$

Where:

η buckling utilisation factor

$$\frac{\sigma_{hg-net50}}{\sigma_{cr}}$$

$\sigma_{hg-net50}$ hull girder compressive stress based on net hull girder sectional properties, in N/mm² as defined in 1.4.2.3

σ_{cr} critical compressive buckling stress, σ_{xcr} or σ_{ycr} as appropriate, in N/mm², as specified in *Section 10/3.2.1.3*. The critical compressive buckling stress is to be calculated for the effects of hull girder compressive stress only. The effects of other membrane stresses and lateral pressure are to be ignored. The net thickness given as $t_{grs} - t_{corr}$ as described in *Section 6/3.3.2.2* is to be used for the calculation of σ_{cr} .

η_{allow} allowable buckling utilisation factor:
 = 1.0 for plate panels at or above 0.5D
 = 0.90 for plate panels below 0.5D

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

(RCN 1, effective from 1 April 2007)

1.4.2.7 The shear buckling strength, of plate panels, is to satisfy the following criteria:

$$\eta \leq \eta_{allow}$$

Where:

η buckling utilisation factor

$$\frac{\tau_{hg-net50}}{\tau_{cr}}$$

$\tau_{hg-net50}$ design hull girder shear stress, in N/mm², as defined in 1.4.2.5

τ_{cr} critical shear buckling stress, in N/mm², as specified in *Section 10/3.2.1.3*. The critical shear buckling stress is to be calculated for the effects of hull girder shear stress only. The effects of other membrane stresses and lateral pressure are to be ignored. The net thickness given as $t_{grs} - t_{corr}$ as described in *Section 6/3.3.2.2* is to be used for the calculation of τ_{cr}

η_{allow} allowable buckling utilisation factor
 = 0.95

t_{grs} gross plate thickness, in mm

t_{corr} corrosion addition, in mm, as defined in *Section 6/3.2*

1.4.2.8 The compressive buckling strength of longitudinal stiffeners is to satisfy the following criteria:

$$\eta \leq \eta_{allow}$$

Where:

η greater of the buckling utilisation factors given in *Section 10/3.3.2.1* and *Section 10/3.3.3.1*. The buckling utilisation factor is to be calculated for the effects of hull girder compressive stress only. The effects of other membrane stresses and lateral pressure are to be ignored.

η_{allow} allowable buckling utilisation factor:
 = 1.0 for stiffeners at or above 0.5D
 = 0.90 for stiffeners below 0.5D

(RCN 1, effective from 1 April 2007)

1.5 Hull Girder Fatigue Strength

1.5.1 General

- 1.5.1.1 The following provides a simplified fatigue control measure against the dynamic hull girder stresses in the longitudinal deck structure.
- 1.5.1.2 The requirements in 1.5.1.3 are not mandatory, but are recommended to be applied in the early design phase in order to give an indication of the required hull girder section modulus for compliance with the mandatory fatigue requirements specified in *Section 9/3* and *Appendix C*.
- 1.5.1.3 The fatigue life for the deck structure as required by *Section 9/3* and *Appendix C* is normally satisfied providing the net vertical hull girder section modulus at the moulded deck line at side, $Z_{v-net50}$, as defined in *Section 4/2.6.1.1*, is not less than the required hull girder section modulus, Z_{v-fat} , defined as:

$$Z_{v-fat} = \frac{M_{wv-hog} - M_{wv-sag}}{1000R_{al}} \quad \text{m}^3$$

Where:

M_{wv-hog} hogging vertical wave bending moment for fatigue, in kNm, as defined in *Section 7/3.4.1*

M_{wv-sag} sagging vertical wave bending moment for fatigue, in kNm, as defined in *Section 7/3.4.1*

R_{al} allowable stress range, in N/mm²
 = 0.17L + 86 for class F-details
 = 0.15L + 76 for class F2-details

L rule length, in m, as defined in *Section 4/1.1.1.1*

1.6 Tapering and Structural Continuity of Longitudinal Hull Girder Elements

1.6.1 Tapering based on minimum hull girder section property requirements

- 1.6.1.1 Scantlings of all continuous longitudinal members of the hull girder based on the moment of inertia and section modulus requirements given in 1.2.2 are to be maintained within 0.4L of amidships.
- 1.6.1.2 Scantlings outside of 0.4L amidships as required by the rule minimum moment of inertia and section modulus as given in 1.2.2 may be gradually reduced to the local requirements at the ends provided the hull girder bending and buckling requirements, along the full length of the ship, as given in 1.2.3 and 1.4 are complied with. For tapering of higher strength steel, see 1.6.2 and 1.6.3..

1.6.2 Longitudinal extent of higher strength steel

- 1.6.2.1 Where used, the application of higher strength steel is to be continuous over the length of the ship up to locations where the longitudinal stress levels are within the allowable range for mild steel structure, see *Figure 8.1.9*.

1.6.3 Vertical extent of higher strength steel

1.6.3.1 The vertical extent of higher strength steel, z_{hts} , used in the deck or bottom and measured from the moulded deck line at side or keel is not to be taken less than the following, see also *Figure 8.1.10*.

$$z_{hts} = z_1 \left(1 - \frac{190}{\sigma_1 k_i} \right) \quad \text{m}$$

Where:

z_1 distance from horizontal neutral axis to moulded deck line or keel respectively, in m

σ_1 to be taken as σ_{dk} or σ_{kl} for the hull girder deck and keel respectively, in N/mm²

σ_{dk} hull girder bending stress at moulded deck line given by:

$$= \frac{|M_{sw-perm-sea} + M_{wv-v}|}{I_{v-net50}} (z_{dk-side} - z_{NA-net50}) \cdot 10^{-3} \quad \text{N/mm}^2$$

σ_{kl} hull girder bending stress at keel given by:

$$= \frac{|M_{sw-perm-sea} + M_{wv-v}|}{I_{v-net50}} (z_{NA-net50} - z_{kl}) \cdot 10^{-3} \quad \text{N/mm}^2$$

$M_{sw-perm-sea}$ permissible hull girder still water bending moment for seagoing operation, in kNm, as defined in *Section 7/2.1.1*

M_{wv-v}	hogging and sagging vertical wave bending moments, in kNm, as defined in Section 7/3.4.1 M_{wv-v} is to be taken as: M_{wv-hog} for assessment with respect to hogging vertical wave bending moment M_{wv-sag} for assessment with respect to sagging vertical wave bending moment
$I_{v-net50}$	net vertical hull girder moment of inertia, in m^4 , as defined in Section 4/2.6.1.1
$Z_{dk-side}$	distance from baseline to moulded deck line at side, in m
Z_{kl}	vertical distance from the baseline to the keel, in m
$Z_{NA-net50}$	distance from baseline to horizontal neutral axis, in m
k_i	higher strength steel factor for the area i defined in Figure 8.1.10. The factor, k , is defined in Section 6/1.1.4

1.6.4 Tapering of plate thickness due to hull girder shear requirement

- 1.6.4.1 Longitudinal tapering of shear reinforcement is permitted, provided that for any longitudinal position the requirements given in 1.3.2 are complied with. Control of the shear strength at intermediate positions is to be carried out by linear interpolation of permissible shear limits at the bulkhead and in the middle of the tank.

1.6.5 Structural continuity of longitudinal bulkheads

- 1.6.5.1 Suitable scarphing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes. In particular longitudinal bulkheads are to be terminated at an effective transverse bulkhead and large transition brackets shall be fitted in line with the longitudinal bulkhead.

1.6.6 Structural continuity of longitudinal stiffeners

- 1.6.6.1 Where longitudinal stiffeners terminate, and are replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover.
- 1.6.6.2 Where a deck longitudinal stiffener is cut, in way of an opening, compensation is to be arranged to ensure structural continuity of the area. The compensation area is to extend well beyond the forward and aft end of the opening and not be less than the area of the longitudinal that is cut. Stress concentration in way of the stiffener termination and the associated buckling strength of the plate and panel are to be considered.

2 CARGO TANK REGION

2.1 General

2.1.1 Application

- 2.1.1.1 The requirements of this Sub-Section apply to the hull structure within the cargo tank region of the ship, for the shell, deck, inner bottom and bulkhead plating, stiffeners and primary support members.

2.1.2 Basis of scantlings

- 2.1.2.1 The net scantlings described in this Sub-Section are related to gross scantlings as follows:
- (a) for application of the minimum thickness requirements specified in 2.1.5 and 2.1.6, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*
 - (b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*
 - (c) for primary support members, the gross shear area, gross section modulus, and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion addition specified in *Section 6/3*
 - (d) for application of the buckling requirements of *Section 10/3*, the gross thickness and gross cross-sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

2.1.3 Evaluation of scantlings

- 2.1.3.1 The following scantling requirements are based on the assumption that all structural joints and welded details are designed and fabricated, such that they are to be compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details during the design of highly stressed regions are to be considered. Structural design details are to comply with the requirements given in *Section 4/3*.
- 2.1.3.2 The scantlings are to be assessed to ensure that the strength criteria are satisfied at all longitudinal positions, where applicable.
- 2.1.3.3 Local scantling increases are to be applied where applicable to cover local variations, such as increased spacing, increased stiffener spans and green sea pressure loads. Local scantling increases may also be required to cover fore end strengthening requirements, see *Section 8/3*.

2.1.4 General scantling requirements

- 2.1.4.1 The hull structure is to comply with the applicable requirements of:
- (a) hull girder longitudinal strength, see *Section 8/1*
 - (b) strength against sloshing and impact loads, see *Section 8/6*
 - (c) hull girder ultimate strength, see *Section 9*
 - (d) strength assessment (FEM), see *Section 9*

- (e) fatigue strength, see Section 9/3
- (f) buckling and ultimate strength, see Section 10.

- 2.1.4.2 The net section modulus, shear areas and other sectional properties of the local and primary support members are to be determined in accordance with Section 4/2.
- 2.1.4.3 The section modulus, shear areas and other sectional properties of the local and primary support members apply to the areas clear of the end brackets.
- 2.1.4.4 The spans of the local and primary support members are defined in Section 4/2.1.
- 2.1.4.5 The moments of inertia for the primary support members are to be determined in association with the effective attached plating at the mid span as specified in Section 4/2.3.2.3.
- 2.1.4.6 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure the free flow to the suction pipes and escape of air to the vents. See also Section 4/3.
- 2.1.4.7 All shell frames and tank boundary stiffeners are in general to be continuous, or are to be bracketed at their ends, except as permitted in Sections 4/3.2.4 and 4/3.2.5.
- 2.1.4.8 Enlarged stiffeners (with or without web stiffening) used for Permanent Means of Access (PMA) are to comply with the following requirements:
 - a) Buckling strength including proportion (slenderness ratio) requirements for primary support members as follows:
 - For stiffener web, see Section 10/2.3.1.1 (a), 10/3.2.
 - For stiffener flange, see Section 10/2.3.1.1 (b), 10/2.3.3.1.
 - For web stiffeners, see Section 10/2.3.2.1, 10/2.3.2.2, 10/3.3.

Note: Note 1 of table 10.2.1 is not applicable.

- b) Buckling strength of longitudinal PMA platforms without web stiffeners may also be ensured using the criteria for local support members in Section 10/2.2 and Section 10/3.3, including Note 1 of Table 10.2.1, provided shear buckling strength of web is verified in line with Section 10/3.2.
- c) All other requirements for local support members as follows:
 - Corrosion additions: requirements for local support members
 - Minimum thickness: requirements for local support members
 - Fatigue: requirements for local support members

Note: For primary support members (or part of it) used as a PMA platform the requirements for primary support members are to be applied.

2.1.5 Minimum thickness for plating and local support members

- 2.1.5.1 The thickness of plating and stiffeners in the cargo tank region is to comply with the appropriate minimum thickness requirements given in Table 8.2.1.

<div>Table 8.2.1</div> <div>Minimum Net Thickness for Plating and Local Support Members in the Cargo Tank Region</div>			
Scantling Location			Net Thickness (mm)
Plating	Shell	Keel plating	$6.5+0.03L_2$
		Bottom shell/bilge/side shell	
	Upper Deck		$4.5+0.02L_2$
	Other structure	Hull internal tank boundaries	$4.5+0.02L_2$
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	
Local support members	Local support members on tight boundaries		$3.5+0.015L_2$
	Local support members on other structure		$2.5+0.015L_2$
Tripping brackets			$5.0+0.015L_2$
Where:			
L_2 rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m			

RCN 1 (effective from 1 July 2009)

2.1.6 Minimum thickness for primary support members

- 2.1.6.1 The thickness of web plating and face plating of primary support members in the cargo tank region is to comply with the appropriate minimum thickness requirements given in Table 8.2.2.

Table 8.2.2 Minimum Net Thickness for Primary Support Members in Cargo Tank Region	
Scantling Location	Net Thickness (mm)
Double bottom centreline girder	$5.5+0.025L_2$
Other double bottom girders	$5.5+0.02L_2$
Double bottom floors, web plates of side transverses and stringers in double hull	$5.0+0.015L_2$
Web and flanges of vertical web frames on longitudinal bulkheads, horizontal stringers on transverse bulkhead, deck transverses (above and below upper deck) and cross ties.	$5.5+0.015L_2$
Where: L_2 rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m	

2.2 Hull Envelope Plating

2.2.1 Keel plating

- 2.2.1.1 Keel plating is to extend over the flat of bottom for the complete length of the ship. The breadth, b_{kl} , is not to be less than:

$$b_{kl} = 800 + 5L_2 \quad \text{mm}$$

Where:

L_2 rule length, L , as defined in *Section 4/1.1.1.1*, but not to be taken greater than 300m

2.2.1.2 The thickness of the keel plating is to comply with the requirements given in 2.2.2.

2.2.2 Bottom shell plating

2.2.2.1 The thickness of the bottom shell plating is to comply with the requirements in *Table 8.2.4*.

2.2.3 Bilge plating

2.2.3.1 The thickness of bilge plating is not to be less than that required for the adjacent bottom shell, see 2.2.2.1, or adjacent side shell plating, see 2.2.4.1, whichever is the greater.

2.2.3.2 The net thickness of bilge plating, t_{net} , without longitudinal stiffening is not to be less than:

$$t_{net} = \frac{\sqrt[3]{r^2 S_t P_{ex}}}{100} \quad \text{mm}$$

Where:

P_{ex} design sea pressure for the design load set 1 calculated at the lower turn of bilge, in kN/m²

r effective bilge radius
 $= r_0 + 0.5(a + b) \quad \text{mm}$

r_0 radius of curvature, in mm. See *Figure 8.2.1*

S_t distance between transverse stiffeners, webs or bilge brackets, in m

a distance between the lower turn of bilge and the outermost bottom longitudinal, in mm, see *Figure 8.2.1* and 2.3.1.2. Where the outermost bottom longitudinal is within the curvature, this distance is to be taken as zero.

b distance between the upper turn of bilge and the lowest side longitudinal, in mm, see *Figure 8.2.1* and 2.3.1.2. Where the lowest side longitudinal is within the curvature, this distance is to be taken as zero.

Where plate seam is located in the straight plate just below the lowest stiffener on the side shell, any increased thickness required for the bilge plating does not have to extend to the adjacent plate above the bilge provided that the plate seam is not more than $S_b/4$ below the lowest side longitudinal. Similarly for flat part of adjacent bottom plating, any increased thickness for the bilge plating does not have to be applied provided that the plate seam is not more than $S_a/4$ beyond the outboard bottom longitudinal. Regularly longitudinally stiffened bilge plating is to be assessed as a stiffened plate. The bilge keel is not considered as “longitudinal stiffening” for the application of this requirement.

2.2.3.3 Where bilge longitudinals are omitted, the bilge plate thickness outside $0.4L$ amidships will be considered in relation to the support derived from the hull form and internal stiffening arrangements. In general, outside of $0.4L$ amidships the bilge plate scantlings and arrangement are to comply with the requirements of ordinary side or bottom shell plating in the same region. Consideration is to be given where there is increased loading in the forward region.

2.2.4 Side shell plating

2.2.4.1 The thickness of the side shell plating is to comply with the requirements in *Table 8.2.4*.

2.2.4.2 The net thickness, t_{net} , of the side plating within the range as specified in 2.2.4.3 is not to be less than:

$$t_{net} = 26 \left(\frac{s}{1000} + 0.7 \right) \left(\frac{BT_{sc}}{\sigma_{yd}^2} \right)^{0.25} \text{ mm}$$

Where:

s stiffener spacing, in mm, as defined in *Section 4/2.2*

B moulded breadth, in m as defined in *Section 4/1.1.3.1*

T_{sc} scantling draught, in m, as defined in *Section 4/1.1.5.5*

σ_{yd} specified minimum yield stress of the material, in N/mm^2

2.2.4.3 The thickness in 2.2.4.2 is to be applied to the following extent of the side shell plating, see *Figure 8.2.2*:

(a) longitudinal extent:

- between a section aft of amidships where the breadth at the waterline exceeds $0.9B$, and a section forward of amidships where the breadth at the waterline exceeds $0.6B$

(b) vertical extent:

- between 300mm below the minimum design ballast waterline, T_{bal} , amidships to $0.25T_{sc}$ or 2.2m, whichever is greater, above the draught T_{sc} .

Figure 8.2.2
Extent of Side Shell Plating

2.2.5 Sheer strake

- 2.2.5.1 The sheer strake is to comply with the requirements in 2.2.4.
- 2.2.5.2 The welding of deck fittings to rounded sheer strakes is to be avoided within $0.6L$ of amidships.
- 2.2.5.3 Where the sheer strake extends above the deck stringer plate, the top edge of the sheer strake is to be kept free from notches and isolated welded fittings, and is to be smooth with rounded edges. Grinding may be required if the cutting surface is not smooth. Drainage openings with a smooth transition in the longitudinal direction may be permitted.

2.2.6 Deck plating

- 2.2.6.1 The thickness of the deck plating is to comply with the requirements given in Table 8.2.4.

2.3 Hull Envelope Framing

2.3.1 General

- 2.3.1.1 The bottom shell, inner bottom and deck are to be longitudinally framed in the cargo tank region. The side shell, inner hull bulkheads and longitudinal bulkheads are generally to be longitudinally framed. Where the side shell is longitudinally framed, the inner hull bulkheads are to be similarly constructed. Suitable alternatives which take account of resistance to buckling will be specially considered.
- 2.3.1.2 Where longitudinals are omitted in way of the bilge, a longitudinal is to be fitted at the bottom and at the side close to the position where the curvature of the bilge plate starts. The distance between the lower turn of bilge and the outermost bottom longitudinal, a , is generally not to be greater than one-third of the spacing between the two outermost bottom longitudinals, s_a . Similarly, the distance between the upper turn of the bilge and the lowest side longitudinal, b , is generally not to be greater than one-third of the spacing between the two lowest side longitudinals, s_b . See Figure 8.2.1.
(RCN 2, effective from 1 July 2008)
- 2.3.1.3 The longitudinals are to comply with the requirements of continuity given in Section 4/3.2.

2.3.2 Scantling criteria

- 2.3.2.1 The section modulus, and thickness, of the hull envelope framing is to comply with the requirements given in *Tables 8.2.5* and *8.2.6*.
- 2.3.2.2 Where the side shell longitudinal or the vertical stiffener is inclined to the longitudinal or vertical axis, respectively, the span is to be taken in accordance with *Section 4/2.1.3*.
- 2.3.2.3 For curved stiffeners, the span is to be taken in accordance with *Section 4/2.1.3*.

2.4 Inner Bottom

2.4.1 Inner bottom plating

- 2.4.1.1 The thickness of the inner bottom plating is to comply with the requirements given in *Table 8.2.4*.
- 2.4.1.2 In way of a welded hopper knuckle, the inner bottom is to be scarfed to ensure adequate load transmission to surrounding structure and reduce stress concentrations.
- 2.4.1.3 In way of corrugated bulkhead stools, where fitted, particular attention is to be given to the through-thickness properties, and arrangements for continuity of strength, at the connection of the bulkhead stool to the inner bottom. For requirements for plates with specified through-thickness properties, see *Section 6/1.1.5*.

2.4.2 Inner bottom longitudinals

- 2.4.2.1 The section modulus and web plate thickness of the inner bottom longitudinals are to comply with the requirements given in *Tables 8.2.5* and *8.2.6*.

2.5 Bulkheads

2.5.1 General

- 2.5.1.1 The inner hull and longitudinal bulkheads are generally to be longitudinally framed, and plane. Corrugated bulkheads are to comply with the requirements given in *2.5.6*.
- 2.5.1.2 Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way are to be adequate for the loads imparted to the bulkheads by the hydraulic forces in the pipes.

2.5.2 Longitudinal tank boundary bulkhead plating

- 2.5.2.1 The thickness of the longitudinal tank boundary bulkhead plating is to comply with the requirements given in *Table 8.2.4*.
- 2.5.2.2 Inner hull and longitudinal bulkheads are to extend as far forward and aft as practicable and are to be effectively scarfed into the adjoining structure.

2.5.3 Hopper side structure

- 2.5.3.1 Knuckles in the hopper tank plating are to be supported by side girders and stringers, or by a deep longitudinal.

2.5.4 Transverse tank boundary bulkhead plating

- 2.5.4.1 The thickness of the transverse tank boundary bulkhead plating is to comply with the requirements given in *Table 8.2.4*.

2.5.5 Tank boundary bulkhead stiffeners

- 2.5.5.1 The section modulus and web thickness of stiffeners, on longitudinal or transverse tank boundary bulkheads, are to comply with the requirements given in *Tables 8.2.5* and *8.2.6*.

2.5.6 Corrugated bulkheads

- 2.5.6.1 The scantling requirements relating to corrugated bulkheads defined in 2.5.6 and 2.5.7 are net requirements. The gross scantling requirements are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.
- 2.5.6.2 In general, corrugated bulkheads are to be designed with the corrugation angles, ϕ , between 55 and 90 degrees, see *Figure 8.2.3*.
- 2.5.6.3 The global strength of corrugated bulkheads, lower stools and upper stools, where fitted, and attachments to surrounding structures are to be verified with the cargo tank FEM model in the midship region, see *Section 9/2*. The global strength of corrugated bulkheads outside of midship region are to be considered based on results from the cargo tank FEM model and using the appropriate pressure for the bulkhead being considered. Additional FEM analysis of cargo tank bulkheads forward and aft of the midship region may be necessary if the bulkhead geometry, structural details and support arrangement details differ significantly from bulkheads within the mid cargo tank region.
- 2.5.6.4 The net thicknesses, t_{net} , of the web and flange plates of corrugated bulkheads are to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$t_{net} = 0.0158 b_p \sqrt{\frac{|P|}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

P design pressure for the design load set being considered,
calculated at the load point defined in *Section 3/5.1*, in kN/m²

b_p breadth of plate:
= b_f for flange plating, in mm. See *Figure 8.2.3*
= b_w for web plating, in mm. See *Figure 8.2.3*

C_a permissible bending stress coefficient:
= 0.75 for acceptance criteria set AC1
= 0.90 for acceptance criteria set AC2

σ_{yd} specified minimum yield stress of the material, in N/mm²

- 2.5.6.5 Where the corrugated bulkhead is built with flange and web plate of different thickness, then the thicker net plating thickness, t_{m-net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by:

$$t_{m-net} = \sqrt{\frac{0.0005 b_p^2 |P|}{C_a \sigma_{yd}}} - t_{n-net}^2 \quad \text{mm}$$

Where:

t_{n-net}	net thickness of the thinner plating, either flange or web, in mm
b_p	breadth of thicker plate, either flange or web, in mm
P	design pressure for the design load set being considered, calculated at the load point defined in <i>Section 3/5.1</i> , in kN/m ²
C_a	permissible bending stress coefficient: = 0.75 for acceptance criteria set AC1 = 0.90 for acceptance criteria set AC2
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

2.5.7 Vertically corrugated bulkheads

- 2.5.7.1 In addition to the requirements of 2.5.6, vertically corrugated bulkheads are also to comply with the requirements of 2.5.7.
- 2.5.7.2 The net plate thicknesses as required by 2.5.7.5 and 2.5.7.6 are to be maintained for two thirds of the corrugation length, l_{cg} , from the lower end, where l_{cg} is as defined in 2.5.7.3. Above that, the net plate thickness may be reduced by 20%.
- 2.5.7.3 The net web plating thickness of the lower 15% of the corrugation, t_{w-net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool, see 2.5.7.9.

$$t_{w-net} = \frac{1000 |Q_{cg}|}{d_{cg} C_{t-cg} \tau_{yd}} \quad \text{mm}$$

Where:

Q_{cg}	design shear force imposed on the web plating at the lower end of the corrugation $= \frac{s_{cg} l_{cg} 3P_l + P_u }{8000} \quad \text{kN}$
P_l	design pressure for the design load set being considered, calculated at the lower end of the corrugation, in kN/m ²
P_u	design pressures for the design load set being considered, calculated at the upper end of the corrugation, in kN/m ²
s_{cg}	spacing of corrugation, in mm. See <i>Figure 8.2.3</i>
l_{cg}	length of corrugation, which is defined as the distance between the lower stool and the upper stool or the upper end where no upper stool is fitted, in m, see <i>Figure 8.2.3</i>
d_{cg}	depth of corrugation, in mm. See 2.5.7.4 and <i>Figure 8.2.3</i>
C_{t-cg}	permissible shear stress coefficient = 0.75 for acceptance criteria set AC1

= 0.90 for acceptance criteria set AC2

$$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.5.7.4 The depth of the corrugation, d_{cg} , is not to be less than:

$$d_{cg} = \frac{1000 l_{cg}}{15} \quad \text{mm}$$

Where:

l_{cg} length of corrugation, which is defined as the distance between the lower stool or the inner bottom if no lower stool is fitted and the upper stool or the upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

2.5.7.5 The net thicknesses of the flanges of corrugated bulkheads, t_{f-net} , for two thirds of the corrugation length from the lower end are to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool, see 2.5.7.9.

$$t_{f-net} = \frac{0.00657 b_f \sqrt{\sigma_{bdg-max}}}{C_f} \quad \text{mm}$$

Where:

$\sigma_{bdg-max}$ maximum value of the vertical bending stresses in the flange. The bending stress is to be calculated at the lower end and at the mid span of the corrugation length

$$= \frac{1000 M_{cg}}{Z_{cg-act-net}} \quad \text{N/mm}^2$$

M_{cg} as defined in 2.5.7.6

$Z_{cg-act-net}$ actual net section modulus at the lower end and at the mid length of the corrugation, in cm³

b_f breadth of flange plating, in mm. See *Figure 8.2.3*

b_w breadth of web plating, in mm. See *Figure 8.2.3*

C_f coefficient

$$= 7.65 - 0.26 \left(\frac{b_w}{b_f} \right)^2$$

2.5.7.6 The net section modulus at the lower and upper ends and at the mid length of the corrugation ($l_{cg}/2$) of a unit corrugation, Z_{cg-net} , are to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.2.7*, and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool, see 2.5.7.9.

$$Z_{cg-net} = \frac{1000 M_{cg}}{C_{s-cg} \sigma_{yd}} \quad \text{cm}^3$$

Where:

$$M_{cg} = \frac{C_i |P| s_{cg} l_o^2}{12000} \quad \text{kNm}$$

$$P = \frac{P_u + P_l}{2} \quad \text{kN/m}^2$$

P_l, P_u design pressure for the design load set being considered, calculated at the lower and upper ends of the corrugation, respectively, in kN/m²:

- (a) for transverse corrugated bulkheads, the pressures are to be calculated at a section located at $b_{tk}/2$ from the longitudinal bulkheads of each tank
- (b) for longitudinal corrugated bulkheads, the pressures are to be calculated at the ends of the tank, i.e., the intersection of the forward and aft transverse bulkheads and the longitudinal bulkhead

b_{tk} maximum breadth of tank under consideration measured at the bulkhead, in m

s_{cg} spacing of corrugation, in mm. See *Figure 8.2.3*

l_o effective bending span of the corrugation, measured from the mid depth of the lower stool to the mid depth of the upper stool, or upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

l_{cg} length of corrugation, which is defined as the distance between the lower stool and the upper stool or the upper end where no upper stool is fitted, in m, see *Figure 8.2.3*

C_i the relevant bending moment coefficients as given in *Table 8.2.3*

C_{s-cg} permissible bending stress coefficient
at the mid length of the corrugation length, l_{cg} :
= c_e , but not to be taken as greater than 0.75 for acceptance criteria set AC1
= c_e , but not to be taken as greater than 0.90 for acceptance criteria set AC2

at the lower and upper ends of corrugation length, l_{cg} :
= 0.75 for acceptance criteria set AC1
= 0.90 for acceptance criteria set AC2

$$c_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \quad \text{for } \beta \geq 1.25$$

$$= 1.0 \quad \text{for } \beta < 1.25$$

$$\beta = \frac{b_f}{t_{f-net}} \sqrt{\frac{\sigma_{yd}}{E}}$$

b_f breadth of flange plating, in mm, see *Figure 8.2.3*

t_{f-net} net thickness of the corrugation flange, in mm

E modulus of elasticity, in N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.2.3 Values of C_i			
Bulkhead	At lower end of l_{cg}	At mid length of l_{cg}	At upper end of l_{cg}
Transverse Bulkhead	C_1	C_{m1}	$0.80C_{m1}$
Longitudinal Bulkhead	C_3	C_{m3}	$0.65C_{m3}$
Where:			
C_1	$= a_1 + b_1 \sqrt{\frac{A_{dt}}{b_{dk}}}$	but is not to be taken as less than 0.60	
a_1	$= 0.95 - \frac{0.41}{R_{bt}}$		
b_1	$= -0.20 + \frac{0.078}{R_{bt}}$		
C_{m1}	$= a_{m1} + b_{m1} \sqrt{\frac{A_{dt}}{b_{dk}}}$	but is not to be taken as less than 0.55	
a_{m1}	$= 0.63 + \frac{0.25}{R_{bt}}$		
b_{m1}	$= -0.25 - \frac{0.11}{R_{bt}}$		
C_3	$= a_3 + b_3 \sqrt{\frac{A_{dl}}{l_{dk}}}$	but is not to be taken as less than 0.60	
a_3	$= 0.86 - \frac{0.35}{R_{bl}}$

Values of C_i

b_3	$= -0.17 + \frac{0.10}{R_{bl}}$	
C_{m3}	$= a_{m3} + b_{m3} \sqrt{\frac{A_{dl}}{l_{dk}}}$	but is not to be taken as less than 0.55
a_{m3}	$= 0.32 + \frac{0.24}{R_{bl}}$	
b_{m3}	$= -0.12 - \frac{0.10}{R_{bl}}$	
R_{bt}	$= \frac{A_{bt}}{b_{ib}} \left(1 + \frac{l_{ib}}{b_{ib}} \right) \left(1 + \frac{b_{av-t}}{h_{st}} \right)$	for transverse bulkheads
R_{bl}	$= \frac{A_{bl}}{l_{ib}} \left(1 + \frac{l_{ib}}{b_{ib}} \right) \left(1 + \frac{b_{av-l}}{h_{sl}} \right)$	for longitudinal bulkheads
A_{dt}	cross sectional area enclosed by the moulded lines of the transverse bulkhead upper stool, in m ² = 0 if no upper stool is fitted	
A_{dl}	cross sectional area enclosed by the moulded lines of the longitudinal bulkhead upper stool, in m ² = 0 if no upper stool is fitted	
A_{bt}	cross sectional area enclosed by the moulded lines of the transverse bulkhead lower stool, in m ²	
A_{bl}	cross sectional area enclosed by the moulded lines of the longitudinal bulkhead lower stool, in m ²	
b_{av-t}	average width of transverse bulkhead lower stool, in m. See Figure 8.2.3	
b_{av-l}	average width of longitudinal bulkhead lower stool, in m. See Figure 8.2.3	
h_{st}	height of transverse bulkhead lower stool, in m. See Figure 8.2.3	
h_{sl}	height of longitudinal bulkhead lower stool, in m. See Figure 8.2.3	
b_{ib}	breadth of cargo tank at the inner bottom level between hopper tanks, or between the hopper tank and centreline lower stool, in m. See Figure 8.2.3	
b_{dk}	breadth of cargo tank at the deck level between upper wing tanks, or between the upper wing tank and centreline deck box or between the corrugation flanges if no upper stool is fitted, in m. See Figure 8.2.3	
l_{ib}	length of cargo tank at the inner bottom level between transverse lower stools, in m. See Figure 8.2.3	
l_{dk}	length of cargo tank at the deck level between transverse upper stools or between the corrugation flanges if no upper stool is fitted, in m. See Figure 8.2.3	

2.5.7.7 For tanks with effective sloshing breadth, b_{slh} , greater than $0.56B$ or effective sloshing length l_{slh} , greater than $0.13L$, additional sloshing analysis is to be carried out to assess the section modulus of the unit corrugation in accordance with the requirements of the individual Classification Society.

2.5.7.8 For ships with a moulded depth, see Section 4/1.1.4, equal to or greater than 16m, a lower stool is to be fitted in compliance with the following requirements:

(a) general:

- the height and depth are not to be less than the depth of the corrugation

- the lower stool is to be fitted in line with the double bottom floors or girders
- the side stiffeners and vertical webs (diaphragms) within the stool structure are to align with the structure below, as far as is practicable, to provide appropriate load transmission to structures within the double bottom.

(b) stool top plating:

- the net thickness of the stool top plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation
- the extension of the top plate beyond the corrugation is not to be less than the as-built flange thickness of the corrugation.

(c) stool side plating and internal structure:

- within the region of the corrugation depth from the stool top plate the net thickness of the stool side plate is not to be less than 90% of that required by 2.5.7.2 for the corrugated bulkhead flange at the lower end and is to be of at least the same material yield strength
- the net thickness of the stool side plating and the net section modulus of the stool side stiffeners is not to be less than that required by 2.5.2, 2.5.4 and 2.5.5 for transverse or longitudinal bulkhead plating and stiffeners
- the ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool
- continuity is to be maintained, as far as practicable, between the corrugation web and supporting brackets inside the stool. The bracket net thickness is not to be less than 80% of the required thickness of the corrugation webs and is to be of at least the same material yield strength
- scallops in the diaphragms in way of the connections of the stool sides to the inner bottom and to the stool top plate are not permitted.

2.5.7.9 For ships with a moulded depth, see *Section 4/1.1.4*, less than 16m, the lower stool may be eliminated provided the following requirements are complied with:

(a) general:

- double bottom floors or girders are to be fitted in line with the corrugation flanges for transverse or longitudinal bulkheads, respectively
- brackets/carlings are to be fitted below the inner bottom and hopper tank in line with corrugation webs. Where this is not practicable gusset plates with shedder plates are to be fitted, see item (c) below and *Figure 8.2.3*
- the corrugated bulkhead and its supporting structure is to be assessed by Finite Element (FE) analysis in accordance with *Section 9/2*. In addition the local scantlings requirements of 2.5.6.4 and 2.5.6.5 and the minimum corrugation depth requirement of 2.5.7.4 are to be applied.

(b) inner bottom and hopper tank plating:

- the inner bottom and hopper tank in way of the corrugation is to be of at least the same material yield strength as the attached corrugation

RCN 1 (effective from 1 July 2009)

(c) supporting structure:

- within the region of the corrugation depth below the inner bottom the net thickness of the supporting double bottom floors or girders is not to be less than the net thickness of the corrugated bulkhead flange at the lower end and is to be of at least the same material yield strength

- the upper ends of vertical stiffeners on supporting double bottom floors or girders are to be bracketed to adjacent structure
- brackets/carlings arranged in line with the corrugation web are to have a depth of not less than 0.5 times the corrugation depth and a net thickness not less than 80% of the net thickness of the corrugation webs and are to be of at least the same material yield strength
- cut outs for stiffeners in way of supporting double bottom floors and girders in line with corrugation flanges are to be fitted with full collar plates
- where support is provided by gussets with shedder plates, the height of the gusset plate, see h_g in *Figure 8.2.3*, is to be at least equal to the corrugation depth, and gussets with shedder plates are to be arranged in every corrugation. The gusset plates are to be fitted in line with and between the corrugation flanges. The net thickness of the gusset and shedder plates are not to be less than 100% and 80%, respectively, of the net thickness of the corrugation flanges and are to be of at least the same material yield strength. Also see 2.5.7.11.
- scallops in brackets, gusset plates and shedder plates in way of the connections to the inner bottom or corrugation flange and web are not permitted.

2.5.7.10 In general, an upper stool is to be fitted in compliance with the following requirements:

(a) general:

- where no upper stool is fitted, finite element analysis is to be carried out to demonstrate the adequacy of the details and arrangements of the bulkhead support structure to the upper deck structure
- side stiffeners and vertical webs (diaphragms) within the stool structure are to align with adjoining structure to provide for appropriate load transmission
- brackets are to be arranged in the intersections between the upper stool and the structure on deck

(b) stool bottom plating:

- the net thickness of the stool bottom plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation
- the extension of the bottom plate beyond the corrugation is not to be less than the attached as-built flange thickness of the corrugation.

(c) stool side plating and internal structure:

- within the region of the corrugation depth above the stool bottom plate the net thickness of the stool side plate is to be not less than 80% of that required by 2.5.7.2 for the corrugated bulkhead flange at the upper end where the same material is used. If material of different yield strength is used the required thickness is to be adjusted by the ratio of the two material factors (k). k is defined in *Section 6/1.1.4.1*
- the net thickness of the stool side plating and the net section modulus of the stool side stiffeners is not to be less than that required by 2.5.2, 2.5.4 and 2.5.5 for the transverse or longitudinal bulkhead plating and stiffeners
- the ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool

- scallops in the diaphragms in way of the connections of the stool sides to the deck and to the stool bottom plate are not permitted.

2.5.7.11 Where gussets with shedder plates or shedder plates (slanting plates) are fitted at the end connection of the corrugation to the lower stool or to the inner bottom, appropriate means are to be provided to prevent the possibility of gas pockets being formed by these plates.

2.5.7.12 Welding for all connections and joints is to comply with *Section 6/5*.

2.5.8 Non-tight bulkheads

2.5.8.1 Non-tight bulkheads (wash bulkheads), where fitted, are to be in line with transverse webs, bulkheads or similar structures. They are to be of plane construction, horizontally or vertically stiffened, and are to comply with the sloshing requirements given in 6.2. In general, openings in the non-tight bulkheads are to have generous radii and their aggregate area is not to be less than 10% of the area of the bulkhead.

Figure 8.2.3
Definition of Parameters for Corrugated Bulkhead
(Tankers with Longitudinal Bulkhead at Centreline)

Table 8.2.4
Thickness Requirements for Plating

The minimum net thickness, t_{net} , is to be taken as the greatest value for all applicable design load sets, as given in Table 8.2.7, and given by:

$$t_{net} = 0.0158 \alpha_p s \sqrt{\frac{|P|}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

P design pressure for the design load set being considered and calculated at the load calculation point defined in Section 3/5.1, in kN/m²

α_p correction factor for the panel aspect ratio
 $= 1.2 - \frac{s}{2100 l_p}$ but is not to be taken as greater than 1.0

s as defined in Section 4/2.2, in mm

l_p length of plate panel, to be taken as the spacing of primary support members, S , unless carlings are fitted, in m

σ_{yd} specified minimum yield stress of the material, in N/mm²

C_a permissible bending stress coefficient for the design load set being considered

$$= \beta_a - \alpha_a \frac{|\sigma_{hg}|}{\sigma_{yd}} \quad \text{but not to be taken greater than } C_{a-max}$$

Acceptance Criteria Set	Structural Member		β_a	α_a	C_{a-max}
AC1	Longitudinal Strength Members	Longitudinally stiffened plating	0.9	0.5	0.8
		Transversely or vertically stiffened plating	0.9	1.0	0.8
	Other members		0.8	0	0.8
AC2	Longitudinal Strength Members	Longitudinally stiffened plating	1.05	0.5	0.95
		Transversely or vertically stiffened plating	1.05	1.0	0.95
	Other members, including watertight boundary plating		1.0	0	1.0

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the load calculation point defined in Section 3/5.1.2

$$= \left(\frac{(z - z_{NA-net50}) M_{v-total}}{I_{v-net50}} - \frac{y M_{h-total}}{I_{h-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at the longitudinal position under consideration for the design load set being considered, in kNm. The still water bending moment, $M_{sw-perm}$, is to be taken with the same sign as the simultaneously acting wave bending moment, M_{wv} , see Table 7.6.1

$M_{h-total}$ design horizontal bending moment at the longitudinal position under consideration for the design load set being considered, in kNm

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.1, in m⁴

$I_{h-net50}$ net horizontal hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.2, in m⁴

y transverse coordinate of load calculation point, in m

z vertical coordinate of the load calculation point under consideration, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in Section 4/2.6.1, in m

Table 8.2.5
Section Modulus Requirements for Stiffeners

The minimum net section modulus, Z_{net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in Table 8.2.7, and given by:

$$Z_{net} = \frac{|P| s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P design pressure for the design load set being considered and calculated at the load calculation point defined in Section 3/5.2, in kN/m²

f_{bdg} bending moment factor:
for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having as fixed ends:
= 12 for horizontal stiffeners
= 10 for vertical stiffeners
for stiffeners with reduced end fixity see Sub-section 7.

l_{bdg} effective bending span, in m, as defined in Section 4/2.1.1

s as defined in Section 4/2.2, in mm

σ_{yd} specified minimum yield stress of the material, see also Section 3/5.2.6.5, in N/mm²

C_s permissible bending stress coefficient for the design load set being considered, to be taken as:

Sign of Hull Girder Bending Stress, σ_{hg}	Side Pressure Acting On	Acceptance Criteria
Tension (+ve)	Stiffener side	$C_s = \beta_s - \alpha_s \frac{ \sigma_{hg} }{\sigma_{yd}}$ but not to be taken greater than C_{s-max}
Compression (-ve)	Plate side	
Tension (+ve)	Plate side	$C_s = C_{s-max}$
Compression (-ve)	Stiffener side	

Acceptance Criteria Set	Structural Member	β_s	α_s	C_{s-max}
AC1	Longitudinal strength member	0.85	1.0	0.75
	Transverse or vertical member	0.75	0	0.75
AC2	Longitudinal strength member	1.0	1.0	0.9
	Transverse or vertical member	0.9	0	0.9
	Watertight boundary Stiffeners	0.9	0	0.9

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the reference point defined in Section 3/5.2.2.5

$$= \left(\frac{(z - z_{NA-net50}) M_{v-total}}{I_{v-net50}} - \frac{y M_{h-total}}{I_{h-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at longitudinal position under consideration for the design load set being considered, in kNm.

$M_{v-total}$ is to be calculated in accordance with Table 7.6.1 using the permissible hogging or sagging still water bending moment, $M_{sw-perm}$, to be taken as:

Stiffener Location	$M_{sw-perm}$	
	Pressure acting on Plate Side	Pressure acting on Stiffener Side
Above Neutral Axis	Sagging SWBM	Hogging SWBM
Below Neutral Axis	Hogging SWBM	Sagging SWBM

$M_{h-total}$ design horizontal bending moment at longitudinal position under consideration for the design load set being considered, see Table 7.6.1, in kNm

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.1, in m⁴

$I_{h-net50}$ net horizontal hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.2, in m⁴

y transverse coordinate of the reference point defined in Section 3/5.2.2.5, in m

z vertical coordinate of the reference point defined in Section 3/5.2.2.5, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in Section 4/2.6.1, in m

Table 8.2.6
Web Thickness Requirements for Stiffeners

The minimum net web thickness, t_{w-net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in Table 8.2.7, and given by:

$$t_{w-net} = \frac{f_{shr} |P| s l_{shr}}{d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

Where:

P	design pressure for the design load set being considered and calculated at the load calculation point defined in Section 3/5.1, in kN/m ²
f_{shr}	shear force distribution factor: for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having as fixed ends: = 0.5 for horizontal stiffeners = 0.7 for vertical stiffeners for stiffeners with reduced end fixity, see Sub-section 7
d_{shr}	as defined in Section 4/2.4.2.2, in mm
C_t	permissible shear stress coefficient for the design load set being considered, to be taken as: = 0.75 for acceptance criteria set AC1 = 0.90 for acceptance criteria set AC2
s	as defined in Section 4/2.2, in mm
l_{shr}	effective shear span, in m, see Section 4/2.1.2
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm ²
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 8.2.7
Design Load Sets for Plating and Local Support Members

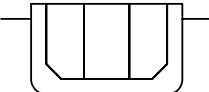

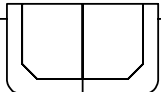

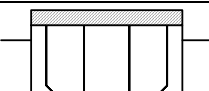

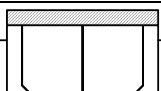

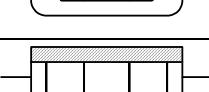

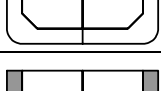

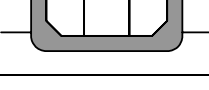

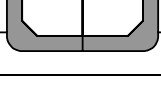

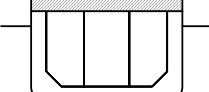

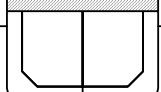

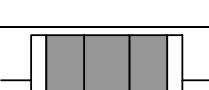

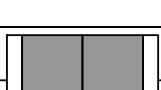

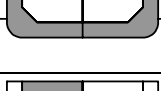

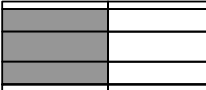

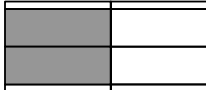

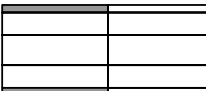

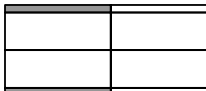

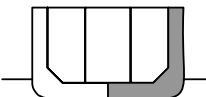

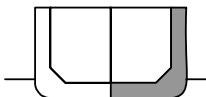

Structural Member		Design Load Set (1, 2, 3)	Load Component	Draught	Comment	Diagrammatic Representation	
Keel, Bottom Shell, Bilge, Side Shell, Sheer strake		1	P_{ex}	T_{sc}	Sea pressure only		
		2	P_{ex}	T_{sc}			
		7	$P_{in} - P_{ex}$	T_{bal}	Net pressure difference between water ballast pressure and sea pressure		
		8	$P_{in} - P_{ex}$	$0.25T_{sc}$			
Deck	In way of cargo tanks	1	P_{ex}	T_{sc}	Green sea pressure only or other loads on deck		
		3	P_{in}	$0.6T_{sc}$	Cargo pressure only		
		4	P_{in}	-			
		11	$P_{in-flood}$	-			
	In way of other tanks	1	P_{ex}	T_{sc}	Green sea pressure only or other loads on deck		
		5	P_{in}	T_{bal}	Water ballast or other liquid pressure only		
		6	P_{in}	$0.25T_{sc}$			
		11	$P_{in-flood}$	-			
	Any location	9	P_{dk}	T_{bal}	Distributed or concentrated loads only. Simultaneously occurring green sea pressure may be ignored		
		10	P_{dk}	-			
Inner Bottom, Inner hull, Hopper side		3	P_{in}	$0.6T_{sc}$	Cargo pressure only		
		4	P_{in}	-			
		5	P_{in}	T_{bal}	Water ballast or other liquid pressure only		
		6	P_{in}	$0.25T_{sc}$			
		11	$P_{in-flood}$	-			
Longitudinal Bulkhead, Centreline Bulkhead		3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent cargo tank empty. Two cases are to be evaluated: 1. Inner empty, outer full 2. Inner full, outer empty		
		4	P_{in}	-			
		11	$P_{in-flood}$	-			

Table 8.2.7 (Continued)
Design Load Sets for Plating and Local Support Members

Structural Member		Design Load Set (1, 2, 3)	Load Component	Draught	Comment	Diagrammatic Representation	
Transverse Bulkhead	In way of cargo tanks	3	P_{in}	$0.6T_{sc}$	Pressure from one side only.		
		4	P_{in}	-	Full cargo tank with adjacent fwd or aft cargo tank empty.		
		11	$P_{in-flood}$	-	Need to evaluate 2 cases		
	In way of other tanks	5	P_{in}	T_{bal}	1) Fwd empty, aft full		
		6	P_{in}	$0.25T_{sc}$	2) Fwd full, aft empty		
		11	$P_{in-flood}$	-			
Other tank boundaries, e.g. Girders, Floors, Stringers		5	P_{in}	T_{bal}	Pressure from one side only.		
		6	P_{in}	$0.25T_{sc}$	Full tank with adjacent tank empty.		
		11	$P_{in-flood}$	-	Need to evaluate 2 cases, see above		

Where:

 T_{sc} scantling draught, in m, as defined in Section 4/1.1.5.5 T_{bal} minimum design ballast draught, in m, as defined in Section 4/1.1.5.2Notes

- Specification of design load combination, load component, acceptance criteria and other load parameters for each design load set are given in Table 8.2.8
- When the ship's configuration cannot be described by the above, then the applicable Design Load Sets to determine the scantling requirements of structural boundaries are to be selected so as to specify a full tank on one side with the adjacent tank or space empty. The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. See Note 4 and Table 8.2.8.
- The boundaries of void and dry space not forming part of the hull envelope are to be evaluated using Design Load Set 11. See Note 2.
- Design load sets (DLS) for some structural members not covered by the above:
 For the boundaries of a stool water ballast tank with the cargo tank:
 - DLSs 5, 6 and 11 are to be applied for pressure from the WB tank side
 - DLSs 3, 4 and 11 for pressure from the cargo tank side
 For a double bottom girder separating two water ballast tanks or separating a water ballast and fuel oil tank:
 - DLSs 5, 6 and 11 are to be applied for pressure from each side in turn
 For the boundary of a stool void space to the cargo tank:
 - DLSs 3, 4 and 11 for pressure from the cargo tank side
 - DLS 11 for pressure from the void space side

Table 8.2.8
Specification of Design Load Combination, Acceptance Criteria and
other Load Parameters for each Design Load Set

Design Load Set	Load Component ⁽¹⁾	Design Load Combination ⁽²⁾	Acceptance Criteria Set	Parameters for Calculating Load Components

Where: <i>PSM</i> Primary Support Members <i>LSM</i> Local Support Members <i>DLCF</i> Dynamic Load Combination Factors <i>P_{in}</i> <i>P_{ex}</i> <i>P_{dk}</i> <i>P_{in-flood}</i> as given in Table 7.6.1 and as shown in Table 8.2.7 or Table 8.2.9 <i>B</i> moulded breadth, in m, as defined in Section 4/1.1.3.1						
<u>Note</u> 1. Structural members are to be designed using all design load sets which are applicable. This table gives the pressure load component of the design load set. The hull girder bending moments are given in Tables 8.2.4 and 8.2.5 for local support members. 2. This column specifies which column in the design load combination table is to be applied for each design load set, see Table 7.6.1. Where <i>S</i> denotes the static design load combination, <i>S+D</i> denotes the static plus dynamic design load combination and <i>A</i> denotes the accidental design load combination. 3. This column specifies which dynamic load combination factor table is to be used for the deviation of the pressure components and global load components, see Table 7.6.1						

2.6 Primary Support Members

2.6.1 General

2.6.1.1 The following requirements relate to the determination of scantlings of the primary support members in the cargo tank region for the extents shown in *Figure 8.2.4*.

2.6.1.2 The section modulus and shear area criteria for primary support members contained in 2.6 apply to structural configurations shown in *Figure 2.3.1* and are applicable to the following structural elements:

- (a) floors and girders within the double bottom;
- (b) deck transverses fitted below the upper deck;
- (c) side transverses within double side structure;
- (d) vertical web frames on longitudinal bulkheads with or without cross ties;
- (e) horizontal stringers on transverse bulkheads, except those fitted with buttresses or other intermediate supports; and
- (f) cross ties in wing cargo and centre cargo tanks.

The section modulus and shear area criteria for primary support members of structural configurations other than those listed above are to be obtained by calculation methods as described in *Section 8/7*.

2.6.1.3 The scantlings of primary support members are to be verified by the Finite Element (FE) cargo tank structural analysis defined in *Section 9/2*.

2.6.1.4 The section modulus and/or shear area of a primary support member and/or the cross sectional area of a primary support member cross tie may be reduced to 85% of the prescriptive requirements provided that the reduced scantlings comply with the FE cargo tank structural analysis and with 2.1.6.

2.6.1.5 In general, primary support members are to be arranged in one plane to form continuous transverse rings. Brackets forming connections between primary support members of the ring are to be designed in accordance with *Section 4/3.3.3*.

2.6.1.6 Webs of the primary support members are to be stiffened in accordance with *Section 10/2.3*.

2.6.1.7 Webs of the primary support members are to have a depth of not less than given by the requirements of 2.6.4.1, 2.6.6.1 and 2.6.7.1, as applicable. Lesser depths may be accepted where equivalent stiffness is demonstrated. See 3/5.3.3.4. Primary support members that have open slots for stiffeners are to have a depth not less than 2.5 times the depth of the slots.

2.6.2 Design load sets and permissible stress coefficients for primary support members

- 2.6.2.1 The design load sets for the evaluation of the primary support members are given in *Table 8.2.9*.
- 2.6.2.2 The permissible bending and shear stress coefficients for the evaluation of the primary support members are given in *Table 8.2.10*.

Table 8.2.9
Design Load Sets for Primary Support Members

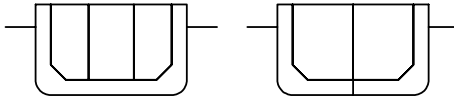

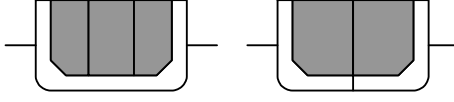

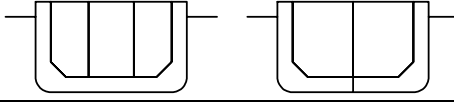

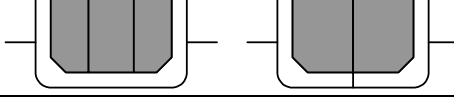

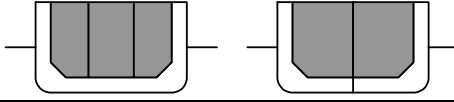

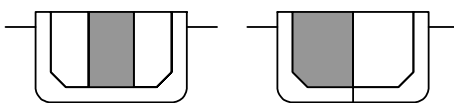

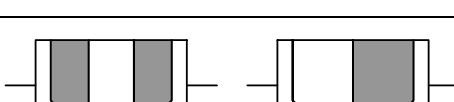

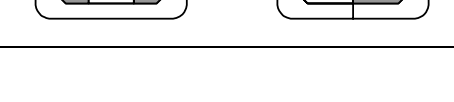

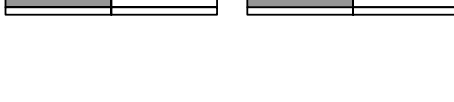

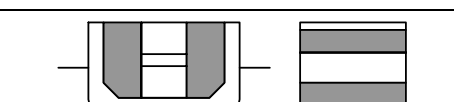

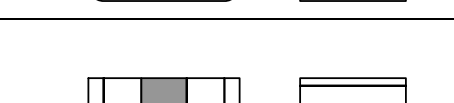

Structural Member	Design Load Set (1, 5, 6)	Load Component	Draught	Comment	Diagrammatic Representation
Double bottom floors and girders ⁽³⁾	1	P_{ex}	$0.9T_{sc}$ ⁽²⁾	Sea pressure only	
	2	P_{ex}	T_{sc}		
	12	$P_{in} - P_{ex}$	$0.6T_{sc}$	Net pressure difference between cargo pressure and sea pressure	
	13	$P_{in} - P_{ex}$	(4)		
Side transverses ⁽³⁾	1	P_{ex}	$0.9T_{sc}$	Sea pressure only	
	2	P_{ex}	T_{sc}		
	3	P_{in}	$0.6T_{sc}$	Cargo pressure only	
	4	P_{in}	-		
Deck transverses	1	P_{ex}	T_{sc}	Green sea pressure only or other loads on deck	
	3	P_{in}	$0.6T_{sc}$	Cargo pressure only	
	4	P_{in}	-		
Vertical web frames on longitudinal bulkheads	3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent cargo tank empty	
	4	P_{in}	-	Pressure from one side only. Full cargo tank with adjacent cargo tank empty	
	3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent cargo tank empty	
	4	P_{in}	-	Pressure from one side only. Full cargo tank with adjacent cargo tank empty	
Horizontal stringers on transverse bulkhead	3	P_{in}	$0.6T_{sc}$	Pressure from one side only. Full cargo tank with adjacent forward or aft cargo tank empty. Two cases are to be evaluated:	
	4	P_{in}	-	1. forward empty/ aft full	
	11	$P_{in-flood}$	-	2. forward full/ aft empty	
Cross ties in centre tanks	3	$\frac{P_{in-pt} + P_{in-stb}}{2}$	$0.6T_{sc}$	Full wing cargo tanks, centre tank empty.	
	4	P_{in}	-		
Cross ties in wing tanks	14	$\frac{P_{in} + P_{ex}}{2}$	T_{sc}	Full centre tank, wing cargo tanks empty.	
	15	$\frac{P_{in} + P_{ex}}{2}$	$0.6T_{sc}$		
	16	$\frac{P_{in} + P_{ex}}{2}$	T_{sc}		

Table 8.2.9 (Continued)
Design Load Sets for Primary Support Members

Where:

P_{in-pt} design pressure from port side wing cargo tank, in kN/m²

P_{in-stb} design pressure from starboard side wing cargo tank, in kN/m²

T_{sc} scantling draught, in m, as defined in Section 4/1.1.5.5

T_{bal} minimum design ballast draught, in m, as defined in Section 4/1.1.5.2

Notes

1. Specification of design load combination, load component, acceptance criteria set and other load parameters for each design load set are given in Table 8.2.8.
2. See 1.1.2.9(b)
3. Draughts specified for bottom floors, girders and side transverses are based on operational limits specified in 1.1.2. Where the optional loading conditions exceed the minimum Rule required loading conditions the draughts will be subject to special consideration.
4. For tankers with two oil-tight longitudinal bulkheads, the draught is to be taken as $0.25T_{sc}$. For tankers with a centreline bulkhead, the draught is to be taken as $0.33T_{sc}$.
5. When the ship's configuration cannot be described by the structural members or structural configurations identified above, then the applicable Design Load Sets to determine the scantling requirements of primary support member are to be selected so as to specify all applicable cases from the following:
 - a full tank on one side of the member with the tank or space on the other side empty
 - a full tank on one side of the member with the external pressure minimised
 - external pressure maximised with the adjacent tank or space empty

The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the net pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. Design Load Set 11 may also need to be applied, depending on the particular structural configuration. See Note 4 on Table 8.2.7 and Table 8.2.8.
6. For a void or dry space, the pressure component from the void side is to be ignored, except where Design Load Set 11 needs to be applied.

Table 8.2.10 Permissible Stress Coefficients, C_{s-pr} and C_{t-pr}, for Primary Support Members		
Acceptance criteria set	Permissible bending stress coefficient, C_{s-pr}	Permissible shear stress coefficient, C_{t-pr}
AC1	0.70	0.70
AC2	0.85	0.85

2.6.3 Floors and girders in double bottom

2.6.3.1 Continuous double bottom girders are to be arranged at the centreline or duct keel, at the hopper side and in way of longitudinal bulkheads and bulkhead stools. Plate floors are to be arranged in way of transverse bulkheads and bulkhead stools.

2.6.3.2 The net shear area, $A_{shr-net50}$, of the floors at any position in the floor is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force
 $= f_{shr} P S l_{shr} \quad \text{kN}$

f_{shr} shear force distribution factor
 $= f_{shr-i} \left(1 - \frac{2y_i}{l_{shr}} \right)$ but not to be taken as less than 0.2

f_{shr-i} shear force distribution factor at the end of the span, l_{shr} , as given in Table 8.2.11

l_{shr} effective shear span, of the double bottom floor, in m, as shown in Figure 8.2.6. In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in Section 4/2.1.5. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in Figure 8.2.6.

y_i distance from the considered cross-section of the floor to the nearest end of the effective shear span, l_{shr} , in m

S primary support member spacing, in m, as defined in Section 4/2.2.2

P design pressure for the design load set being considered, calculated at mid point of effective shear span, l_{shr} , of a floor located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m²

C_{t-pr} permissible shear stress coefficient for primary support member as given in Table 8.2.10

τ_{yd} $= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.2.11 Shear Force Distribution Factors of Floors			
Structural Configuration	Centre tank (f_{shr3} in Figure 8.2.5)	Wing Tank	
		At inboard end (f_{shr2} in Figure 8.2.5)	At hopper knuckle end (f_{shr1} in Figure 8.2.5)
Ships with centreline longitudinal bulkhead	-	0.4	0.6
Ships with two longitudinal bulkheads	0.5	0.50	0.65

2.6.3.3 For double bottom centre girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr-net50}$, of the double bottom centre girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force
 $= 0.21 n_1 n_2 P l_{shr}^2 \quad \text{kN}$

l_{shr} effective shear span, of the double bottom floor, in m, as shown in Figure 8.2.6. In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in Section 4/2.1.5. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in Figure 8.2.6.

P design pressure for the design load set being considered, calculated at mid point of effective shear span, l_{shr} , of a floor

located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m²

$$n_1 = 0.00935 \left(\frac{l_{shr}}{S} \right)^2 - 0.163 \left(\frac{l_{shr}}{S} \right) + 1.289$$

$$n_2 = 1.3 - \left(\frac{S}{12} \right)$$

S double bottom floor spacing, in m, as defined in Section 4/2.2.2

C_{t-pr} permissible shear stress coefficient for primary support member as given in Table 8.2.10

$$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.6.3.4 For double bottom side girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr-net50}$, of the double bottom side girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force
 $= 0.14 n_3 n_4 P l_{shr}^2 \quad \text{kN}$

$$n_3 = 1.072 - 0.0357 \left(\frac{l_{shr}}{S} \right)$$

$$n_4 = 1.2 - \left(\frac{S}{18} \right)$$

l_{shr} effective shear span, of the double bottom floor, in m, as shown in Figure 8.2.6. In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in Section 4/2.1.5. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in Figure 8.2.6.

S double bottom floor spacing, in m, as defined in Section 4/2.2.2

P design pressure for the design load set being considered, calculated at mid point of effective shear span, l_{shr} , of a floor located midway between transverse bulkheads or transverse bulkhead and wash bulkhead, where fitted, in kN/m²

C_{t-pr} permissible shear stress coefficient for primary support member as given in Table 8.2.10

$$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.6.4 Deck transverses

2.6.4.1 The web depth of deck transverses is not to be less than:

- (a) $0.20 l_{bdg-dt}$ for deck transverses in the wing cargo tanks of ships with two longitudinal bulkheads
- (b) $0.13 l_{bdg-dt}$ for deck transverses in the centre cargo tanks of ships with two longitudinal bulkheads. The web depth of deck transverses in the centre cargo tank is not to be less than 90% of that of the deck transverses in the wing cargo tank
- (c) $0.10 l_{bdg-dt}$ for the deck transverses of ships with a centreline longitudinal bulkhead.
- (d) See also 2.6.1.7

Where:

l_{bdg-dt} effective bending span of the deck transverse, in m, see *Section 4/2.1.4* and *Figure 8.2.7*, but is not to be taken as less than 60% of the breadth of the tank at the location being considered

2.6.4.2 The moment of inertia of the deck transverses, with associated deck plating, is to comply with *Section 10/2.3.2.3* to control the overall deflection of the deck structure.

2.6.4.3 The net section modulus of deck transverses is not to be less than $Z_{in-net50}$ and $Z_{ex-net50}$ as given by the following. The net section modulus of the deck transverses in the wing cargo tanks is also not to be less than required for the deck transverses in the centre tanks.

$$Z_{in-net50} = \frac{1000 M_{in}}{C_{s-pr} \sigma_{yd}} \quad \text{cm}^3$$

$$Z_{ex-net50} = \frac{1000 M_{ex}}{C_{s-pr} \sigma_{yd}} \quad \text{cm}^3$$

Where:

M_{in} design bending moment due to cargo pressure, in kNm, to be taken as:

- (a) for deck transverses in wing cargo tanks of ships with two longitudinal bulkheads, and for deck transverses in cargo tanks of ships with a centreline longitudinal bulkhead:

$$= 0.042 \varphi_t P_{in-dt} S l_{bdg-dt}^2 + M_{st} \quad \text{but is not to be taken as less than } M_o$$

- (b) for deck transverses in centre cargo tank of ships with two longitudinal bulkheads:

$$= 0.042 \varphi_t P_{in-dt} S l_{bdg-dt}^2 + M_{vw} \quad \text{but is not to be taken as less than } M_o$$

M_{st} bending moment transferred from the side transverse

$$= c_{st} \beta_{st} P_{in-st} S l_{bdg-st}^2 \quad \text{kNm}$$

where a cross tie is fitted in a wing cargo tank and $l_{bdg-st-ct}$ is greater than $0.7l_{bdg-st}$, then l_{bdg-st} in the above formula may be

	taken as $l_{bdg-st-ct}$.
M_{vw}	<p>bending moment transferred from the vertical web frame on the longitudinal bulkhead</p> $= c_{vw} \beta_{vw} P_{in-vw} S l_{bdg-vw}^2 \quad \text{kNm}$ <p>where $l_{bdg-vw-ct}$ is greater than $0.7l_{bdg-vw}$, then l_{bdg-vw} in the above formula may be taken as $l_{bdg-vw-ct}$.</p> <p>for vertically corrugated bulkheads, M_{vw} is to be taken equal to bending moment in upper end of corrugation over the spacing between deck transverses</p>
M_0	<p>minimum bending moment</p> $= 0.083 P_{in-dt} S l_{bdg-dt}^2 \quad \text{kNm}$
M_{ex}	<p>design bending moment due to green sea pressure</p> $= 0.067 P_{ex-dt} S l_{bdg-dt}^2 \quad \text{kNm}$
P_{in-dt}	design cargo pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-dt} , of the deck transverse located at mid tank, in kN/m ²
P_{in-st}	corresponding design cargo pressure in wing cargo tank for the design load set being considered, calculated at the mid point of effective bending span, l_{bdg-st} , of the side transverse located at mid tank, in kN/m ²
P_{in-vw}	corresponding design cargo pressure in the centre cargo tank of ships with two longitudinal bulkheads for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-vw} , of the vertical web frame on the longitudinal bulkhead located at mid tank, in kN/m ²
P_{ex-dt}	design green sea pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-dt} , of the deck transverse located at mid tank, in kN/m ²
φ_t	$= 1 - 5 \left(\frac{y_{toe}}{l_{bdg-dt}} \right) \quad \text{but is not to be taken as less than 0.6}$
y_{toe}	distance from the end of effective bending span, l_{bdg-dt} , to the toe of the end bracket of the deck transverse, in m
β_{st}	$= 0.9 \left(\frac{l_{bdg-st}}{l_{bdg-dt}} \right) \left(\frac{I_{dt}}{I_{st}} \right) \quad \text{but is not to be taken as less than 0.10}$ <p>or greater than 0.65</p>
β_{vw}	$= 0.9 \left(\frac{l_{bdg-vw}}{l_{bdg-dt}} \right) \left(\frac{I_{dt}}{I_{vw}} \right) \quad \text{but is not to be taken as less than 0.10}$ <p>or greater than 0.50</p>
S	primary support member spacing, in m, as defined in Section 4/2.2.2
l_{bdg-dt}	effective bending span of the deck transverse, in m, see Section 4/2.1.4 and Figure 8.2.7, but is not to be taken as less than 60% of the breadth of the tank at the location being considered

l_{bdg-st}	effective bending span of the side transverse, in m, between the deck transverse and the bilge hopper, see <i>Section 4/2.1.4</i> and <i>Figure 8.2.7</i>
$l_{bdg-st-ct}$	effective bending span of the side transverse, in m, between the deck transverse and the mid depth of the cross tie, where fitted in wing cargo tank, see <i>Section 4/2.1.4</i>
l_{bdg-vw}	effective bending span of the vertical web frame on the longitudinal bulkhead, in m, between the deck transverse and the bottom structure, see <i>Section 4/2.1.4</i> and <i>Figure 8.2.7</i> .
$l_{bdg-vw-ct}$	effective bending span of the vertical web frame on longitudinal bulkhead, in m, between the deck transverse and the mid depth of the cross tie, see <i>Section 4/2.1.4</i>
I_{dt}	net moment of inertia of the deck transverse with an effective breadth of attached plating specified in <i>Section 4/2.3.2.3</i> , in cm ⁴
I_{st}	net moment of inertia of the side transverse with an effective breadth of attached plating specified in <i>Section 4/2.3.2.3</i> , in cm ⁴
I_{vw}	net moment of inertia of the longitudinal bulkhead vertical web frame with an effective breadth of attached plating specified in <i>Section 4/2.3.2.3</i> , in cm ⁴
c_{st}	as defined in <i>Table 8.2.12</i>
c_{vw}	as defined in <i>Table 8.2.12</i>
C_{s-pr}	permissible bending stress coefficient for primary support member as given in <i>Table 8.2.10</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 8.2.12
Values of c_{st} and c_{vw} for Deck Transverses

Structural Configuration			c_{st}	c_{vw}
Ships with centreline longitudinal bulkhead			0.056	-
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M_{vw} based on $l_{bdg-vw-ct}$	-	0.044
		M_{st} based on l_{bdg-st} or M_{vw} based on l_{bdg-vw}	0.044	0.016
	Cross ties in wing cargo tanks	M_{st} based on $l_{bdg-st-ct}$ or M_{vw} based on $l_{bdg-vw-ct}$	0.044	0.044
		M_{st} based on l_{bdg-st} or M_{vw} based on l_{bdg-vw}	0.041	0.015

2.6.4.4 The net shear area of deck transverses is not to be less than $A_{shr-in-net50}$ and $A_{shr-ex-net50}$ as given by:

$$A_{shr-in-net50} = \frac{10Q_{in}}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

$$A_{shr-ex-net50} = \frac{10Q_{ex}}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q_{in}	design shear force due to cargo pressure $= 0.65 P_{in-dt} S l_{shr} + c_1 D b_{ctr} S \rho g$ kN
Q_{ex}	design shear force due to green sea pressure $= 0.65 P_{ex-dt} S l_{shr}$ kN
P_{in-dt}	design cargo pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-dt} , of the deck transverse located at mid tank, in kN/m ²
P_{ex-dt}	design green sea pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-dt} , of the deck transverse located at mid tank, in kN/m ²
S	primary support member spacing, in m, as defined in <i>Section 4/2.2.2</i>
l_{shr}	effective shear span, of the deck transverse, in m, see <i>Section 4/2.1.5</i>
l_{bdg-dt}	effective bending span of the deck transverse, in m, see <i>Section 4/2.1.4</i> and <i>Figure 8.2.7</i> , but is not to be taken as less than 60% of the breadth of the tank at the location being considered
c_1	$= 0.04$ in way of wing cargo tanks of ships with two longitudinal bulkheads $= 0.00$ in way of centre tank of ships with two longitudinal bulkheads $= 0.00$ for ships with a centreline longitudinal bulkhead
D	moulded depth, in m, as defined in <i>Section 4/1.1.4</i>
b_{ctr}	breadth of the centre tank, in m
ρ	density of liquid in the tank, in tonnes/m ³ , not to be taken less than 1.025, see <i>Section 2/3.1.8</i>
g	acceleration due to gravity, 9.81 m/s ²
C_{t-pr}	permissible shear stress coefficient for primary support member as given in <i>Table 8.2.10</i>
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm ²
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Figure 8.2.7
Definition of Spans of Deck, Side Transverses, Vertical Web Frames on Longitudinal Bulkheads and Horizontal Stringers on Transverse Bulkheads

2.6.5 Side transverses

2.6.5.1 The net shear area, $A_{shr-net50}$, of side transverses is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force as follows, in kN:

	$= Q_u$ for upper part of the side transverse $= Q_l$ for lower part of the side transverse
Q_u	$= S [c_u l_{st} (P_u + P_l) - h_u P_u]$ where a cross tie is fitted in a wing cargo tank and l_{st-ct} is greater than $0.7l_{st}$, then l_{st} in the above formula is to be taken as l_{st-ct} .
Q_l	to be taken as the greater of the following: (a) $S [c_l l_{st} (P_u + P_l) - h_l P_l]$ (b) $0.35 c_l S l_{st} (P_u + P_l)$ (c) $1.2 Q_u$ where a cross tie is fitted in a wing cargo tank and l_{st-ct} is greater than $0.7l_{st}$, then l_{st} in the above formula is to be taken as l_{st-ct} .
P_u	design pressure for the design load set being considered, in kN/m^2 , calculated at mid tank as follows: (a) where deck transverses are fitted below deck, P_u is to be calculated at mid height of upper bracket of the side transverse, h_u (b) where deck transverses are fitted above deck, P_u is to be calculated at the elevation of the deck at side, except in cases where item (c) applies (c) where deck transverses are fitted above deck and the inner hull longitudinal bulkhead is arranged with a top wing structure as follows: <ul style="list-style-type: none"> • the breadth at top of the wing structure is greater than 1.5 times the breadth of the double side and • the angle along a line between the point at base of the slope plate at its intersection with the inner hull longitudinal bulkhead and the point at the intersection of top wing structure and deck is 30 degrees or more to vertical P_u is to be calculated at mid depth of the top wing structure
P_l	corresponding design pressure for the design load set being considered, calculated at mid height of bilge hopper, h_l , located at mid tank, in kN/m^2 .
l_{st}	length of the side transverse, in m, and is to be taken as follows: (a) where deck transverses are fitted below deck, l_{st} is the length between the flange of the deck transverse and the inner bottom, see <i>Figure 8.2.7</i> (b) where deck transverses are fitted above deck, l_{st} is the length between the elevation of the deck at side and the inner bottom
l_{st-ct}	length of the side transverse, in m, and is to be taken as follows:

	(a) where deck transverses are fitted below deck, l_{st} is the length between the flange of the deck transverse and mid depth of cross tie, where fitted in wing cargo tank
	(b) where deck transverses are fitted above deck, l_{st} is the length between the elevation of the deck at side and mid depth of the cross tie, where fitted in wing cargo tank
S	primary support member spacing, in m, as defined in <i>Section 4/2.2.2</i>
h_u	effective length of upper bracket of the side transverse, in m, and is to be taken as follows: <ul style="list-style-type: none"> (a) where deck transverses are fitted below deck, h_u is as shown in Figure 8.2.7 and as described in <i>Section 4/2.1.5</i>. (b) where deck transverses are fitted above deck, h_u is to be taken as 0.0, except in cases where item (c) applies. (c) where deck transverses are fitted above deck and the inner hull longitudinal bulkhead is arranged with a top wing structure as follows: <ul style="list-style-type: none"> • the breadth at top of the wing structure is greater than 1.5 times the breadth of the double side, and • the angle along a line between the point at base of the slope plate at its intersection with the inner hull longitudinal bulkhead and the point at the intersection of top wing structure and the deck is 30 degrees or more to vertical <p>h_u is to be taken as the distance between the deck at side and the lower end of slope plate of the top wing structure.</p>
h_l	height of bilge hopper, in m, as shown in <i>Figure 8.2.7</i>
c_u and c_l	as defined in <i>Table 8.2.13</i>
C_{t-pr}	permissible shear stress coefficient for primary support member as given in <i>Table 8.2.10</i>
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 8.2.13 Values of c_u and c_l for Side Transverses						
Structural Configuration			c_u		c_l	
Number of side stringers			Less than three	Equal to or greater than three	Less than three	Equal to or greater than three
Ships with a centreline longitudinal bulkhead			0.12	0.09	0.29	0.21
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank					
	Cross ties in wing cargo tanks	Q_u or Q_l based on l_{st-ct}				
		Q_u or Q_l based on l_{st}	0.08	0.20		

2.6.5.2 The shear area over the length of the side transverse is to comply with the following:

- the required shear area for the upper part is to be maintained over the upper $0.2 l_{shr}$
- the required shear area for the lower part is to be maintained over the lower $0.2 l_{shr}$
- where Q_u and Q_l are determined based on l_{st-ct} , the required shear area for the lower part is also to be maintained below the cross tie
- for ships without cross ties in the wing cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid span
- for ships with cross ties in the wing cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts

Note

When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress

Where:

l_{shr} effective shear span of the side transverse, in m
 $= l_{st} - h_u - h_l$ where Q_u and Q_l are determined based on l_{st}
 $= l_{st-ct} - h_u$ where Q_u and Q_l are determined based on l_{st-ct}
 l_{st} , l_{st-ct} , h_u , h_l , Q_u and Q_l as defined in 2.6.5.1

2.6.6 Vertical web frames on longitudinal bulkhead

2.6.6.1 The web depth of the vertical web frame on the longitudinal bulkhead is not to be less than:

- $0.14 l_{bdg-vw}$ for ships with a centreline longitudinal bulkhead
- $0.09 l_{bdg-vw}$ for ships with two longitudinal bulkheads
- see also 2.6.1.7

Where:

l_{bdg-vw} effective bending span of the vertical web frame on the longitudinal bulkhead, see 2.6.6.2 and Figure 8.2.7

2.6.6.2 The net section modulus, Z_{net50} , of the vertical web frame is not to be less than:

$$Z_{net50} = \frac{1000 M}{C_{s-pr} \sigma_{yd}} \quad \text{cm}^3$$

Where:

M design bending moment, in kNm, as follows:

$$= c_u P S l_{bdg-vw}^2 \quad \text{for upper part of the web frame}$$

$$= c_l P S l_{bdg-vw}^2 \quad \text{for lower part of the web frame}$$

where a cross tie is fitted and $l_{bdg-vw-ct}$ is greater than $0.7l_{bdg-vw}$, then l_{bdg-vw} in the above formula is to be taken as $l_{bdg-vw-ct}$.

P design pressure for the design load set being considered, calculated at mid point of the effective bending span, l_{bdg-vw} , of the vertical web frame located at mid tank, in kN/m²

l_{bdg-vw} effective bending span of the vertical web frame on the longitudinal bulkhead, between the deck transverse and the bottom structure, in m, see Section 4/2.1.4 and Figure 8.2.7.

$l_{bdg-vw-ct}$ effective bending span of the vertical web frame on longitudinal bulkhead, between the deck transverse and mid depth of the cross tie on ships with two longitudinal bulkheads, in m, see Section 4/2.1.4

S primary support member spacing, in m, as defined in Section 4/2.2.2

C_{s-pr} permissible bending stress coefficient as given in Table 8.2.10

σ_{yd} specified minimum yield stress of the material, in N/mm²

c_u and c_l as defined in Table 8.2.14

Table 8.2.14 Values of c_u and c_l for Vertical Web Frame on Longitudinal Bulkheads				
Structural Configuration			c_u	c_l
Ships with a centreline longitudinal bulkhead			0.057	0.071
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M based on $l_{bdg-vw-ct}$	0.057	0.071
		M based on l_{bdg-vw}	0.012	0.028
	Cross ties in wing cargo tanks	M based on $l_{bdg-vw-ct}$	0.057	0.071
		M based on l_{bdg-vw}	0.016	0.032

2.6.6.3 The section modulus over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following:

- the required section modulus for the upper part is to be maintained over the upper $0.2 l_{bdg-vw}$ or $0.2 l_{bdg-vw-ct}$, as applicable
- the required section modulus for the lower part is to be maintained over the lower $0.2 l_{bdg-vw}$ or $0.2 l_{bdg-vw-ct}$, as applicable

- (c) where the required section modulus is determined based on $l_{bdg-vw-ct}$, the required section modulus for the lower part is also to be maintained below the cross tie
- (d) the required section modulus between the upper and lower parts is to be reduced linearly to 70% of the required section modulus for the lower part at mid span

Note

When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

Where:

l_{bdg-vw} and $l_{bdg-vw-ct}$ as defined in 2.6.6.2

2.6.6.4 The net shear area, $A_{shr-net50}$, of the vertical web frame is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force as follows, in kN:
 $= Q_u$ for upper part of the web frame
 $= Q_l$ for lower part of the web frame

$$Q_u = S [c_u l_{vw} (P_u + P_l) - h_u P_u]$$

where a cross tie is fitted in a centre or wing cargo tank and l_{vw-ct} is greater than $0.7l_{vw}$, then l_{vw} in the above formula is to be taken as l_{vw-ct} .

Q_l to be taken as the greater of the following:

$$(a) S[c_l l_{vw} (P_u + P_l) - h_l P_l]$$

$$(b) c_w S c_l l_{vw} (P_u + P_l)$$

$$(c) 1.2 Q_u$$

where a cross tie is fitted in a centre or wing cargo tank and l_{vw-ct} is greater than $0.7l_{vw}$, then l_{vw} in the above formula is to be taken as l_{vw-ct} .

P_u design pressure for the design load set being considered, calculated at mid height of upper bracket of the vertical web frame, h_u , located at mid tank, in kN/m²

P_l design pressure for the design load set being considered, calculated at mid height of lower bracket of the vertical web frame, h_l , located at mid tank, in kN/m²

l_{vw} length of the vertical web frame, in m, between the flange of the deck transverse and the inner bottom, see Figure 8.2.7

l_{vw-ct} length of the vertical web frame, in m, between the flange of the deck transverse and mid depth of the cross tie, where fitted

S primary support member spacing, in m, as defined in Section 4/2.2.2

h_u effective length of upper bracket of the vertical web frame, in m, as shown in Figure 8.2.7 and as described in Section 4/2.1.5

h_l effective length of lower bracket of the vertical web frame, in m,

as shown in *Figure 8.2.7* and as described in *Section 4/2.1.5*

c_u and c_l as defined in *Table 8.2.15*

c_w 0.57 for ships with a centreline longitudinal bulkhead
0.50 for ships with two longitudinal bulkheads

C_{t-pr} permissible shear stress coefficient for primary support member
as given in *Table 8.2.10*

$$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.2.15 Values of c_u and c_l for Vertical Web Frame on Longitudinal Bulkhead			
Structural Configuration		c_u	c_l
Ships with a centreline longitudinal bulkhead		0.17	0.28
Ships with two longitudinal bulkheads	Q_u or Q_l based on l_{vw-ct}		
	Q_u or Q_l based on l_{vw}	0.075	0.18

2.6.6.5 The shear area over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following:

- the required shear area for the upper part is to be maintained over the upper $0.2l_{shr}$
- the required shear area for the lower part is to be maintained over the lower $0.2l_{shr}$
- where Q_u and Q_l are determined based on l_{vw-ct} , the required shear area for the lower part is also to be maintained below the cross tie
- for ships without cross ties in the wing or centre cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid span
- for ships with cross ties in the wing or centre cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts

Note

When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

Where:

l_{shr} effective shear span of the side transverse
 $= l_{vw} - h_u - h_l$ where Q_u and Q_l are determined based on l_{vw}
 $= l_{vw-ct} - h_u$ where Q_u and Q_l are determined based on l_{vw-ct}

l_{vw} , l_{vw-ct} , h_u , h_l , Q_u and Q_l as defined in 2.6.6.4

2.6.7 Horizontal stringers on transverse bulkheads

2.6.7.1 The web depth of horizontal stringers on transverse bulkhead is not to be less than:

- (a) $0.28 l_{bdg-hs}$ for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads
- (b) $0.20 l_{bdg-hs}$ for horizontal stringers in centre tanks of ships with two longitudinal bulkheads, but the web depth of horizontal stringers in centre tank is not to be less than required depth for a horizontal stringer in wing cargo tanks
- (c) $0.20 l_{bdg-hs}$ for horizontal stringers of ships with a centreline longitudinal bulkhead
- (d) see also 2.6.1.7.

Where:

l_{bdg-hs} effective bending span of the horizontal stringer, in m, but is not to be taken as less than 50% of the breadth of the tank at the location being considered, see *Section 4/2.1.4* and *Figure 8.2.7*

2.6.7.2 The net section modulus, Z_{net50} , of the horizontal stringer over the end $0.2l_{bdg-hs}$ is not to be less than:

$$Z_{net50} = \frac{1000 M}{C_{s-pr} \sigma_{yd}} \quad \text{cm}^3$$

Where:

M design bending moment:

$$= c P S l_{bdg-hs}^2 \quad \text{kNm}$$

P design pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-hs} , and at mid point of the spacing, S , of the horizontal stringer, in kN/m²

S sum of the half spacing (distance between stringers) on each side of the horizontal stringer under consideration, in m

l_{bdg-hs} effective bending span of the horizontal stringer, in m, but is not to be taken as less than 50% of the breadth of the tank at the location being considered, see *Section 4/2.1.4* and *Figure 8.2.7*

c

- 0.073 for horizontal stringers in cargo tanks of ships with a centreline bulkhead
- 0.083 for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads
- 0.063 for horizontal stringers in the centre tank of ships with two longitudinal bulkheads

C_{s-pr} permissible bending stress coefficient as given in *Table 8.2.10*

σ_{yd} specified minimum yield stress of the material, in N/mm²

2.6.7.3 The required section modulus at mid effective bending span is to be taken as 70% of that required at the ends, intermediate values are to be obtained by linear

interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

- 2.6.7.4 The net shear area, $A_{shr-net50}$, of the horizontal stringer over the end $0.2 l_{shr}$ is not to be less than:

$$A_{shr-net50} = \frac{10Q}{C_{t-pr} \tau_{yd}} \quad \text{cm}^2$$

Where:

Q design shear force
 $= 0.5 P S l_{shr} \quad \text{kN}$

P design pressure for the design load set being considered, calculated at mid point of effective bending span, l_{bdg-hs} , and at mid point of the spacing, S , of the horizontal stringer, in kN/m^2

S sum of the half spacing (distance between stringers), on each side of the horizontal stringer under consideration, in m

l_{shr} effective shear span of the horizontal stringer, in m, see Section 4/2.1.5

C_{t-pr} permissible shear stress coefficient as given in Table 8.2.10

$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$

σ_{yd} specified minimum yield stress of the material, in N/mm^2

- 2.6.7.5 The required shear area at mid effective shear span is to be taken as 50% of that required in the ends, intermediate values are to be obtained by linear interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

2.6.8 Cross ties

- 2.6.8.1 The maximum applied design axial load on cross ties, W_{ct} , is to be less than or equal to the permissible load, $W_{ct-perm}$, as given by:

$$W_{ct} \leq W_{ct-perm}$$

Where:

W_{ct} applied axial load
 $= P b_{ct} S \quad \text{kN}$

$W_{ct-perm}$ permissible load
 $= 0.1 A_{ct-net50} \eta_{ct} \sigma_{cr} \quad \text{kN}$

P maximum design pressure for all the applicable design load sets being considered, calculated at centre of the area supported by the cross tie located at mid tank, in kN/m^2

b_{ct} where cross tie is fitted in centre cargo tank:
 $= 0.5 l_{bdg-vw}$
 where cross ties are fitted in wing cargo tanks:
 $= 0.5 l_{bdg-vw}, \quad \text{for design cargo pressure from the centre cargo}$

	tank
	$= 0.5 l_{bdg-st}$ for design sea pressure
l_{bdg-vw}	effective bending span of the vertical web frame on the longitudinal bulkhead, in m, see <i>Section 4/2.1.4</i> and <i>Figure 8.2.7</i> .
l_{bdg-st}	effective bending span of the side transverse, in m, see <i>Section 4/2.1</i> and <i>Figure 8.2.7</i> .
S	primary support member spacing, in m, as defined in <i>Section 4/2.2.2</i>
η_{ct}	utilisation factor, to be taken as: $= 0.65$ for acceptance criteria set AC1 $= 0.75$ for acceptance criteria set AC2 <i>RCN 1 (effective from 1 July 2009)</i>
σ_{cr}	critical buckling stress in compression of the cross tie, in N/mm ² , as calculated using the net sectional properties in accordance with <i>Section 10/3.5.1</i> , where the effective length of the cross tie is to be taken as follows, in m: (a) for cross tie in centre tank: distance between the flanges of longitudinal stiffeners on the starboard and port longitudinal bulkheads to which the cross tie's horizontal stiffeners are attached (b) for cross tie in wing tank: distance between the flanges of longitudinal stiffeners on the longitudinal bulkhead to which the cross tie's horizontal stiffeners are attached, and the inner hull plating
$A_{ct-net50}$	net cross sectional area of the cross tie, in cm ²

2.6.8.2 Special attention is to be paid to the adequacy of the welded connections for the transmission of the forces, and also to the stiffening arrangements, in order to provide effective means for transmission of the compressive forces into the webs. Particular attention is to be paid to the welding at the toes of all end brackets of the cross ties.

2.6.8.3 Horizontal stiffeners are to be located in line with, and attached to, the longitudinals at the ends of the cross ties.

2.6.9 Primary support members located beyond 0.4L amidships

2.6.9.1 If a cargo tank FE analysis is not available for the region outside of 0.4L amidships, the requirements given in 2.6.9.2 and 2.6.9.3 may be used to obtain the scantlings of primary support members located beyond 0.4L of amidships. Scantlings used for the 0.4L amidships are to be those required by *Sections 8/2* and *Section 9/2*, see 2.6.1.3 and 2.6.1.4.

2.6.9.2 The net section modulus of primary support members, $Z_{end-net50}$, located beyond 0.4L of amidships is not to be less than:

$$Z_{end-net50} = \frac{Z_{mid-net50} \sigma_{yd-mid} M_{end}}{\sigma_{yd-end} M_{mid}} \quad \text{cm}^3$$

Where:

M_{end}	bending moment, in kNm, for the structural member under consideration located beyond $0.4L$ amidships, calculated in accordance with corresponding requirements of 2.6.3 to 2.6.8 and using the design pressure specified for the given location
M_{mid}	bending moment, in kNm, for the corresponding structural member and location of cross section, amidships, obtained from the corresponding requirements of 2.6.2 to 2.6.8
$Z_{mid-net50}$	net section modulus at the flange of the corresponding structural member and location of cross section amidships, in cm^3
σ_{yd-end}	specified minimum yield stress of the flange of the structural member under consideration located beyond $0.4L$ amidships, in N/mm^2
σ_{yd-mid}	specified minimum yield stress of the flange of the structural member under consideration amidships, in N/mm^2

2.6.9.3 The net shear area for primary support members, $A_{shr-end-net50}$, located beyond $0.4L$ amidships is not to be less than:

$$A_{shr-end-net50} = \frac{A_{shr-mid-net50} \tau_{yd-mid} Q_{end}}{\tau_{yd-end} Q_{mid}} \quad \text{cm}^2$$

Where:

Q_{end}	shear force, in kN, for the structural member under consideration located beyond $0.4L$ of amidships, calculated in accordance with the corresponding requirements of 2.6.3 to 2.6.8 and using the design pressure, specified for the given location
Q_{mid}	shear force, in kN, for the corresponding structural member and corresponding location of cross section, amidships, obtained from the requirements of 2.6.2 to 2.6.8
$A_{shr-mid-net50}$	shear area of corresponding structural member and location of cross section amidships, in cm^2
τ_{yd-end}	$= \frac{\sigma_{yd-end}}{\sqrt{3}}$
τ_{yd-mid}	$= \frac{\sigma_{yd-mid}}{\sqrt{3}}$
σ_{yd-end}	specified minimum yield stress of the structural member under consideration located beyond $0.4L$ amidships, in N/mm^2
σ_{yd-mid}	specified minimum yield stress of the structural member under consideration amidships, in N/mm^2

3 FORWARD OF THE FORWARD CARGO TANK

3.1 General

3.1.1 Application

- 3.1.1.1 The requirements of this Sub-Section apply to structure forward of the forward end of the foremost cargo tank. Where the forward end of the foremost cargo tank is aft of $0.1L$ of the ship's length, measured from the F.P., special consideration will be given to the applicability of these requirements and the requirements of *Section 8/2*.
- 3.1.1.2 The net scantlings described in this Sub-Section are related to gross scantlings as follows:
- (a) for application of the minimum thickness requirements of 3.1.4, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.
 - (b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*
 - (c) for primary support members, the gross shear area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion additions specified in *Section 6/3*
 - (d) for application of buckling requirements of *Section 10/2* the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

3.1.2 General scantling requirements

- 3.1.2.1 The hull structure is to comply with the applicable requirements of:
- (a) hull girder longitudinal strength, see *Section 8/1*
 - (b) strength against sloshing and impact loads, see *Section 8/6*
 - (c) buckling/ultimate strength, see *Section 10*.
- 3.1.2.2 The deck plating thickness and supporting structure are to be suitably reinforced in way of the anchor windlass and other deck machinery, and in way of cranes, masts and derrick posts. See *Section 11/3*.
- 3.1.2.3 The net section modulus, shear area and other sectional properties of local and primary support members are to be determined in accordance with *Section 4/2*.
- 3.1.2.4 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support members are to be applied as required in the notes to *Table 8.3.5*.
- 3.1.2.5 The scantling criteria are based on assumptions that all structural joints and welded details are designed and fabricated such that they are compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details during the design of highly stressed regions are to be considered. Structural design details are to comply with the requirements in *Section 4/3*.
- 3.1.2.6 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure free flow to the suction pipes and the escape of air to the vents.

Arrangements are to be made for draining the spaces above deep tanks. See also *Section 4/3*.

- 3.1.2.7 Web stiffeners are to be fitted on primary support members at each longitudinal on the side and bottom shell. Alternative arrangements may be accepted where adequacy of stiffener end connections and strength of adjoining web and bulkhead plating is demonstrated.

3.1.3 Structural continuity

- 3.1.3.1 Scantlings of the shell envelope, upper deck and inner bottom are to be tapered towards the forward end. See also 1.6.
- 3.1.3.2 In the transition zone aft of the fore peak into the forward cargo tank, due consideration is to be given to the arrangement of major longitudinal members in order to avoid abrupt changes in section. Structures within the fore peak, such as flats, decks, horizontal ring frames or side stringers, are to be scarphed effectively into the structure aft into the cargo tank. Where such structures are in line with longitudinal members aft of the forward cargo tank bulkhead fitting of tapered transition brackets may be used.
- 3.1.3.3 Where inner hull or longitudinal bulkhead structures terminate at the forward bulkhead of the forward cargo tank, adequate backing structure is to be provided together with tapering brackets to ensure continuity of strength.
- 3.1.3.4 Longitudinal framing of the strength deck is to be carried as far forward as practicable.
- 3.1.3.5 All shell frames and tank boundary stiffeners are to be continuous, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4* and *4/3.2.5*.

3.1.4 Minimum thickness

- 3.1.4.1 In addition to the thickness, section modulus and stiffener web shear area requirements as given in this Sub-Section, the thickness of plating and stiffeners in the forward region are to comply with the appropriate minimum thickness requirements given in *Table 8.3.1*.

3.2 Bottom Structure

3.2.1 Plate keel

- 3.2.1.1 A flat plate keel is to extend as far forward as practical and is to satisfy the scantling requirements given in 2.2.1.

3.2.2 Bottom shell plating

- 3.2.2.1 The thickness of the bottom shell plating is to comply with the requirements in 3.9.2.1.

3.2.3 Bottom longitudinals

- 3.2.3.1 Bottom longitudinals are to be carried as far forward as practicable. Beyond this, suitably stiffened frames are to be fitted.
- 3.2.3.2 The section modulus and thickness of the bottom longitudinals are to comply with the requirements in 3.9.2.2 and 3.9.2.3.

Table 8.3.1			
Minimum Net Thickness of Structure Forward of the Forward Cargo Tank			
Scantling Location			Net Thickness (mm)
Plating	Shell	Keel plating	See 2.1.5.1
		Bottom shell/bilge/side shell plating	See 2.1.5.1
	Upper Deck		See 2.1.5.1
	Other structure	Hull internal tank boundaries	See 2.1.5.1
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	See 2.1.5.1
		Pillar bulkheads	7.5
		Breasthooks	6.5
Floors and bottom girders			5.5 + 0.02L ₂
Web plating of primary support members			6.5 + 0.015L ₂
Local support members			See 2.1.5.1
Tripping brackets			See 2.1.5.1
Where:			
L ₂	rule length, <i>L</i> , in m, as defined in Section 4/1.1.1.1, but need not be taken greater than 300m		

RCN 1 (effective from 1 July 2009)

3.2.4 Bottom floors

- 3.2.4.1 Bottom floors are to be fitted at each web frame location. The minimum depth of the floor at the centreline is to be not to be less than the required depth of the double bottom of the cargo tank region. See Section 5/3.2.1.1.

3.2.5 Bottom girders

- 3.2.5.1 A supporting structure is to be provided at the centreline either by extending the centreline girder to the stem or by providing a deep girder or centreline bulkhead.
- 3.2.5.2 Where a centreline girder is fitted, the minimum depth and thickness is not to be less than that required for the depth of the double bottom in the cargo tank region, and the upper edge is to be stiffened. Where a centreline wash bulkhead is fitted, the lowest strake is to have thickness not less than required for a centreline girder.
- 3.2.5.3 Where a longitudinal wash bulkhead supports bottom transverses, the details and arrangements of openings in the bulkhead are to be configured to avoid areas of high stresses in way of the connection of the wash bulkhead with bottom transverses.

3.2.6 Plate stems

- 3.2.6.1 Plate stems are to be supported by stringers and flats, and by intermediate breasthook diaphragms spaced not more than 1500mm apart, measured along the stem. Where the stem radius is large, a centreline support structure is to be fitted.
- 3.2.6.2 Between the minimum design ballast draught, T_{bal} at the stem and the scantling draught, T_{sc} , the plate stem net thickness, $t_{stem-net}$, is not to be less than:

$$t_{stem-net} = \frac{L_2 \sqrt{\frac{235}{\sigma_{yd}}}}{12} \quad \text{mm, but need not be taken as greater than 21mm}$$

Where:

L_2 rule length, L , in m, as defined in *Section 4/1.1.1.1*, but need not be taken greater than 300m

σ_{yd} specified minimum yield stress of the material, in N/mm²

Above the scantling draught the thickness of the stem plate may be tapered to the requirements for the shell plating at the upper deck.

Below the minimum design ballast draught the thickness of the stem plate may be tapered to the requirements for the plate keel.

3.2.7 Floors and girders in spaces aft of the collision bulkhead

- 3.2.7.1 Floors and girders which are aft of the collision bulkhead and forward of the forward cargo tank, are to comply with the requirements in 3.2.4 and 3.2.5 and are to comply with the shear area requirements in 3.9.3.3.

3.3 Side Structure

3.3.1 Side shell plating

- 3.3.1.1 The thickness of the side shell plating is to comply with the requirements in 3.9.2.1. Where applicable, the thickness of the side shell plating is to comply with the requirements in 2.2.4.2.
- 3.3.1.2 Where a forecastle is fitted, the side shell plating requirements are to be applied to the plating extending to the forecastle deck elevation.

3.3.2 Side shell local support members

- 3.3.2.1 Longitudinal framing of the side shell is to be carried as far forward as practicable.
- 3.3.2.2 The section modulus and thickness of the hull envelope framing is to comply with the requirements in 3.9.2.2 and 3.9.2.3.
- 3.3.2.3 End connections of longitudinals at transverse bulkheads are to provide adequate fixity, lateral support, and where not continuous are to be provided with soft-nosed brackets. Brackets lapped onto the longitudinals are not to be used.

3.3.3 Side shell primary support structure

- 3.3.3.1 In general, the spacing of web frames, S as defined in *Section 4/2.2.2*, is to be taken as:

$$S = 2.6 + 0.005L_2 \quad \text{m, but not to be taken greater than 3.5m}$$

Where:

L_2 rule length, L , as defined in *Section 4/1.1.1.1*, but is not to be taken greater than 300m

- 3.3.3.2 In general, the transverse framing forward of the collision bulkhead stringers are to be spaced approximately 3.5m apart. Stringers are to have an effective span not greater than 10m, and are to be adequately supported by web frame structures. Aft of the collision bulkhead, where transverse framing is adopted, the spacing of stringers may be increased.

- 3.3.3.3 Perforated flats are to be fitted to limit the effective span of web frames to not greater than 10m.
- 3.3.3.4 The scantlings of web frames supporting longitudinal frames, and stringers and/or web frames supporting transverse frames in the forward region are to be determined from 3.9.3, with the following additional requirements:
- (a) where no cross ties are fitted:
 - the required section modulus of the web frame is to be maintained for 60% of the effective span for bending, measured from the lower end. The value of the bending moment used for calculation of the required section modulus of the remainder of the web frame may be appropriately reduced, but not greater than 20%
 - the required shear area of the lower part of the web frame is to be maintained for 60% of the shear span measured from the lower end.
 - (b) where one cross tie is fitted:
 - the effective spans for bending and shear of a web frame or stringer are to be taken ignoring the presence of the cross tie. The shear forces and bending moments may be reduced to 50% of the values that are calculated ignoring the presence of the cross ties. For a web frame, the required section modulus and shear area of the lower part of the web frame is to be maintained up to the cross tie, and the required section modulus and shear area of the upper part of the web frame is to be maintained for the section above the cross tie
 - cross ties are to satisfy the requirements of 2.6.8 using the design loads specified in *Table 8.3.8*.
 - (c) configurations with multiple cross ties are to be specially considered, in accordance with 3.3.3.4(d)
 - (d) where complex grillage structures are employed the suitability of the scantlings of the primary support members is to be determined by more advanced calculation methods.
- 3.3.3.5 The web depth of primary support members is not to be less than 14% of the bending span and is to be at least 2.5 times as deep as the slots for stiffeners if the slots are not closed.

3.4 Deck Structure

3.4.1 Deck plating

- 3.4.1.1 The thickness of the deck plating is to comply with the requirements in 3.9.2.1 with the applicable lateral pressure, green sea and deck loads.
- 3.4.1.2 (void)

RCN 1 (effective from 1 July 2009)

3.4.2 Deck stiffeners

- 3.4.2.1 The section modulus and thickness of deck stiffeners are to comply with the requirements in 3.9.2.2 and 3.9.2.3, with the applicable lateral pressure, green sea and deck loads.

3.4.3 Deck primary support structure

- 3.4.3.1 The section modulus and shear area of primary support members are to comply with the requirements in 3.9.3.

- 3.4.3.2 The web depth of primary support members is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is bending span as defined in *Section 4/2.1.4* or in case of a grillage structure, the distance between connections to other primary support members.

RCN 1 (effective from 1 July 2009)

- 3.4.3.3 In way of concentrated loads from heavy equipment, the scantlings of the deck structure are to be determined based on the actual loading. See also *Section 11/3*.

3.4.4 Pillars

- 3.4.4.1 Pillars are to be fitted in the same vertical line wherever possible and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.
- 3.4.4.2 Tubular and hollow square pillars are to be attached at their heads and heels by efficient brackets or doublers/insert plates, where applicable, to transmit the load effectively. Pillars are to be attached at their heads and heels by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be distributed by brackets or other equivalent means.
- 3.4.4.3 Pillars in tanks are to be of solid section. Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45% of the specified minimum yield stress of the material.
- 3.4.4.4 The scantlings of pillars are to comply with the requirements in 3.9.5.
- 3.4.4.5 Where the loads from heavy equipment exceed the design load of 3.9.5, the pillar scantlings are to be determined based on the actual loading.

3.5 Tank Bulkheads

3.5.1 General

- 3.5.1.1 Tanks may be required to have divisions or deep wash plates in order to minimise the dynamic stress on the structure.

3.5.2 Construction

- 3.5.2.1 In no case are the scantlings of tank boundary bulkheads to be less than the requirements for watertight bulkheads.

3.5.3 Scantlings of tank boundary bulkheads

- 3.5.3.1 The thickness of tank boundary plating is to comply with the requirements in 3.9.2.1.
- 3.5.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in 3.9.2.2 and 3.9.2.3.
- 3.5.3.3 The section modulus and shear area of primary support members are to comply with the requirements in 3.9.3.
- 3.5.3.4 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending, and is not to be less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 (effective from 1 July 2009)

- 3.5.3.5 Scantlings of corrugated bulkheads are to comply with the requirements in 3.9.4.

3.6 Watertight Boundaries

3.6.1 General

3.6.1.1 Watertight boundaries are to be fitted in accordance with *Section 5/2*.

3.6.2 Collision bulkhead

3.6.2.1 The scantlings of structural components of the collision bulkheads are to comply with the requirements in 3.6.3, as applicable. Additionally, the collision bulkhead is to comply with the requirements in 3.6.2.2 to 3.6.2.4.

3.6.2.2 The position of the collision bulkhead is to be in accordance with *Section 5/2.2*.

3.6.2.3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck. Where the collision bulkhead is extended above the freeboard deck, the number of openings in the extension is to be kept to a minimum compatible with the design and proper working of the ship. The openings are to be fitted with weathertight closing appliances. The collision bulkhead may be pierced by pipes necessary for dealing with the contents of tanks forward of the bulkhead, provided the pipes are fitted with valves capable of being operated from above the freeboard deck. The valves are generally to be fitted on the collision bulkhead inside the fore peak and are not to be fitted inside the cargo tank.

3.6.2.4 Compartments forward of the collision bulkhead may not be arranged for the carriage of flammable liquids.

3.6.3 Scantlings of watertight boundaries

3.6.3.1 The thickness of boundary plating is to comply with the requirements in 3.9.2.1.

3.6.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in 3.9.2.2 and 3.9.2.3.

3.6.3.3 The section modulus and shear area of primary support members are to comply with the requirements in 3.9.3.

3.6.3.4 Web plating of primary support members is to have a depth of not less than 10% of the unsupported span in bending, and is not to be less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 (effective from 1 July 2009)

3.6.3.5 Scantlings of corrugated bulkheads are to comply with the requirements in 3.9.4.

3.7 Superstructure

3.7.1 Forecastle structure

3.7.1.1 Forecastle structures are to be supported by girders with deep beams and web frames, and in general, arranged in complete transverse belts and supported by lines of pillars extending down into the structure below. Deep beams and girders are to be arranged, where practicable, to limit the spacing between deep beams, web frames, and/or girders to about 3.5m. Pillars are to be provided as required by 3.4.4. Main structural intersections are to be carefully developed with special attention given to pillar head and heel connections, and to the avoidance of stress concentrations.

3.7.2 Forecastle end bulkhead

- 3.7.2.1 The details and scantlings of the forecastle end bulkhead are to meet the requirements of *Section 11/1.4*.

3.8 Miscellaneous Structures

3.8.1 Pillar bulkheads

- 3.8.1.1 Bulkheads that support girders, or pillars and longitudinal bulkheads which are fitted in lieu of girders, are to be stiffened to provide supports not less effective than required for stanchions or pillars. The acting load and the required net cross sectional area of the pillar section are to be determined using the requirements of 3.4.4. The net moment of inertia of the stiffener is to be calculated with a width of $40t_{net}$, where t_{net} is the net thickness of plating, in mm.
- 3.8.1.2 Pillar bulkheads are to comply with the following requirements:
- (a) the distance between bulkhead stiffeners is not to exceed 1500mm
 - (b) where corrugated, the depth of the corrugation is not to be less than 100mm.

3.8.2 Bulbous bow

- 3.8.2.1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.
- 3.8.2.2 At the forward end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1m apart in conjunction with a deep centreline web.
- 3.8.2.3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.
- 3.8.2.4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.
- 3.8.2.5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames is to be fitted.
- 3.8.2.6 The shell plating is to be increased in thickness at the forward end of the bulb and also in areas likely to be subjected to contact with anchors and chain cables during anchor handling. The increased plate thickness is to be the same as that required for plated stems given in 3.2.6.

3.8.3 Chain lockers

- 3.8.3.1 Chain lockers are to meet the requirements of *Section 11/4.2.9*.

3.8.4 Bow thruster tunnels

- 3.8.4.1 The net thickness of the tunnel plating, $t_{tun-net}$, is not to be less than as required for the shell plating in the vicinity of the bow thruster. In addition, $t_{tun-net}$ is not to be taken less than:

$$t_{tun-net} = 0.008d_{tun} + 1.8 \quad \text{mm}$$

Where:

d_{tun} inside diameter of the tunnel, in mm, but not to be taken less than 970mm

3.8.4.2 Where the outboard ends of the tunnel are provided with bars or grids, the bars or grids are to be effectively secured.

3.9 Scantling Requirements

3.9.1 General

3.9.1.1 The design load sets are to be applied to the structural requirements for the local support and primary support members as given in *Table 8.3.8*. The static and dynamic load components are to be combined in accordance with *Table 7.6.1* and the procedure given in *Section 7/6.3*.

3.9.2 Plating and local support members

3.9.2.1 For plating subjected to lateral pressure, the net plating thickness, t_{net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$t_{net} = 0.0158 \alpha_p s \sqrt{\frac{|P|}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$$= 1.2 - \frac{s}{2100l_p}, \text{ but not to be greater than } 1.0$$

P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.1.2*, in kN/m²

s stiffener spacing, in mm, as defined in *Section 4/2.2*

l_p length of plate panel, to be taken as the spacing of primary support members, unless carlings are fitted, in m

C_a permissible bending stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.2*

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.2 Permissible Bending Stress Coefficient for Plating		
Acceptance criteria set	Structural member	C_a
AC1	All plating	0.80
AC2	Hull envelope plating	0.95
	Internal boundary plating ⁽¹⁾	1.00
<u>Note</u> 1. Collision bulkhead plating is to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1		

3.9.2.2 For stiffeners subjected to lateral pressure, the net section modulus, Z_{net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$Z_{net} = \frac{|P| s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

- P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²
- s stiffener spacing, in mm, as defined in *Section 4/2.2*
- l_{bdg} effective bending span, as defined in *Section 4/2.1.1*, in m
- f_{bdg} bending moment factor:
for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having fixed ends:
12 for horizontal stiffeners
10 for vertical stiffeners
for other configurations the bending moment factor may be taken as in *Table 8.3.5*.
- C_s permissible bending stress coefficient for the acceptance criteria set being considered, as given in *Table 8.3.3*
- σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.3 Permissible Bending Stress Coefficient for Stiffeners		
Acceptance criteria set	Structural member	C_s
AC1	All stiffeners	0.75
AC2	All stiffeners ⁽¹⁾	0.90
<u>Note</u> 1. Collision bulkhead stiffeners are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1		

3.9.2.3 For stiffeners subjected to lateral pressure, the net web thickness based on shear area requirements, t_{w-net} , is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and given by:

$$t_{w-net} = \frac{f_{shr} |P| s l_{shr}}{d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

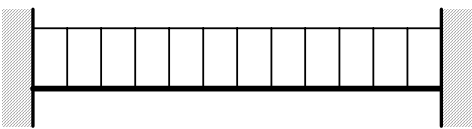

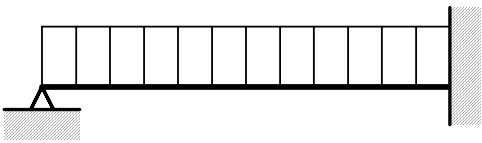

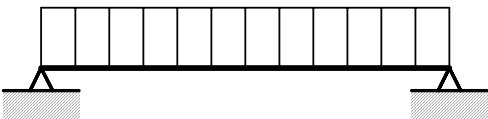

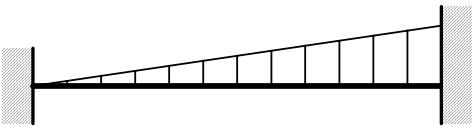

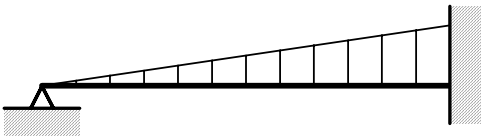

Where:

- P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.2.2*, in kN/m²

f_{shr}	<p>shear force factor:</p> <p>for continuous stiffeners and where end connections are fitted consistent with idealisation of the stiffener as having fixed ends:</p> <p>0.5 for horizontal stiffeners</p> <p>0.7 for vertical stiffeners</p> <p>for other configurations the shear force factor may be taken as in <i>Table 8.3.5</i>.</p>
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_{shr}	effective shear span, as defined in <i>Section 4/2.1.2</i> , in m
d_{shr}	effective web depth of stiffeners, in mm, as defined in <i>Section 4/2.4.2.2</i>
C_t	permissible shear stress coefficient for the acceptance criteria set being considered, as given in <i>Table 8.3.4</i>
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 8.3.4 Permissible Shear Stress Coefficient for Stiffeners		
Acceptance criteria set	Structural member	C_t
AC1	All stiffeners	0.75
AC2	All stiffeners ⁽¹⁾	0.90
<u>Note</u> 1. Collision bulkhead stiffeners are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1		

Table 8.3.5
Bending Moment and Shear Force Factors, f_{bdg} and f_{shr}

Load and boundary condition				Bending moment and shear force factor (based on load at mid span, where load varies)		
Position				1	2	3
Load model	1 Support	2 Field	3 Support	f_{bdg1} f_{shr1}	f_{bdg2} -	f_{bdg3} f_{shr3}
A				12.0 0.50	24.0 -	12.0 0.50
B				- 0.38	14.2 -	8.0 0.63
C				- 0.50	8.0 -	- 0.50
D				15.0 0.30	23.3 -	10.0 0.70
E				- 0.20	16.8 -	7.5 0.80

Note

- The bending moment factor f_{bdg} for the support positions are applicable for a distance of $0.2l_{bdg}$ from the end of the effective bending span for both local and primary support members.
- The shear force factor f_{shr} for the support positions are applicable for a distance of $0.2l_{shr}$ from the end of the effective shear span for both local and primary support members.
- Application of f_{bdg} and f_{shr} for local support members:
 - the section modulus requirement of local support members is to be determined using the lowest value of f_{bdg1} , f_{bdg2} and f_{bdg3}
 - the shear area requirement of local support members is to be determined using the greatest value of f_{shr1} and f_{shr3} .
- Application of f_{bdg} and f_{shr} for primary support members:
 - the section modulus requirement within $0.2l_{bdg}$ from the end of the effective span is generally to be determined using the applicable f_{bdg1} and f_{bdg3} , however f_{bdg} is not to be taken greater than 12
 - the section modulus of mid span area is to be determined using $f_{bdg} = 24$, or f_{bdg2} from the table if lesser
 - the shear area requirement of end connections within $0.2l_{shr}$ from the end of the effective span is to be determined using $f_{shr} = 0.5$ or the applicable f_{shr1} or f_{shr3} , whichever is greater
 - for models A through E the value of f_{shr} may be gradually reduced outside of $0.2l_{shr}$ towards $0.5f_{shr}$ at mid span where f_{shr} is the greater value of f_{shr1} and f_{shr3} .
- For other load models see Table 8.7.1.

3.9.3 Primary support members

3.9.3.1 For primary support members intersecting with or in way of curved hull sections, the effectiveness of end brackets is to include allowance for the curvature of the hull. For side transverse frames, the requirements may be reduced due to the presence of cross ties, see 3.3.3.4.

3.9.3.2 For primary support members subjected to lateral pressure, the net section modulus, Z_{net50} , is to be taken as the greatest value for all applicable design load sets, as given in Table 8.3.8, and given by:

$$Z_{net50} = 1000 \frac{|P| S l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in Section 3/5.3.3, in kN/m²

S primary support member spacing, in m, as defined in Section 4/2.2.2

l_{bdg} effective bending span, as defined in Section 4/2.1.4, in m

f_{bdg} bending moment factor, as given in Table 8.3.5

C_s permissible bending stress coefficient for the acceptance criteria set being considered, as given in Table 8.3.6

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.3.6 Permissible Bending Stress Coefficient for Primary Support Members		
Acceptance criteria set	Structure attached to primary support member	C_s
AC1	All boundaries, including decks and flats	0.70
AC2	All boundaries, including decks and flats ⁽¹⁾	0.85
<u>Note</u> 1. Collision bulkhead primary support members are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1		

3.9.3.3 For primary support members subjected to lateral pressure, the effective net shear area, $A_{shr-net50}$, is to be taken as the greatest value for all applicable design load sets, as given in Table 8.3.8, and given by:

$$A_{shr-net50} = 10 \frac{f_{shr} |P| S l_{shr}}{C_t \tau_{yd}} \quad \text{cm}^2$$

Where:

P design pressure for the design load set being considered, calculated at the load calculation point defined in Section 3/5.3.2, in kN/m²

S primary support member spacing, in m, as defined in Section 4/2.2.2

l_{shr} effective shear span, as defined in Section 4/2.1.5, in m

f_{shr}	shear force factor, as given in <i>Table 8.3.5</i>
C_t	permissible shear stress coefficient for the acceptance criteria set being considered, as given in <i>Table 8.3.7</i>
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 8.3.7		
Permissible Shear Stress Coefficient for Primary Support Members		
Acceptance criteria set	Structure attached to primary support member	C_t
AC1	All boundaries, including decks and flats	0.70
AC2	All boundaries, including decks and flats ⁽¹⁾	0.85
Note 1. Collision bulkhead primary support members are to be evaluated for design load set 11 (accidental flooding) using acceptance criteria set AC1		

- 3.9.3.4 Primary support members are to generally be analysed with the specific methods as described for the particular structure type. More advanced calculation methods may be necessary to ensure that nominal stress level for all primary support members are less than the permissible stresses and stress coefficients given in 3.9.3.2 and 3.9.3.3 when subjected to the applicable design load sets.

3.9.4 Corrugated bulkheads

- 3.9.4.1 Special consideration will be given to the approval of corrugated bulkheads where fitted.

Guidance Note

Scantling requirements of corrugated bulkheads in the cargo tank region may be used as a basis, see 2.5.6 and 2.5.7.

3.9.5 Pillars

- 3.9.5.1 The maximum load on a pillar, W_{pill} , is to be taken as the greatest value calculated for all applicable design load sets, as given in *Table 8.3.8*, and is to be less than or equal to the permissible pillar load as given by the following equation, where $W_{pill-perm}$ is based on the net properties of the pillar.

$$W_{pill} \leq W_{pill-perm}$$

Where:

$$W_{pill} = \text{applied axial load on pillar} \\ = P b_{a-sup} l_{a-sup} + W_{pill-upr} \quad \text{kN}$$

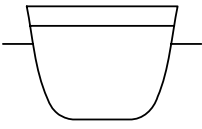

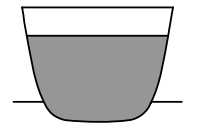

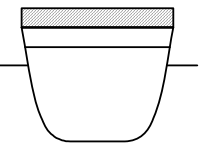

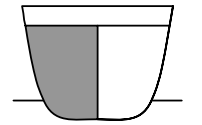

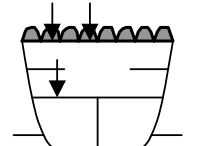

$$W_{pill-perm} = \text{permissible load on a pillar} \\ = 0.1 A_{pill-net50} \eta_{pill} \sigma_{crb} \quad \text{kN}$$

P design pressure for the design load set being considered, calculated at centre of the deck area supported by the pillar being considered, in kN/m²

b_{a-sup} mean breadth of area supported, in m

l_{a-sup}	mean length of area supported, in m
$W_{pill-upr}$	axial load from pillar or pillars above, in kN
$A_{pill-net50}$	net cross section area of the pillar, in cm ²
η_{pill}	utilisation factor for the design load set being considered: = 0.5 for acceptance criteria set AC1 = 0.6 for acceptance criteria set AC2
σ_{crb}	critical buckling stress in compression of pillar based on the net sectional properties calculated in accordance with <i>Section 10/3.5.1</i> , in N/mm ²

Table 8.3.8
Design Load Sets for Plating, Local Support Members and Primary Support Members

Type of Local Support and Primary Support Member	Design Load Set ⁽¹⁾	Load Component	External Draught	Comment	Diagrammatic Representation
Shell Envelope	1	P_{ex}	T_{sc}	Sea pressure only	
	2	P_{ex}	T_{sc}		
	5	P_{in}	T_{bal}	Tank pressure only. Sea pressure to be ignored	
	6	P_{in}	$0.25T_{sc}$		
External Decks	1	P_{ex}	T_{sc}	Green sea pressure only	
Tank Boundaries and/or Watertight Boundaries	5	P_{in}	T_{bal}	Pressure from one side only Full tank with adjacent tank empty	
	6	P_{in}	$0.25T_{sc}$		
	11	$P_{in-flood}$	-		
Internal and External Decks or Flats	9	P_{dk}	T_{bal}	Distributed or concentrated loads only. Adjacent tanks empty. Green sea pressure may be ignored	
	10	P_{dk}	T_{bal}		

Where:

T_{sc} scantling draught, in m, as defined in Section 4/1.1.5.5

T_{bal} minimum design ballast draught, in m, as defined in Section 4/1.1.5.2

Notes

1. The specification of design load combinations and other load parameters for the design load sets are given in Table 8.2.8
2. When the ship's configuration cannot be described by the above, then the applicable Design Load Sets to determine the scantling requirements of structural boundaries are to be selected so as to specify a full tank on one side with the adjacent tank or space empty. The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. See Note 4 on Table 8.2.7 and Table 8.2.8.
3. The boundaries of void and dry space not forming part of the hull envelope are to be evaluated using Design Load Set 11. See Note 2.

4 MACHINERY SPACE

4.1 General

4.1.1 Application

- 4.1.1.1 The requirements of this Sub-Section apply to machinery spaces situated in the aft end region, aft of the aftermost cargo tank bulkhead and forward of, and including, the aft peak bulkhead.
- 4.1.1.2 The net scantlings described in this Sub-Section are related to gross scantlings as follows:
- (a) for application the minimum thickness requirements of 4.1.5, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions as specified in *Section 6/3*.
 - (b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions as specified in *Section 6/3*.
 - (c) for primary support members, the gross shear area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion additions as specified in *Section 6/3*.
 - (d) for application of buckling requirements of *Section 10/2* the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions as specified in *Section 6/3*.

4.1.2 General scantling requirements

- 4.1.2.1 The hull structure is to comply with the applicable requirements of:
- (a) hull girder longitudinal strength, see *Section 8/1*
 - (b) strength against sloshing and impact loads, see *Section 8/6*
 - (c) buckling/ultimate strength, see *Section 10*.
- 4.1.2.2 The net section modulus, shear area and other sectional properties of local and primary support members are to be determined in accordance with *Section 4/2*.
- 4.1.2.3 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support members are to be applied as required in the notes to *Table 8.3.5*.
- 4.1.2.4 The scantling criteria are based on assumptions that all structural joints and welded details are designed and fabricated such that they are compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details during the design of highly stressed regions are to be considered. Structure design details are to comply with the requirements in *Section 4/3*.
- 4.1.2.5 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure the free flow to the suction pipes and the escape of air to the vents. Arrangements are to be made for draining the spaces above tanks. See also *Section 4/3*.

4.1.3 Structural continuity

- 4.1.3.1 Scantlings of the shell envelope, upper deck and inner bottom are to be properly tapered towards the aft end. See also 1.6.
- 4.1.3.2 Suitable arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities when structure that contributes to the main longitudinal strength of the ship is omitted in way of the machinery space.
- 4.1.3.3 Where inner hull or longitudinal bulkhead structures terminate at the forward engine room bulkhead, adequate backing structure is to be provided together with tapering brackets to ensure continuity of strength.
- 4.1.3.4 All shell frames and tank boundary stiffeners are to be continuous throughout, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4 and 4/3.2.5*.
- 4.1.3.5 Longitudinal primary support members, lower decks, and bulkheads arranged in the engine room are to be aligned with similar structures in the cargo tank region, as far as practicable. Where direct alignment is not possible, suitable scarphing arrangements such as taper brackets are to be provided.

4.1.4 Arrangements

- 4.1.4.1 Where openings in decks/bulkheads are provided in the machinery space, the arrangements are to ensure support for deck, side, and bottom structure.
- 4.1.4.2 All parts of the machinery, shafting, etc., are to be supported to distribute the loads into the ship's structure. The adjacent structure is to be suitably stiffened.
- 4.1.4.3 Primary support members are to be positioned giving consideration to the provision of through stiffeners and in-line pillar supports to achieve an efficient structural design.
- 4.1.4.4 These requirements are formulated assuming conventional single screw, single engine propulsion arrangements. Twin-screw or multi-engine vessels, or vessels of higher power, may require additions to the scantlings of the structure and the area of attachments, which are proportional to the weight, power and proportions of the machinery especially where the engines are positioned relatively high in proportion to the width of the bed plate.
- 4.1.4.5 The foundations for main propulsion units, reduction gears, shaft and thrust bearings, and the structure supporting those foundations are to maintain the required alignment and rigidity under all anticipated conditions of loading. Consideration is to be given to the submittal of the following plans to the machinery manufacturer for review:
 - (a) foundations for main propulsion units
 - (b) foundations for reduction gears
 - (c) foundations for thrust bearings
 - (d) structure supporting (a), (b) and (c).
- 4.1.4.6 A cofferdam is to be provided to separate the cargo tanks from the machinery space. Pump room, ballast tanks, or fuel oil tanks may be considered as cofferdams for this purpose.

4.1.5 Minimum thickness

- 4.1.5.1 In addition to the requirements for thickness, section modulus and shear area, as given in 4.2 to 4.8, the thickness of plating and stiffeners in the machinery space is to comply with applicable minimum thickness requirements given in *Table 8.4.1*.

Table 8.4.1			
Minimum Net Thickness of Structure in the Machinery Space			
Scantling Location			Net Thickness (mm)
Plating	Shell	Keel plating	See 2.1.5.1
		Bottom shell/bilge/side shell plating	See 2.1.5.1
	Upper deck		See 2.1.5.1
	Other structure	Hull internal tank boundaries	See 2.1.5.1
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	See 2.1.5.1
		Lower decks and flats	$3.3 + 0.0067s$
		Inner bottom	$6.5 + 0.02L_2$
	Bottom centreline girder		
Floors and bottom longitudinal girders off centreline			$5.5 + 0.02L_2$
Web plating of primary support members			$5.5 + 0.015 L_2$
Local support members			See 2.1.5.1
Tripping brackets			See 2.1.5.1
Where:			
L_2	rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m		
s	stiffener spacing, in mm, as defined in Section 4/2.2		

RCN 1 (effective from 1 July 2009)

4.2 Bottom Structure

4.2.1 General

- 4.2.1.1 In general, a double bottom is to be fitted in the machinery space. The depth of the double bottom is to be at least the same as required in the cargo tank region, see Section 5/3.2.1. Where the depth of the double bottom in the machinery space differs from that in the adjacent spaces, continuity of the longitudinal material is to be maintained by sloping the inner bottom over a suitable longitudinal extent. Lesser double bottom height may be accepted in local areas provided that the overall strength of the double bottom structure is not thereby impaired.

(RCN 2, effective from 1 July 2008)

4.2.2 Bottom shell plating

- 4.2.2.1 The keel plate breadth is to comply with the requirements in Section 8/2.2.1.1.
- 4.2.2.2 The thickness of the bottom shell plating (including keel plating) is to comply with the requirements in 4.8.1.1.

4.2.3 Bottom shell stiffeners

- 4.2.3.1 The section modulus and thickness of bottom shell stiffeners are to comply with the requirements in 4.8.1.2 and 4.8.1.3.

4.2.4 Girders and floors

- 4.2.4.1 The double bottom is to be arranged with a centreline girder.
(RCN 2, effective from 1 July 2008)
- 4.2.4.2 Full depth bottom girders are to be arranged in way of the main machinery to effectively distribute its weight, and to ensure rigidity of the structure. The girders are to be carried as far forward and aft as practicable, and suitably supported at their ends to provide distribution of loads from the machinery. The girders are to be tapered beyond their required extent.
- 4.2.4.3 Where fitted, side girders are to align with the bottom side girders in the adjacent space.
- 4.2.4.4 Where the double bottom is transversely framed, plate floors are to be fitted at every frame.
- 4.2.4.5 Where the double bottom is longitudinally framed, plate floors are to be fitted at every frame under the main engine and thrust bearing. Outboard of the engine and bearing seatings, the floors may be fitted at alternate frames.
- 4.2.4.6 Where heavy equipment is mounted directly on the inner bottom, the thickness of the floors and girders is to be suitably increased.

4.2.5 Inner bottom plating

- 4.2.5.1 Where main engines or thrust bearings are bolted directly to the inner bottom, the net thickness of the inner bottom plating is to be at least 19mm. Hold-down bolts are to be arranged as close as possible to floors and longitudinal girders. Plating thickness and the arrangements of hold-down bolts are also to consider the manufacturer's recommendations.

4.2.6 Sea chests

- 4.2.6.1 Where the inner bottom or double bottom structure forms part of a sea chest, the thickness of the plating is not to be less than that required for the shell at the same location, taking into account the maximum unsupported width of the plating.

4.3 Side Structure

4.3.1 General

- 4.3.1.1 The scantlings of the side shell plating and longitudinals are to be properly tapered from the midship region towards the aft end.
- 4.3.1.2 A suitable scarphing arrangement of the longitudinal framing is to be arranged where the longitudinal framing terminates and is replaced by transverse framing.
- 4.3.1.3 Stiffeners and primary support members are to be supported at their ends.

4.3.2 Side shell plating

- 4.3.2.1 The thickness of the side shell plating is to comply with the requirements in 4.8.1.1. Where applicable, the thickness of the side shell plating is to comply with the requirements in 2.2.4.2.

4.3.3 Side shell local support members

- 4.3.3.1 The section modulus and thickness of side longitudinal and vertical stiffeners are to comply with the requirements in 4.8.1.2 and 4.8.1.3.

4.3.3.2 (void)

- 4.3.3.3 End connections of longitudinals at transverse bulkheads are to provide fixity, lateral support, and when not continuous are to be provided with soft-nosed brackets. Brackets lapped onto the longitudinals are not to be fitted.

4.3.4 Side shell primary support members

- 4.3.4.1 Web frames are to be connected at the top and bottom to members of suitable stiffness, and supported by deck transverses.
- 4.3.4.2 The spacing of web frames in way of transversely framed machinery spaces is generally not to exceed five transverse frame spaces.
- 4.3.4.3 The section modulus and shear area of primary support members are to comply with the requirements in 4.8.2.
- 4.3.4.4 The web depth is to be not less than 2.5 times the web depth of the adjacent frames if the slots are not closed.
- 4.3.4.5 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending.

4.4 Deck Structure

4.4.1 General

- 4.4.1.1 All openings are to be framed. Attention is to be paid to structural continuity. Abrupt changes of shape, section or plate thickness are to be avoided.
- 4.4.1.2 The corners of the machinery space openings are to be of suitable shape and design to minimise stress concentrations.
- 4.4.1.3 In way of machinery openings, deck or flats are to have sufficient strength where they are intended as effective supports for side transverse frames or web frames.
- 4.4.1.4 Where a transverse framing system is adopted, deck stiffeners are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Where fitted, deck transverses are to be arranged in line with web frames to provide end fixity and transverse continuity of strength.
- 4.4.1.5 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in line with web frames in association with pillars or pillar bulkheads.
- 4.4.1.6 Machinery casings are to be supported by a suitable arrangement of deck transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required. These are to be arranged in line with deck transverses.
- 4.4.1.7 The structural scantlings are to be not less than the requirement for tank boundaries if the deck forms the boundary of a tank.
- 4.4.1.8 The structural scantlings are to be not less than the requirement for watertight bulkheads if the deck forms the boundary of a watertight space.

4.4.2 Deck scantlings

- 4.4.2.1 The plate thickness of deck plating is to comply with the requirements in 4.8.1.1.
- 4.4.2.2 The section modulus and thickness of deck stiffeners are to comply with the requirements in 4.8.1.2 and 4.8.1.3.

- 4.4.2.3 The web depth of deck stiffeners is to be not less than 60mm.
- 4.4.2.4 The section modulus and shear area of primary support members are to comply with the requirements in 4.8.2.
- 4.4.2.5 The web depth of primary support members is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is bending span as defined in *Section 4/2.1.4* or in case of a grillage structure the distance between connections to other primary support members.
- RCN 1 (effective from 1 July 2008)*
- 4.4.2.6 In way of concentrated loads from heavy equipment, the scantlings of the deck structure are to be determined based on the actual loading.

4.4.3 Pillars

- 4.4.3.1 Pillars are to be fitted in the same vertical line wherever possible, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.
- 4.4.3.2 Tubular and hollow square pillars are to be attached at their heads and heels by efficient brackets, or doublers/insert plates, where applicable, to transmit the load effectively. Pillars are to be attached at their heads and heels by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be distributed by brackets or other equivalent means.
- 4.4.3.3 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars.
- 4.4.3.4 Pillars in tanks are to be of solid section. Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45% of the specified minimum yield stress of the material.
- 4.4.3.5 The scantlings of pillars are to comply with the requirements in 4.8.4.
- 4.4.3.6 Where the pillar loads from heavy equipment exceed the design load required by 4.8.4, the pillar scantlings are to be determined based on the actual loading.

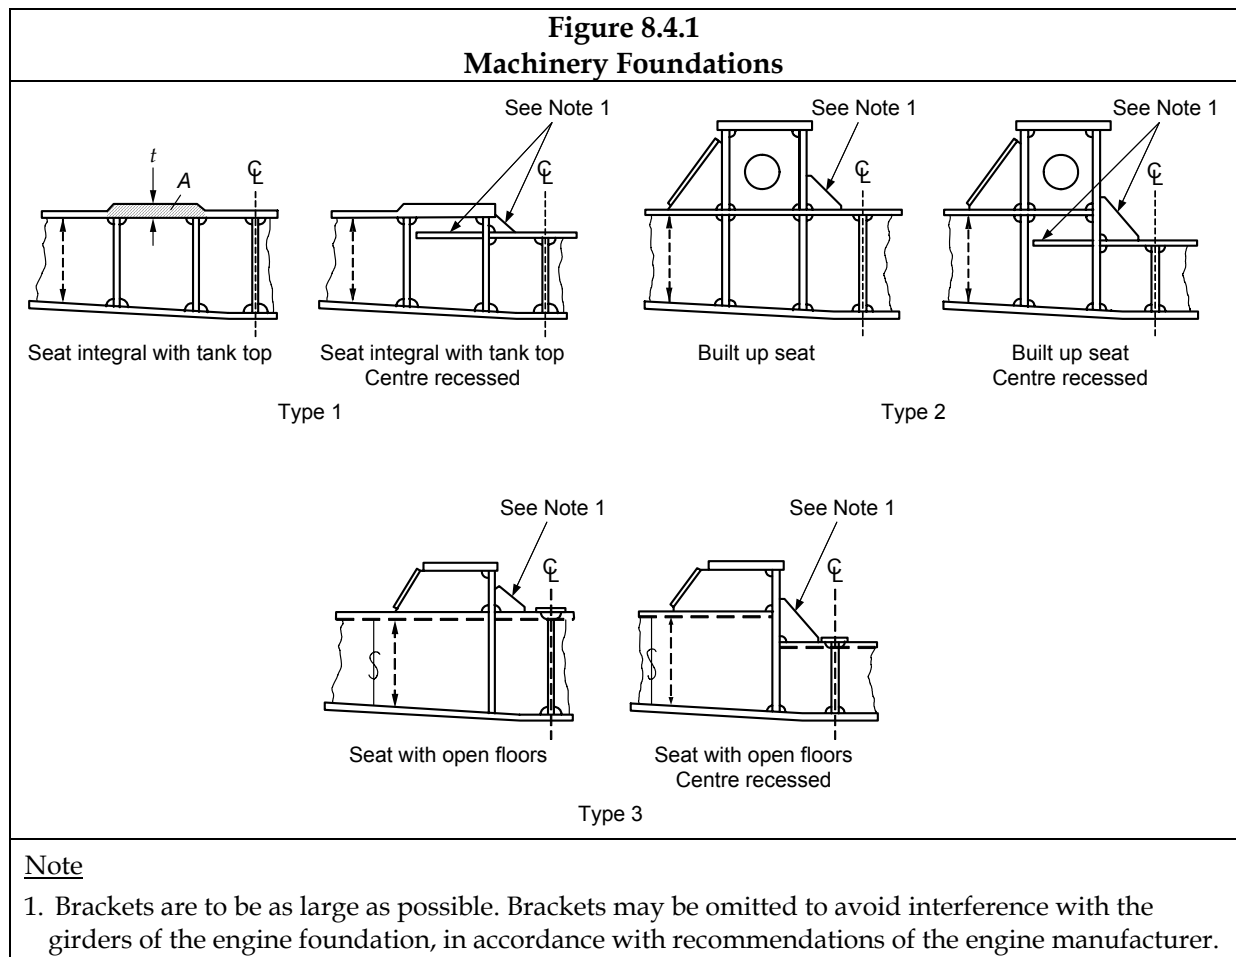

4.5 Machinery Foundations

4.5.1 General

- 4.5.1.1 Main engines and thrust bearings are to be effectively secured to the hull structure by foundations of strength that is sufficient to resist the various gravitational, thrust, torque, dynamic, and vibratory forces which may be imposed on them.
- 4.5.1.2 In the case of higher power internal combustion engines or turbine installations, the foundations are generally to be integral with the double bottom structure. Consideration is to be given to substantially increase the inner bottom plating thickness in way of the engine foundation plate or the turbine gear case, and the thrust bearing, see *Figure 8.4.1, Type 1*.
- 4.5.1.3 For main machinery supported on foundations of Type 2, as shown in *Figure 8.4.1*, the forces from the engine into the adjacent structure are to be distributed as

uniformly as possible. Longitudinal members supporting the foundation are to be aligned with girders in the double bottom, and transverse stiffening is to be arranged in line with the floors, see *Figure 8.4.1, Type 2*.

- 4.5.1.4 For ships with open floors in the machinery space, the foundations are generally to be arranged above the level of the top of the floors and securely bracketed, see *Figure 8.4.1, Type 3*.

4.5.2 Foundations for internal combustion engines and thrust bearings

- 4.5.2.1 In determining the scantlings of foundations for internal combustion engines and thrust bearings, consideration is to be given to the general rigidity of the engine and to its design characteristics with regard to out of balance forces.
- 4.5.2.2 Generally two girders are to be fitted in way of the foundation for internal combustion engines and thrust bearings.

Guidance Note

In general, the gross thickness of foundation top plates is not to be less than 45mm, where the maximum continuous output of the propulsion machinery is 3500kw or greater.

4.5.3 Auxiliary foundations

- 4.5.3.1 Auxiliary machinery is to be secured on foundations that are of suitable size and arrangement to distribute the loads from the machinery evenly into the supporting structure.

4.6 Tank Bulkheads

4.6.1 General

- 4.6.1.1 Tanks may be required to have divisions or deep wash plates to minimise the dynamic stress on the structure.

4.6.2 Construction

- 4.6.2.1 In no case are the scantlings of tank boundary bulkheads to be less than the requirements for watertight bulkheads.

4.6.3 Scantlings of tank boundary bulkheads

- 4.6.3.1 The thickness of tank boundary plating is to comply with the requirements in 4.8.1.1.
- 4.6.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in 4.8.1.2 and 4.8.1.3.
- 4.6.3.3 The section modulus and shear area of primary support members are to comply with the requirements in 4.8.2.
- 4.6.3.4 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 (effective from 1 July 2009)

4.7 Watertight Boundaries

4.7.1 General

- 4.7.1.1 Watertight boundaries within the machinery space are to be fitted in accordance with *Section 5/2*.

4.7.2 Scantlings of watertight boundaries

- 4.7.2.1 The thickness of watertight boundary plating is to comply with the requirements in 4.8.1.1.
- 4.7.2.2 The section modulus and thickness of stiffeners are to comply with the requirements in 4.8.1.2 and 4.8.1.3.
- 4.7.2.3 The section modulus and shear area of primary support members are to comply with the requirements in 4.8.2.
- 4.7.2.4 Web plating of primary support members is to have a depth of not less than 10% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 (effective from 1 July 2009)

4.8 Scantling Requirements

4.8.1 Plating and local support members

- 4.8.1.1 For plating subjected to lateral pressure the net plating thickness is to comply with the requirements in 3.9.2.1, but using the permissible bending stress coefficient, C_a , defined in *Table 8.4.2*.

- 4.8.1.2 For stiffeners subjected to lateral pressure the net section modulus requirement is to comply with the requirements in 3.9.2.2, but using the permissible bending stress coefficient, C_s , defined in Table 8.4.3.
- 4.8.1.3 For stiffeners subjected to lateral pressure the net web thickness based on shear area requirements is to comply with the requirements in 3.9.2.3.

Table 8.4.2
Permissible Bending Stress Coefficient for Plating

The permissible bending stress coefficient, C_a , for the design load set being considered is to be taken as:

$$C_a = \beta_a - \alpha_a \frac{|\sigma_{hg}|}{\sigma_{yd}} \quad \text{but not to be taken greater than } C_{a-max}$$

Where:

$\beta_a, \alpha_a, C_{a-max}$

Acceptance Criteria Set	Structural Member	β_a	α_a	C_{a-max}
AC1	Longitudinal Strength Members			
	Longitudinally stiffened plating	0.9	0.5	0.8
	Transversely or vertically stiffened plating	0.9	1.0	0.8
	Other members	0.8	0	0.8
AC2	Longitudinal Strength Members			
	Longitudinally stiffened plating	1.05	0.5	0.95
	Transversely or vertically stiffened plating	1.05	1.0	0.95
	Other members, including watertight boundary plating	1.0	0	1.0

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the load calculation point defined in Section 3/5.1.2

$$= \frac{(z - z_{NA-net50}) M_{v-total}}{I_{v-net50}} 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at the longitudinal position under consideration for the design load set being considered, in kNm. The still water bending moment, $M_{sw-perm}$, is to be taken with the same sign as the simultaneously acting wave bending moment, M_{wv} , see Table 7.6.1

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.1, in m^4

z vertical coordinate of the load calculation point under consideration, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in Section 4/2.6.1, in m

σ_{yd} specified minimum yield stress of the material, in N/mm^2

Table 8.4.3
Permissible Bending Stress Coefficient for Stiffeners

The permissible bending stress coefficient C_s is to be taken as:

Sign of Hull Girder Bending Stress, σ_{hg}	Side that Pressure is Acting On	Acceptance Criteria
Tension (+ve)	Stiffener side	$C_s = \beta_s - \alpha_s \frac{ \sigma_{hg} }{\sigma_{yd}}$ but not to be taken greater than C_{s-max}
Compression (-ve)	Plate side	
Tension (+ve)	Plate side	$C_s = C_{s-max}$
Compression (-ve)	Stiffener side	

Where:

$\beta_s, \alpha_s, C_{s-max}$ permissible bending stress factors and are to be taken as:

Acceptance Criteria Set	Structural Member	β_s	α_s	C_{s-max}
AC1	Longitudinally effective stiffeners	0.85	1.0	0.75
	Other stiffeners	0.75	0	0.75
AC2	Longitudinally effective stiffeners	1.0	1.0	0.9
	Other stiffeners	0.9	0	0.9
	Watertight boundary stiffeners	0.9	0	0.9

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the reference point defined in Section 3/5.2.2.5

$$= \left(\frac{(z - z_{NA-net50}) M_{v-total}}{I_{v-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

$M_{v-total}$ design vertical bending moment at longitudinal position under consideration for the design load set being considered, in kNm

$M_{v-total}$ is to be calculated in accordance with Table 7.6.1 using the sagging or hogging still water bending moment

Stiffener Location	$M_{sw-perm}$	
	Pressure acting on Plate Side	Pressure acting on Stiffener Side
Above Neutral Axis	Sagging SWBM	Hogging SWBM
Below Neutral Axis	Hogging SWBM	Sagging SWBM

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.1, in m^4

z vertical coordinate of the reference point defined in Section 3/5.2.2.5, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in Section 4/2.6.1, in m

σ_{yd} specified minimum yield stress of the material, in N/mm^2

4.8.2 Primary support members

4.8.2.1 For primary support members intersecting with or in way of curved hull sections, the effectiveness of end brackets is to include allowance for the curvature of the hull.

4.8.2.2 For primary support members subjected to lateral pressure the net section modulus requirement is to comply with the requirements in 3.9.3.2.

- 4.8.2.3 For primary support members subjected to lateral pressure the net cross sectional area of the web is to comply with the requirements in 3.9.3.3.
- 4.8.2.4 Primary support members are to generally be analysed with the specific methods as described for the particular structure type. More advanced calculation methods may be required to ensure that nominal stress level for all primary support members are less than permissible stresses and stress coefficients given in 3.9.3.2 and 3.9.3.3 when subjected to the applicable design load sets.

4.8.3 Corrugated bulkheads

- 4.8.3.1 Special consideration will be given to the approval of corrugated bulkheads where fitted.

Guidance Note

Scantling requirements of corrugated bulkheads in the cargo tank region may be used as a basis, see 2.5.6 and 2.5.7.

4.8.4 Pillars

- 4.8.4.1 The maximum load on a pillar is to be less than the permissible pillar load as given by the requirements in 3.9.5.

5 AFT END

5.1 General

5.1.1 Application

- 5.1.1.1 The requirements of this Sub-Section apply to structure located between the aft peak bulkhead and the aft end of the ship.
- 5.1.1.2 The requirements of this Sub-Section do not apply to the following:
- (a) rudder horns
 - (b) structures which are not integral with the hull, such as rudders, steering nozzles and propellers
 - (c) other appendages permanently attached to the hull.
- Where such items are fitted, the requirements of the individual Classification Society are to be complied with.
- 5.1.1.3 The net scantlings described in 5.1 to 5.7 are related to gross scantlings as follows:
- (a) for application the minimum thickness requirements of 5.1.4, the gross thickness is obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.
 - (b) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*
 - (c) for primary support members, the gross shear area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the relevant full corrosion additions specified in *Section 6/3*
 - (d) for application of buckling requirements of *Section 10/2* the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*.

5.1.2 General scantling requirements

- 5.1.2.1 The hull structure is to comply with the applicable requirements of:
- (a) hull girder longitudinal strength, see *Section 8/1*
 - (b) strength against sloshing and impact loads, see *Section 8/6*
 - (c) buckling/ultimate strength, see *Section 10*.
- 5.1.2.2 The deck plating thickness and supporting structure are to be suitably reinforced for the steering gear, mooring windlasses, and other deck machinery. See *Section 11/3*.
- 5.1.2.3 The net section modulus, shear area and other sectional properties of local and primary support members are to be determined in accordance with *Section 4/2*.
- 5.1.2.4 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support members are to be applied as required in the notes to *Table 8.3.5*.
- 5.1.2.5 The scantling criteria are based on assumptions that all structural joints and welded details are designed and fabricated such that they are compatible with the anticipated working stress levels at the locations considered. The loading patterns, stress concentrations and potential failure modes of structural joints and details

during the design of highly stressed regions are to be considered. Structure design details are to comply with the requirements in *Section 4/3*.

- 5.1.2.6 Limber, drain and air holes are to be cut in all parts of the structure, as required, to ensure the free flow to the suction pipes and the escape of air to the vents. Arrangements are to be made for draining the spaces above deep tanks. See also *Section 4/3*.

5.1.3 Structural continuity

- 5.1.3.1 Scantlings of the shell envelope, upper deck and inner bottom are to be tapered towards the aft end. See also 1.6.
- 5.1.3.2 In transition zones forward of the aft peak into the machinery space, due consideration is to be given to the tapering of primary support members.
- 5.1.3.3 Longitudinal framing of the strength deck is to be carried aft to the stern.
- 5.1.3.4 All shell frames and tank boundary stiffeners are in general to be continuous, or are to be bracketed at their ends, except as permitted in *Sections 4/3.2.4* and *4/3.2.5*.

5.1.4 Minimum thickness

- 5.1.4.1 In addition to the thickness, section modulus and stiffener web shear area requirements as given in 5.2 to 5.7, the thickness of plating and stiffeners in the aft end region is to comply with the appropriate minimum thickness requirements given in *Table 8.5.1*.

Table 8.5.1 Minimum Net Thickness of Structure Aft of the Aft Peak Bulkhead			
Scantling Location			Net Thickness (mm)
Plating	Shell	Keel plating	See 2.1.5.1
		Bottom shell/bilge/side shell plating	See 2.1.5.1
	Upper Deck		See 2.1.5.1
	Other structure	Hull internal tank boundaries	See 2.1.5.1
		Non-tight bulkheads, bulkheads between dry spaces and other plates in general	See 2.1.5.1
		Pillar bulkheads	7.5
Bottom girders and aft peak floors			$5.5 + 0.02L_2$
Web plating of primary support members			$6.5 + 0.015L_2$
Local support members			See 2.1.5.1
Tripping brackets			See 2.1.5.1
Where:			
L_2 rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m			

RCN 1 (effective from 1 July 2009)

5.2 Bottom Structure

5.2.1 General

- 5.2.1.1 Floors are to be fitted at each frame space in the aft peak and carried to a height at least above the stern tube. Where floors do not extend to flats or decks they are to be stiffened by flanges at their upper end.
- 5.2.1.2 The centreline bottom girder is to extend as far aft as is practicable and is to be attached to the stern frame.

5.2.2 Aft peak floors and girders

- 5.2.2.1 The height of stiffeners, h_{stf} , on the floors and girders are to be not less than:

$$h_{stf} = 80.0 l_{stf} \quad \text{mm, for flat bar stiffeners}$$

$$h_{stf} = 70.0 l_{stf} \quad \text{mm, for bulb profiles and flanged stiffeners}$$

Where:

l_{stf} length of stiffener as shown in Figure 8.5.1, in m

- 5.2.2.2 In conjunction with the requirements of 5.2.2.1, stiffeners are to be provided with end brackets as follows:

- (a) brackets are to be fitted at the lower and upper ends when l_{stf-t} exceeds 4m
- (b) brackets are to be fitted at the lower end when l_{stf-t} exceeds 2.5m.

Where:

l_{stf-t} total length of stiffener as shown in Figure 8.5.1, in m

- 5.2.2.3 Heavy plate floors are to be fitted in way of the aft face of the horn and in line with the webs in the rudder horn. They may be required to be carried up to the first deck or flat. In this area, cut outs, scallops or other openings are to be kept to a minimum.

5.2.3 Stern frames

5.2.3.1 Stern frames may be fabricated from steel plates or made of cast steel. For applicable material specifications and steel grades see *Table 6.1.3*. Stern frames of other material or construction will be specially considered.

5.2.3.2 Scantlings below the propeller boss on stern frames for single screw vessels are to comply with the requirements in 5.2.3.3 or 5.2.3.4, as applicable.

5.2.3.3 Fabricated stern frames are to satisfy the following criteria:

$$\begin{aligned} \text{(a)} \quad t_{grs} &\geq 2.25\sqrt{L} \quad \text{mm} \\ \text{(b)} \quad w_{stn} &\geq 450 \quad \text{mm} \\ \text{(c)} \quad t_{grs} &\geq \frac{C_f L^{1.5}}{w_{stn}^2 \sqrt{1 + \left(\frac{2l_{stn}}{w_{stn}}\right)^2}} \quad \text{mm} \end{aligned}$$

Where:

t_{grs}	gross thickness of side plating, in mm
w_{stn}	width of stern frame, in mm, see <i>Figure 8.5.2a</i>
l_{stn}	length of stern frame, in mm, see <i>Figure 8.5.2a</i>
L	rule length, as defined in <i>Section 4/1.1.1.1</i>
C_f	= 9600

5.2.3.4 Cast stern frames are to satisfy the following criteria:

$$\begin{aligned} \text{(a)} \quad t_{1-grs} &\geq 3.0\sqrt{L} \quad \text{mm, but not to be less than 25mm} \\ \text{(b)} \quad t_{2-grs} &\geq 1.25t_{1-grs} \quad \text{mm} \\ \text{(c)} \quad \frac{(t_{1-grs} + t_{2-grs})}{2} &\geq \frac{C_f L^{1.5}}{w_{stn}^2 \sqrt{1 + \left(\frac{2l_{stn}}{w_{stn}}\right)^2}} \end{aligned}$$

Where:

t_{1-grs}	gross thickness of casting at end, in mm, see <i>Figure 8.5.2b</i>
t_{2-grs}	gross thickness of casting at mid length, in mm, see <i>Figure 8.5.2b</i>
w_{stn}	width of stern frame, in mm, see <i>Figure 8.5.2b</i>
l_{stn}	length of stern frame, in mm, see <i>Figure 8.5.2b</i>
L	rule length, as defined in <i>Section 4/1.1.1.1</i>
C_f	= 8400

The thickness of butt welding to shell plating may be tapered below t_1 with a length of taper that is at least three times the offset. The castings are to be cored out to avoid large masses of thick material likely to contain defects and are to maintain a

relatively uniform section throughout. Suitable radii are to be provided in way of changes in section.

- 5.2.3.5 Above the propeller boss, the scantlings are to be in accordance with 5.2.3.2 to 5.2.3.4 except that in the upper part of the propeller aperture, where the hull form is full and centreline supports are provided, the thickness may be reduced to 80% of the applicable requirements in 5.2.3.2 to 5.2.3.4.
- 5.2.3.6 Where round bars are used at the aft edge of stern frames, their scantlings and connection details are to facilitate welding.
- 5.2.3.7 Ribs or horizontal brackets of thickness not less than $0.8t_{grs}$ or $0.8t_{l-grs}$ are to be provided at suitable intervals, where t_{grs} and t_{l-grs} are as defined in 5.2.3.3 and 5.2.3.4. When t_{grs} or t_{l-grs} is reduced in accordance with 5.2.3.5, a proportionate reduction in the thickness of ribs or horizontal brackets may be made.
- 5.2.3.8 Rudder gudgeons are to be an integral part of the stern frame and are to meet the requirements of the individual Classification Society.

5.3 Shell Structure

5.3.1 Shell plating

- 5.3.1.1 The net thickness of the side shell and transom plating, t_{net} , is to comply with the requirements in 3.9.2.1.

RCN 1(effective from 1 July 2009)

- 5.3.1.2 The net plating thickness of shell, t_{net} , attached to the stern frame is to comply with the requirements in 3.9.2.1 and is not to be less than:

$$t_{net} = 0.094(L_2 - 43) + 0.009s \quad \text{mm}$$

Where:

L_2 rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m

s stiffener spacing, in mm, as defined in Section 4/2.2

- 5.3.1.3 In way of the boss and heel plate, the shell net plating thickness, t_{net} , is not to be less than:

$$t_{net} = 0.105(L_2 - 47) + 0.011s \quad \text{mm}$$

Where:

L_2 rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m

s stiffener spacing, in mm, as defined in Section 4/2.2

- 5.3.1.4 Within the extents specified in 2.2.4.3, the thickness of the side shell plating is to comply with the requirements in 2.2.4.2.

- 5.3.1.5 Heavy shell plates are to be fitted locally in way of the heavy plate floors as required by 5.2.2.3. Outboard of the heavy floors, the heavy shell plates may be reduced in thickness in as gradual a manner as practicable. Where the horn plating is radiused into the shell plating, the radius at the shell connection, r , is not to be less than:

$$r = 150 + 0.8L_2 \quad \text{mm}$$

Where:

L_2 rule length, L , as defined in Section 4/1.1.1.1, but need not be taken greater than 300m

5.3.2 Shell local support members

- 5.3.2.1 The section modulus and thickness of the hull envelope framing are to comply with the requirements in 3.9.2.2 and 3.9.2.3.

5.3.3 Shell primary support members

- 5.3.3.1 The requirements of 5.3.3 apply to single side skin construction supported by system of vertical webs and/or horizontal stringers or flats.
- 5.3.3.2 Where a longitudinal framing system is adopted, longitudinals are to be supported by vertical primary support members extending from the floors to the upper deck. Deck transverses are to be fitted in line with the web frames.
- 5.3.3.3 Where a transverse framing system is adopted, frames are to be supported by horizontal primary support members spanning between the vertical primary support members.
- 5.3.3.4 The scantlings of web frames supporting; longitudinal framing, stringers and transverse framing are to be determined from 3.9.3.

- 5.3.3.5 The web depth of primary support members is not to be less than 14% of the bending span and is to be at least 2.5 times as deep as the slots for stiffeners if the slots are not closed.

5.4 Deck Structure

5.4.1 Deck plating

- 5.4.1.1 The thickness of the deck plating is to comply with the requirements in 3.9.2.1.

- 5.4.1.2 (void)

RCN 1 (effective from 1 July 2009)

5.4.2 Deck stiffeners

- 5.4.2.1 The section modulus and thickness of deck stiffeners are to comply with the requirements in 3.9.2.2 and 3.9.2.3.

5.4.3 Deck primary support members

- 5.4.3.1 The section modulus and shear area of primary support members are to comply with the requirements in 3.9.3.

- 5.4.3.2 The web depth of primary support members is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is bending span as defined in *Section 4/2.1.4* or in case of a grillage structure the distance between connections to other primary support members.

RCN 1 (effective from 1 July 2009)

- 5.4.3.3 In way of concentrated loads from heavy equipment, the scantlings of the deck structure are to be determined based on the actual loading. See also *Section 11/3*.

5.4.4 Pillars

- 5.4.4.1 Pillars are to be fitted in the same vertical line wherever possible and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

- 5.4.4.2 Tubular and hollow square pillars are to be attached at their heads and heels by efficient brackets, or doublers/insert plates, where applicable, to transmit the load effectively. Pillars are to be attached at their heads and heels by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be distributed by brackets or other equivalent means.

- 5.4.4.3 Pillars in tanks are to be of solid section. Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45% of the specified minimum yield stress of the material.

- 5.4.4.4 The scantlings of pillars are to comply with the requirements in 3.9.5.

- 5.4.4.5 Where the loads from heavy equipment exceed the design load of 3.9.5, the pillar scantlings are to be determined based on the actual loading.

5.5 Tank Bulkheads

5.5.1 General

- 5.5.1.1 Tanks may be required to have divisions or deep wash structures to minimise the dynamic stress on the structure.

5.5.2 Construction

- 5.5.2.1 In no case are the scantlings of tank boundary bulkheads to be less than the requirements for watertight bulkheads.

5.5.3 Scantlings of tank boundary bulkheads

- 5.5.3.1 The thickness of tank boundary plating is to comply with the requirements in 3.9.2.1.
- 5.5.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in 3.9.2.2 and 3.9.2.3.
- 5.5.3.3 The section modulus and shear area of primary support members are to comply with the requirements in 3.9.3.
- 5.5.3.4 Web plating of primary support members is to have a depth of not less than 14% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 (effective from 1 July 2009)

5.6 Watertight Boundaries

5.6.1 General

- 5.6.1.1 Watertight boundaries are to be fitted in accordance with *Section 5/2*.
- 5.6.1.2 The number of openings in watertight bulkheads is to be kept to a minimum compatible with the design and operation of the ship. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity.

5.6.2 Aft peak bulkhead

- 5.6.2.1 An aft peak bulkhead complying with *Section 5/2.3* is to be provided.
- 5.6.2.2 The scantlings of structural components of the aft peak bulkhead are to comply with the requirements in 5.5 and 5.6.3, as applicable.

5.6.3 Scantlings of watertight boundaries

- 5.6.3.1 The thickness of boundary plating is to comply with the requirements in 3.9.2.1.
- 5.6.3.2 The section modulus and thickness of stiffeners are to comply with the requirements in 3.9.2.2 and 3.9.2.3.
- 5.6.3.3 The section modulus and shear area of primary support members are to comply with the requirements in 3.9.3.
- 5.6.3.4 Web plating of primary support members is to have a depth of not less than 10% of the unsupported span in bending and not less than 2.5 times the depth of the slots if the slots are not closed.

RCN 1 (effective from 1 July 2009)

5.7 Miscellaneous Structures

5.7.1 Pillar bulkheads

- 5.7.1.1 Bulkheads that support girders, or pillars and longitudinal bulkheads which are fitted in lieu of girders, are to be stiffened to provide supports not less effective than required for stanchions or pillars. The acting load and the required net cross sectional area of the pillar section is to be determined using the requirements of 5.4.4. The net moment of inertia of the stiffener is to be calculated with a width of $40t_{net}$ of the plating, where t_{net} is net plating thickness in mm.
- 5.7.1.2 Pillar bulkheads are to meet the following requirements:
- (a) the distance between bulkhead stiffeners is not to exceed 1500mm
 - (b) where corrugated, the depth of the corrugation is not to be less than 100mm.

5.7.2 Rudder trunk

- 5.7.2.1 The scantlings of the rudder trunk are to be in accordance with the shell plating and framing in 5.3.1 and 5.3.2. Where the rudder trunk is open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline to prevent water from entering the steering gear compartment.

5.7.3 Stern thruster tunnels

- 5.7.3.1 The net thickness of the tunnel plating, $t_{tun-net}$, is not to be less than required for shell plating in the vicinity of the thruster. In addition $t_{tun-net}$ is not to be taken less than:

$$t_{tun-net} = 0.008d_{tun} + 1.8 \quad \text{mm}$$

Where:

d_{tun} inside diameter of the tunnel, in mm, but not to be taken less than 970 mm

- 5.7.3.2 Where the outboard ends of the tunnel are provided with bars or grids, the bars or grids are to be effectively secured.

6 EVALUATION OF STRUCTURE FOR SLOSHING AND IMPACT LOADS

6.1 General

6.1.1 Application

- 6.1.1.1 The requirements of this Sub-Section cover the strengthening requirements for localised sloshing loads that may occur in tanks carrying liquid and local impact loads that may occur in the forward structure. The sloshing and impact loads to be applied in 6.2 to 6.4 are described in *Section 7/4*.
- 6.1.1.2 The net scantlings described in this Sub-Section are related to gross scantlings as follows:
- (a) for plating and local support members, the gross thickness and gross cross sectional properties are obtained from the applicable requirements by adding the full corrosion additions specified in *Section 6/3*
 - (b) for primary support members, the gross sectional area, gross section modulus and other gross cross sectional properties are obtained from the applicable requirements by adding one half of the full corrosion additions specified in *Section 6/3*.

6.1.2 General scantling requirements

- 6.1.2.1 The requirements of 6.2 to 6.4 are to be applied in addition to the applicable requirements in *Section 8*.
- 6.1.2.2 Local scantling increases due to impact or sloshing loads are to be made with due consideration given to details and avoidance of hard spots, notches and other harmful stress concentrations.

6.2 Sloshing in Tanks

6.2.1 Scope and limitations

- 6.2.1.1 The requirements of 6.2 specify the scantling requirements for boundary and internal structure of tanks subject to sloshing loads, as given in *Section 7/4.2*, due to the free movement of liquid in tanks.
- 6.2.1.2 The structure of cargo tanks, slop tanks, ballast tanks and large deep tanks, e.g. fuel oil bunkering tanks and main fresh water tanks, are to be assessed for sloshing. Small tanks do not need to be assessed for sloshing pressures.
- 6.2.1.3 All cargo and ballast tanks are to have scantlings suitable for unrestricted filling heights.
- 6.2.1.4 The following structural members are to be assessed:
- (a) plates and stiffeners forming boundaries of tanks
 - (b) plates and stiffeners on wash bulkheads
 - (c) web plates and web stiffeners of primary support members located in tanks
 - (d) tripping brackets supporting primary support members in tanks.
- 6.2.1.5 For tanks with effective sloshing breadth, b_{slh} , greater than $0.56B$ or effective sloshing length, l_{slh} , greater than $0.13L$, an additional sloshing impact assessment is to be carried out in accordance with the individual Classification Society's procedures. The effective sloshing length, l_{slh} , and breadth, b_{slh} , are defined in *Section 7/4.2.2* and *Section 7/4.2.3* respectively.

6.2.2 Application of sloshing pressure

6.2.2.1 The following tanks are to be assessed for the design sloshing pressures $P_{slh-lng}$ and P_{slh-t} in accordance with 6.2.2.2 to 6.2.2.5:

- (a) cargo and slop tanks
- (b) fore peak and aft peak ballast tanks
- (c) other tanks which allow free movement of liquid, except as follows:
 - where the effective sloshing length is less than $0.03L$, calculations involving $P_{slh-lng}$ are not required and
 - where the effective sloshing breadth is less than $0.32B$, calculations involving P_{slh-t} are not required.

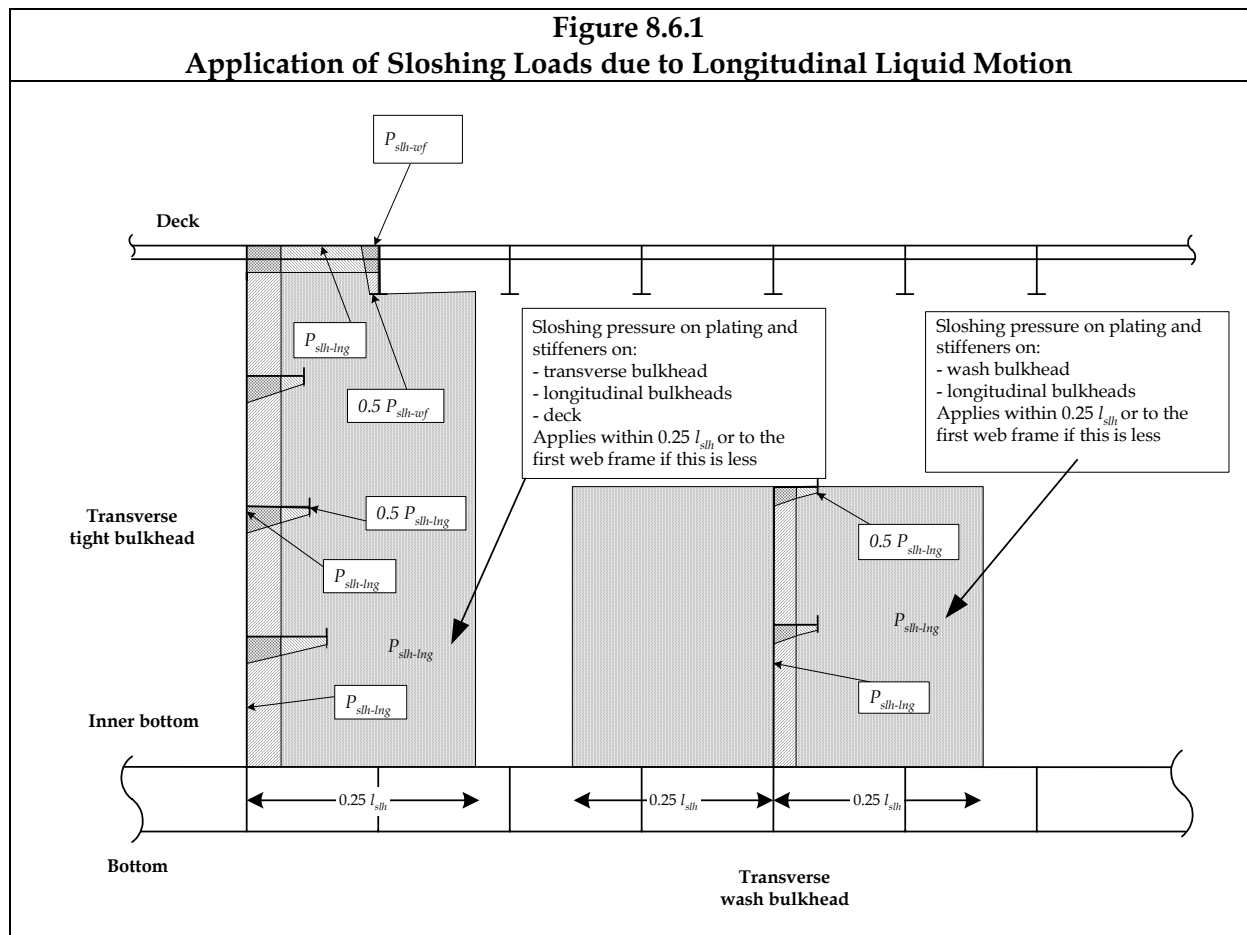

The design sloshing pressure for other tanks mentioned in 6.2.1.2 is to be taken as the minimum sloshing pressure, $P_{slh-min}$, as defined in Section 7/4.2.4.

6.2.2.2 The design sloshing pressure due to longitudinal liquid motion, $P_{slh-lng}$, as defined in Section 7/4.2.2.1 is to be applied to the following members as shown in Figure 8.6.1:

- (a) transverse tight bulkheads
- (b) transverse wash bulkheads
- (c) stringers on transverse tight and wash bulkheads
- (d) plating and stiffeners on the longitudinal bulkheads, deck and inner hull which are between the transverse bulkhead and the first web frame from the bulkhead or the bulkhead and $0.25l_{slh}$, whichever is lesser.

6.2.2.3 In addition to 6.2.2.2, the first web frame next to a transverse tight or wash bulkhead if the web frame is located within $0.25l_{slh}$ from the bulkhead, as shown in Figure 8.6.1, is to be assessed for the web frame reflected sloshing pressure, $P_{slh-wvf}$, as defined in Section 7/4.2.2.5.

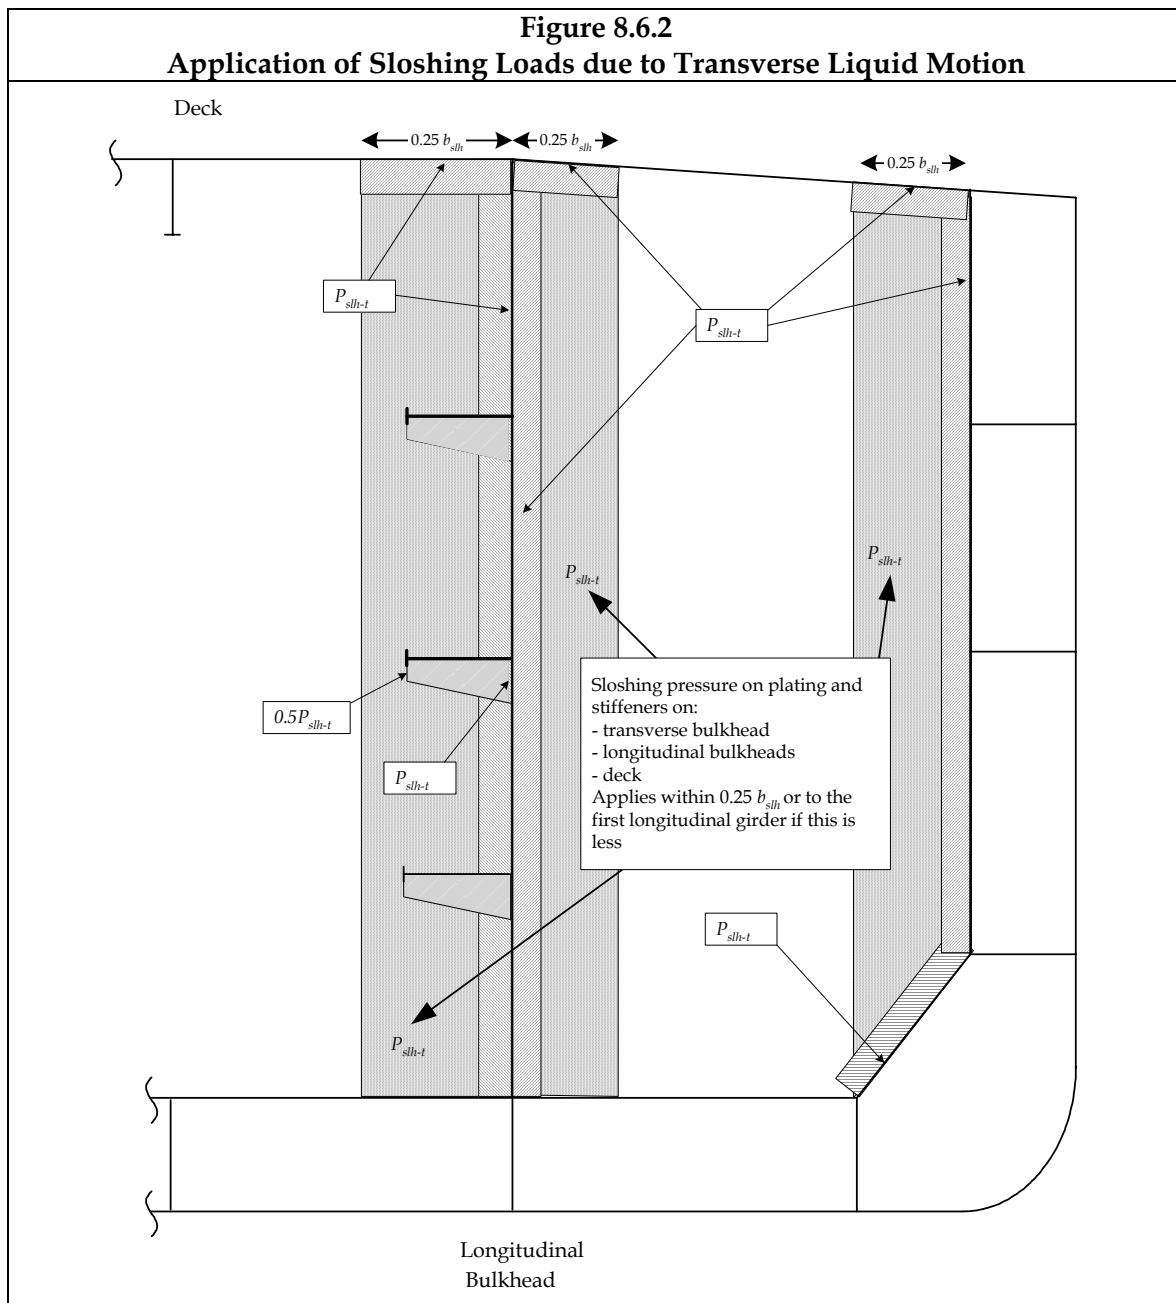

6.2.2.4 The minimum sloshing pressure, $P_{slh-min}$, as defined in Section 7/4.2.4 is to be applied to all other members.

6.2.2.5 The design sloshing pressure due to transverse liquid motion, P_{slh-t} , as defined in Section 7/4.2.3.1, is to be applied to the following members as shown in Figure 8.6.2:

- (a) longitudinal tight bulkhead
- (b) longitudinal wash bulkhead
- (c) horizontal stringers and vertical webs on longitudinal tight and wash bulkheads
- (d) plating and stiffeners on the transverse tight bulkheads including stringers and deck which are between the longitudinal bulkhead and the first girder from the bulkhead or the bulkhead and $0.25b_{slh}$ whichever is lesser.

6.2.2.6 In addition to 6.2.2.5, the first girder next to longitudinal tight or wash bulkhead if the girder is located within $0.25b_{slh}$ from the longitudinal bulkhead, as shown in Figure 8.6.2, is to be assessed for the reflected sloshing pressure, $P_{slh-grd}$ as defined in Section 7/4.2.3.5.

6.2.2.7 The minimum sloshing pressure, $P_{slh-min}$, as defined in Section 7/4.2.4, is to be applied to all other members.

6.2.2.8 The sloshing pressures due to transverse and longitudinal fluid motion are assumed to act independently. Structural members are therefore to be evaluated based on the greatest sloshing pressure due to longitudinal and transverse fluid motion.

6.2.3 Sloshing assessment of plating forming tank boundaries

6.2.3.1 The net thickness of plating forming tank boundaries, t_{net} , subjected to sloshing pressures is not to be less than:

$$t_{net} = 0.0158 \alpha_p s \sqrt{\frac{P_{slh}}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p	correction factor for the panel aspect ratio $= 1.2 - \frac{s}{2100 l_p} \quad \text{but not to be taken as greater than 1.0}$
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_p	length of plate panel, to be taken as the spacing of primary support members, S , unless carlings are fitted, in m
P_{slh}	the greater of $P_{slh-lng}$, P_{slh-t} or $P_{slh-min}$ as specified in 6.2.2
C_a	permissible plate bending stress coefficient as given in <i>Table 8.6.1</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.2.4 Sloshing assessment of stiffeners on tank boundaries

6.2.4.1 The net section modulus, Z_{net} , of stiffeners on tank boundaries subjected to sloshing pressures is not to be less than:

$$Z_{net} = \frac{P_{slh} s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

l_{bdg}	effective bending span, of stiffener, as defined in <i>Section 4/2.1</i> , in m
C_s	permissible bending stress coefficient as given in <i>Table 8.6.2</i>
P_{slh}	the greater of $P_{slh-lng}$, P_{slh-t} or $P_{slh-min}$ as specified in 6.2.2
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²
f_{bdg}	bending moment factor: $= 12$ for stiffeners fixed against rotation at each end. This is generally to be applied for scantlings of all continuous stiffeners $= 8$ for stiffeners with one or both ends not fixed against rotation. This is generally to be applied to discontinuous stiffeners for other configurations the bending moment factor may be taken as given in <i>Table 8.3.5</i>

6.2.5 Sloshing assessment of primary support members

6.2.5.1 Web plating, web stiffeners and tripping brackets on stringers, girders and web frames in cargo and ballast tanks are to be assessed based on sloshing pressures as given in 6.2.2.

6.2.5.2 The web plating net thickness of primary support members, t_{net} , is not to be less than:

$$t_{net} = 0.0158 \alpha_p s \sqrt{\frac{P_{slh}}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p	correction factor for the panel aspect ratio $= 1.2 - \frac{s}{2100l_p} \quad \text{but not to be taken as greater than 1.0}$
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_p	length of plate panel, mean spacing between local support members on the long edges of the panel, typically between tripping brackets, in m
P_{slh}	the greater of $P_{slh-lng}$, P_{slh-t} , P_{slh-wf} , $P_{slh-grd}$ or $P_{slh-min}$ as specified in 6.2.2. The pressure is to be calculated at the load application point, defined in <i>Section 3/5.1.2</i> , taking into account the distribution over the height of the member, as shown in <i>Figure 8.6.1</i>
C_a	permissible plate bending stress coefficient as given in <i>Table 8.6.1</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

- 6.2.5.3 The net section modulus, Z_{net} , of each individual stiffener on the web plating of primary support members subjected to sloshing pressures is not to be less than:

$$Z_{net} = \frac{P_{slh} s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{slh}	the greater of $P_{slh-lng}$, P_{slh-t} , P_{slh-wf} , $P_{slh-grd}$ or $P_{slh-min}$ as specified in 6.2.2. The pressure is to be calculated at the load application point taking into account the distribution over the height of the member, as shown in <i>Figure 8.6.1</i> and <i>8.6.2</i> .
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_{bdg}	effective bending span, in m, of web stiffener as defined in <i>Section 4/2.1</i>
C_s	permissible bending stress coefficient as given in <i>Table 8.6.2</i>
f_{bdg}	bending moment factor $= 12 \quad \text{for stiffeners fixed against rotation at each end. This is generally to be applied for scantlings of all continuous stiffeners}$ $= 8 \quad \text{for stiffeners with one or both ends not fixed against rotation. This is generally to be applied to discontinuous stiffeners}$ for other configurations the bending moment factor may be taken as given in <i>Table 8.3.5</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

- 6.2.5.4 The net section modulus, Z_{net} , in way of the base of tripping brackets supporting primary support members in cargo and ballast tanks is not to be less than:

$$Z_{net} = \frac{1000 P_{slh} s_{trip} l_{trip}^2}{2 C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{slh}	the greater of $P_{slh-lng}$, P_{slh-t} , P_{slh-wf} , $P_{slh-grd}$ and $P_{slh-min}$ as defined in 6.2.2. The average pressure may be calculated at mid point of the tripping bracket taking into account the distribution as shown in <i>Figure 8.6.1</i> and 8.6.2
s_{trip}	mean spacing, between tripping brackets or other primary support members or bulkheads, in m
l_{trip}	length of tripping bracket, see <i>Figure 8.6.3</i> , in m
C_s	permissible bending stress coefficient for tripping brackets = 0.75
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.2.5.5 The net shear area, $A_{shr-net}$, after deduction of cut-outs and slots, of tripping brackets supporting primary support members in cargo and ballast tanks is not to be less than:

$$A_{shr-net} = 10 \frac{P_{slh} s_{trip} l_{trip}}{C_t \tau_{yd}} \quad \text{cm}^2$$

Where:

P_{slh}	the greater of $P_{slh-lng}$, P_{slh-t} , P_{slh-wf} , $P_{slh-grd}$ and $P_{slh-min}$ as defined in 6.2.2. The average pressure may be calculated at mid point of the tripping bracket taking into account the distribution as shown in <i>Figure 8.6.1</i> and 8.6.2
s_{trip}	mean spacing, between tripping brackets or other primary support members or bulkheads, in m
l_{trip}	length of tripping bracket, see <i>Figure 8.6.3</i> , in m
C_t	permissible shear stress coefficient, as given in <i>Table 8.6.3</i>
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 8.6.1
Allowable Plate Bending Stress Coefficient, C_a , for Assessment of Sloshing on Plates

The permissible bending stress coefficient for the design load set being considered is to be taken as:

$$C_a = \beta_a - \alpha_a \frac{|\sigma_{hg}|}{\sigma_{yd}} \quad \text{but not to be taken greater than } C_{a-max}$$

Where:

$\alpha_a, \beta_a, C_{a-max}$ permissible bending stress factors and are to be taken as follows

Acceptance Criteria Set	Structural Member	β_a	α_a	C_{a-max}
AC1	Longitudinal strength members in the cargo tank region including but not limited to : - deck - longitudinal plane bulkhead - horizontal corrugated longitudinal bulkhead - longitudinal girders and stringers within the cargo tank region	Longitudinally stiffened plating 0.9	0.5	0.8
		Transversely or vertically stiffened plating 0.9	1.0	0.8
	Other strength members including: - vertical corrugated longitudinal bulkhead - transverse plane bulkhead - transverse corrugated bulkhead - transverse stringers and web frames - plating of tank boundaries and primary support members outside the cargo tank region	0.8	0	0.8

σ_{hg} hull girder bending stress for the design load set being considered and calculated at the load calculation point defined in Section 3/5.1.2

$$= \left(\frac{(z - z_{NA-net50}) M_{sw-perm-sea}}{I_{v-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

z vertical coordinate of the load calculation point under consideration, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in Section 4/2.6.1, in m

$M_{sw-perm-sea}$ permissible hull girder hogging and sagging still water bending moment for seagoing operation at the location being considered, in kNm. The greatest of the sagging and hogging bending moment is to be used, see Section 7/2.1.

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.1, in m⁴

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.6.2
Allowable Bending Stress Coefficient, C_s , for Assessment of Sloshing on Stiffeners

The permissible bending stress coefficient for the design load set being considered is to be taken as:

$$C_s = \beta_s - \alpha_s \frac{|\sigma_{hg}|}{\sigma_{yd}} \quad \text{but not to be taken greater than } C_{s-max}$$

Where:

$\alpha_s, \beta_s, C_{s-max}$ permissible bending stress factors and are to be taken as follows:

Acceptance Criteria Set	Structural Member	β_s	α_s	C_{s-max}
AC1	Longitudinal strength members in the cargo tank region including but not limited to: - deck stiffeners - stiffeners on longitudinal bulkheads - stiffeners on longitudinal girders and stringers within the cargo tank region	0.85	1.0	0.75
	Transverse or vertical stiffeners	0.7	0	0.7
	Other strength members including: - stiffeners on transverse bulkheads - stiffeners on transverse stringers and web frames - stiffeners on tank boundaries and primary support members outside the cargo tank region	0.75	0	0.75

σ_{hg} hull girder bending stress for the design load set being considered at the reference point defined in Section 3/5.2.2.5

$$= \left(\frac{(z - z_{NA-net50}) M_{sw-perm-sea}}{I_{v-net50}} \right) 10^{-3} \quad \text{N/mm}^2$$

z vertical coordinate of the reference point defined in Section 3/5.2.2.5, in m

$z_{NA-net50}$ distance from the baseline to the horizontal neutral axis, as defined in Section 4/2.6.1, in m

$M_{sw-perm-sea}$ permissible hull girder hogging and sagging still water bending moment for seagoing operation at the location being considered, in kNm. The greatest of the sagging and hogging bending moment is to be used, see Section 7/2.1.

$I_{v-net50}$ net vertical hull girder moment of inertia, at the longitudinal position being considered, as defined in Section 4/2.6.1, in m⁴

σ_{yd} specified minimum yield stress of the material, in N/mm²

Table 8.6.3
Permissible Shear Stress Coefficient

Acceptance Criteria Set	Structural member	C_t
AC1	Tripping brackets	0.75

6.3 Bottom Slamming

6.3.1 Application

6.3.1.1 Where the minimum draughts forward, T_{FP-mt} or $T_{FP-full}$, as specified in Section 7/4.3.2.1, is less than $0.045L$, the bottom forward is to be additionally strengthened to resist bottom slamming pressures.

- 6.3.1.2 The draughts for which the bottom has been strengthened are to be indicated on the shell expansion plan and loading guidance information, see 1.1.
- 6.3.1.3 The scantlings described in 6.3 are net scantlings, which are related to gross scantlings as described in 6.1.1.2. The section modulus and shear area of the primary support members is to be determined as specified in Section 4/2.5.
- 6.3.1.4 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The cross sectional shear areas of primary support members are to be applied as required by 6.3.7.3 and 6.3.7.4.

6.3.2 Extent of strengthening

- 6.3.2.1 The strengthening is to extend forward of $0.3L$ from the F.P. over the flat of bottom and adjacent plating with attached stiffeners up to a height of 500mm above the baseline, see Figure 8.6.4.

- 6.3.2.2 Outside the region strengthened to resist bottom slamming the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

6.3.3 Design to resist bottom slamming loads

- 6.3.3.1 The design of end connections of stiffeners in the bottom slamming region is to ensure end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with Section 4/3.2.3. Where it is not practical to comply with this requirement the net plastic section modulus, $Z_{pl-alt-net}$, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt-net} = \frac{16Z_{pl-net}}{f_{bdg}} \quad \text{cm}^3$$

Where:

Z_{pl-net} net plastic section modulus, in cm^3 , as required by 6.3.5.1

f_{bdg} bending moment factor

$$= 8 \left(1 + \frac{n_s}{2} \right)$$

n_s = 0 for both ends with low end fixity (simply supported)
 = 1 for one end equivalent to built in and one end simply supported

- 6.3.3.2 Scantlings and arrangements at primary support members, including bulkheads, are to comply with 6.3.7.

6.3.4 Hull envelope plating

6.3.4.1 The net thickness of the hull envelope plating, t_{net} , is not to be less than:

$$t_{net} = \frac{0.0158 \alpha_p s}{C_d} \sqrt{\frac{P_{slm}}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p	correction factor for the panel aspect ratio $= 1.2 - \frac{s}{2100 l_p} \quad \text{but not to be taken as greater than 1.0}$
s	stiffener spacing, in mm, as defined in Section 4/2.2
l_p	length of plate panel, to be taken as the spacing between primary support members (see Section 4/2.2.2) or panel breakers, in m
P_{slm}	bottom slamming pressure as given in Section 7/4.3 and calculated at the load calculation point defined in Section 3/5.1.2, in kN/m ²
C_d	plate capacity correction coefficient $= 1.3$
C_a	permissible bending stress coefficient $= 1.0$ for acceptance criteria set AC3
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.3.5 Hull envelope stiffeners

6.3.5.1 The net plastic section modulus, Z_{pl-net} , of each individual stiffener, is not to be less than:

$$Z_{pl-net} = \frac{P_{slm} s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{slm}	bottom slamming pressure as given in Section 7/4.3 and calculated at the load calculation point defined in Section 3/5.2.2, in kN/m ²
s	stiffener spacing, in mm, as defined in Section 4/2.2
l_{bdg}	effective bending span, as defined in Section 4/2.1.1, in m
f_{bdg}	bending moment factor $= 8 \left(1 + \frac{n_s}{2} \right)$
n_s	$= 2.0$ for continuous stiffeners or where stiffeners are bracketed at both ends see 6.3.3.1 for alternative arrangements
C_s	permissible bending stress coefficient $= 0.9$ for acceptance criteria set AC3
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.3.5.2 The net web thickness, t_{w-net} , of each longitudinal is not to be less than:

$$t_{w-net} = \frac{P_{slm} s l_{shr}}{2 d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

Where:

l_{shr} effective shear span, as defined in Section 4/2.1.2, in m

s stiffener spacing, in mm, as defined in Section 4/2.2

P_{slm} bottom slamming pressure as given in Section 7/4.3 and calculated at the load calculation point defined in Section 3/5.2.2, in kN/m²

d_{shr} effective web depth of stiffener, in mm, as defined in Section 4/2.4.2.2

C_t permissible shear stress coefficient
= 1.0 for acceptance criteria set AC3

$$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.3.5.3 The slenderness ratio of each longitudinal is to comply with Section 10/2.

6.3.6 Definition of idealised bottom slamming load area for primary support members

6.3.6.1 The scantlings of items in 6.3.7 are based on the application of the slamming pressure defined in Section 7/4.3 to an idealised area of hull envelope plating, the slamming load area, A_{slm} , given by:

$$A_{slm} = \frac{1.1 L B C_b}{1000} \quad \text{m}^2$$

Where:

L rule length, as defined in Section 4/1.1.1.1

B moulded breadth, in m, as defined in Section 4/1.1.3.1

C_b block coefficient, as defined in Section 4/1.1.9.1

6.3.7 Primary support members

6.3.7.1 The size and number of openings in web plating of the floors and girders is to be minimised considering the required shear area as given in 6.3.7.2.

6.3.7.2 The net shear area, $A_{shr-net50}$, of each primary support member web at any position along its span is not to be less than:

$$A_{shr-net50} = 10 \frac{Q_{slm}}{C_t \tau_{yd}} \quad \text{cm}^2$$

Where:

Q_{slm} the greatest shear force due to slamming for the position being considered, in kN, based on the application of a patch load, F_{slm} to the most onerous location, as determined in accordance with 6.3.7.3

C_t permissible shear stress coefficient
= 0.9 for acceptance criteria set AC3

$$\tau_{yd} = \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.3.7.3 For simple arrangements of primary support members, where the grillage affect may be ignored, the shear force, Q_{slm} , is given by:

$$Q_{slm} = f_{pt} f_{dist} F_{slm} \quad \text{kN}$$

Where:

f_{pt} Correction factor for the proportion of patch load acting on a single primary support member
 $= 0.5(f_{slm}^3 - 2f_{slm}^2 + 2)$

f_{slm} patch load modification factor
 $= 0.5 \frac{b_{slm}}{S}$, but not to be greater than 1.0

f_{dist} factor for the greatest shear force distribution along the span, see *Figure 8.6.5*

$$F_{slm} = P_{slm} l_{slm} b_{slm}$$

P_{slm} bottom slamming pressure as given in *Section 7/4.3* and calculated at the load calculation point defined in *Section 3/5.3.2*, in kN/m²

l_{slm} extent of slamming load area along the span
 $= \sqrt{A_{slm}}$ m, but not to be greater than l_{shr}

l_{shr} effective shear span, as defined in *Section 4/2.1.5*, in m

b_{slm} breadth of impact area supported by primary support member
 $= \sqrt{A_{slm}}$ m, but not to be greater than S

A_{slm} as defined in 6.3.6.1

S primary support member spacing, in m, as defined in *Section 4/2.2.2*

6.3.7.4 For complex arrangements of primary support members, the greatest shear force, Q_{slm} , at any location along the span of each primary support member is to be derived by direct calculation in accordance with Table 8.6.4.

Table 8.6.4 Direct Calculation Methods for Derivation of Q_{slm}		
Type of analysis	Beam theory	Double bottom grillage
Model extent	Overall span of member between effective bending supports	Longitudinal extent to be one cargo tank length Transverse extent to be between inner hopper knuckle and centreline
Assumed end fixity of floors	Fixed at ends	Floors and girders to be fixed at boundaries of the model
Note 1. The envelope of greatest shear force along each primary support member is to be derived by applying the load patch to a number of locations along the span, see 6.3.7.2.		

6.3.7.5 The net web thickness, t_{w-net} , of primary support members adjacent to the shell is not to be less than:

$$t_{w-net} = \frac{s}{70} \sqrt{\frac{\sigma_{yd}}{235}} \text{ mm}$$

Where:

s_w plate breadth, in mm, taken as the spacing between the web stiffening

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.3.8 Connection of longitudinals to primary support members

- 6.3.8.1 Longitudinals are, in general, to be continuous. Where this not practicable end brackets complying with 4/3.2.3 are to be provided.
- 6.3.8.2 The scantlings in way of the end connections of each longitudinal are to comply with the requirements of *Section 4/3.4*.

6.4 Bow Impact

6.4.1 Application

- 6.4.1.1 The side structure in the area forward of $0.1L$ from the F.P. is to be strengthened against bow impact pressures.
- 6.4.1.2 The scantlings described in 6.4 are net scantlings, which are related to gross scantlings as described in 6.1.1.2.
- 6.4.1.3 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus of the primary support member is to apply along the bending span clear of end brackets and cross sectional areas of the primary support member is to be applied at the ends/supports and may be gradually reduced along the span and clear of the ends/supports following the distribution of f_{dist} indicated in *Figure 8.6.5*.

6.4.2 Extent of strengthening

- 6.4.2.1 The strengthening is to extend forward of $0.1L$ from the F.P. and vertically above the minimum design ballast draught, T_{bal} , defined in *Section 4/1.1.5.2*. See *Figure 8.6.6*.

- 6.4.2.2 Outside the strengthening region as given in 6.4.2.1 the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

6.4.3 Design to resist bow impact loads

- 6.4.3.1 In the bow impact region, longitudinal framing is to be carried as far forward as practicable.
- 6.4.3.2 The design of end connections of stiffeners in the bow impact region are to ensure end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with *Section 4/3.2.3*. Where it is not practical to comply with this requirement the net plastic section modulus, $Z_{pl-alt-net}$, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt-net} = \frac{16Z_{pl-net}}{f_{bdg}} \quad \text{cm}^3$$

Where:

Z_{pl-net} effective net plastic section modulus, required by 6.4.5, in cm³

f_{bdg} bending moment factor

$$= 8 \left(1 + \frac{n_s}{2} \right)$$

n_s = 0 for both ends with low end fixity (simply supported)
 = 1.0 for one end equivalent to built in and one end simply supported

6.4.3.3 Scantlings and arrangements at primary support members, including decks and bulkheads, are to comply with 6.4.7. In areas of greatest bow impact load the adoption of web stiffeners arranged perpendicular to the hull envelope plating and the provision of double sided lug connections are, in general to be applied.

6.4.3.4 The main stiffening direction of decks and bulkheads supporting shell framing is to be arranged parallel to the span direction of the supported shell frames, to protect against buckling.

6.4.4 Side shell plating

6.4.4.1 The net thickness of the side shell plating, t_{net} , is not to be less than:

$$t_{net} = 0.0158 a_p s \sqrt{\frac{P_{im}}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p correction factor for the panel aspect ratio

$$= 1.2 - \frac{s}{2100 l_p} \quad \text{but is not to be taken as greater than 1.0}$$

s stiffener spacing, in mm, as defined in Section 4/2.2

l_p length of plate panel, to be taken as the spacing between the primary support members, see Section 4/2.2.2, or panel breakers, in m

P_{im} bow impact pressure as given in Section 7/4.4 and calculated at the load calculation point defined in Section 3/5.1.2, in kN/m²

C_a permissible bending stress coefficient
 = 1.0 for acceptance criteria set AC3

σ_{yd} specified minimum yield stress of the material, in N/mm²

6.4.5 Side shell stiffeners

6.4.5.1 The effective net plastic section modulus, Z_{pl-net} , of each stiffener, in association with the effective plating to which it is attached, is not to be less than:

$$Z_{pl-net} = \frac{P_{im} s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

P_{im} bow impact pressure as given in Section 7/4.4 and calculated at

	the load calculation point defined in <i>Section 3/5.2.2</i> , in kN/m ²
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_{bdg}	effective bending span, as defined in <i>Section 4/2.1.1</i> , in m
f_{bdg}	bending moment factor $= 8 \left(1 + \frac{n_s}{2} \right)$
n_s	= 2.0 for continuous stiffeners or where stiffeners are bracketed at both ends see 6.3.3.1 for alternative arrangements
C_s	permissible bending stress coefficient = 0.9 for acceptance criteria set AC3
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.4.5.2 The net web thickness, t_{w-net} , of each stiffener is not to be less than:

$$t_{w-net} = \frac{P_{im} s l_{shr}}{2 d_{shr} C_t \tau_{yd}} \quad \text{mm}$$

Where:

l_{shr}	effective shear span, as defined in <i>Section 4/2.1.2</i> , in m
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
P_{im}	bow impact pressure as given in <i>Section 7/4.4</i> and calculated at the load calculation point defined in <i>Section 3/5.2.2</i> , in kN/m ²
d_{shr}	effective web depth of stiffener, in mm, as defined in <i>Section 4/2.4.2.2</i>
C_t	permissible shear stress coefficient = 1.0 for acceptance criteria set AC3
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.4.5.3 The slenderness ratio of each longitudinal is to comply with *Section 10/2*.

6.4.5.4 The minimum net thickness of breasthooks/diaphragm plates, t_{w-net} , is not to be less than:

$$t_{w-net} = \frac{s}{70} \sqrt{\frac{\sigma_{yd}}{235}} \quad \text{mm}$$

Where:

s	spacing of stiffeners on the web, as defined in <i>Section 4/2.2</i> , in mm. Where no stiffeners are fitted s is to be taken as the depth of the web
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.4.6 Definition of idealised bow impact load area for primary support members

- 6.4.6.1 The scantlings of items in 6.4.7 are based on the application of the bow impact pressure, as defined in *Section 7/4.4*, to an idealised area of hull envelope plating, where the bow impact load area, A_{slm} , is given by:

$$A_{slm} = \frac{1.1LBC_b}{1000} \quad \text{m}^2$$

Where:

- L rule length, as defined in *Section 4/1.1.1.1*
 B moulded breadth, in m, as defined in *Section 4/1.1.3.1*
 C_b block coefficient, as defined in *Section 4/1.1.9.1*

6.4.7 Primary support members

- 6.4.7.1 Primary support members in the bow impact region are to be configured to ensure effective continuity of strength and the avoidance of hard spots.

- 6.4.7.2 To limit the deflections under extreme bow impact loads and ensure boundary constraint for plate panels, the spacing, S , measured along the shell girth of web frames supporting longitudinal framing or stringers supporting transverse framing is not to be greater than:

$$S = 3 + 0.008L_2 \quad \text{m}$$

Where:

- L_2 rule length, L , as defined in *Section 4/1.1.1.1*, but not to be taken greater than 300m

- 6.4.7.3 End brackets of primary support members are to be suitably stiffened along their edge. Consideration is to be given to the design of bracket toes to minimise abrupt changes of cross-section.

- 6.4.7.4 Tripping arrangements are to comply with *Section 10/2.3.3*. In addition, tripping brackets are to be fitted at the toes of end brackets and at locations where the primary support member flange is knuckled or curved.

- 6.4.7.5 The net section modulus of each primary support member, Z_{net50} , is not to be less than:

$$Z_{net50} = 1000 \frac{f_{bdg-pt} P_{im} b_{slm} f_{slm} l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3$$

Where:

- f_{bdg-pt} correction factor for the bending moment at the ends and considering the patch load

$$= 3f_{slm}^3 - 8f_{slm}^2 + 6f_{slm}$$

- f_{slm} patch load modification factor

$$= \frac{l_{slm}}{l_{bdg}}$$

- l_{slm} extent of bow impact load area along the span

$$= \sqrt{A_{slm}} \quad \text{m, but not to be taken as greater than } l_{bdg}$$

A_{slm}	bow impact load area, in m ² , as defined in 6.4.6.1
l_{bdg}	effective bending span, as defined in Section 4/2.1.4, in m
P_{im}	bow impact pressure as given in Section 7/4.4 and calculated at the load calculation point defined in Section 3/5.3.3, in kN/m ²
b_{slm}	breadth of impact load area supported by the primary support member, to be taken as the spacing between primary support members as defined in Section 4/2.2.2, but not to be taken as greater than l_{slm} , in m
f_{bdg}	bending moment factor = 12 for primary support members with end fixed continuous face plates, stiffeners or where stiffeners are bracketed in accordance with Section 4/3.3 at both ends
C_s	permissible bending stress coefficient = 0.8 for acceptance criteria set AC3
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.4.7.6 The net shear area of the web, $A_{shr-net50}$, of each primary support member at the support/toe of end brackets is not to be less than:

$$A_{shr-net50} = \frac{5f_{pt}P_{im}b_{slm}l_{shr}}{C_t\tau_{yd}} \quad \text{cm}^2$$

Where:

f_{pt}	patch load modification factor $= \frac{l_{slm}}{l_{shr}}$
l_{slm}	extent of bow impact load area along the span $= \sqrt{A_{slm}}$ m, but not to be taken as greater than l_{shr}
l_{shr}	effective shear span, as defined in Section 4/2.1.5, in m
P_{im}	bow impact pressure as given in Section 7/4.4 and calculated at the load calculation point defined in Section 3/5.3.2, in kN/m ²
b_{slm}	breadth of impact load area supported by the primary support member, to be taken as the spacing between primary support members as defined in Section 4/2.2.2, but not to be taken as greater than l_{slm} , in m
C_t	permissible shear stress coefficient = 0.75 for acceptance criteria set AC3
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}}$ N/mm ²
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

6.4.7.7 The net web thickness of each primary support member, t_{w-net} , including decks/bulkheads in way of the side shell is not to be less than:

$$t_{w-net} = \frac{P_{im} b_{slm}}{\sin \varphi_w \sigma_{crb}} \quad \text{mm}$$

Where:

- P_{im} bow impact pressure as given in Section 7/4.4 and calculated at the load calculation point defined in Section 3/5.3.2 or at the intersection of the side shell with the deck/bulkhead, in kN/m²
- b_{slm} breadth of impact load area supported by the primary support member, to be taken as spacing between primary support members as defined in Section 4/2.2.2, but not to be taken as greater than l_{slm} , in m
- φ_w angle, in degrees, between the primary support member web and the shell plate, see Figure 8.6.7
- σ_{crb} critical buckling stress in compression of the web of the primary support member or deck/bulkhead panel in way of the applied load given by Section 10/3.2.1, in N/mm²

6.4.8 Connection of stiffeners to primary support members

- 6.4.8.1 Stiffeners are, in general, to be continuous. Where this not practicable end brackets complying with Section 4/3.2.3 are to be provided.
- 6.4.8.2 The scantlings of the end connection of each stiffener are to comply with Section 4/3.4.

7 APPLICATION OF SCANTLING REQUIREMENTS TO OTHER STRUCTURE

7.1 General

7.1.1 Application

- 7.1.1.1 The requirements of this Sub-Section apply to plating, local and primary support members where the basic structural configurations or strength models assumed in *Section 8/2 to 8/5* are not appropriate. These are general purpose strength requirements to cover various load assumptions and end support conditions. These requirements are not to be used as an alternative to the requirements of *Section 8/2 to 8/5* where those sections can be applied.
- 7.1.1.2 The net scantlings described in 7.2 are related to gross scantlings as follows:
- (a) for plating and local support members, the gross thickness and gross cross-sectional properties are obtained from the requirements of 7.2.2 by adding the full corrosion additions specified in *Section 6/3*.
 - (b) for primary support members, the gross shear area, gross section modulus and other gross cross-sectional properties are obtained from the requirements of 7.2.3 by adding one half of the relevant full corrosion additions specified in *Section 6/3*.
- 7.1.1.3 These requirements are to be applied in conjunction with all other appropriate requirements in *Sections 8, 9 and 10* for the particular structural member under consideration, including longitudinal strength, minimum thickness, proportions and structural stability, strength assessment (FEM), fatigue and hull girder ultimate strength.
- 7.1.1.4 The requirements for local and primary support members are to be specially considered when the member is:
- (a) part of a grillage structure
 - (b) subject to large relative deflection between end supports
 - (c) where the load model or end support condition is not given in *Table 8.7.1*.
- 7.1.1.5 The application of alternative or more advanced calculation methods will be specially considered.

7.2 Scantling Requirements

7.2.1 General

- 7.2.1.1 The design load sets to be applied to the structural requirements for the local and primary support members are given in *Table 8.7.2*, as applicable for the particular structure under consideration. The static and dynamic load components are to be combined in accordance with *Table 7.6.1* and the requirements given in *Section 7/6.3*.

7.2.2 Plating and local support members

- 7.2.2.1 For plating subjected to lateral pressure the net thickness, t_{net} , is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$t_{net} = 0.0158 a_p s \sqrt{\frac{|P|}{C_a \sigma_{yd}}} \quad \text{mm}$$

Where:

α_p	correction factor for the panel aspect ratio $= 1.2 - \frac{s}{2100l_p}$
P	design pressure for the design load set being considered, calculated at the load calculation point defined in <i>Section 3/5.1.2</i> , in kN/m ²
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_p	length of plate panel, to be taken as the spacing of primary support members, S , unless carlings are fitted, in m
C_a	permissible bending stress coefficient for the design load set being considered, as given in <i>Tables 8.2.4, 8.3.2 or 8.4.2</i> , as applicable for the individual member being considered
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

7.2.2.2 For stiffeners subjected to lateral pressure, point loads, or some combination thereof, the net section modulus requirement, Z_{net} , is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$Z_{net} = \frac{|P| s l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3, \text{ for lateral pressure loads}$$

$$Z_{net} = \frac{1000 |F| l_{bdg}}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3, \text{ for point loads}$$

$$Z_{net} = \frac{\left| \sum \frac{P_i s l_{bdg}^2}{f_{bdg-i}} + \sum \frac{1000 F_j l_{bdg}}{f_{bdg-j}} \right|}{C_s \sigma_{yd}} \quad \text{cm}^3, \text{ for a combination of loads}$$

Where:

P	design pressure for the design load set being considered, calculated at the load calculation point defined in <i>Section 3/5.2.2</i> , in kN/m ²
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_{bdg}	effective bending span, as defined in <i>Section 4/2.1.1</i>
f_{bdg}	bending moment factor for continuous stiffeners and where end connections are fitted consistent with idealization of the stiffener as having fixed ends: = 12 for horizontal stiffeners = 10 for vertical stiffeners for other configurations the bending moment factor may be taken as in <i>Table 8.7.1</i>
C_s	permissible bending stress coefficient for the design load set being considered as given in <i>Tables 8.2.5, 8.3.3 or 8.4.3</i> , as applicable for the individual member being considered

σ_{yd}	specified minimum yield stress of the material, in N/mm ²
F	point load for the design load set being considered, in kN
i	indices for load component i
j	indices for load component j

7.2.2.3 For stiffeners subjected to lateral pressure, point loads, or some combination thereof, the net web thickness, t_{w-net} , based on shear area requirements is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$t_{w-net} = \frac{f_{shr} |P| s l_{shr}}{d_{shr} C_t \tau_{yd}} \quad \text{mm, for lateral pressure loads}$$

$$t_{w-net} = \frac{1000 f_{shr} |F|}{d_{shr} C_t \tau_{yd}} \quad \text{mm, for point loads}$$

$$t_{w-net} = \frac{\left| \sum f_{shr-i} P_i s l_{shr} + \sum 1000 f_{shr-j} F_j \right|}{d_{shr} C_t \tau_{yd}} \quad \text{mm, for a combination of loads}$$

Where:

P	design pressure for the design load set being considered, calculated at the load calculation point defined in <i>Section 3/5.2.2</i> , in kN/m ²
f_{shr}	shear force factor for continuous stiffeners and where end connections are fitted consistent with idealization of the stiffener as having fixed ends: = 0.5 for horizontal stiffeners = 0.7 for vertical stiffeners for other configurations the shear force factor may be taken as in <i>Table 8.7.1</i> .
s	stiffener spacing, in mm, as defined in <i>Section 4/2.2</i>
l_{shr}	effective shear span, as defined in <i>Section 4/2.1.2</i>
d_{shr}	as defined in <i>Section 4/2.4.2.2</i>
C_t	permissible shear stress coefficient for the design load set being considered as given in <i>Tables 8.2.6</i> or <i>8.3.4</i> , as applicable for the individual member being considered
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²
F	point load for the design load set being considered, in kN
i	indices for load component i
j	indices for load component j

7.2.3 Primary support members

- 7.2.3.1 The requirements in 7.2.3 are applicable where the primary support member is idealised as a simple beam. More advanced calculation methods may be required to ensure that nominal stress level for all primary support members are less than the permissible stresses and stress coefficients given in 7.2.3.4 and 7.2.3.5 when subjected to the applicable design load sets. See also 7.1.1.4.
- 7.2.3.2 The section modulus and web thickness of the local support members apply to the areas clear of the end brackets. The section modulus and cross sectional shear areas of the primary support member are to be applied as required in the notes of *Table 8.7.1*.
- 7.2.3.3 For primary support members intersecting with or in way of curved hull sections, the effectiveness of end brackets is to include an allowance for the curvature of the hull.
- 7.2.3.4 For primary support members the net section modulus requirement, Z_{net50} , is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$Z_{net50} = \frac{1000 |P| S l_{bdg}^2}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3, \text{ for lateral pressure loads}$$

$$Z_{net50} = \frac{1000 |F| l_{bdg}}{f_{bdg} C_s \sigma_{yd}} \quad \text{cm}^3, \text{ for point loads}$$

$$Z_{net50} = \frac{\left| \sum \frac{1000 P_i S l_{bdg}^2}{f_{bdg-i}} + \sum \frac{1000 F_j l_{bdg}}{f_{bdg-j}} \right|}{C_s \sigma_{yd}} \quad \text{cm}^3, \text{ for a combination of loads}$$

Where:

- P design pressure for the design load set being considered, calculated at the load calculation point defined in *Section 3/5.3.3*, in kN/m²
- S primary support member spacing, in m, as defined in *Section 4/2.2.2*
- l_{bdg} effective bending span, as defined in *Section 4/2.1.4*
- f_{bdg} bending moment factor, as given in *Table 8.7.1*.
- C_s permissible bending stress coefficient for the design load set being considered as given in *Tables 8.2.10* or *8.3.6*, as applicable for the individual member being considered
- σ_{yd} specified minimum yield stress of the material, in N/mm²
- F point load for the design load set being considered, in kN
- i indices for load component i
- j indices for load component j

7.2.3.5 For primary support members the net shear area of the web, $A_{shr-net50}$, is to be taken as the greatest value for all applicable design load sets given in *Table 8.7.2*, and given by:

$$A_{shr-net50} = \frac{10f_{shr}|P|Sl_{shr}}{C_t\tau_{yd}} \quad \text{cm}^2, \text{ for lateral pressure loads}$$

$$A_{shr-net50} = \frac{10f_{shr}|F|}{C_t\tau_{yd}} \quad \text{cm}^2, \text{ for point loads}$$

$$A_{shr-net50} = \frac{|\sum 10f_{shr-i}P_i l_{shr} + \sum 10f_{shr-j}F_j|}{C_t\tau_{yd}} \quad \text{cm}^2, \text{ for a combination of}$$

loads

Where:

P	design pressure for the design load set being considered, calculated at the load calculation point defined in <i>Section 3/5.3.2</i> , in kN/m ²
S	primary support member spacing, in m, as defined in <i>Section 4/2.2.2</i>
l_{shr}	effective shear span, as defined in <i>Section 4/2.1.5</i>
f_{shr}	shear force factor, as given in <i>Table 8.7.1</i>
C_t	permissible shear stress coefficient for the design load set being considered as given in <i>Tables 8.2.10</i> or <i>8.3.7</i> , as applicable for the individual member being considered
τ_{yd}	$= \frac{\sigma_{yd}}{\sqrt{3}} \quad \text{N/mm}^2$
σ_{yd}	specified minimum yield stress of the material, in N/mm ²
F	point load for the design load set being considered, in kN
i	indices for load component i
j	indices for load component j

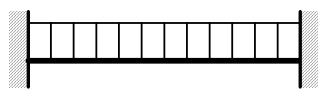

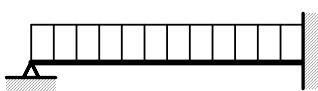

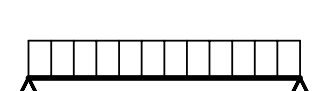

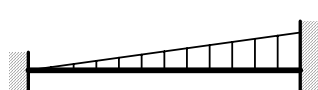

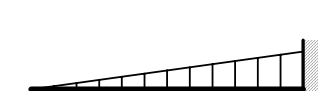

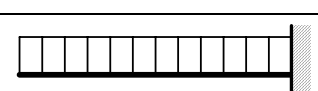

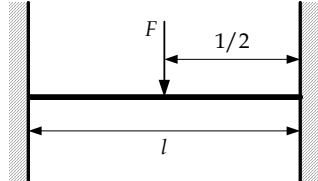

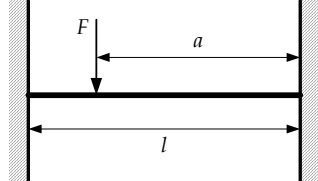

<div>Table 8.7.1</div> <div>Values of f_{bdg} and f_{shr}</div>							
Load and boundary conditions			Bending moment and shear force factor (based on load at mid span where load varies)			Application	
Load model	Position ⁽¹⁾			1	2		3
	1 Support	2 Field	3 Support	f_{bdg1} f_{shr1}	f_{bdg2} -	f_{bdg3} f_{shr3}	
A				12.0 0.50	24.0 -	12.0 0.50	Built in at both ends. Uniform pressure distribution
B				- 0.38	14.2 -	8.0 0.63	Built in one end plus simply supported one end. Uniform pressure distribution
C				- 0.50	8.0 -	- 0.50	Simply supported, (both ends are free to rotate). Uniform pressure distribution
D				15.0 0.30	23.3 -	10.0 0.70	Built in both ends. Linearly varying pressure distribution
E				- 0.20	16.8 -	7.5 0.80	Built in one end plus simply supported one end. Linearly varying pressure distribution
F				- -	- -	2.0 1.0	Cantilevered beam. Uniform pressure distribution
G				8.0 0.5	8.0 -	8.0 0.5	Built in at both ends. Single point load in the centre of the span
H				$\frac{l^3}{a^2(l-a)}$ $\frac{a^2(3l-2a)}{l^3}$	$\frac{l^4}{2a^2(l-a)^2}$ -	$\frac{l^3}{a(l-a)^2}$ $\frac{(l-a)^2(l+2a)}{l^3}$	Built in at both ends. Single point load, with load anywhere in the span

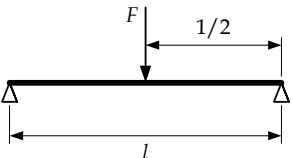

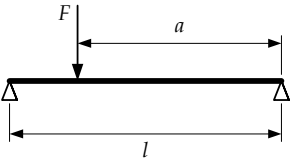

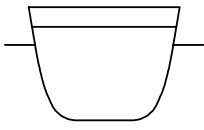

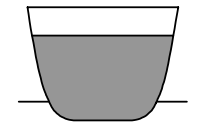

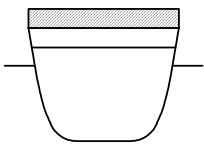

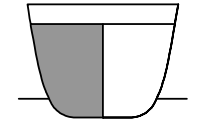

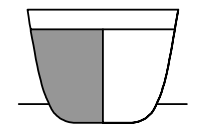

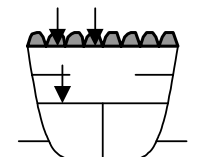

Table 8.7.1 (Continued) Values of f_{bdg} and f_{shr}							
Load and boundary conditions				Bending moment and shear force factor (based on load at mid span where load varies)			Application
Load model	Position ⁽¹⁾			1	2	3	
	1 Support	2 Field	3 Support	f_{bdg1} f_{shr1}	f_{bdg2} -	f_{bdg3} f_{shr3}	
I				- 0.5	4 -	- 0.5	Simply supported. Single point load in the centre of the span
J				- $\frac{a}{l}$	$\frac{l^2}{a(l-a)}$ -	- $\frac{l-a}{l}$	Simply supported. Single point load, load anywhere along the span
Note							
1. The bending moment factor f_{bdg} for the support positions are applicable for a distance of $0.2l_{bdg}$ from the end of the effective bending span for both local and primary support members.							
2. The shear force factor f_{shr} for the support positions are applicable for a distance of $0.2l_{shr}$ from the end of the effective shear span for both local and primary support members.							
3. Application of f_{bdg} and f_{shr} for local support members: (a) the section modulus requirement of local support members is to be determined using the lowest value of f_{bdg1} , f_{bdg2} and f_{bdg3} (b) the shear area requirement of local support members is to be determined using the greatest value of f_{shr1} and f_{shr3} .							
4. Application of f_{bdg} and f_{shr} for primary support members: (a) the section modulus requirement within $0.2l_{bdg}$ from the end of the effective span is generally to be determined using the applicable f_{bdg1} and f_{bdg3} , however f_{bdg} is not to be taken greater than 12 (b) the section modulus of mid span area is to be determined using $f_{bdg} = 24$, or f_{bdg2} from the table if lesser (c) the shear area requirement of end connections within $0.2l_{shr}$ from the end of the effective span is to be determined using $f_{shr} = 0.5$ or the applicable f_{shr1} or f_{shr3} , whichever is greater (d) for models A through F the value of f_{shr} may be gradually reduced outside of $0.2l_{shr}$ towards $0.5f_{shr}$ at mid span where f_{shr} is the greater value of f_{shr1} and f_{shr3} .							
Where: l effective span, l_{bdg} and l_{shr} as applicable l_{bdg} as defined in Section 4/2.1.1 for local support members and Section 4/2.1.4 for primary support members l_{shr} as defined in Section 4/2.1.2 for local support members and Section 4/2.1.5 for primary support members							

Table 8.7.2
Design Load Sets for Plating, Local Support Members and Primary Support Members

Type of Local Support and Primary Support Member	Design Load Set ⁽¹⁾	Load Component	External Draught	Comment	Diagrammatic Representation
Shell Envelope	1	P_{ex}	T_{sc}	Sea pressure only	
	2	P_{ex}	T_{sc}		
	5	P_{in}	T_{bal}	Tank pressure only. Sea pressure to be ignored	
	6	P_{in}	$0.25T_{sc}$		
External Decks	1	P_{ex}	T_{sc}	Green sea pressure only	
Cargo Tank Boundaries	3	P_{in}	$0.6T_{sc}$	Pressure from one side only Full tank with adjacent tank empty	
	4	P_{in}	-		
	11	$P_{in-flood}$	-		
Other Tank Boundaries or Watertight Boundaries	5	P_{in}	T_{bal}	Pressure from one side only Full tank with adjacent tank empty	
	6	P_{in}	$0.25T_{sc}$		
	11	$P_{in-flood}$	-		
Internal and External Decks or Flats	9	P_{dk}	T_{bal}	Distributed or concentrated loads only. Adjacent tanks empty. Green sea pressure may be ignored	
	10	P_{dk}	T_{bal}		

Where:

T_{sc} scantling draught, in m, as defined in Section 4/1.1.5.5

T_{bal} minimum design ballast draught, in m, as defined in Section 4/1.1.5.2

Notes

- The specification of design load combinations, and other load parameters for the design load sets are given in Table 8.2.8
- When the ship's configuration cannot be described by the above, then the applicable Design Load Sets to determine the scantling requirements of structural boundaries are to be selected so as to specify a full tank on one side with the adjacent tank or space empty. The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected. See Note 4 on Table 8.2.7 and Table 8.2.8.
- The boundaries of void and dry space not forming part of the hull envelope are to be evaluated using Design Load Set 11. See Note 2.

SECTION 9

DESIGN VERIFICATION

1 HULL GIRDER ULTIMATE STRENGTH

1.1 General

1.1.1 Application

- 1.1.1.1 The hull girder ultimate bending capacity in sagging is to be evaluated and checked to ensure it satisfies the following criteria. The criteria are applicable to intact ship structures, in extreme at sea conditions. They do not cover hogging, harbour or damaged conditions.
- 1.1.1.2 The scantling requirements in this Sub-Section are to be applied within 0.4L amidships and are in addition to all other requirements within the rules.
- 1.1.1.3 Outside the 0.4L region of amidships the plate and stiffeners may be gradually reduced towards the local requirements at the ends.

1.2 Rule Criteria

1.2.1 Vertical hull girder ultimate bending capacity

- 1.2.1.1 The vertical hull girder ultimate bending capacity is to satisfy the following criteria:

$$\gamma_S M_{sw} + \gamma_W M_{wv-sag} \leq \frac{M_U}{\gamma_R}$$

Where:

M_{sw} sagging still water bending moment, in kNm, to be taken as specified in *Table 9.1.1*.

M_{wv-sag} sagging vertical wave bending moment, in kNm, to be taken as the midship sagging value defined in *Section 7/3.4.1.1*

M_U sagging vertical hull girder ultimate bending capacity, in kNm, as defined in *Appendix A/1.1.1*

$\gamma_S, \gamma_W, \gamma_R$ are the partial safety factors for the design load combinations given in *1.4*

1.3 Hull Girder Bending Moment Capacity

1.3.1 Calculation of capacity

- 1.3.1.1 The hull girder ultimate bending capacity, M_U , in sagging is to be calculated according to *Appendix A/1.1.1*.
- 1.3.1.2 The effective area for the hull girder ultimate strength capacity assessment is specified in *Section 8/1.2.1*.
- 1.3.1.3 The capacity is to be based on net scantlings using a corrosion addition, $0.5t_{corr}$, see *Section 6/3.2*

1.4 Partial Safety Factors

1.4.1 General

- 1.4.1.1 The partial safety factors given in *Table 9.1.1* apply when M_U is calculated according to the single step method in *Appendix A/2.1* or the incremental method in *A/2.2*. The partial safety factors are given for two different design load combinations and both

combinations are to be satisfied. Note that the definition of M_{sw} is different for each combination.

Table 9.1.1 Partial Safety Factors				
Design load combination	Definition of Still Water Bending Moment, M_{sw}	γ_S	γ_W	γ_R
a)	Permissible sagging still water bending moment, $M_{sw-perm-sea}$, in kNm, see Section 7/2.1.1	1.0	1.2	1.1
b)	Maximum sagging still water bending moment for operational seagoing homogeneous full load condition, $M_{sw-full}$, in kNm, see note 1	1.0	1.3	1.1
Where: γ_S partial safety factor for the sagging still water bending moment γ_W partial safety factor for the sagging vertical wave bending moment covering environmental and wave load prediction uncertainties γ_R partial safety factor for the sagging vertical hull girder bending capacity covering material, geometric and strength prediction uncertainties				
Notes 1 The maximum sagging still water bending moment is to be taken from the departure condition with the ship homogeneously loaded at maximum draught and corresponding arrival and any mid-voyage conditions.				

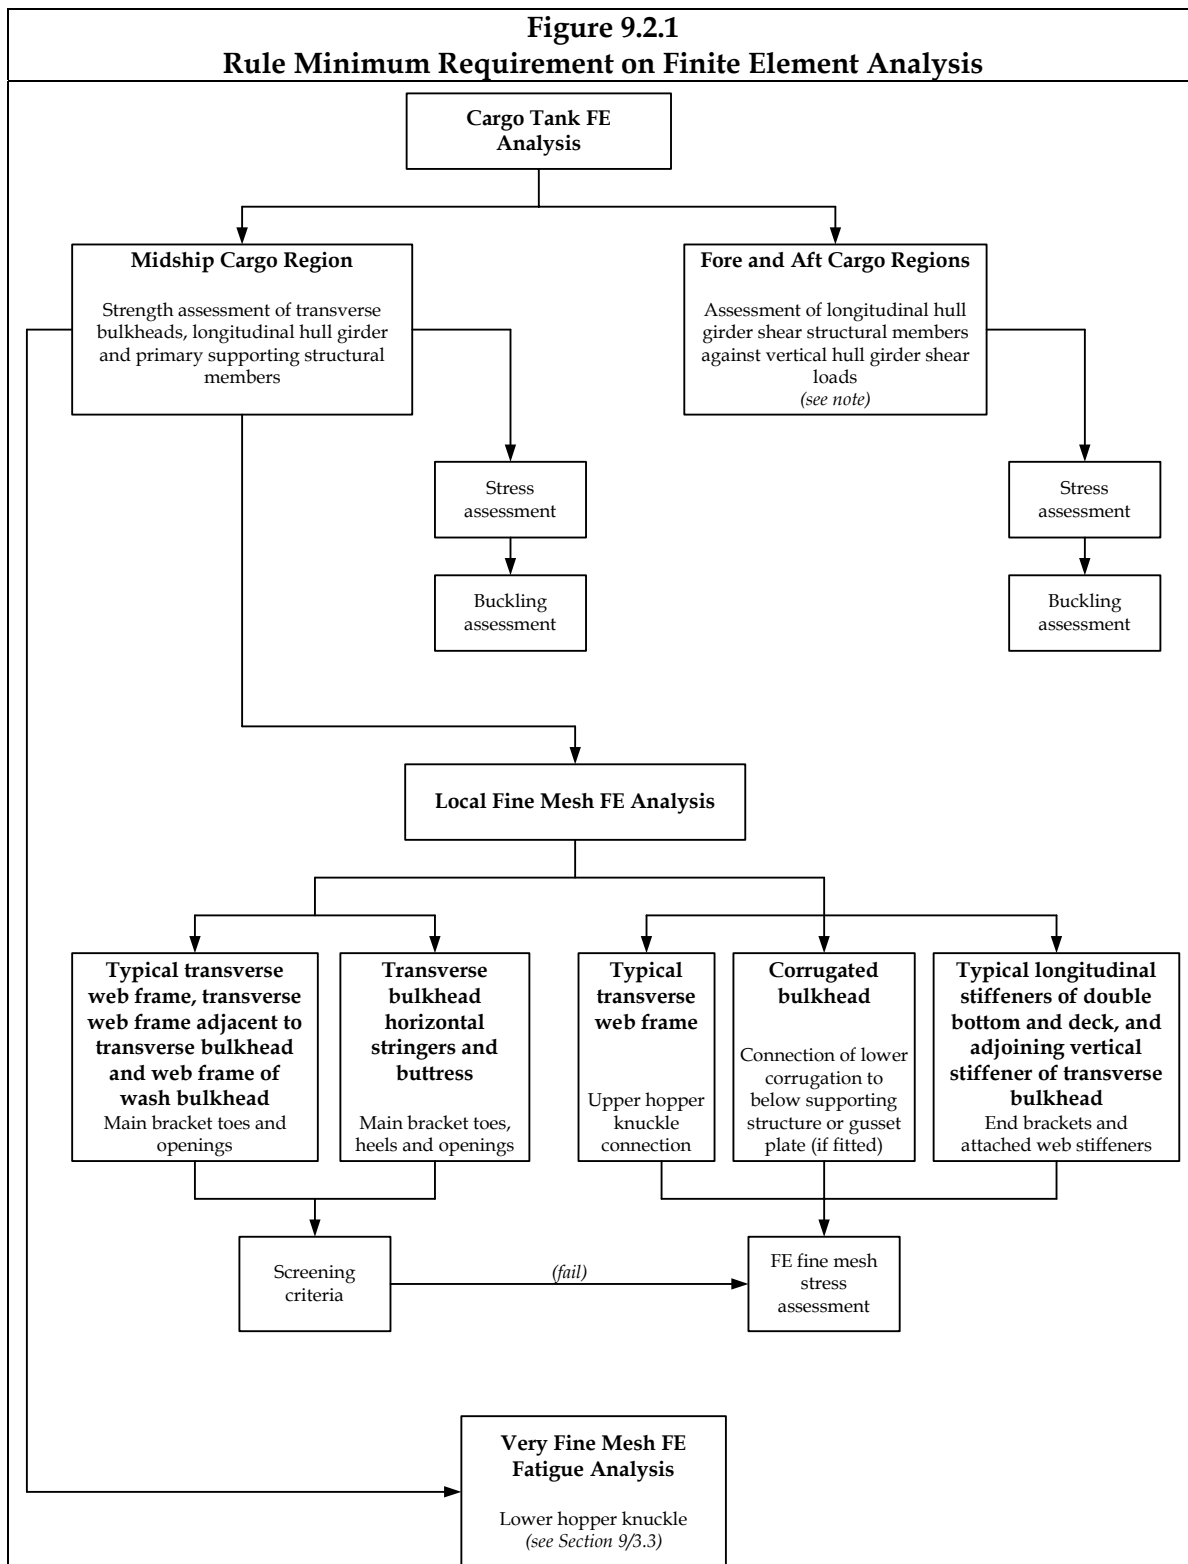

2 STRENGTH ASSESSMENT (FEM)

2.1 General

2.1.1 Application

- 2.1.1.1 A strength assessment of the hull structure using finite element analysis is mandatory.
- 2.1.1.2 The finite element analysis consists of two parts:
 - (a) cargo tank analysis to assess the strength of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads.
 - (b) fine mesh analysis to assess detailed stress levels in local structural details.
- 2.1.1.3 A flow diagram showing the minimum requirement of finite element analysis is shown in *Figure 9.2.1*.
- 2.1.1.4 The structural assessment is to be carried out in accordance with the requirements given in *Appendix B*. The structural assessment is to verify that the acceptance criteria specified in 2.2.5 and 2.3.5 are complied with.
- 2.1.1.5 The application of the scantlings verified by the structural assessment within the cargo tank region is to be in accordance with 2.4.

Figure 9.2.1
Rule Minimum Requirement on Finite Element Analysis

Note

1. The strength assessment of longitudinal hull girder shear structural members, as defined in 2.2.1.1 and Section 4/Table 4.1.1, against hull girder vertical shear loads in way of transverse bulkheads may be based on the midship cargo tank finite element model with modification of plate and stiffener properties where appropriate, see Appendix B/1.1.1 and Appendix B/2.2.1.

2.1.2 Submission of results

- 2.1.2.1 A detailed report of the structural analysis is to be submitted to demonstrate compliance with the specified structural design criteria. This report shall include the following information:
- (a) list of plans used including dates and versions
 - (b) detailed description of structural modelling including all modelling assumptions and any deviations in geometry and arrangement of structure compared with plans
 - (c) plots to demonstrate correct structural modelling and assigned properties
 - (d) details of material properties, plate thickness, beam properties used in the model
 - (e) details of boundary conditions
 - (f) details of all loading conditions reviewed with calculated hull girder shear force and bending moment distributions
 - (g) details of applied loads and confirmation that individual and total applied loads are correct
 - (h) plots and results that demonstrate the correct behaviour of the structural model under the applied loads
 - (i) summaries and plots of global and local deflections
 - (j) summaries and sufficient plots of stresses to demonstrate that the design criteria are not exceeded in any member
 - (k) plate and stiffened panel buckling analysis and results
 - (l) tabulated results showing compliance, or otherwise, with the design criteria
 - (m) proposed amendments to structure where necessary, including revised assessment of stresses, buckling and fatigue properties showing compliance with design criteria.

2.1.3 Computer programs

- 2.1.3.1 In general, any finite element computation program recognised by the Classification Society may be employed to determine the stress and deflection of the hull structure, provided that the combined effects of bending, shear, axial and torsional deformations are considered.
- 2.1.3.2 The computer program used for the assessment of panel buckling capability is to take account of the combined interaction of bi-axial compressive stresses, shear stress and lateral pressure loads, as required by *Section 10/4*.
- 2.1.3.3 A computer program that has been demonstrated to produce reliable results to the satisfaction of the Classification Society is regarded as a recognised program. Where the computer programs employed are not supplied or recognised by the Classification Society, full particulars of the computer program, including calculation output, are to be submitted for approval. It is recommended that the designers consult the Classification Society on the suitability of the computer programs intended to be used prior to the commencement of any analysis work.

2.2 Cargo Tank Structural Strength Analysis

2.2.1 Objective and scope

2.2.1.1 The analysis is to cover at least the assessment of:

- (a) longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads in the midship cargo tank region, and
- (b) longitudinal hull girder shear structural members in way of transverse bulkheads against hull girder vertical shear loads within the cargo area. These structural members include side shell, inner hull longitudinal bulkheads including upper sloped plate where fitted, hopper, longitudinal bulkheads and double bottom girders as defined in *Section 4/Table 4.1.1*. The required strengthening in way of transverse bulkheads for hull girder shear loads in the forward, midship or aft cargo region may be based on the maximum hull girder shear force within the region considered. Alternatively assessment may be carried out to determine the strengthening requirement in way of individual transverse bulkhead position. The details are given in *Appendix B/1.1.1*.

2.2.1.2 The required strengthening in way of transverse bulkheads for hull girder shear loads in the forward, midship or aft cargo region may be based on the maximum hull girder shear force within the region considered. Alternatively assessment may be carried out to determine the strengthening requirement in way of individual transverse bulkhead position. The details are given in *Appendix B/1.1.1*

2.2.1.3 The analysis is to verify that the following are within the acceptance criteria under the applied static and dynamic loads:

- (a) stress level in the plating of longitudinal hull girder structural members, primary support structural members and transverse bulkheads, face plate of primary support members modelled by plate or rod elements.
- (b) buckling capability of plates and stiffened panels.

2.2.2 Structural modelling

2.2.2.1 The modelling scantlings of the cargo tank finite element model are to be based on net scantlings as described in *Section 6/3.3.6.1* and *Appendix B/2.2.1.5*.

2.2.2.2 The length of the cargo tank finite element model is to cover three cargo tank lengths. Where the tanks in the midship cargo region are of different lengths, the middle tank of the finite element model is to represent the cargo tank of the greatest length. All main longitudinal and transverse structural elements are to be represented in the finite element model. These include inner and outer shell, double bottom floor and girder system, transverse and vertical web frames, stringers, transverse and longitudinal bulkhead structures. All plating and stiffeners, including web stiffeners, on these structural elements are to be modelled.

2.2.2.3 The mesh of the finite element model is to follow the stiffening system of the structure as far as practical, and is to represent the actual plate panels between stiffeners.

2.2.2.4 The structure modelling is to be in accordance with the requirements given in *Appendix B/2.2*.

2.2.3 Loads and loading conditions

2.2.3.1 The combinations of the ship static and dynamic loads which are likely to impose the most onerous load regimes on the hull structure are to be investigated in the structural analysis.

- 2.2.3.2 The standard load cases to be used in the structural analysis are given in *Appendix B/2.3.1*. These load cases cover seagoing conditions (design load combination S + D) and harbour/tank testing conditions (design load combination S).
- 2.2.3.3 Where the loading conditions specified by the designer are not covered by the standard load cases then these additional loading conditions are to be examined, see also *Appendix B/2.3.1*.

2.2.4 Load applications and boundary conditions

- 2.2.4.1 All simultaneously acting hull girder and local loads are to be applied to the model. The application of local and hull girder loads to the finite element model is to be in accordance with the requirement given in *Appendix B/2.4* and *B/2.5*.
- 2.2.4.2 The boundary conditions to be applied are given in *Appendix B/2.6*.

2.2.5 Acceptance criteria

- 2.2.5.1 Verification of results against the acceptance criteria is to be carried out in accordance with *Appendix B/2.7*.
- 2.2.5.2 Verification of results against the acceptance criteria is to be carried out for all structural members within the longitudinal extent of the middle tanks of the three tank FE model, and the regions forward and aft of the middle tanks up to the extent of the transverse bulkhead stringer and buttress structure. For the assessment of shear strength in way of transverse bulkheads against hull girder shear loads, stress level and buckling capability of inner hull longitudinal bulkheads including upper sloped plate where fitted, side shell, longitudinal bulkheads, hopper and bottom longitudinal girders are to be verified against the acceptance criteria. See also *Appendix B/2.7.1*.
- 2.2.5.3 The structural analysis is to demonstrate that the permissible von Mises stress criteria and utilisation factor against buckling for plate and stiffened panels specified in *Tables 9.2.1* and *9.2.2* are not exceeded.
- 2.2.5.4 Capacity models used for the assessment of local buckling capability of plate and stiffened panels are to be based on deduction of full corrosion addition thickness from the plate and stiffeners, as described in *Section 6/3.3.6.2* and *Appendix B/2.7.3*.
- 2.2.5.5 Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible stresses and buckling utilisation factors given in *Tables 9.2.1* and *9.2.2* are to be reduced by 10% for the corrugation and below supporting structure within the extent defined as follows:
- (a) Full height of the corrugation
 - (b) Supporting structure for a transverse corrugated bulkhead - longitudinally within half a web frame space forward and aft of the bulkhead
 - (c) Supporting structure for a longitudinal corrugated bulkhead - transversely within three longitudinal stiffener spacings from each side of the bulkhead.

Table 9.2.1 Maximum Permissible Stresses	
Structural component	Yield utilisation factor
Internal structure in tanks	
Plating of all non-tight structural members including transverse web frame structure, wash bulkheads, internal web, horizontal stringers, floors and girders. Face plate of primary support members modelled using plate or rod elements	$\lambda_y \leq 1.0$ (load combination S + D)
	$\lambda_y \leq 0.8$ (load combination S)
Structure on tank boundaries	
Plating of deck, sides, inner sides, hopper plate, bilge plate, plane and corrugated cargo tank longitudinal bulkheads. Tight floors, girders and webs	$\lambda_y \leq 0.9$ (load combination S + D)
	$\lambda_y \leq 0.72$ (load combination S)
Plating of inner bottom, bottom, plane transverse bulkheads and corrugated bulkheads.	$\lambda_y \leq 0.8$ (load combination S + D)
	$\lambda_y \leq 0.64$ (load combination S)
<p>Where:</p> <p>λ_y yield utilisation factor</p> <p>$= \frac{\sigma_{vm}}{\sigma_{yd}}$ for plate elements in general</p> <p>$= \frac{\sigma_{rod}}{\sigma_{yd}}$ for rod elements in general</p> <p>σ_{vm} von Mises stress calculated based on membrane stresses at element's centroid, in N/mm²</p> <p>σ_{rod} axial stress in rod element, in N/mm²</p> <p>σ_{yd} specified minimum yield stress of the material, in N/mm², but not to be taken as greater than 315 N/mm² for load combination S + D in areas of stress concentration ⁽²⁾</p>	
<p><u>Note</u></p> <ol style="list-style-type: none"> Structural items given in the table are for guidance only. Stresses for all parts of the FE model specified in 2.2.5.2 are to be verified against the permissible stress criteria. See also <i>Appendix B/2.7.1</i> Areas of stress concentration are corners of openings, knuckle joints, toes and heels of primary supporting structural members and stiffeners Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible stresses are to be reduced by 10% in accordance with 2.2.5.5. 	

(RCN 1, effective from 1 April 2007)

Table 9.2.2 Maximum Permissible Utilisation Factor Against Buckling	
Structural component	Buckling utilisation factor
Plate and stiffened panels ⁽³⁾	$\eta \leq 1.0$ (load combination S + D)
	$\eta \leq 0.8$ (load combination S)
Web plate in way of openings	$\eta \leq 1.0$ (load combination S + D)
	$\eta \leq 0.8$ (load combination S)
Pillar buckling of cross tie structure	$\eta \leq 0.75$ (load combination S + D)
	$\eta \leq 0.65$ (load combination S)
Corrugated bulkheads - flange buckling - column buckling	$\eta \leq 0.9$ (load combination S + D)
	$\eta \leq 0.72$ (load combination S)
Where: η utilisation factor against buckling calculated in accordance with <i>Appendix D/5</i> and <i>Appendix B/2.7.3</i> . Also see <i>Section 10/3.4.1</i> for web plate in way of openings and <i>Section 10/3.5.1</i> for cross tie structure	
<u>Note</u> 1. Buckling capability of curved panels (e.g. bilge plate), face plate and tripping bracket of primary supporting members are not assessed based on finite element stress result 2. Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible buckling utilisation factors are to be reduced by 10% in accordance with 2.2.5.5 3. Permissible buckling utilisation factors specified in this table are applicable for the reference advanced buckling method given in <i>Appendix D/1.1.2</i> . If alternative buckling procedures are used the permissible utilisation factors are to be assessed and if required adjusted to meet acceptance criteria for equivalence specified in <i>Appendix D/1.1.2</i> .	

RCN 1 (effective from 1 July 2009)

2.3 Local Fine Mesh Structural Strength Analysis

2.3.1 Objective and scope

2.3.1.1 For tankers of conventional arrangements, as a minimum requirement, the following areas in the midship cargo region are to be investigated:

- main bracket toes and openings at critical locations and upper hopper knuckle joint of a typical transverse web frame located in the midship tank. Where a wash bulkhead is fitted, main bracket toes and openings at critical locations of transverse and vertical webs
- main bracket toes and openings at critical locations on a typical transverse web frame adjacent to a transverse bulkhead in way of the transverse bulkhead horizontal stringers
- main bracket toes, heels and openings at critical locations of horizontal stringers, connection of transverse bulkhead to double bottom girder or buttress of a typical transverse bulkhead
- connections of transverse and longitudinal corrugated bulkheads to bottom stool or inner bottom and double bottom supporting structure if a lower stool is

not fitted. If a gusset plate is fitted the connection between the corrugation and the upper corners of the gusset are to be assessed

- (e) end brackets and attached web stiffeners of typical longitudinal stiffeners of double bottom and deck, and adjoining vertical stiffener of transverse bulkhead.

2.3.1.2 The selection of critical locations on the structural members described in 2.3.1.1 to perform fine mesh analysis is to be in accordance with *Appendix B/3.1*.

2.3.1.3 Where the stress level in areas of stress concentration on structural members not specified in 2.3.1.1 exceeds the acceptance criteria of the cargo tank analysis, a fine mesh analysis is to be carried out to demonstrate satisfactory scantlings.

2.3.1.4 Where the geometry can not be adequately represented in the cargo tank finite element model, a fine mesh analysis may be used to demonstrate satisfactory scantlings. In such cases the average stress within an area equivalent to that specified in the cargo tank analysis (typically s by s) is to comply with the requirement given in *Table 9.2.1*. See also Note 1 of *Table 9.2.3*.

2.3.2 Structural modelling

2.3.2.1 The fine mesh structural models are to be in accordance with the requirements given in *Appendix B/3.2*.

2.3.2.2 The fine mesh analysis may be carried out by means of a separate local finite element model with fine mesh zones, in conjunction with the boundary conditions obtained from the cargo tank model, or by incorporating fine mesh zones into the cargo tank model.

2.3.2.3 The extent of the local finite element models is to be such that the calculated stresses at the areas of interest are not significantly affected by the imposed boundary conditions and application of loads. Detailed requirements on the extension of local finite element models are given in *Appendix B/3.2*.

2.3.2.4 The fine mesh zone is to represent the localised area of high stress. The finite element mesh size within the fine mesh zones is to be not greater than 50mm x 50mm. The extent of the fine mesh zone is to be in accordance with *Appendix B/3.2*.

2.3.2.5 The fine mesh models are to be based on the net scantlings in accordance with *Section 6/3.3.6.3* and *Appendix B/3.2*.

2.3.3 Loads and loading conditions

2.3.3.1 Fine mesh detailed stress analysis is to be carried out for the standard load cases, and any other specifically specified load cases, required by 2.2.3.

2.3.4 Load applications and boundary conditions

2.3.4.1 The application of loads and boundary conditions to the finite element model is to be in accordance with the requirements given in *Appendix B/3.4*.

2.3.5 Acceptance criteria

2.3.5.1 Verification of stress results against the acceptance criteria is to be carried out in accordance with *Appendix B/3.5*.

2.3.5.2 The structural assessment is to demonstrate that the von Mises stresses obtained from the fine mesh finite element analysis do not exceed the maximum permissible stress criteria specified in *Table 9.2.3*.

Table 9.2.3
Maximum Permissible Membrane Stresses for Fine Mesh Analysis

Element stress	Yield utilisation factor
Element not adjacent to weld	$\lambda_y \leq 1.7$ (load combination S + D)
	$\lambda_y \leq 1.36$ (load combination S)
Element adjacent to weld	$\lambda_y \leq 1.5$ (load combination S + D)
	$\lambda_y \leq 1.2$ (load combination S)

Where:

λ_y yield utilisation factor

$$= \frac{k \sigma_{vm}}{235} \quad \text{for plate element}$$

$$= \frac{k \sigma_{rod}}{235} \quad \text{for rod or beam element}$$

σ_{vm} von Mises stress calculated based on membrane stress at element's centroid, in N/mm²

σ_{rod} axial stress in rod element, in N/mm²

k higher strength steel factor, as defined in Section 6/1.1.4 but not to be taken as less than 0.78 for load combination S + D

Note

- Where the von Mises stress of the elements in the cargo tank FE model in way of the area under investigation by fine mesh exceeds its permissible value specified in Table 9.2.1, average von Mises stress, obtained from the fine mesh analysis, calculated over an area equivalent to the mesh size of the cargo tank finite element model is to be less than the permissible value specified in Table 9.2.1
- The maximum permissible stresses are based on the mesh size of 50mm x 50mm. Where a smaller mesh size is used, an average von Mises stress calculated in accordance with Appendix B/3.5.1 over an area equal to the specified mesh size may be used to compare with the permissible stresses.
- Average von Mises stress is to be calculated based on weighted average against element areas:

$$\sigma_{vm-av} = \frac{\sum_{i=1}^n A_i \sigma_{vm-i}}{\sum_{i=1}^n A_i}$$

where

σ_{vm-av} is the average von Mises stress

σ_{vm-i} is the von Mises stress of the *i*th plate element within the area considered

A_i is the area of the *i*th plate element within the area considered

n is the number of elements within the area considered

- Stress averaging is not to be carried across structural discontinuities and abutting structure
- Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the maximum permissible stresses are to be reduced by 10% for the areas under investigation by fine mesh analysis.

2.4 Application of Scantlings in Cargo Tank Region

2.4.1 General

- 2.4.1.1 The application of the scantlings that comply with the requirements of the finite element strength assessment, to the structure within the cargo tank region, is to be in accordance with the requirements given in this sub-section.
- 2.4.1.2 The application given in this sub-section assumes that the same material yield strength of the structure is maintained throughout the cargo tank region. Where steel having a different yield strength is applied, the required scantlings are to be assessed.
- 2.4.1.3 The scaling procedure given in this sub-section is based on scantlings that satisfied the requirements given in *Section 9/2* and *Appendix B*.
- 2.4.1.4 The net thickness and sectional properties for plating and local support members described in this sub-section are to be based on deduction of full corrosion addition, as specified in *Section 6/Table 6.3.2*, from the gross scantlings. The gross thickness of plating, web and face plate of local support members are to be obtained by adding the full corrosion addition to the net thickness.

2.4.2 Application of scantlings to deck

- 2.4.2.1 The scantlings of deck plating and deck longitudinal stiffeners are to be maintained longitudinally within $0.4L$ amidships. The scantlings of deck plating and deck longitudinal stiffeners at a given transverse location within $0.4L$ amidships are not to be taken as less than the maximum of that required for the corresponding transverse location along the length of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*.
- 2.4.2.2 Outside $0.4L$ amidships, the scantlings of the deck plating and deck longitudinal stiffeners may be tapered to that required by *Section 8* at the ends of the cargo tank region.

2.4.3 Application of scantlings to inner bottom

- 2.4.3.1 The thickness of inner bottom plating may vary along the length and breadth of a tank.
- 2.4.3.2 The scantlings of the inner bottom plating and longitudinal stiffeners of midship cargo tanks are not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks.
- 2.4.3.3 For the fore-most and aft-most cargo tanks, the scantlings of the inner bottom longitudinal stiffeners are not to be less than the scantling requirements for the midship cargo tanks provided that the spacing of primary support members are not reduced in the forward and/or aft cargo tank. The minimum net thickness of the inner bottom plate, t_{ib-net} , is given by:

$$t_{ib-net} = t_{ib-net-mid} \left(\frac{l_{bdg}}{l_{bdg-mid}} \right)^{0.25} \frac{s_{ib}}{s_{ib-mid}} \quad \text{mm}$$

where:

$t_{ib-net-mid}$	required net thickness of the inner bottom plating for the corresponding location in the midship tank, in mm
l_{bdg}	effective bending span, of floor at location under consideration, in accordance with <i>Figure 4.2.7</i> , in m
$l_{bdg-mid}$	effective bending span, of floor at corresponding location in midship tank, defined in accordance with <i>Figure 4.2.7</i> , in m
s_{ib}	spacing between longitudinal stiffeners at location under consideration, in mm
s_{ib-mid}	spacing between longitudinal stiffeners at corresponding location in midship tank, in mm

2.4.4 Application of scantlings to bottom

- 2.4.4.1 The scantlings of bottom longitudinal stiffeners are to be maintained longitudinally within $0.4L$ amidships. The scantlings of the bottom longitudinal stiffener at a given transverse location within $0.4L$ amidships are not to be less than the maximum of that required for the corresponding transverse location along the length of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*.
- 2.4.4.2 Outside $0.4L$ amidships, the scantlings of the bottom longitudinal stiffeners may be tapered to that required by *Section 8* at the ends of the cargo region.
- 2.4.4.3 The thickness of the bottom plating may vary along the length and breadth of a tank. The bottom plate thicknesses of midship tanks are not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These thicknesses are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks.
- 2.4.4.4 For the fore-most and aft-most cargo tanks, the required minimum net thickness of the bottom plating, $t_{btm-net}$, is to be obtained as follows:

$$t_{btm-net} = t_{btm-net-mid} \left(\frac{l_{bdg}}{l_{bdg-mid}} \right)^{0.25} \frac{s_{btm}}{s_{btm-mid}} \quad \text{mm}$$

where:

$t_{btm-net-mid}$	required net thickness of the bottom plating for the corresponding location in the midship tank, in mm
l_{bdg}	effective bending span, of floor at location under consideration, in accordance with <i>Figure 4.2.7</i> , in m
$l_{bdg-mid}$	effective bending span, of floor at corresponding location in midship tank, defined in accordance with <i>Figure 4.2.7</i> , in m
s_{btm}	spacing between longitudinal stiffeners at location under consideration, in mm
$s_{btm-mid}$	spacing between longitudinal stiffeners at corresponding location in midship tank, in mm

2.4.5 Application of scantlings to side shell, longitudinal bulkheads and inner hull longitudinal bulkheads

- 2.4.5.1 The scantlings of plating and longitudinal stiffeners of side shell, longitudinal bulkheads and inner longitudinal bulkheads within $0.15D$ from the deck are to be maintained longitudinally within $0.4L$ amidships. The scantlings of plating and longitudinal stiffener at a given height are not to be less than the maximum of that required for the corresponding vertical location along the length of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. Outside $0.4L$ amidships, the scantlings of the plating and stiffeners within $0.15D$ from the deck may be tapered to that required by *Section 8* at the ends of the cargo tank region.
- 2.4.5.2 The plate thickness of side shell, longitudinal bulkheads and inner hull longitudinal bulkheads, including hopper plating, outside $0.15D$ from the deck may vary along the length and height of a tank. The plate thickness away from the transverse bulkheads is not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks. For the fore-most and aft-most cargo tanks, the minimum net thickness of the side shell, longitudinal bulkheads or inner hull longitudinal bulkheads (including hopper plating) plating outside $0.15D$ from the deck is given by:

$$t_{net} = t_{net-mid} \frac{s}{s_{mid}} \quad \text{mm}$$

Where:

$t_{net-mid}$	required net thickness for corresponding location in the midship tank, in mm
s	spacing between longitudinal stiffeners at location under consideration, in mm
s_{mid}	spacing between longitudinal stiffeners at corresponding location in midship tank, in mm

- 2.4.5.3 The plate thickness of side shell, longitudinal bulkheads and inner hull longitudinal bulkheads, including hopper plating, in way of transverse bulkheads required for strengthening against hull girder shear loads is not to be less than that required by *Appendix B/1.1.1.6*, *B/1.1.1.7* and *B/1.1.1.8*. Within $0.15D$ from the deck, the plate thicknesses in way of transverse bulkheads are not to be taken as less than that required by 2.4.5.1. Outside $0.15D$ from the deck, the plate thicknesses in way of transverse bulkheads are not to be taken as less than that required by 2.4.5.2.
- 2.4.5.4 The scantlings of longitudinal stiffeners of side shell, longitudinal bulkheads, inner longitudinal bulkheads and hopper plate at a given height, outside $0.15D$ from the deck, are not to be less than that required for the corresponding vertical location of the middle tanks of the cargo tank finite element model as required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region.

2.4.6 Application of scantlings to transverse bulkheads

- 2.4.6.1 The scantlings of transverse bulkhead plating, stiffeners and horizontal stringers may vary along the height and breadth of the bulkhead. The scantlings at a given location are not to be less than the maximum required at the corresponding location

of both middle tank end transverse bulkheads of the cargo tank finite element model as required by *Appendix B/1.1.1.5*.

2.4.7 Application of scantlings to primary structural support members

- 2.4.7.1 The web thickness of primary structural support members may vary along the length, breadth and height of a tank. The scantlings of the primary structural support members are not to be less than that required for the corresponding location of the middle tanks of the cargo tank finite element model required by *Appendix B/1.1.1.5*. These scantlings are to be maintained for all tanks within the cargo region, other than the fore-most and aft-most cargo tanks.
- 2.4.7.2 Scantling requirements for primary support members in the fore-most and aft-most cargo tanks are to be determined by scaling the scantlings of the corresponding structural members in the midship tanks in accordance with *Section 8/2.6.9*.

2.4.8 Structural details and openings

- 2.4.8.1 Arrangement and scantlings of openings and structural details of primary structural members, complying with the requirements of *Appendix B/3*, are to be applied to the corresponding structural members in all tanks within the cargo tank region.

3 FATIGUE STRENGTH

3.1 Fatigue Evaluation

3.1.1 General

- 3.1.1.1 This Sub-Section, together with *Appendix C*, gives the minimum Rule requirements for design against fatigue failure for the structural details stipulated in these Rules. Structural details at other locations that are considered to be critical may require assessment using a procedure consistent with that contained in these Rules.
- 3.1.1.2 The fatigue criteria, applicable to a broad range of structural details and arrangements, are to be used for the assessment of fatigue strength utilising numerical techniques.
- 3.1.1.3 The fatigue analysis is to be carried out using either a '*nominal stress approach*' or a '*hot spot stress approach*' depending on the structural details, as specified in 3.4. The procedure is illustrated in *Figure 9.3.1*.
- 3.1.1.4 In a *nominal stress approach*, stresses in a structural component are calculated by using either analytical methods (e.g. a beam model) or using numerical methods (e.g. a coarse finite element mesh), based on the applied loads and the structural properties of the component.
- 3.1.1.5 In a *hot spot stress approach*, local stresses at a critical location (hot spot) where fatigue cracks may initiate are evaluated by numerical methods (e.g. a fine mesh finite element analysis). The analysis takes into account the influence of structural discontinuities due to the geometry of the connection but excludes the effects of welds.

3.2 Fatigue Criteria

3.2.1 Corrosion model

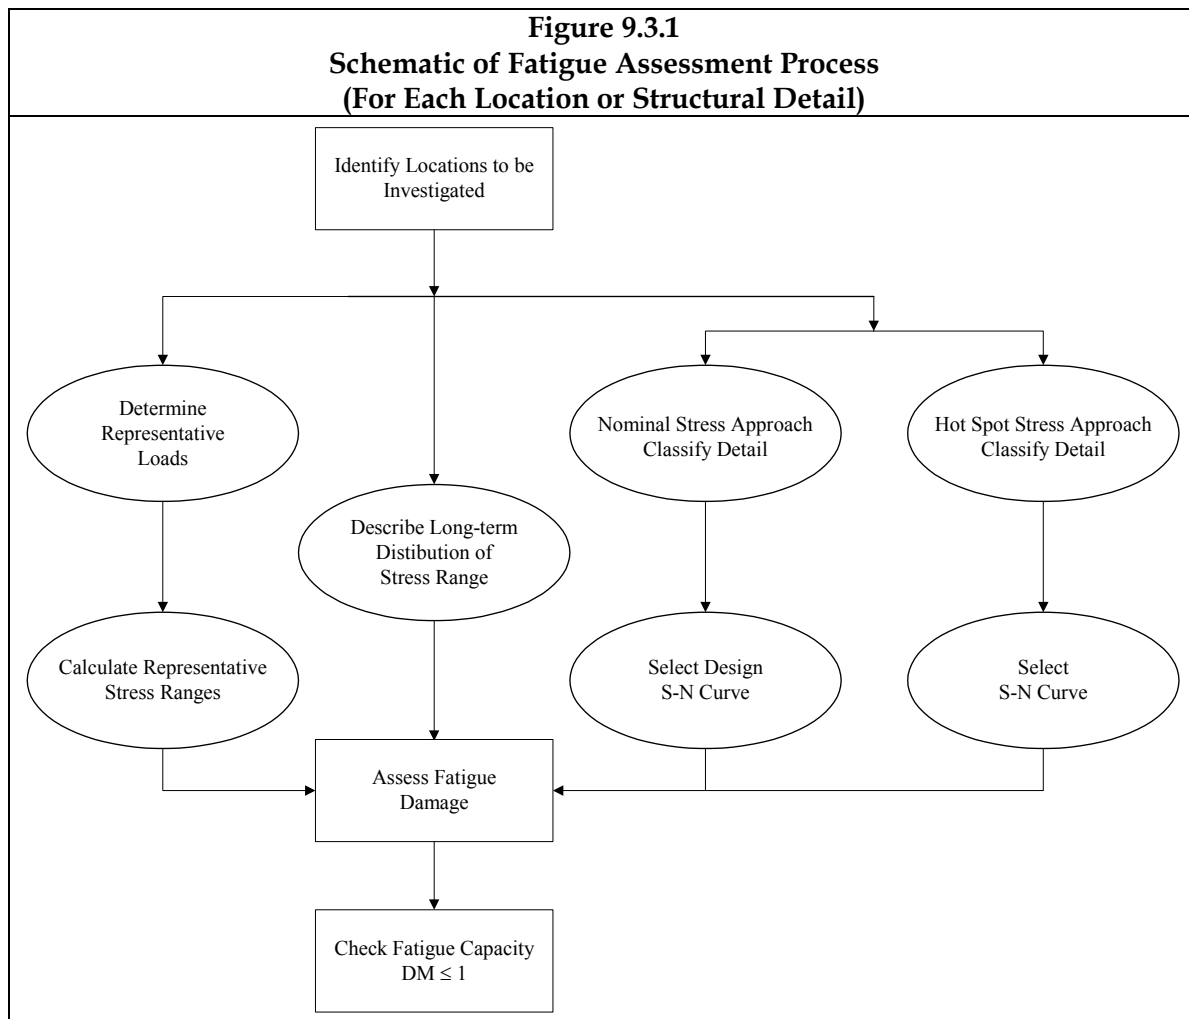

- 3.2.1.1 Net thicknesses in accordance with *Section 6/3.3.7* are to be used in the fatigue assessment.

3.2.2 Loads

- 3.2.2.1 The loads specified in *Section 7/3*, which are based on the North Atlantic wave environment, are to be used for the fatigue assessment. Other secondary cyclic loading, such as slamming, low cycle, or vibration induced fatigue, which may result in significant levels of stress range over the expected lifetime of the vessel, although not within the scope of these Rules, may need to be specially considered.
- 3.2.2.2 These Rules assume a 10^{-4} probability level of exceedance for the purposes of load application and fatigue strength assessment.

3.2.3 Acceptance criteria

- 3.2.3.1 The criteria stated in this sub-section and *Appendix C* are presented as a comparison of fatigue strength of the structure (capacity), and fatigue inducing loads (demands), in the form of a fatigue damage parameter, *DM*, see *Appendix C/1.4.1.1*. The calculated fatigue damage, *DM*, is to be less than or equal to 1 for the design life of the ship, which is not to be taken as less than 25 years.

3.3 Locations to Apply

3.3.1 Longitudinal structure

3.3.1.1 A fatigue strength assessment is to be carried out and submitted for the end connections of longitudinal stiffeners to transverse bulkheads, including wash bulkheads and web frames within the cargo tank region, located on the bottom shell, inner bottom, side shell, inner hull longitudinal bulkheads, longitudinal bulkheads and strength deck.

3.3.1.2 A fatigue strength assessment is to be carried out for scallops in way of block joints on the strength deck within the cargo tank region.

3.3.2 Transverse structure

3.3.2.1 A fatigue strength assessment is to be carried out and submitted for the knuckle between inner bottom and hopper plate for at least one transverse frame close to amidships. The total stress range for fatigue assessment is to be determined from a fine mesh finite element analysis.

3.4 Fatigue Assessment Methods

3.4.1 Nominal stress approach

- 3.4.1.1 The nominal stress approach, as described in *Appendix C/1*, is to be used for the fatigue evaluation of the following items:
- (a) longitudinal stiffener end connections to the transverse bulkheads, including wash bulkheads, and web frames on the bottom, inner bottom, side shell, inner hull longitudinal bulkheads, longitudinal bulkheads and strength deck.
 - (b) scallops in way of block joints on the strength deck as described in *Appendix C/1.6*.

3.4.2 Hot spot stress approach

- 3.4.2.1 The hot spot stress approach, as described in *Appendix C/2*, is to be used for the fatigue evaluation of the following items:
- (a) knuckle between inner bottom and hopper plate.

3.4.3 Alternative direct calculation approach

- 3.4.3.1 Where it is considered necessary to carry out a fatigue assessment using an alternative direct calculation approach, not applying the loads specified in *Section 7/3*, it is to be based on the individual Classification Society's procedures. However, in no case are the scantlings to be lower than those which would be required by 3.4.1 and 3.4.2.

SECTION 10

BUCKLING AND ULTIMATE STRENGTH

1 GENERAL

1.1 Strength Criteria

1.1.1 Scope

- 1.1.1.1 This Section contains the strength criteria for buckling and ultimate strength of local support members, primary support members and other structure such as pillars, corrugated bulkheads and brackets. These criteria are to be applied as specified in *Section 8* for determining the initial structural scantlings and also *Section 9* for the design verification.
- 1.1.1.2 All structural elements are to comply with the stiffness and proportions requirements specified in *Sub-Section 2*.
- 1.1.1.3 For each structural member the characteristic buckling strength is to be taken as the most unfavourable/critical buckling mode.
- 1.1.1.4 The strength criteria are to be based on the following assumptions and limitations in respect to buckling and ultimate strength control in design:
 - (a) the buckling strength of stiffeners is to be greater than the plate panels they support
 - (b) the primary support members supporting stiffeners are to have sufficient inertia to prevent out of plane buckling of the primary member, see 2.3.2.3
 - (c) all stiffeners with their associated effective plate are to have moments of inertia to provide adequate lateral stability, see 2.2.2
 - (d) the proportions of local support members and primary support members are to be such that local instability is prevented
 - (e) tripping of primary support members (e.g. torsional instability) is to be prevented by fitment of tripping brackets or equivalents, see in 2.3.3
 - (f) the web plate of primary support members is to be such that elastic buckling of the plate between web stiffeners is prevented
 - (g) for plates with openings, the buckling strength of the areas surrounding the opening or cut out and any edge reinforcements are adequate, see 3.4.2 and 2.4.3.

2 STIFFNESS AND PROPORTIONS

2.1 Structural Elements

2.1.1 General

- 2.1.1.1 All structural elements are to comply with the applicable slenderness or proportional ratio requirements in 2.2 to 2.3.
- 2.1.1.2 The following requirements are based on net scantlings, see also *Section 6/3*.
- 2.1.1.3 For structural idealisation and definitions see *Section 4/2*.

2.2 Plates and Local Support Members

2.2.1 Proportions of plate panels and local support members

- 2.2.1.1 The net thickness of plate panels and stiffeners is to satisfy the following criteria:

- (a) plate panels

$$t_{net} \geq \frac{s}{C} \sqrt{\frac{\sigma_{yd}}{235}}$$

- (b) stiffener web plate

$$t_{w-net} \geq \frac{d_w}{C_w} \sqrt{\frac{\sigma_{yd}}{235}}$$

- (c) flange/face plate

$$t_{f-net} \geq \frac{b_{f-out}}{C_f} \sqrt{\frac{\sigma_{yd}}{235}}$$

Where:

s	plate breadth, in mm, taken as the spacing between the stiffeners, as defined in <i>Section 4/2.2.1</i>
t_{net}	net thickness of plate, in mm
d_w	depth of stiffener web, in mm, as given in <i>Table 10.2.1</i>
t_{w-net}	net web thickness, in mm
b_{f-out}	breadth of flange outstands, in mm, as given in <i>Table 10.2.1</i>
t_{f-net}	net flange thickness, in mm
C, C_w, C_f	slenderness coefficients, as given in <i>Table 10.2.1</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

Table 10.2.1
Slenderness Coefficients

Item		Coefficient
plate panel, C	hull envelope and tank boundaries	100
	other structure	125
stiffener web plate, C_w	angle and T profiles	75
	bulb profiles	41
	flat bars	22
flange/face plate ⁽¹⁾ , C_f	angle and T profiles	12

Note

1. The total flange breadth, b_f , for angle and T profiles is not to be less than: $b_f = 0.25d_w$
2. Measurements of breadth and depth are based on gross scantlings

Where:

t_{net}	net thickness of plate, in mm
d_w	depth of web plate, in mm
t_{w-net}	net web thickness, in mm
b_{f-out}	breadth of flange outstands, in mm
t_{f-net}	net flange thickness, in mm

(RCN 1, effective from 1 April 2007)

2.2.2 Stiffness of stiffeners

2.2.2.1 The minimum net moment of inertia about the neutral axis parallel to the attached plate, I_{net} , of each stiffener with effective breadth of plate equal to 80% of the stiffener spacing s , is given by:

$$I_{net} = Cl_{stf}^2 A_{net} \frac{\sigma_{yd}}{235} \quad \text{cm}^4$$

Where:

l_{stf}	length of stiffener between effective supports, in m
A_{net}	net sectional area of stiffener including attached plate assuming effective breadth of 80% of stiffener spacing s , in cm^2
s	stiffener spacing, in mm, as defined in Section 4/2.2.1
σ_{yd}	specified minimum yield stress of the material of the attached

- plate, in N/mm²
- C slenderness coefficient:
 = 1.43 for longitudinals subject to hull girder stresses
 = 0.72 for other stiffeners

2.3 Primary Support Members

2.3.1 Proportions of web plate and flange/face plate

2.3.1.1 The net thicknesses of the web plates and face plates of primary support members are to satisfy the following criteria:

(a) web plate

$$t_{w-net} \geq \frac{s_w}{C_w} \sqrt{\frac{\sigma_{yd}}{235}}$$

(b) flange/face plate

$$t_{f-net} \geq \frac{b_{f-out}}{C_f} \sqrt{\frac{\sigma_{yd}}{235}}$$

Where:

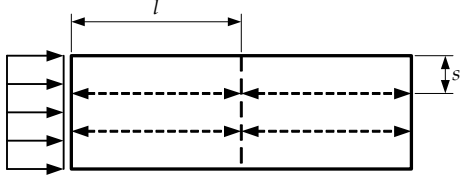

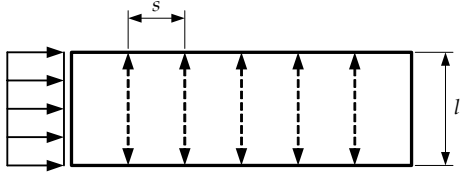

- s_w plate breadth, in mm, taken as the spacing between the web stiffeners. For web plates with stiffening parallel to the attached plate the spacing may be corrected in accordance with *Appendix D/Fig. 5.6*.
- t_{w-net} net web thickness, in mm
- b_{f-out} breadth of flange outstand, in mm
- t_{f-net} net flange thickness, in mm
- C_w slenderness coefficient for the web plate
 = 100
- C_f slenderness coefficient for the flange/face plate
 = 12
- σ_{yd} specified minimum yield stress of the material, in N/mm²

2.3.2 Stiffness requirements

2.3.2.1 The web and flange net thicknesses of web stiffeners are not to be less than specified in 2.2.1.

2.3.2.2 The net moment of inertia of each web stiffener, I_{net} , with effective breadth of plate equal to 80% of stiffener spacing s , is not to be less than as defined in *Table 10.2.2*.

Table 10.2.2
Stiffness Criteria for Web Stiffening

Mode	Inertia requirements, cm ⁴
<p>(a) web stiffeners parallel to the flanges of the primary support member</p> 	$I_{net} = Cl^2 A_{net} \frac{\sigma_{yd}}{235}$
<p>(b) web stiffeners normal to flanges of the primary support member</p> 	$I_{net} = 1.14 \times 10^{-5} l s^2 t_{w-net} \left(2.5 \frac{1000l}{s} - 2 \frac{s}{1000l} \right) \frac{\sigma_{yd}}{235}$
<p>Where:</p> <p>C = 1.43 for longitudinal stiffeners in cargo tank region = 0.72 for other stiffeners</p> <p>l length of web stiffener, in m. For web stiffeners welded to local support members (LSM), the length is to be measured between the flanges of the local support members. For sniped web stiffeners the length is to be measured between the lateral supports e.g. the total distance between the flanges of the primary support member as shown for Mode (b).</p> <p>A_{net} net section area of web stiffener including attached plate assuming effective breadth of 80% of stiffener spacing s, in cm²</p> <p>s spacing of stiffeners, in mm, as defined in Section 4/2.2.1</p> <p>t_{w-net} net web thickness of the primary support member, in mm</p> <p>σ_{yd} specified minimum yield stress of the material of the web plate of the primary support member, in N/mm²</p>	

2.3.2.3 The net moment of inertia for primary support members, $I_{prm-net50}$, supporting stiffeners subject to axial compressive stresses, including effective plate width at mid span, is not to be less than:

$$I_{psm-net50} = 300 \frac{l_{bdg}^4}{S^3 s} I_{net} \quad \text{cm}^4$$

Where:

- l_{bdg} bending span of primary support member, in m
- S distance between primary support members, in m
- s spacing of stiffeners, in mm, as defined in Section 4/2.2.1

I_{net} maximum required moment of inertia, as given in 2.2.2.1, for stiffeners within the central half of the bending span, in cm⁴

2.3.3 Spacing between flange supports or tripping brackets

2.3.3.1 The torsional buckling mode of primary support members is to be controlled by flange supports or tripping brackets. The unsupported length of the flange of the primary support member, i.e. the distance between tripping brackets, s_{bkt} , is not to be greater than:

$$s_{bkt} = b_f C \sqrt{\frac{A_{f-net50}}{\left(A_{f-net50} + \frac{A_{w-net50}}{3}\right) \left(\frac{235}{\sigma_{yd}}\right)}} \text{ m, but need not be less than } s_{bkt-min}$$

Where:

b_f breadth of flange, in mm

C slenderness coefficient:
= 0.022 for symmetrical flanges
= 0.033 for one sided flanges

$A_{f-net50}$ net cross-sectional area of flange, in cm²

$A_{w-net50}$ net cross-sectional area of the web plate, in cm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

$s_{bkt-min}$ = 3.0m for primary support members in the cargo tank region,
on tank boundaries or on the hull envelope including external
decks
= 4.0m for primary support members in other areas

2.4 Other Structure

2.4.1 Proportions of pillars

2.4.1.1 For I-sections the thickness of the web plate and the flange thickness is to comply with 2.2.1.1.

2.4.1.2 The thickness of thin walled box sections is to comply with 2.2.1.1(b). The radius of circular tube sections is to be less than 50 times the net thickness of the pillar.

2.4.2 Proportions of brackets

2.4.2.1 The net thickness of end brackets, $t_{bkt-net}$, is except as specified in 2.4.2.2 not to be less than:

$$t_{bkt-net} = \frac{d_{bkt}}{C} \sqrt{\frac{\sigma_{yd}}{235}} \text{ mm}$$

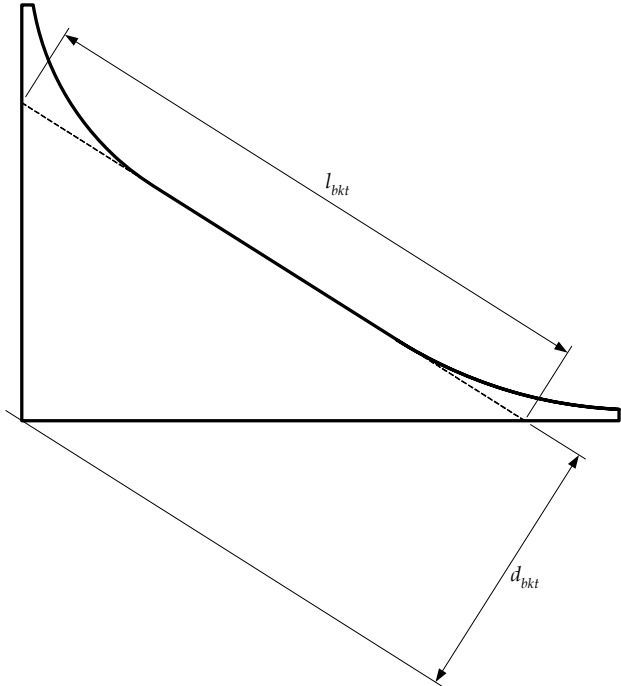

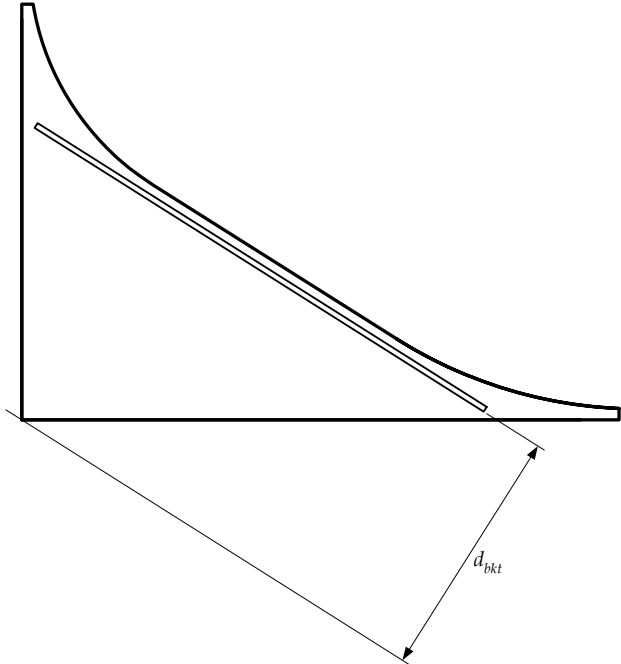

Where:

d_{bkt} depth of brackets, in mm. See Table 10.2.3

C slenderness coefficient as defined in Table 10.2.3

σ_{yd} specified minimum yield stress of the material, in N/mm²

- 2.4.2.2 Where it can be demonstrated that the bracket is only subjected to tensile stresses, e.g. in way of internal brackets in a tank surrounded by void space, the requirement in 2.4.2.1 need not be complied with.

Table 10.2.3 Buckling Coefficient, <i>C</i> , for Proportions of Brackets	
Mode	<i>C</i>
<p>(a) Brackets without edge stiffener</p> 	$C = 20 \left(\frac{d_{bkt}}{l_{bkt}} \right) + 16$ <p>Where:</p> $0.25 \leq \frac{d_{bkt}}{l_{bkt}} \leq 1.0$
<p>(b) Brackets with edge stiffener</p> 	$C = 70$
<p>Where:</p> <p>l_{bkt} effective length of edge of bracket, in mm</p>	

- 2.4.2.3 Tripping brackets on primary support members are to be stiffened by a flange or edge stiffener if the effective length of the edge, l_{bkt} , is greater than:

$$l_{bkt} = 75t_{bkt-net} \quad \text{mm}$$

Where:

$t_{bkt-net}$ bracket thickness, in mm

2.4.3 Requirements to edge reinforcements in way of openings and bracket edges

- 2.4.3.1 The depth of stiffener web, d_w , of edge stiffeners in way of openings and bracket edges is not to be less than:

$$d_w = Cl \sqrt{\frac{\sigma_{yd}}{235}} \quad \text{mm, or 50 mm, whichever is greater}$$

Where:

l length of edge stiffener, in m

σ_{yd} specified minimum yield stress of the material, in N/mm²

C slenderness coefficient

75 for end brackets

50 for tripping brackets

50 for edge reinforcements in way of openings

- 2.4.3.2 The net thickness of the web plate and flange of the edge stiffener is not to be less than that required in 2.2.1.

3 PRESCRIPTIVE BUCKLING REQUIREMENTS

3.1 General

3.1.1 Scope

3.1.1.1 This Sub-Section contains the methods for determination of the buckling capacity, definitions of buckling utilisation factors and other measures necessary to control buckling of plate panels, stiffeners and primary support members.

3.1.1.2 The buckling utilisation factor, η , is to satisfy the following criteria:

$$\eta \leq \eta_{allow}$$

Where:

η_{allow} allowable buckling utilisation factor as defined in *Section 8* and *Section 9*

η buckling utilisation factor, as defined in 3.2.1.1, 3.3.2.2, 3.3.3.1, 3.4.1.1 and 3.5.1.1

3.1.1.3 For structural idealisation and definitions see also *Section 4/2*. The thickness and section properties of plates and stiffeners are to be taken as specified by the appropriate rule requirements.

3.2 Buckling of Plates

3.2.1 Uni-axial buckling of plates

3.2.1.1 The buckling utilisation factor, η , for uni-axial stress is to be taken as:

$$\eta = \frac{\sigma_x}{\sigma_{xcr}} \quad \text{for compressive stresses in x-direction}$$

$$\eta = \frac{\sigma_y}{\sigma_{ycr}} \quad \text{for compressive stresses in y-direction}$$

$$\eta = \frac{\tau}{\tau_{cr}} \quad \text{for shear stress}$$

Where:

σ_x, σ_y actual compressive stresses, in N/mm²

τ actual shear stress, in N/mm²

$\sigma_{xcr}, \sigma_{ycr}$ critical compressive stress, in N/mm², as defined in 3.2.1.3

τ_{cr} critical shear stress, in N/mm², as defined in 3.2.1.3

3.2.1.2 Reference degree of slenderness, to be taken as:

$$\lambda = \sqrt{\frac{\sigma_{yd}}{K \sigma_E}}$$

Where:

K buckling factor, see *Table 10.3.1*

σ_E	reference stress, in N/mm ² $= 0.9 E \left(\frac{t_{net}}{l_a} \right)^2$
E	modulus of elasticity, 206 000 N/mm ²
t_{net}	net thickness of plate panel, in mm
l_a	length of the side of the plate panel as defined in <i>Table 10.3.1</i> , in mm
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

3.2.1.3 The critical stresses, σ_{xcr} , σ_{ycr} or τ_{cr} , of plate panels subject to compression or shear, respectively, is to be taken as:

$$\sigma_{xcr} = C_x \sigma_{yd}$$

$$\sigma_{ycr} = C_y \sigma_{yd}$$

$$\tau_{cr} = C_\tau \frac{\sigma_{yd}}{\sqrt{3}}$$

Where:

C_x, C_y, C_τ reduction factors, as given in *Table 10.3.1*

Table 10.3.1
Buckling Factor and Reduction Factor for Plane Plate Panels

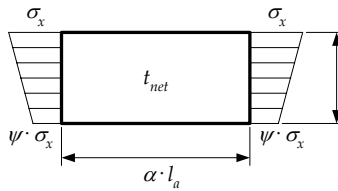

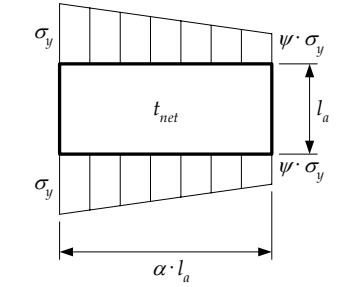

Case	Stress ratio ψ	Aspect ratio α	Buckling factor K	Reduction factor C
1 	$1 \geq \psi \geq 0$	$\alpha > 1$	$K = \frac{8.4}{\psi + 1.1}$	$C_x = 1$ for $\lambda \leq \lambda_c$ $C_x = c \left(\frac{1}{\lambda} - \frac{0.22}{\lambda^2} \right)$ for $\lambda > \lambda_c$ Where: $c = (1.25 - 0.12\psi) \leq 1.25$ $\lambda_c = \frac{c}{2} \left(1 + \sqrt{1 - \frac{0.88}{c}} \right)$
	$0 > \psi > -1$		$K = 7.63 - \psi (6.26 - 10\psi)$	
	$\psi \leq -1$		$K = 5.975 (1 - \psi)^2$	
2 	$1 \geq \psi \geq 0$	$\alpha \geq 1$	$K = \left(1 + \frac{1}{\alpha^2} \right)^2 \frac{2.1}{(\psi + 1.1)}$	$C_y = c \left(\frac{1}{\lambda} - \frac{R + F^2 (H - R)}{\lambda^2} \right)$ Where: $c = (1.25 - 0.12\psi) \leq 1.25$ $R = \lambda(1 - \lambda/c)$ for $\lambda < \lambda_c$ $R = 0.22$ for $\lambda \geq \lambda_c$ $\lambda_c = 0.5c \left(1 + \sqrt{1 - 0.88/c} \right)$ $F = \left(1 - \left(\frac{K}{0.91} - 1 \right) / \lambda_p^2 \right) c_1 \geq 0$ $\lambda_p^2 = \lambda^2 - 0.5$ and $1 \leq \lambda_p^2 \leq 3$ $c_1 = 1$ for σ_y due to direct loads ⁽³⁾ $c_1 = (1 - 1/a) \geq 0$ for σ_y due to bending (in general) ⁽²⁾ $c_1 = 0$ for σ_y due to bending in extreme load cases (e.g. w/t. bhds.) $H = \lambda - \frac{2\lambda}{c(T + \sqrt{T^2 - 4})} \geq R$ $T = \lambda + \frac{14}{15\lambda} + \frac{1}{3}$
	$0 > \psi > -1$	$1 \leq \alpha \leq 1.5$	$K = \left[1 + \frac{1}{\alpha^2} \right]^2 \frac{2.1(1 + \psi)}{1.1}$ $- \frac{\psi}{\alpha^2} (13.9 - 10\psi)$	
		$\alpha > 1.5$	$K = \left[1 + \frac{1}{\alpha^2} \right]^2 \frac{2.1(1 + \psi)}{1.1}$ $- \frac{\psi}{\alpha^2} (5.87 + 1.87\alpha^2 + \frac{8.6}{\alpha^2} - 10\psi)$	
	$\psi \leq -1$	$1 \leq \alpha \leq \frac{3(1 - \psi)}{4}$	$K = \left(\frac{1 - \psi}{\alpha} \right)^2 5.975$	
		$\alpha > \frac{3(1 - \psi)}{4}$	$K = \left(\frac{1 - \psi}{\alpha} \right)^2 3.9675$ $+ 0.5375 \left(\frac{1 - \psi}{\alpha} \right)^4 + 1.87$	

Table 10.3.1 (Continued)
Buckling Factor and Reduction Factor for Plane Plate Panels

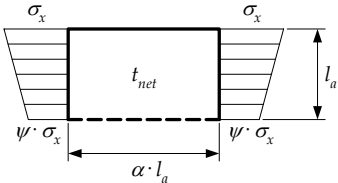

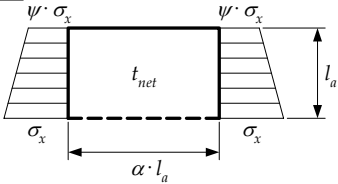

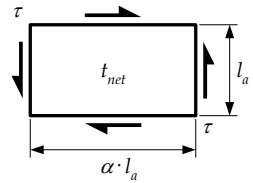

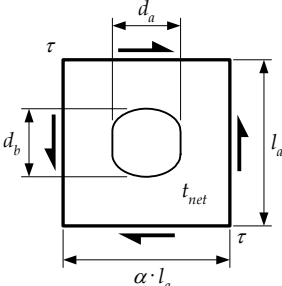

Case	Stress ratio ψ	Aspect ratio α	Buckling factor K	Reduction factor C
3 	$1 \geq \psi \geq 0$	$\alpha > 0$	$K = \frac{4(0.425 + 1/\alpha^2)}{3\psi + 1}$	$C_x = 1$ for $\lambda \leq 0.7$ $C_x = \frac{1}{\lambda^2 + 0.51}$ for $\lambda > 0.7$
	$0 > \psi \geq -1$		$K = 4(0.425 + 1/\alpha^2)(1 + \psi)$ $-5\psi(1 - 3.42\psi)$	
4 	$1 \geq \psi \geq -1$	$\alpha > 0$	$K = \left(0.425 + \frac{1}{\alpha^2}\right) \frac{3 - \psi}{2}$	
5 	-		$K = K_\tau \sqrt{3}$	$C_\tau = 1$ for $\lambda \leq 0.84$ $C_\tau = \frac{0.84}{\lambda}$ for $\lambda > 0.84$
		$\alpha \geq 1$	$K_\tau = \left[5.34 + \frac{4}{\alpha^2}\right]$	
		$0 < \alpha < 1$	$K_\tau = \left[4 + \frac{5.34}{\alpha^2}\right]$	
6 	-		$K = K' r$ $K' = K$ according to Case 5 $r = \text{opening red. factor}$ $r = \left(1 - \frac{d_a}{\alpha l_a}\right) \left(1 - \frac{d_b}{l_a}\right)$ $\frac{d_a}{\alpha l_a} \leq 0.7$ and $\frac{d_b}{l_a} \leq 0.7$	

Table 10.3.1 (Continued)
Buckling Factor and Reduction Factor for Plane Plate Panels

Where:

- ψ the ratio between smallest and largest compressive stress as shown for Case 1-4
- l_a length in mm, of the shorter side of the plate panel for Cases 1 and 2
- l_a length in mm, of the side of the plate panel as defined for Cases 3, 4, 5 and 6
- α aspect ratio of the plate panel

Edge boundary conditions:

- plate edge free
- plate edge simply supported

Notes

- (1) Cases listed are general cases. Each stress component (σ_x, σ_y) is to be understood in local coordinates.
- (2) c_1 due to bending (in general) corresponds to straight edges (uniform displacement) of a plate panel integrated in a large structure.
This value is to be applied for hull girder buckling and buckling of web plate of primary support members in way of openings.
- (3) c_1 for direct loads corresponds to a plate panel with edges not restrained from pull-in which may result in non-straight edges

3.3 Buckling of Stiffeners

3.3.1 Critical compressive stress

3.3.1.1 The buckling utilisation factor of stiffeners is to be taken as the maximum of the column and torsional buckling mode as given in 3.3.2 and 3.3.3.

3.3.2 Column buckling mode

3.3.2.1 Stiffeners are to be verified against the column buckling mode as given in 3.3.2.2 with the allowable buckling utilisation factor, η_{allow} , see 3.1.1.2. Stiffeners not subjected to lateral pressure and that have a net moment of inertia, I_{net} , complying with 3.3.2.4 have acceptable column buckling strength and need not be verified against 3.3.2.2.

3.3.2.2 The buckling utilisation factor for column buckling of stiffeners is to be taken as:

$$\eta = \frac{\sigma_x + \sigma_b}{\sigma_{yd}}$$

Where:

σ_x compressive axial stress in the stiffener, in N/mm², in way of the midspan of the stiffener. See Section 3/5.2.3.1

σ_b bending stress at the midspan of the stiffener according to 3.3.2.3, in N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.3.2.3 The bending stress, σ_b , in N/mm², in the stiffener is equal to:

$$\sigma_b = \frac{M_o + M_1}{1000 Z_{net}}$$

Where:

Z_{net} net section modulus of stiffener, in cm³, including effective breadth of plating according to 3.3.4.1

a) if lateral pressure is applied to the stiffener:

Z_{net} is the section modulus calculated at flange if the lateral pressure is applied on the same side as the stiffener.

Z_{net} is the section modulus calculated at attached plate if the lateral pressure is applied on the side opposite to the stiffener.

b) if no lateral pressure is applied on the stiffener:

Z_{net} is the minimum section modulus among those calculated at flange and attached plate.

M_1 bending moment, in Nmm, due to the lateral load P

$$= \frac{P s l_{stf}^2}{24} 10^3$$

P lateral load, in kN/m²

s stiffener spacing as defined in Section 4/2.2.1, in mm

l_{stf} span of stiffener, in m, equal to spacing between primary support members

M_0 bending moment, in Nmm, due to the lateral deformation w of stiffener

$$= F_E \left(\frac{P_z w}{c_f - P_z} \right) \quad \text{where } (c_f - P_z) > 0$$

F_E ideal elastic buckling force of the stiffener, in N

$$= \left(\frac{\pi^2}{l_{stf}^2} \right) E I_{net} 10^{-2}$$

E modulus of elasticity, 206 000 N/mm²

I_{net} moment of inertia, in cm⁴, of the stiffener including effective width of attached plating according to 3.3.4.1. I_{net} is to comply with the following requirement:

$$I_{net} \geq \frac{s t_{net}^3}{12} 10^{-4}$$

t_{net} net thickness of plate flange, to be taken as the mean thickness of the two attached plate panels, in mm

P_z nominal lateral load, in N/mm², acting on the stiffener due to membrane stresses, σ_x , σ_y and τ_1 , in the attached plate in way of the stiffener midspan:

$$= \frac{t_{net}}{s} \left(\sigma_{xl} \left(\frac{\pi s}{1000 l_{stf}} \right)^2 + 2 c_y \sigma_y + \sqrt{2} \tau_1 \right)$$

σ_{xl} $= \sigma_x \left(1 + \frac{A_{net}}{s t_{net}} \right)$ N/mm²

τ_1 $= \left[\tau - t_{net} \sqrt{\sigma_{yd} E \left(\frac{m_1}{(1000 l_{stf})^2} + \frac{m_2}{s^2} \right)} \right] \geq 0$

with m_1 and m_2 taken equal to

$$m_1 = 1.47 \quad m_2 = 0.49 \quad \text{for} \quad \frac{1000 l_{stf}}{s} \geq 2.0$$

$$m_1 = 1.96 \quad m_2 = 0.37 \quad \text{for} \quad \frac{1000 l_{stf}}{s} < 2.0$$

σ_x compressive axial stress in the stiffener, in N/mm², in way of the midspan of the stiffener. See Section 3/5.2.3.1

A_{net} net sectional area of the stiffener without attached plating, in mm²

c_y factor taking into account the membrane stresses in the attached plating acting perpendicular to the stiffener's axis

$$= 0.5 (1 + \psi) \quad \text{for} \quad 0 \leq \psi \leq 1$$

$$= \frac{0.5}{1 - \psi} \quad \text{for} \quad \psi < 0$$

ψ	edge stress ratio for Case 2 according to <i>Table 10.3.1</i>
σ_y	membrane compressive stress in the attached plating acting perpendicular to the stiffener's axis, in N/mm ²
τ	shear membrane stress in the attached plating, in N/mm ²
σ_{yd}	specified minimum yield stress of the material, in N/mm ²
w	deformation of stiffener, in mm $= w_0 + w_1$
w_0	assumed imperfection, in mm. $= \min \left[\frac{1000 l_{stf}}{250}, \frac{s}{250}, 10 \right]$ <p>For stiffeners sniped at both ends w_0 is not to be taken less than the distance from the midpoint of attached plating to the neutral axis of the stiffener calculated with the effective width of the attached plating according to 3.3.4.1</p>
w_1	deformation of stiffener at midpoint of stiffener span due to lateral load P , in mm. In case of uniformly distributed load the w_1 is to be taken as: $= \frac{P s l_{stf}^4}{384 \cdot E I_{net}} 10^5$
c_f	elastic support provided by the stiffener, in N/mm ² $= F_E \frac{\pi^2}{l_{stf}^2} (1 + c_p) 10^{-6}$
c_p	$= \frac{1}{1 + \frac{0.91}{c_a} \left(\frac{12 I_{net} 10^4}{s t_{net}^3} - 1 \right)}$ $c_a = \left[\frac{1000 l_{stf}}{2s} + \frac{2s}{1000 l_{stf}} \right]^2 \quad \text{for } l_{stf} \geq \frac{2s}{1000}$ $c_a = \left[1 + \left(\frac{1000 l_{stf}}{2s} \right)^2 \right]^2 \quad \text{for } l_{stf} < \frac{2s}{1000}$

3.3.2.4 Stiffeners not subjected to lateral pressure are considered as complying with the requirements of 3.3.2.2 if their net moments of inertia, in cm⁴, satisfy the following requirement:

$$I_{net} \geq 100 \frac{P_z l_{stf}^2}{\pi^2} \left[\frac{w_o (e_f - 0.5 t_{f-net})}{\eta_{allow} \sigma_{yd} - \sigma_x} + \frac{l_{stf}^2}{E \pi^2} 10^6 \right]$$

Where:

e_f distance from connection to plate (C as shown in *Figure 10.3.1*) to centre of flange, in mm
 $= (d_w - 0.5 t_{f-net})$ for bulb flats

$$= (d_w + 0.5t_{f-net}) \quad \text{for angles and T bars}$$

d_w	depth of web plate, in mm, as shown in <i>Figure 10.3.1</i>
t_{f-net}	net flange thickness, in mm
η_{allow}	allowable buckling utilisation factor as defined in <i>Section 8</i> and <i>Section 9</i>

Note

Other parameters are as defined in 3.3.2.3

3.3.3 Torsional buckling mode

3.3.3.1 The torsional buckling mode is to be verified against the allowable buckling utilisation factor, η_{allow} , see 3.1.1.2. The buckling utilisation factor for torsional buckling of stiffeners is to be taken as:

$$\eta = \frac{\sigma_x}{C_T \sigma_{yd}}$$

Where:

σ_x compressive axial stress in the stiffener, in N/mm², in way of the midspan of the stiffener. See *Section 3/5.2.3.1*

C_T torsional buckling coefficient
= 1.0 for $\lambda_T \leq 0.2$

$$= \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_T^2}} \quad \text{for } \lambda_T > 0.2$$

$$\Phi = 0.5(1 + 0.21(\lambda_T - 0.2) + \lambda_T^2)$$

λ_T reference degree of slenderness for torsional buckling
= $\sqrt{\frac{\sigma_{yd}}{\sigma_{ET}}}$

σ_{ET} reference stress for torsional buckling, in N/mm²

$$= \frac{E}{I_{p-net}} \left(\frac{\varepsilon \pi^2 I_{\omega-net} 10^{-4}}{I_t^2} + 0.385 I_{T-net} \right)$$

RCN 1 (effective from 1 July 2009)

σ_{yd} specified minimum yield stress of the material, in N/mm²

E modulus of elasticity, 206 000 N/mm²

I_{p-net} net polar moment of inertia of the stiffener about point C, in cm⁴, as shown in *Figure 10.3.1* and *Table 10.3.2*

RCN 1 (effective from 1 July 2009)

I_{T-net} net St. Venant's moment of inertia of the stiffener, in cm⁴, as shown in *Table 10.3.2*

RCN 1 (effective from 1 July 2009)

$I_{\omega-net}$ net sectorial moment of inertia of the stiffener about point C, in cm⁶ as shown in *Figure 10.3.1* and *Table 10.3.2*

RCN 1 (effective from 1 July 2009)

ε degree of fixation

$$1 + 1000 \sqrt{\frac{l_t^4}{\frac{3}{4} \pi^4 I_{\omega-net} \left(\frac{s}{t_{net}^3} + \frac{4(e_f - 0.5t_{f-net})}{3t_{w-net}^3} \right)}}$$

RCN 1 (effective from 1 July 2009)

l_t torsional buckling length to be taken equal the distance between tripping supports, in m

d_w depth of web plate, in mm

t_{w-net} net web thickness, in mm

b_f flange breadth, in mm

t_{f-net} net flange thickness, in mm

e_f distance from connection to plate (C in *Figure 10.3.1*) to centre of flange, in mm

$= (d_w - 0.5t_{f-net})$ for bulb flats

$= (d_w + 0.5t_{f-net})$ for angles and T bars

A_{w-net} net web area, in mm²

$= (e_f - 0.5t_{f-net}) t_{w-net}$

A_{f-net} net flange area, in mm²

$= b_f t_{f-net}$

s stiffener spacing as defined in *Section 4/2.2.1*, in mm

Table 10.3.2 Moments of Inertia		
Section property	Flat bars	Bulb flats, angles and T bars
I_{P-net}	$\frac{d_w^3 t_{w-net}}{3 \times 10^4}$	$\left(\frac{A_{w-net} (e_f - 0.5 t_{f-net})^2}{3} + A_{f-net} e_f^2 \right) 10^{-4}$
I_{T-net}	$\frac{d_w t_{w-net}^3}{3 \times 10^4} \left(1 - 0.63 \frac{t_{w-net}}{d_w} \right)$	$\frac{(e_f - 0.5 t_{f-net}) t_{w-net}^3}{3 \times 10^4} \left(1 - 0.63 \frac{t_{w-net}}{e_f - 0.5 t_{f-net}} \right)$ $+ \frac{b_f t_{f-net}^3}{3 \times 10^4} \left(1 - 0.63 \frac{t_{f-net}}{b_f} \right)$
$I_{\omega-net}$	$\frac{d_w^3 t_{w-net}^3}{36 \times 10^6}$	<p>for bulb flats and angles:</p> $\frac{A_{f-net} e_f^2 b_f^2}{12 \times 10^6} \left(\frac{A_{f-net} + 2.6 A_{w-net}}{A_{f-net} + A_{w-net}} \right)$ <p>for T bars:</p> $\frac{b_f^3 t_{f-net} e_f^2}{12 \times 10^6}$

3.3.4 Effective breadth of attached plating

3.3.4.1 The effective breadth of attached plating of ordinary stiffeners is to be taken as:

$$b_{eff} = \min(C_x s, \chi_s s)$$

Where:

$$\chi_s = 0.0035 \left(\frac{1000 l_{eff}}{s} \right)^3 - 0.0673 \left(\frac{1000 l_{eff}}{s} \right)^2 + 0.4422 \left(\frac{1000 l_{eff}}{s} \right) - 0.0056 \leq 1.0$$

s stiffener spacing as defined in *Section 4/2.2.1*, in mm

C_x average reduction factor for buckling of the two attached plate panels, according to Case 1 in *Table 10.3.1*

l_{stf} span of stiffener, in m, equal to spacing between primary support members

l_{eff} effective span of stiffeners in m
 $l_{eff} = l_{stf}$ if simply supported at both ends
 $l_{eff} = 0.6 l_{stf}$ if fixed at both ends

(RCN 2, effective from 1 July 2008)

3.4 Primary Support Members

3.4.1 Buckling of web plate of primary support members in way of openings

3.4.1.1 The web plate of primary support members with openings is to be assessed for buckling based on the combined axial compressive and shear stresses. The web plate adjacent to the opening on both sides is to be considered as individual unstiffened plate panels as shown in *Table 10.3.3*. The buckling utilisation factor, η , is to be taken as:

$$\eta = \left(\frac{|\sigma_{av}|}{C \sigma_{yd}} \right)^{e_c} + \left(\frac{|\tau_{av}| \sqrt{3}}{C_\tau \sigma_{yd}} \right)^{e_\tau}$$

Where:

σ_{av} average compressive stress in the area of web plate being considered according to case: 1, 2 or 3 in *Table 10.3.1*, in N/mm²

τ_{av} average shear stress in the area of web plate being considered according to case 5 or 6 in *Table 10.3.1*, in N/mm²

σ_{yd} specified minimum yield stress of the material, in N/mm²

$e_c = 1 + C^4$ exponent for compressive stress

$e_\tau = 1 + C C_\tau^2$ exponent for shear stress

$C = C_x$ reduction factor according to Case 1 or 3, *Table 10.3.1*

$C = C_y$ reduction factor according to Case 2, *Table 10.3.1*

C_τ reduction factor according to Case 5 or 6, *Table 10.3.1*

3.4.1.2 The reduction factors, C_x or C_y in combination with C_τ , of the plate panel(s) of the web adjacent to the opening is to be taken as shown in *Table 10.3.3*.

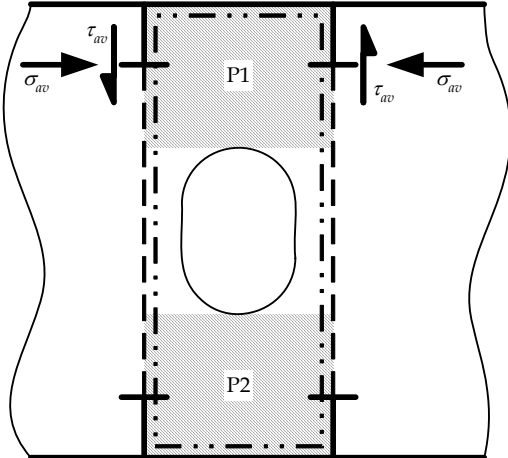

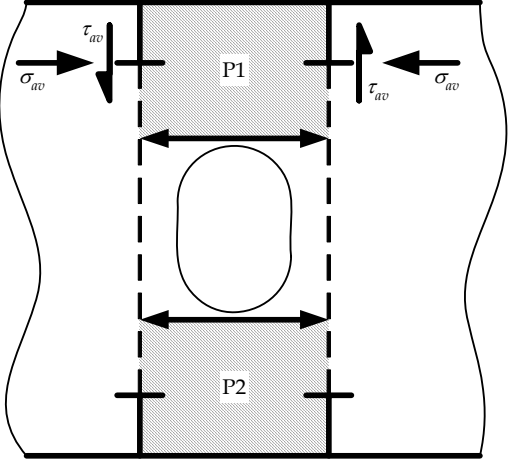

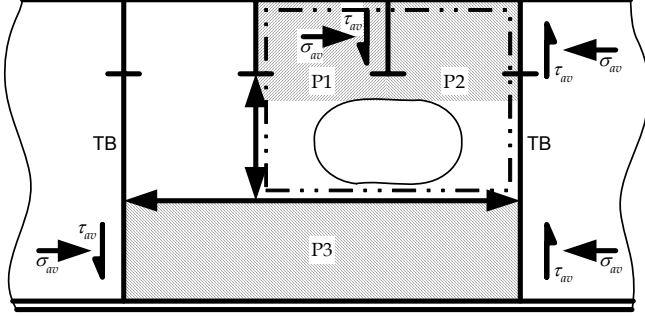

Table 10.3.3 Reduction Factors		
Mode	C_x, C_y	C_τ
<p>(a) without edge reinforcements</p> 	<p>Separate reduction factors are to be applied to areas P1 and P2 using Case 3, <i>Table 10.3.1</i>, with edge stress ratio: $\psi = 1.0$</p>	<p>A common reduction factor is to be applied to areas P1 and P2 using Case 6, <i>Table 10.3.1</i> for area marked:</p> 

Table 10.3.3 (Continued) Reduction Factors		
Mode	C_x, C_y	C_τ
<p>(b) with edge reinforcements</p> 	<p>Separate reduction factors are to be applied for areas P1 and P2 using: C_x for Case 1 or C_y for Case 2, see Table 10.3.1 with stress ratio $\psi = 1.0$</p>	<p>Separate reduction factors are to be applied for areas P1 and P2 using Case 5, Table 10.3.1</p>
<p>(c) example of hole in web</p> 	<p>Panels P1 and P2 are to be evaluated in accordance with (a). Panel P3 is to be evaluated in accordance with (b)</p>	
<p>Note</p> <p>1. Web panels to be considered for buckling in way of openings are shown shaded and numbered P1, P2, etc.</p>		

3.5 Other Structures

3.5.1 Struts, pillars and cross ties

- 3.5.1.1 The critical buckling stress for axially compressed struts, pillars and cross ties is to be taken as the lesser of the column and torsional critical buckling stresses. The buckling utilisation factor, η , is to be taken as:

$$\eta = \frac{\sigma_{av}}{\sigma_{cr}}$$

Where:

- σ_{av} average axial compressive stress in the member, in N/mm²
- σ_{cr} minimum critical buckling stress according to 3.5.1.2, in N/mm²

- 3.5.1.2 The critical buckling stress in compression, σ_{cr} , for each mode is to be taken as:

$$\sigma_{cr} = \sigma_E \text{ for } \sigma_E \leq 0.5\sigma_{yd}$$

$$\sigma_{cr} = \left(1 - \frac{\sigma_{yd}}{4\sigma_E}\right) \sigma_{yd} \text{ for } \sigma_E > 0.5\sigma_{yd}$$

Where:

σ_E elastic compressive buckling stress, in N/mm², given for each buckling mode, see 3.5.1.3 to 3.5.1.5

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.5.1.3 The elastic compressive column buckling stress, σ_E , of pillars subject to axial compression is to be taken as:

$$\sigma_E = 0.001E f_{end} \frac{I_{net50}}{A_{pill-net50} l_{pill}^2} \quad \text{N/mm}^2$$

Where:

I_{net50} net moment of inertia about the weakest axis of the cross-section, in cm⁴

$A_{pill-net50}$ net cross-sectional area of the pillar, in cm²

f_{end} end constraint factor:

1.0 where both ends are pinned

2.0 where one end is pinned and the other end is fixed

4.0 where both ends are fixed

A pillar end may be considered fixed when effective brackets are fitted. These brackets are to be supported by structural members with greater bending stiffness than the pillar.

Column buckling capacity for cross tie shall be calculated using f_{end} equal to 2.0 and span as defined in 8/2.6.8.1

RCN 1 (effective from 1 July 2009)

E modulus of elasticity, 206 000, in N/mm²

l_{pill} unsupported length of the pillar, in m

3.5.1.4 The elastic torsional buckling stress, σ_{ET} , with respect to axial compression of pillars is to be taken as:

$$\sigma_{ET} = \frac{GI_{sv-net50}}{I_{pol-net50}} + \frac{0.001f_{end}Ec_{warp}}{I_{pol-net50}l_{pill}^2} \quad \text{N/mm}^2$$

Where:

G shear modulus

$$= \frac{E}{2(1+\nu)}$$

E modulus of elasticity, 206 000, in N/mm²

ν Poisson's ratio, 0.3

$I_{sv-net50}$ net St. Venants moment of inertia, in cm⁴, see Table 10.3.4

$I_{pol-net50}$ net polar moment of inertia about the shear centre of cross section, in cm⁴

$$= I_{y-net50} + I_{z-net50} + A_{net50} (y_0^2 + z_0^2)$$

 f_{end}

end constraint factor:

1.0 where both ends are pinned

2.0 where one end is pinned and the other end is fixed

4.0 where both ends are fixed

Elastic torsional buckling capacity for cross tie shall be calculated using f_{end} equal to 2.0 and span as defined in 8/2.6.8.1

RCN 1 (effective from 1 July 2008)

 C_{warp} warping constant, in cm⁶, see Table 10.3.4 l_{pill}

unsupported length of the pillar, in m

 y_0

position of shear centre relative to the cross-sectional centroid, in cm, see Table 10.3.4

 z_0

position of shear centre relative to the cross-sectional centroid, in cm, see Table 10.3.4

 A_{net50} net cross-sectional area, in cm² $I_{y-net50}$ net moment of inertia about y-axis, in cm⁴ $I_{z-net50}$ net moment of inertia about z-axis, in cm⁴

- 3.5.1.5 For cross-sections where the centroid and the shear centre do not coincide, the interaction between the torsional and column buckling mode is to be examined. The elastic torsional/column buckling stress, σ_{ETF} , with respect to axial compression is to be taken as:

$$\sigma_{ETF} = \frac{1}{2\zeta} \left[(\sigma_E + \sigma_{ET}) - \sqrt{(\sigma_E + \sigma_{ET})^2 - 4\zeta\sigma_E\sigma_{ET}} \right]$$

Where:

$$\zeta = 1 - \frac{(y_0^2 + z_0^2)A_{net50}}{I_{pol-net50}}$$

 y_0

Position of shear centre relative to the cross-sectional centroid, in cm, see Table 10.3.4

 z_0

position of shear centre relative to the cross-sectional centroid, in cm, see Table 10.3.4

 A_{net50} net cross-sectional area, in cm² $I_{pol-net50}$

net polar moment of inertia about the shear centre of cross section, as defined in 3.5.1.4

 σ_{ET}

elastic torsional buckling stress, as defined in 3.5.1.4

 σ_E

elastic column compressive buckling stress, as defined in 3.5.1.3

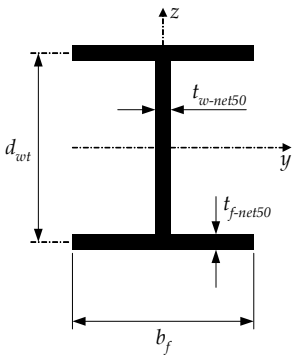

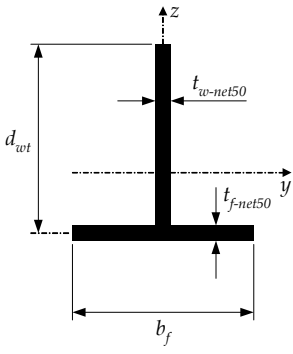

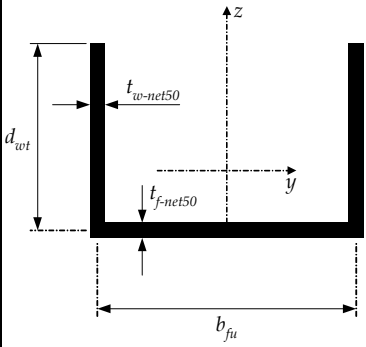

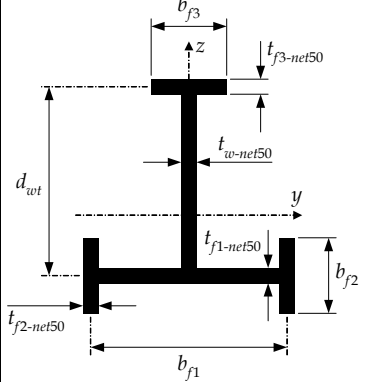

Table 10.3.4 Cross Sectional Properties	
double symmetrical sections	
	$I_{sv-net50} = \frac{1}{3} (2b_f t_{f-net50}^3 + d_{wt} t_{w-net50}^3) 10^{-4} \quad \text{cm}^4$
	$C_{warp} = \frac{d_{wt}^2 b_f^3 t_{f-net50}}{24} 10^{-6} \quad \text{cm}^6$

Table 10.3.4 (Continued) Cross Sectional Properties	
single symmetrical sections	
	$I_{sv-net50} = \frac{1}{3} (b_f t_{f-net50}^3 + d_{wt} t_{w-net50}^3) 10^{-4} \quad \text{cm}^4$
	$y_0 = 0 \text{ cm}$ $z_0 = -\frac{0.5 d_{wt}^2 t_{w-net50}}{d_{wt} t_{w-net50} + b_f t_{f-net50}} 10^{-1} \quad \text{cm}$ $C_{warp} = \frac{b_f^3 t_{f-net50}^3 + 4 d_{wt}^3 t_{w-net50}^3}{144} 10^{-6} \quad \text{cm}^6$
	$I_{sv-net50} = \frac{1}{3} (b_{fu} t_{f-net50}^3 + 2 d_{wt} t_{w-net50}^3) 10^{-4} \quad \text{cm}^4$
	$y_0 = 0 \text{ cm}$ $z_0 = -\frac{d_{wt}^2 t_{w-net50} 10^{-1}}{2 d_{wt} t_{w-net50} + b_f t_{f-net50}} - \frac{0.5 d_{wt}^2 t_{w-net50} 10^{-1}}{d_{wt} t_{w-net50} + b_{fu} t_{f-net50} / 6} \text{ cm}$ $C_{warp} = \frac{b_{fu}^2 d_{wt}^3 t_{w-net50} (3 d_{wt} t_{w-net50} + 2 b_{fu} t_{f-net50})}{12 (6 d_{wt} t_{w-net50} + b_{fu} t_{f-net50})} 10^{-6} \quad \text{cm}^6$

	$I_{sv-net50} = \frac{1}{3} (b_{f1} t_{f1-net50}^3 + 2b_{f2} t_{f2-net50}^3 + b_{f3} t_{f3-net50}^3 + d_{wt} t_{w-net50}^3) 10^{-4}$ <p style="text-align: center;">cm^4</p>
	<p style="text-align: center;">$y_0 = 0 \text{ cm}$</p> $z_o = z_s - \frac{(b_{f3} d_{wt} t_{f3-net50} + 0.5 d_{wt}^2 t_{w-net50}) 10^{-1}}{d_{wt} t_{w-net50} + b_{f1} t_{f1-net50} + 2b_{f2} t_{f2-net50} + b_{f3} t_{f3-net50}} \text{ cm}$ $c_{warp} = I_{f1} z_s^2 + \frac{I_{f2} b_{f1}^2}{200} + I_{f3} \left(\frac{d_{wt}}{10} - z_s \right)^2 \text{ cm}^6$ $I_{f1} = \left(\frac{(b_{f1} - t_{f2-net50})^3 t_{f1-net50}}{12} + \frac{b_{f2} t_{f2-net50} b_{f1}^2}{2} \right) 10^{-4} \text{ cm}^4$ $I_{f2} = \frac{b_{f2}^3 t_{f2-net50}}{12} 10^{-4} \text{ cm}^4$ $I_{f3} = \frac{b_{f3}^3 t_{f3-net50}}{12} 10^{-4} \text{ cm}^4$ $z_s = \frac{I_{f3} d_{wt}}{I_{f1} + I_{f3}} 10^{-1} \text{ cm}$
<p>Note</p> <ol style="list-style-type: none"> 1. All dimensions of thickness, breadth and depth are in mm 2. Cross sectional properties not covered by this table are to be obtained by direct calculation. 	

3.5.2 Corrugated bulkheads

- 3.5.2.1 Local buckling of a unit flange of corrugated bulkheads is to be controlled according to 3.2.1.1, for Case 1, as shown in Table 10.3.1, applying stress ratio $\psi = 1.0$.
- 3.5.2.2 The overall buckling failure mode of corrugated bulkheads subjected to axial compression is to be checked for column buckling according to 3.5.1 (e.g. horizontally corrugated longitudinal bulkheads, vertically corrugated bulkheads subject to localised vertical forces). End constraint factor corresponding to pinned ends is to be applied except for fixed end support to be used in way of stool with width exceeding 2 times the depth of the corrugation.

4 ADVANCED BUCKLING ANALYSES

4.1 General

4.1.1 Assessment

- 4.1.1.1 For the assessment of buckling of plates and stiffened panels subjected to combined stress fields, the advanced buckling assessment method is to be followed.
- 4.1.1.2 The advanced buckling assessment method is to consider the following effects in deriving the buckling capacity:
- (a) non linear geometrical behaviour
 - (b) inelastic material behaviour
 - (c) initial imperfections (geometrical out-of flatness of plate and stiffeners)
 - (d) welding residual stresses
 - (e) interactions between structural elements; plates, stiffeners, girders etc.
 - (f) simultaneous acting loads; bi-axial compression/tension, shear and lateral pressure
 - (g) boundary conditions
- 4.1.1.3 All effects are to be modelled to represent a lower bound of structural strength. The modelling shape and amplitude of geometrical imperfections is to be such that they trigger the most critical failure modes.
- 4.1.1.4 The buckling strength is to be derived in accordance with the method described in *Appendix D*.
- 4.1.1.5 Alternative advanced buckling analysis tools may be used provided they give comparable results with the bench mark results obtained from implementing the advanced buckling methodology described in *Appendix D*.
- 4.1.1.6 Theoretical background, assumptions, models, verifications, calibrations, etc., for alternative advanced buckling analysis are to be submitted for review and acceptance.

SECTION 11

GENERAL REQUIREMENTS

1 HULL OPENINGS AND CLOSING ARRANGEMENTS

1.1 Shell and Deck Openings

1.1.1 General

- 1.1.1.1 For closing appliances for openings in superstructures, deck house sides and ends see 1.4. For overflows and vents, and for discharges and inlets, see 1.5.
- 1.1.1.2 For testing requirements, see *Sub-Section 5*.

1.1.2 Cargo tank hatches - materials

- 1.1.2.1 Covers for access hatches, tank cleaning and other openings for cargo tanks and adjacent spaces are to be manufactured from the following material:
 - (a) normal strength steel in accordance with *Section 6/1*
 - (b) non-ferrous material such as bronze or brass may be considered; however, aluminium alloy is not to be used for covers of any opening to cargo tanks and spaces adjacent thereto
 - (c) synthetic materials may also be considered, taking into account their fire resistance and physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover, and the method of manufacture are to be submitted for approval.
- 1.1.2.2 The hatch cover packing material is to be compatible with the cargoes that are intended to be carried and is to be effectively held in place.

1.1.3 Cargo tank access coamings

- 1.1.3.1 The height of the hatch coaming above the upper surface of the freeboard deck is not to be less than 600mm. Lower heights may be permitted by the Flag Administration. The top of the hatch coaming is also not to be lower than the highest point of the tank over which it is fitted and is to be of sufficient height for the purpose of damage stability.
- 1.1.3.2 The gross thickness of the coaming plate is not to be less than 10mm. Where the coaming height, as fitted, exceeds 600mm, the thickness may be required to be increased or edge stiffening fitted. The scantlings of coaming plates of tank access coamings that enclose an area of 1.2m² or more, and/or those that are not configured with a well rounded shape, may be subject to additional requirements.

1.1.4 Cargo tank access hatch covers

- 1.1.4.1 The gross thickness of unstiffened plate covers with an area less than 1.2m² is not to be less than 12.5mm. The gross thickness of covers of a larger area will need to be increased or the cover will require stiffening.
- 1.1.4.2 Flat and unstiffened covers on circular hatchways are to be secured by fastenings with a spacing of not more than 600mm.
- 1.1.4.3 On rectangular hatchways, the spacing of fastenings is generally not to be greater than 450mm and the distance between hatch corners, and adjacent fastenings, is not to be greater than 230mm.
- 1.1.4.4 The requirements of 1.1.4.1 to 1.1.4.3 do not apply to dished covers or covers of other specially approved design.

- 1.1.4.5 Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be considered securing devices for the cover and should be designed so as to prevent the gasket from being over tightened.

1.1.5 Machinery access openings - protection

- 1.1.5.1 Machinery casings are generally to be protected by an enclosed poop or bridge; or by a deck house structure complying with the strength requirements of 1.4.
- 1.1.5.2 Where a vessel is intended to operate at the freeboard allowed by the *International Convention on Load Lines* for Type-A freeboard vessels, the height of such structure is not to be less than 2.3m. The bulkheads at the forward ends of these structures are to have scantlings at least equivalent to those required for bridge-front bulkheads, see 1.4.9 and 1.4.13.

1.1.6 Small hatches on the exposed fore deck

- 1.1.6.1 Openings to forward spaces as defined in 1.1.6.2 are to comply with the requirements of 1.1.6.3 to 1.1.6.14.
- 1.1.6.2 These requirements apply to small hatches (generally openings 2.5m² or less) on the exposed deck within 0.25L from the F.P. and at a height less than 0.1L or 22m, whichever is less, from the summer load water line at the location of the hatch.
- 1.1.6.3 Hatches designed for emergency escape need not comply with 1.1.6.9(a), 1.1.6.9(b), 1.1.6.13 and 1.1.6.14.
- 1.1.6.4 For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with Table 11.1.1 and Figure 11.1.1.
- 1.1.6.5 Stiffeners, where fitted, are to be aligned with the metal to metal contact points required by 1.1.6.10 and 1.1.6.11. See also Figure 11.1.1. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener. See Figure 11.1.2.
- 1.1.6.6 The upper edge of the hatchway coaming is to be suitably reinforced by a horizontal member, normally not more than 190mm from the upper edge of the coaming.
- 1.1.6.7 For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to provide strength and stiffness equivalent to the requirements for small rectangular hatches.
- 1.1.6.8 For small hatch covers constructed of materials other than normal strength steel, the required scantlings are to provide equivalent strength and stiffness.
- 1.1.6.9 The primary securing devices are to be such that the hatch cover can be secured in place and be made weathertight by means of a closing mechanism employing any one of the following methods:
- (a) butterfly nuts tightening onto forks (clamps)
 - (b) quick acting cleats, or
 - (c) a central locking device.
- Dogs (twist tightening handles) with wedges are not acceptable.
- 1.1.6.10 The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged.

- 1.1.6.11 The metal to metal contacts are to be arranged close to each securing device as shown in *Figure 11.1.1*, and are to be of sufficient capacity to withstand the bearing force.
- 1.1.6.12 The primary securing method is to be designed and manufactured such that the designed compression pressure can be achieved by one person without the need for any tools.
- 1.1.6.13 For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use, by means of curving the forks upward and raising the surface on the free end, or a similar method. The gross plate thickness of unstiffened steel forks is not to be less than 16mm. An example arrangement is shown in *Figure 11.1.2*.
- 1.1.6.14 Small hatches on the exposed fore deck are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device becomes loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

Table 11.1.1 Scantlings for Small Steel Hatch Covers on the Fore Deck			
Nominal Size (mm × mm)	Cover Plate Gross Thickness (mm)	Primary Stiffeners	Secondary Stiffeners
		Gross Flat Bar Scantlings (mm × mm); number	
630 × 630	8	---	---
630 × 830	8	100 × 8; 1	---
830 × 630	8	100 × 8; 1	---
830 × 830	8	100 × 10; 1	---
1030 × 1030	8	120 × 12; 1	80 × 8; 2
1330 × 1330	8	150 × 12; 2	100 × 10; 2

- 10: stiffener
- 11: inner edge stiffener

1.1.7 Manholes and flush deck scuttles

- 1.1.7.1 Manholes and flush deck scuttles in Position 1 or Position 2, as defined in *Section 4/1.2*, or within superstructures, other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight.
- 1.1.7.2 The strength of watertight manholes is to be equivalent to that of the deck.
- 1.1.7.3 Unless secured by closely spaced bolts, the covers are to be permanently attached.

1.1.8 Other openings

- 1.1.8.1 Openings in freeboard decks other than hatchways, machinery space openings, manholes and flush scuttles are to be protected by an enclosed superstructure, or by a deck house or companionway of equivalent strength and weathertightness. Any such opening in an exposed superstructure deck, or in the top of a deck house on the freeboard deck, which gives access to a space below the freeboard deck or a space within an enclosed superstructure, is to be protected by an efficient deck house or companionway, as defined in *1.4*.

1.1.9 Escape openings

1.1.9.1 The closing appliances of escape openings are to be readily operable from each side.

1.1.10 Rope hatches

1.1.10.1 Rope hatches may be accepted with reduced coaming height, but generally not less than 380mm, provided that they are well secured and can be opened only at the Master's discretion. The gross thickness of the coaming is to be not less than the Rule minimum gross thickness for hull envelope plating for that position, or 11mm, whichever is the lesser.

1.1.11 Portable plates

1.1.11.1 Where portable plates are required in casings or decks, for unshipping machinery or other similar reasons, they may be accepted provided that they are of equivalent strength to the un-pierced bulkhead or deck. Portable plates may be fitted with flush covers and they are to be secured by gaskets and closely spaced bolts at a distance not greater than five bolt diameters.

1.1.11.2 The sill heights of access openings and the coaming heights of deck openings, closed by covers which are kept permanently closed at sea will be specially considered.

1.1.12 Tank cleaning and ullage openings

1.1.12.1 Tank cleaning and ullage openings are to be fitted with watertight covers or an equivalent. Flush covers may be accepted for tank cleaning and ullage openings where they comply with the applicable requirements of 1.1.11.

Table 11.1.2 900mm High Ventilator Thickness and Bracket Standards			
Nominal pipe Size	Minimum fitted gross thickness, in mm	Maximum projected area of head, in cm ²	Height of brackets, in mm
80A	6.3	-	460
100A	7.0	-	380
150A	8.5	-	300
200A	8.5	550	-
250A	8.5	880	-
300A	8.5	1200	-
350A	8.5	2000	-
400A	8.5	2700	-
450A	8.5	3300	-
500A	8.5	4000	-

1.2 Ventilators

1.2.1 General

1.2.1.1 Ventilators are to comply with the requirements of 1.2.2 through 1.2.6 and are also to be in accordance with any relevant requirements for machinery of the individual Classification Societies.

1.2.2 Details, arrangements and scantlings for ventilators

- 1.2.2.1 For standard ventilators of 900mm in height, closed by heads of not more than the tabulated projected area, the minimum pipe thickness and bracket heights are to be as specified in *Table 11.1.2*.
- 1.2.2.2 For ventilators of height greater than 900mm, brackets or alternative means of support are to be provided. Brackets, where fitted, are to be of suitable thickness and length according to their height.
- 1.2.2.3 Ventilators are to have coamings constructed of steel or other equivalent material and are to meet the requirements indicated in *Table 11.1.3*.
- 1.2.2.4 All component parts and connections of ventilators are to be capable of withstanding the loads defined in 1.2.3.
- 1.2.2.5 Rotating type mushroom ventilator heads are not to be used for application in the areas specified in 1.2.3.1.
- 1.2.2.6 Ventilators passing through superstructures, other than enclosed superstructures, are to have substantially constructed coamings of steel or other equivalent material at the freeboard deck. Ventilators of deep tanks or tunnels passing through tween decks are to be watertight with scantlings to withstand the expected pressure.

Table 11.1.3 Coamings for Ventilators	
Feature	Requirement
Height ⁽⁴⁾	$h_{coam} = 900$ at Position 1 $h_{coam} = 760$ at Position 2 ⁽¹⁾
Thickness ^{(2), (3)}	$d_{coam} \leq 130$ $t_{coam-grs} = 7.5$ $165 < d_{coam} < 320$ $t_{coam-grs} = 8.5$ $d_{coam} \geq 470$ $t_{coam-grs} = 10.0$ Intermediate values are to be obtained by linear interpolations
Support ⁽³⁾	Where h_{coam} exceeds 900 the coaming is to be specially supported
Where: h_{coam} height of coaming, in mm d_{coam} external diameter of coaming, in mm $t_{coam-grs}$ gross thickness of coaming, in mm	
Note 1. The coaming height may need to be increased to satisfy any applicable subdivision and damage stability requirements. 2. Where the height of the ventilator exceeds that given, the gross thickness given above may be gradually reduced, above that height, to a minimum of 6.5mm. 3. See also 1.2.3 and for 1.2.4 ventilators in the forward part of the ship. 4. Heights are measured above sheathing, if fitted.	

1.2.3 Applied loading on ventilators

- 1.2.3.1 Ventilators on an exposed deck within the forward $0.25L$, and where the height of the exposed deck at the ventilator is less than $0.1L$ or 22m, whichever is less, from the summer load waterline are to comply with the requirements of 1.2.3.2 through 1.2.3.3 and 1.2.4.1.

1.2.3.2 The pressures acting on ventilators, P_{vent} , and their closing devices are given by:

$$P_{vent} = 0.5 \rho_{sw} v_{sea}^2 C_1 C_2 C_3 \quad \text{kN/m}^2$$

Where:

- ρ_{sw} density of sea water, 1.025 tonnes/m³
 v_{sea} velocity of water over the fore deck, 13.5 m/sec
 C_1 shape coefficient:
 0.5 for pipes
 1.3 for pipe or ventilator heads in general
 0.8 for pipe or ventilator heads of cylindrical form with its axis in the vertical direction
 C_2 slamming coefficient, 3.2
 C_3 protection coefficient:
 0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle
 1.0 elsewhere, including immediately behind a bulwark

1.2.3.3 Forces acting in the horizontal direction on the ventilator and its closing device may be calculated from the above pressure, using the largest projected area of each component.

1.2.4 Strength requirements for ventilators and their closing devices

1.2.4.1 Bending moments and stresses in ventilators are to be calculated at critical positions:
 (a) at penetration pieces
 (b) at weld or flange connections
 (c) at toes of supporting brackets.

Bending stresses in the net section are not to exceed $0.8 \sigma_{yld}$, where σ_{yld} is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2mm is then to be applied.

1.2.5 Closing appliances

1.2.5.1 Except as indicated otherwise in this paragraph, ventilator openings are to be provided with efficient, permanently attached, closing appliances. Ventilators in Position 1, the coamings of which extend to more than 4.5m above the deck, and in Position 2, the coamings of which extend to more than 2.3m above the deck, need not be fitted with closing arrangements unless unusual features of the design make it necessary. Position 1 and Position 2 are defined in *Section 4/1.2*.

1.2.6 Fire dampers

1.2.6.1 Where a fire damper is located within a ventilation coaming, an inspection port or opening at least 150mm in diameter is to be provided in the coaming to facilitate survey of the damper without disassembling the coaming or the ventilator. The closure provided for the inspection port or opening is to maintain the weathertight integrity of the coaming and, if appropriate, the fire integrity of the coaming.

1.3 Air Pipes

(RCN 2, effective from 1 July 2008)

1.3.1 General

- 1.3.1.1 Air pipes are to comply with the requirements of 1.3.2 through 1.3.6 and are also to be in accordance with any relevant requirements for machinery of the individual Classification Societies.

(RCN 2, effective from 1 July 2008)

1.3.2 Height

- 1.3.2.1 The minimum height for air pipes on decks exposed to weather is given as:

- (a) 760mm for those on the freeboard deck; and
- (b) 450mm for those on the superstructure deck.

The height is to be measured from the top of the sheathing, if fitted, to the point where water may have access below.

- 1.3.2.2 Where these heights may interfere with the working of the vessel, a lower height may be accepted subject to the fitting of an approved closing appliance at the open end of the vent.
- 1.3.2.3 The height may need to be increased to satisfy any applicable subdivision and damage stability requirements.
- 1.3.2.4 Where air pipes are led through the side of superstructures, the height of their opening is to be at least 2.3m above the summer load waterline. Automatic vent heads of approved design are to be provided.

1.3.3 Details, arrangement and scantlings for air pipes

(RCN 2, effective from 1 July 2008)

- 1.3.3.1 The wall thicknesses of air pipes, where exposed to weather, are not to be taken less than that given in *Table 11.1.4*.

(RCN 2, effective from 1 July 2008)

Table 11.1.4 Minimum wall Thickness for Air Pipes	
External diameter, in mm	Gross minimum wall thickness, in mm
$d_{air} \leq 80$	6.0
$d_{air} \geq 165$	8.5
Where: d_{air} external diameter of pipe, in mm	
<u>Note</u> 1. Intermediate values are to be obtained by linear interpolations. 2. See also 1.3.4 and 1.3.5 for ventilators in forward part of the ship.	

(RCN 2, effective from 1 July 2008)

- 1.3.3.2 For standard air pipes of 760mm in height, closed by heads of not more than the tabulated projected area, the minimum pipe thickness and bracket heights are to be as specified in *Table 11.1.5*. Where brackets are required, three or more radial brackets are to be fitted. In addition, the relevant requirements of 1.3.4 are to be applied.

- 1.3.3.3 Brackets are to have a gross thickness of 8mm or more, minimum length of 100mm, and height according to *Table 11.1.5*, but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported. In addition, loads according to 1.3.4 are to be applied. Brackets, where fitted, are to be of suitable thickness and length according to their height.
- 1.3.3.4 Gross pipe thickness is to be in accordance with the relevant requirements for machinery of the individual Classification Societies.

1.3.4 Applied loading on air pipes

(RCN 2, effective from 1 July 2008)

- 1.3.4.1 Air pipes on an exposed deck within the forward 0.25L, where the height of the exposed deck at the air pipe or sounding pipe is less than 0.1L or 22m, whichever is less, from the summer load waterline are to comply with the requirements of 1.3.4.2 through 1.3.4.3 and 1.3.5.1.

(RCN 2, effective from 1 July 2008)

Table 11.1.5 Thickness and Bracket Standards for 760mm High Air Pipes			
Nominal pipe size	Minimum fitted gross thickness, in mm	Maximum projected area of head, in cm ²	Height ⁽¹⁾ of brackets, in mm
65A	6.0	-	-
80A	6.3	-	480
100A	7.0	-	460
125A	7.8	-	380
150A	8.5	-	300
175A	8.5	-	300
200A	8.5 ⁽²⁾	1900	300
250A	8.5 ⁽²⁾	2500	300 ⁽²⁾
300A	8.5 ⁽²⁾	3200	300 ⁽²⁾
350A	8.5 ⁽²⁾	3800	300 ⁽²⁾
400A	8.5 ⁽²⁾	4500	300 ⁽²⁾
Note 1. Brackets (see 1.3.3.2) need not extend over the joint flange for the head. 2. Brackets are required where the gross thickness of the pipe section is less than 10.5mm, or where the tabulated projected head area is exceeded.			

- 1.3.4.2 The pressures acting on air pipes and their closing devices, P_{pipe} , are given by:

$$P_{pipe} = 0.5 \rho_{sw} v_{sea}^2 C_1 C_2 C_3 \quad \text{kN/m}^2$$

Where:

ρ_{sw} density of sea water, 1.025 tonnes/m³

v_{sea} velocity of water over the fore deck, 13.5 m/sec

C_1 shape coefficient:

0.5 for pipes

1.3 for pipe or ventilator heads in general

- 0.8 for pipe or ventilator heads of cylindrical form with its axis in the vertical direction
- C_2 slamming coefficient, 3.2
- C_3 protection coefficient:
 - 0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle
 - 1.0 elsewhere, including immediately behind a bulwark

(RCN 2, effective from 1 July 2008)

- 1.3.4.3 Forces acting in the horizontal direction on the pipe and its closing device may be calculated from the above pressure, using the largest projected area of each component.

1.3.5 Strength requirements for air pipes and their closing devices

(RCN 2, effective from 1 July 2008)

- 1.3.5.1 Bending moments and stresses in air pipes are to be calculated at critical positions:

- (a) at penetration pieces
- (b) at weld or flange connections
- (c) at toes of supporting brackets.

Bending stresses in the net section are not to exceed $0.8 \sigma_{yd}$, where σ_{yd} is the specified minimum yield stress or 0.2% proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2mm is then to be applied.

(RCN 2, effective from 1 July 2008)

1.3.6 Closing appliances for air pipes

- 1.3.6.1 All air pipes terminating on the weather deck are to be fitted with return bends (gooseneck), or other equivalent arrangement to prevent water from passing inboard.
- 1.3.6.2 A weathertight permanent means of closure is to be provided for the outlet. The closing device is to be of an automatic type, i.e. close automatically upon submergence (e.g. ball float or equivalent) for any one of the following cases:
- (a) the outlet is submerged, with the ship at its summer load water line at an angle of 40 degrees, or the angle of down flooding if this is less than 40 degrees
 - (b) to comply with damage stability requirements.
- 1.3.6.3 Air pipes are not to be fitted with valves that may impair the venting function.

1.4 Deck Houses and Companionways

1.4.1 Applicability

- 1.4.1.1 The requirements of this section are applicable to steel deck houses and companionways, as defined in 1.4.3.1 and 1.4.3.2.
- 1.4.1.2 Scantling requirements depend on the vertical location of the item relative to the waterline. This location is categorized in terms of "tiers".

1.4.2 Materials

- 1.4.2.1 The scantlings in 1.4 apply to structures constructed of hull structural steel, in accordance with the requirements of *Section 6/1*. Scantlings of aluminium alloy deck houses will be considered by the individual Society, supported by the submission of a specification of the proposed alloys.

1.4.3 Definitions

- 1.4.3.1 A deck house is defined as a decked structure, above the strength deck, with the side plating being inboard of the shell plating by more than 4% of the ship's breadth, B .
- 1.4.3.2 A companionway is defined as a weathertight deck structure; protecting an access opening leading below the freeboard deck, or into a space within an enclosed superstructure.
- 1.4.3.3 A tier is defined as a measure of the extent of a deck house. A deck house tier consists of a deck and external bulkheads. In general, the first tier is the tier situated on the freeboard deck.

1.4.4 Structural continuity

- 1.4.4.1 In deck houses aft, the front bulkhead is to be in line with a transverse bulkhead in the hull below or is to be supported by a combination of partial transverse bulkheads, girders and pillars.
- 1.4.4.2 The aft end bulkhead is to be effectively supported.
- 1.4.4.3 At the corners of the deck house attachment at the strength deck, attention is to be given to the connection of the deck house to the deck and the arrangements to transmit load into the under-deck supporting structure.
- 1.4.4.4 As far as practicable, exposed sides and main longitudinal and transverse bulkheads are to be located above bulkheads and/or deep girder frames in the hull structure, and are to be in line in the various tiers of accommodation. Where such structural arrangement in line is not possible, there is to be other effective support.
- 1.4.4.5 Arrangements are to be made to minimize the effect of discontinuities in erections. All openings cut in the sides are to be substantially framed and have well-rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings.

1.4.5 Deck plating

- 1.4.5.1 The gross thickness of the plating, t_{dk-grs} , is not to be less than:

$$t_{dk-grs} = 7.5 \sqrt{\frac{k s}{s_{std}}} \quad \text{mm, on first tier deck houses}$$

$$t_{dk-grs} = 7.0 \sqrt{\frac{k s}{s_{std}}} \quad \text{mm, on second tier deck houses}$$

$$t_{dk-grs} = 6.5 \sqrt{\frac{k s}{s_{std}}} \quad \text{mm, on third tier and above deck house}$$

Where:

s spacing of stiffeners, in m

k	higher strength steel factor, as defined in <i>Section 6/1.1.4</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²
s_{std}	standard reference spacing of longitudinals or beams, in m: $= 0.470 + 0.00167L_1$
L_1	rule length, as defined in <i>Section 4/1.1.1.1</i> , but is not to be taken greater than 250m

- 1.4.5.2 The plating thickness inside deck houses may be reduced by 10 percent provided that the reduced gross thickness, $t_{dlh-grs}$, is not less than:

$$t_{dlh-grs} = (5.8s + 1)\sqrt{k} \quad \text{mm, but is not to be less than 5.5mm}$$

Where:

s	spacing of stiffeners, in m
k	higher strength steel factor, as defined in <i>Section 6/1.1.4</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

1.4.6 Deck longitudinals and beams

- 1.4.6.1 For each longitudinal or beam, in association with the plating to which it is attached, the gross section modulus, $Z_{lng-grs}$, is not to be less than:

$$Z_{lng-grs} = 4.563s l_{bdg}^2 h_{tier} k \quad \text{cm}^3$$

Where:

s	spacing of stiffeners, in m
l_{bdg}	effective bending span, as defined in <i>Section 4/2.1.1</i> , in m
B	as defined in <i>Section 4/1.1.3.1</i>
h_{tier}	load head in relation to the deck house tier, in m: 1.68 for poop and first tier above freeboard deck 1.30 for second tier above freeboard deck 0.91 for third and higher tiers above freeboard deck For decks with position second tier or higher above the freeboard deck, generally used only as weather covering, the value of h_{tier} may be reduced, but in no case is it to be less than 0.46
k	higher strength steel factor, as defined in <i>Section 6/1.1.4</i>
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

1.4.7 Deck girders and transverses

- 1.4.7.1 Deck girders and transverses are to be arranged to support beams or deck longitudinals. Where arrangements of deck girders and transverses are such that these members act as a grillage structure, additional analysis may be carried out to consider grillage effects and justify that scantlings are equivalent to those required by 1.4.7.2 and 1.4.7.3. In this analysis gross scantlings are to be used, basic geometry parameters are to be as indicated in 1.4.7.2, the load is to be taken as the head required by 1.4.7.2 with a unit density of 0.715tonnes/m³ and the permissible bending stress is to be taken as $0.67\sigma_{yd}$. For the determination of equivalent

scantlings to those required by 1.4.7.3, equivalency is to be based on the deflection at girder/transverse intersection points and at midspan of the members, and the permissible deflection is to be taken as the deflections calculated for a simple beam meeting the requirements of 1.4.7.2 and with depth d_{grd} as required by 1.4.7.3.

- 1.4.7.2 For each deck girder or transverse web, the gross section modulus, Z_{t-grs} , is not to be less than:

$$Z_{t-grs} = 4.74 b_{dk} l_{bdg}^2 h_{tier} k \quad \text{cm}^3$$

Where:

b_{dk}	mean breadth of the area of deck supported, in m
l_{bdg}	effective bending span, to be taken as the distance between centres of supporting pillars, or between pillars, transverse members, girders and/or bulkheads supporting them, in m. Where an effective bracket is fitted at the bulkhead, the length l_{bdg} may be modified, see Section 4/2.1.4
h_{tier}	load head in relation to the deck house tier, in m: 1.68 for poop and first tier above freeboard deck 1.30 for second tier above freeboard deck 0.91 for third and higher tiers above freeboard deck For decks with position second tier or higher above the freeboard deck, generally used only as weather covering, the value of h_{tier} may be reduced, but in no case is it to be less than 0.46
k	higher strength steel factor, as defined in Section 6/1.1.4
σ_{yd}	specified minimum yield stress of the material, in N/mm ²

- 1.4.7.3 The depth of girders and transverse webs, d_{grd} , is not to be less than:

$$d_{grd} = 0.0583 l_{bdg} \quad \text{m}$$

Where:

l_{bdg}	effective bending span, to be taken as the distance between centres of supporting pillars, or between pillars, transverse members, girders and/or bulkheads supporting them, in m. Where an effective bracket is fitted at the bulkhead, the length l_{bdg} may be modified, see Section 4/2.1.4
-----------	--

Where girders and transverse webs intersect, consideration may be given to accept a lesser depth for the longer member, where the shorter member provides full support to the longer member.

- 1.4.7.4 The gross thickness of girders or transverse webs is not to be taken as less than 1mm per 100mm of depth, plus an additional 4mm. Where web shear strength and buckling capacity are demonstrated to be satisfactory, lesser thicknesses may be accepted. For shear strength analysis gross scantlings are to be used, basic geometry parameters are to be as indicated in 1.4.7.2, the load is to be taken as the head required by 1.4.7.2 with a unit density of 0.715 tonnes/m³ and the permissible shear stress is to be taken as $0.39\sigma_{yd}$. Buckling capacity is demonstrated as satisfactory when the depth to gross thickness ratio of the web is less than 75.

1.4.8 Pillars

1.4.8.1 The gross scantlings of pillars are to be such that the permissible load, determined in accordance with 1.4.8.2, is greater than the design load, determined in accordance with 1.4.8.3, considering the requirement of 1.4.8.4.

1.4.8.2 The permissible loading on a pillar, W_{perm} , is given by:

$$W_{perm} = (f_{s1} - h_{pill} f_{s2} / r_{gyr-grs}) A_{pill-grs} \quad \text{kN}$$

Where:

f_{s1} steel factor:

12.09	normal strength steel
13.59	HT27 strength steel
16.11	HT32 strength steel
17.12	HT34 strength steel
18.12	HT36 strength steel
20.14	HT40 strength steel

h_{pill} distance between the top of the pillar supporting deck or other structure to the underside of the supported beam or girder, in m

f_{s2} steel factor:

4.44	normal strength steel
5.57	HT27 strength steel
7.47	HT32 strength steel
8.24	HT34 strength steel
9.00	HT36 strength steel
10.52	HT40 strength steel

$r_{gyr-grs}$ radius of gyration for gross pillar section, in cm

$A_{pill-grs}$ gross cross sectional area of pillar, in cm²

1.4.8.3 The design load for a specific pillar, W_{des} , is given by:

$$W_{des} = 7.04 b_{dk} h_{tier} l_{dk} \quad \text{kN}$$

Where:

b_{dk} mean breadth of the area of deck supported, in m

h_{tier} load head in relation to the deck house tier, in m:

1.68 for poop and first tier above freeboard deck

1.30 for second tier above freeboard deck

0.91 for third and higher tiers above freeboard deck

For decks with position second tier or higher above the freeboard deck, generally used only as weather covering, the value of h_{tier} may be reduced, but in no case is it to be less than 0.46

l_{dk} mean length of the area of deck supported, in m

- 1.4.8.4 Where pillars are arranged in a vertical line, the design load on the pillar at each level is to be calculated by summing the design load for the deck directly above the pillar and one-half of the design load for each pillar above.

1.4.9 Exposed bulkheads

- 1.4.9.1 The scantlings of the exposed bulkheads of deck houses and companionways are to be in accordance with 1.4.10 to 1.4.13. Increased scantlings may be required where the structure supports loads from deck equipment, fittings, etc.
- 1.4.9.2 Special consideration may be given to the bulkhead scantlings of deck houses which do not protect openings in the freeboard deck, superstructure deck or in the top of a lowest tier deck house. Special consideration may also be given to the bulkhead scantlings of deck houses which do not protect machinery casings, provided they do not contain accommodation or do not protect equipment essential to the operation of the vessel.
- 1.4.9.3 Long deck houses may need additional support in order to provide resistance to racking, see 1.4.13.

1.4.10 Exposed bulkhead plating

- 1.4.10.1 The gross thickness of plating, $t_{blk-grs}$, is not to be less than that calculated from 1.4.10.2 and that given by:

$$t_{blk-grs} = 3s\sqrt{k h_{des}} \quad \text{mm}$$

Where:

- s spacing of stiffeners, in m
- k higher strength steel factor, as defined in Section 6/1.1.4
- σ_{yd} specified minimum yield stress of the material, in N/mm²
- h_{des} design head, in m:
 $C_4[(C_5 f) - z]c$
 but is not to be taken less than given below for the specified location:
 $2.5 + L_1 / 100$ unprotected front bulkheads on the lowest tier
 $1.25 + L_2 / 200$ elsewhere
- L_1 rule length, L , as defined in Section 4/1.1.1.1, but is not to be taken greater than 250m
- L_2 rule length, L , as defined in Section 4/1.1.1.1, but is not to be taken greater than 300m
- C_4 coefficient as given in Table 11.1.6
- C_5 coefficient:
 $1.0 + \left[\frac{(x/L) - 0.45}{C_{b1} + 0.2} \right]^2$ where $x/L \leq 0.45$
 $1.0 + 1.5 \left[\frac{(x/L) - 0.45}{C_{b1} + 0.2} \right]^2$ where $x/L > 0.45$
- C_{b1} block coefficient as defined in Section 4/1.1.9.1, but is not to be taken as less than 0.60 or greater than 0.80. For aft end

	bulkheads forward of amidships, C_{b1} may be taken as 0.80
x	distance between the A.P. and the bulkhead being considered, in m. Deck house side bulkheads are to be divided into equal parts not exceeding $0.15L$ in length, and x is to be measured from the A.P. to the centre of each part considered
L	rule length, as defined in Section 4/1.1.1.1
f	as defined in Table 11.1.7
z	vertical distance from the summer load waterline measured to the middle of the plate, in m
c	$0.3 + 0.7b_{dh}/B_1$ but is not to be taken as less than 1.0 for exposed machinery casing bulkheads and in no case is b_{dh}/B_1 to be taken as less than 0.25
b_{dh}	breadth of deck house at the position being considered, in m
B_1	actual breadth of the vessel at the freeboard deck at the position being considered, in m

Table 11.1.6 Values of ' C_4 '	
Bulkhead location	Value of ' C_4 '
Unprotected front, lowest tier	$2.0 + L_2/120$
Unprotected front, 2 nd tier	$1.0 + L_2/120$
Unprotected front, 3 rd tier	$0.5 + L_2/150$
Protected front, all tiers	$0.5 + L_2/150$
Sides, all tiers	$0.5 + L_2/150$
Aft ends, aft of amidships, all tiers	$0.7 + (L_2/1000) - 0.8x/L$
Aft ends, forward of amidships, all tiers	$0.5 + (L_2/1000) - 0.4x/L$

Table 11.1.7 Values of ' f '	
L , in m	f , in m
90	6.00
100	6.61
120	7.68
140	8.65
160	9.39
180	9.88
200	10.27
220	10.57
240	10.78
260	10.93
280	11.01
≥ 300	11.03
<u>Note</u> 1. This Table is based on the equations given in Table 11.1.8	

Table 11.1.8 Origin of 'f' Values	
L , in m	f , in m
$L \leq 150$	$(L/10)(e^{-L/300}) - [1 - (L/150)^2]$
$150 < L < 300$	$(L/10)(e^{-L/300})$
$L \geq 300$	11.03

1.4.10.2 The gross thickness for the lowest tier bulkheads, $t_{blk-tier-grs}$, is not to be less than:

$$t_{blk-tier-grs} = 5.0 + L_1 / 100 \quad \text{mm}$$

For other tiers, the gross thickness of bulkheads is not to be less than:

$$t_{blk-tier-grs} = 4.0 + L_1 / 100 \quad \text{mm, or 5.0mm, whichever is greater}$$

Where:

L_1 rule length, L , as defined in Section 4/1.1.1.1, but is not to be taken greater than 250m

1.4.11 Exposed bulkhead stiffeners

1.4.11.1 Each stiffener, in association with the plating to which it is attached, is to have a gross section modulus, $Z_{blk-grs}$, not less than:

$$Z_{blk-grs} = 3.5 s h_{tween}^2 h_{des} k \quad \text{cm}^3$$

Where:

s spacing of stiffeners, in m

h_{tween} 'tween deck height, in m

h_{des} design head, as defined in 1.4.10.1, with z taken as the vertical distance from the summer load waterline to midpoint of the stiffener span, in m

k higher strength steel factor, as defined in Section 6/1.1.4

σ_{yd} specified minimum yield stress of the material, in N/mm²

1.4.12 Stiffener end attachments for stiffeners on exposed bulkheads

1.4.12.1 Both ends of the webs of lowest tier bulkhead stiffeners are to be effectively attached. The scantlings of stiffeners having other types of end connection will be specially considered.

1.4.13 Web arrangements for webs on exposed bulkheads

1.4.13.1 In long deck houses with multiple tiers, web frames or partial bulkheads are to be fitted within the first tier, spaced a maximum of approximately 9m apart and arranged, where practicable, in line with watertight bulkheads below.

1.4.13.2 Webs are also to be arranged in way of large openings, boats davits and other points of high loading.

1.4.14 Closing arrangements for openings in deck houses and companionways

1.4.14.1 All openings in the bulkheads of deck houses and companionways, which give direct access to enclosed superstructures or to spaces below the freeboard, are to be

provided with efficient means of closing so that in any sea condition, water will not penetrate the vessel.

- 1.4.14.2 Doors of such openings are to be of steel or other equivalent material, permanently and strongly attached to the bulkhead. The doors are to be provided with gaskets and clamping devices, or other equivalent arrangements, which are to be permanently attached to the bulkhead or to the doors themselves. The doors are to be so arranged that they can be operated from both sides of the bulkhead. Doors complying with a recognized national or international standard will generally be accepted.
- 1.4.14.3 Access openings are to be framed and stiffened so that the whole structure is equivalent to the un-pierced bulkhead when closed.
- 1.4.14.4 Except as permitted by 1.4.14.5, access doors, air inlets and openings to accommodation spaces, control stations and machinery spaces, are not to face the cargo tank region. They are to be located on the transverse bulkhead or on the side of the deck house at a distance of at least $0.04L$ and not less than 3m from the end of the deck house facing the cargo tank region. This distance need not exceed 5m.
- 1.4.14.5 Access doors in boundary bulkheads facing the cargo tank region, or within the 5m limits specified in 1.4.14.4, leading to the main cargo control stations and to such service spaces used as provision rooms, store rooms and lockers, may be permitted, provided they do not give access directly or indirectly to any other space containing or providing for accommodation, control stations or service spaces such as galley, pantries or work shops, or similar spaces containing source of vapour ignition. The boundary of such a space is to be insulated to "A-60" class standard, with the exception of the boundary facing the cargo tank region.

1.4.15 Sills of access openings

- 1.4.15.1 The height of the sills of access openings, in the bulkheads of deck houses and companionways, which give direct access to enclosed superstructures or to spaces below the freeboard deck, is to be a minimum of 600mm in Position 1 and 380mm in Position 2, as defined in *Section 4/1.2*.

1.4.16 Access openings in machinery casings on Type 'A' freeboard tankers

- 1.4.16.1 In general, there are to be no openings giving direct access from the freeboard deck to the machinery space in exposed machinery casings.
- 1.4.16.2 A door complying with the requirements of 1.4.14.1 to 1.4.14.3 may be permitted in the exposed machinery casing provided that it leads to a space or passageway which is as strongly constructed as the casing, and is separated from the engine room by a second door complying with the requirements of 1.4.14.1 to 1.4.14.3. The sill of the exterior door is not to be taken less than 600mm and the sill of the second door is not to be taken less than 230mm.

1.4.17 Windows and side scuttles

- 1.4.17.1 Side scuttles, in the external bulkheads of deck houses and weathertight doors, are to be of substantial construction in accordance with a recognised national or international standard.

- 1.4.17.2 Windows and side scuttles, fitted in the boundaries of deck houses protecting direct access into superstructures, or to spaces below the freeboard deck, are to be fitted with efficient hinged inside deadlights.
- 1.4.17.3 Windows and portlights facing the cargo tank region, and on the side of the superstructures or deck houses within the limits specified in 1.4.14.4 and 1.4.14.5, shall be of a fixed (non-opening) type. Such windows and portlights, except wheelhouse windows, shall be constructed to "A-60" class standard.

1.5 Scuppers, Inlets and Discharges

1.5.1 Drains – enclosed spaces

- 1.5.1.1 Scuppers and discharges which drain spaces below the freeboard deck, or spaces within intact superstructures or deck houses on the freeboard deck, fitted with doors complying with the requirements of the *International Convention on Load Lines, Regulation 12*, may be led to the bilges in the case of scuppers, or to suitable sanitary tanks in the case of sanitary discharges. Alternatively, they may be led overboard, provided that:
- the freeboard is such that the deck edge is not immersed when the ship heels to five degrees either way, and
 - each drain is fitted with means of preventing water from passing inboard, in accordance with 1.5.3.

1.5.2 Drains – open spaces

- 1.5.2.1 Drains leading from superstructures or deck houses not fitted with doors complying with the requirements of *International Convention on Load Lines, Regulation 12* are to be led overboard.

1.5.3 Prevention of water passing inboard

- 1.5.3.1 Drains either from spaces below the freeboard deck or from within superstructures and deck houses on the freeboard deck, where permitted to be led overboard, see 1.5.1.1(a), are to be fitted with efficient and accessible means for preventing water from passing inboard, in accordance with 1.5.3.2 to 1.5.3.7.
- 1.5.3.2 For drains which remain open during normal operation of the ship, such as sanitary discharges, means for preventing water passing inboard are to be in accordance with those given below for the area described. h_{disc} is the height from the summer load line to the inboard end of the discharge, in m:
- $h_{disc} \leq 0.01L_L$:
 - one automatic non-return valve with a positive means of closing it from a position above the freeboard deck
 - alternatively, one automatic non-return valve and one positive closing valve controlled from above the freeboard deck may be accepted.
 - $0.01L_L < h_{disc} \leq 0.02L_L$:
 - two automatic non-return valves, without positive means of closing, provided that the inboard valve is always accessible for examination under service conditions
 - the inboard valve is to be located above the deepest salt water load line
 - if this is not practicable, additional locally controlled positive closing may be provided outboard, or the outboard non-return valve may be provided with a

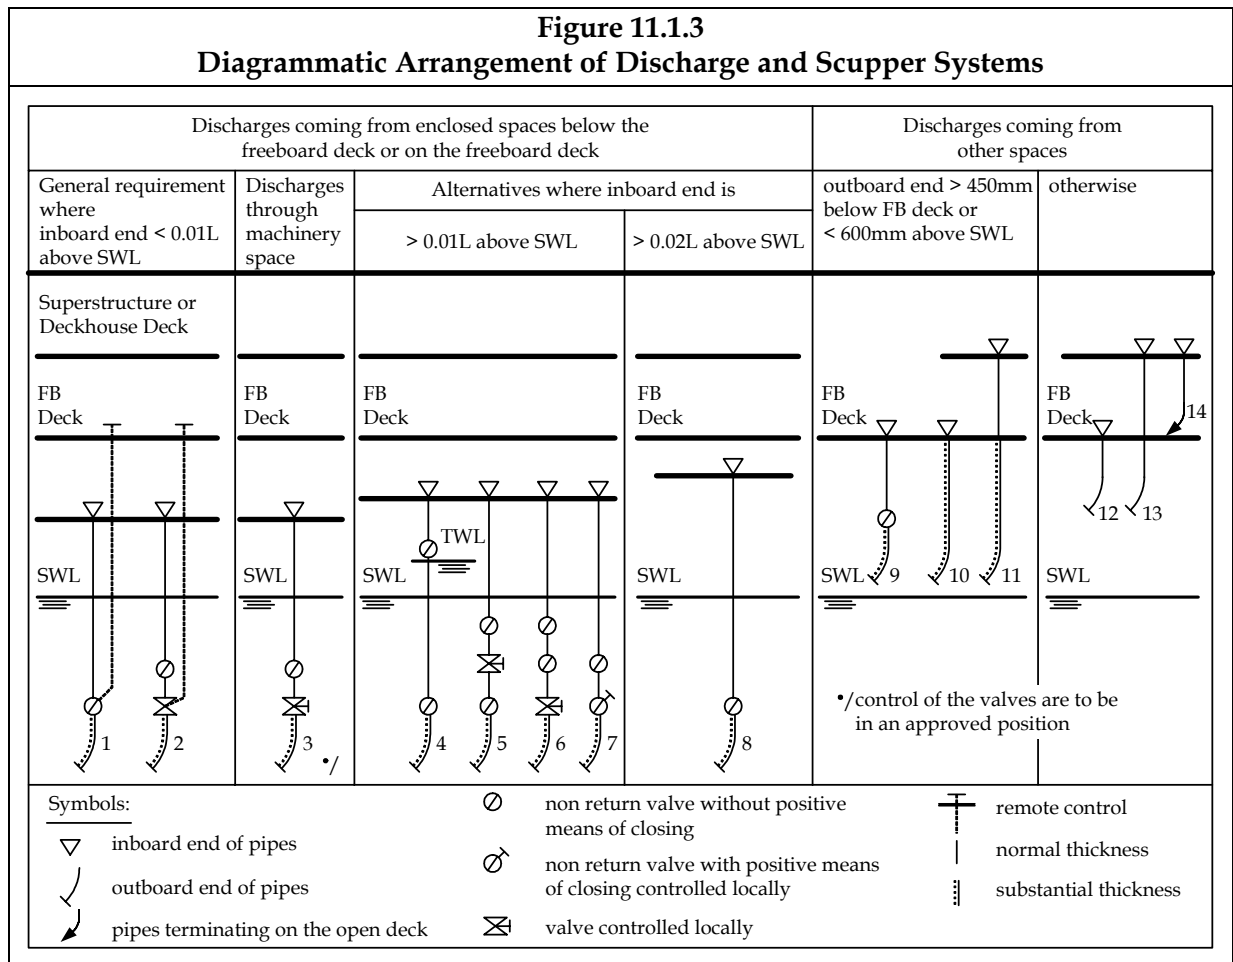

locally controlled positive closing feature, in which case the inboard valve need not be located above the deepest salt water load line.

(c) $h_{disc} > 0.02L_L$:

- one single automatic non-return valve without positive means of closing.

1.5.3.3 For overboard discharges in way of machinery spaces, a locally operated positive closing valve at shell together with a non-return valve inboard, may be accepted in lieu of those required by 1.5.3.2.

1.5.3.4 For acceptable arrangements for discharges and scuppers, see Figure 11.1.3.

1.5.3.5 For drains which are closed at sea, such as gravity drains from topside ballast tanks, a single screw down valve operated from the deck may be accepted.

1.5.3.6 The means for operating the positive closing valve are to be readily accessible and provided with an indicator showing whether the valve is open or closed.

1.5.3.7 Drain pipes originating at any level and penetrating the shell either more than 450mm below the freeboard deck or less than 600mm above the summer load waterline are to be provided with a non-return valve at the shell. This valve, unless required by 1.5.3.2 through 1.5.3.4, may be omitted if the pipe is of substantial thickness, in accordance with 1.5.7.3.

1.5.4 Sea inlets

1.5.4.1 In manned machinery spaces, main and auxiliary sea inlets and discharges in connection with the operation of machinery may be controlled locally. The control is

to be readily accessible and provided with indicators showing whether the valves are open or closed.

1.5.5 Shell valves and fittings

- 1.5.5.1 For installation; the shell valves are to be mounted on the shell (or sea chest). However, where it is impracticable to do so, a distance piece, of substantial thickness in accordance with 1.5.7.3, may be fitted. Shell outlets are to be so located as to prevent any discharge falling onto a lowered survival craft.
- 1.5.5.2 For material; all required shell valves and fittings are to be of steel, bronze or other approved ductile material. Valves of ordinary cast iron or similar material are not acceptable.
- 1.5.5.3 Material readily rendered ineffective by heat is not to be used for shell connection where the failure of the material in case of fire would give rise to danger of flooding.

1.5.6 Unattended machinery space

- 1.5.6.1 For unattended machinery space; the control of any valve serving a sea inlet, a discharge below the waterline, or a bilge injection system, is to be so sited as to allow adequate time to reach and operate the control, in case of ingress of water to the space with the ship in the fully loaded condition.
- 1.5.6.2 For application of 1.5.6.1 in an unattended machinery space; where it can be demonstrated by calculation that the damaged water line will not be above the tank top floor level after 10 minutes from the initiation of the uppermost bilge level alarm, the valve control may be from the tank top floor.

Guidance Note:

Various Flag Administrations have interpretations of this requirement. Where the ship is flagged by an Administration having an interpretation of this requirement, the interpretation of the Flag Administration shall take precedence over the requirements of 1.5.6.2.

1.5.7 Pipes

- 1.5.7.1 All pipes from shell to the first valve are to be of steel or other equivalent material.
- 1.5.7.2 The gross wall thickness of steel piping inboard of the valve is not to be less than that given in Table 11.1.9, unless substantial thickness is required.

Table 11.1.9 Thickness of Normal Steel Piping	
External diameter, in mm	Gross wall thickness, in mm
≤ 155	4.5
≥ 230	6.0
<u>Note</u> 1. Intermediate values are to be obtained by linear interpolation.	

- 1.5.7.3 The gross wall thickness of steel piping, where required to be of substantial thickness, see 1.5.3.7 and 1.5.5.1, is not to be less than given in Table 11.1.10.

Table 11.1.10 Thickness of Substantial Steel Piping	
External diameter, in mm	Gross wall thickness, in mm
≤ 80	7.0
180	10.0
≥ 220	12.5
Note 1. Intermediate values are to be obtained by linear interpolation.	

1.5.8 Rubbish chutes, offal and similar discharges

- 1.5.8.1 Rubbish chutes, offal, and similar discharges are to be constructed of mild steel piping or plating equal to the shell thickness. Other materials will be specially considered.
- 1.5.8.2 Openings are to be kept clear of the sheer strake and areas of high stress concentration.
- 1.5.8.3 Rubbish chute hoppers are to be provided that comprise a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time.
- 1.5.8.4 The hopper cover is to be secured closed when not in use, and a suitable notice is to be displayed at the control position.
- 1.5.8.5 Where the inboard end of the hopper is less than $0.01L_L$, a positive closing valve is to be provided in addition to the cover and flap, in an easily accessible position above the deepest salt water load line.
- 1.5.8.6 The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a notice to that effect is to be displayed at the valve operating position.

2 CREW PROTECTION

2.1 Bulwarks and Guardrails

2.1.1 General

- 2.1.1.1 Bulwarks or guard rails are to be provided at the boundaries of exposed freeboard and superstructure decks, at the boundary of first tier deck houses and at the ends of superstructures.
- 2.1.1.2 Bulwarks, or guard rails, are to be a minimum of 1.0m in height, measured above sheathing, and are to be constructed as required in 2.1.2. Where this height would interfere with the normal operation of the vessel, a lesser height may be approved. Where approval of a lower height is requested, justifying information is to be submitted.
- 2.1.1.3 Within $0.6L$ amidships, bulwarks are to be arranged to ensure that they are free from hull girder stresses.
- 2.1.1.4 Satisfactory means in the form of guard rails, life lines, gangways, under deck passages or an equivalent are to be provided for the protection of crew during passage from their quarters, the machinery space, and all other locations necessary for the crewing of the ship, see 2.3.1.1.

2.1.2 Construction of bulwarks

- 2.1.2.1 The gross thickness of bulwark plating, at the boundaries of exposed freeboard and superstructure decks, is not to be less than that given in *Table 11.2.1*.

Table 11.2.1 Thickness of Bulwark Plates	
Height of Bulwark	Gross Thickness
1.8m or more	As required for superstructure in the same position
1.0m	6.5mm
Intermediate height	To be determined by linear interpolation

- 2.1.2.2 Plate bulwarks are to be stiffened by a top rail. Plate bulwarks on the freeboard deck and forecastle deck are to be supported by stays having a spacing generally not greater than 2.0m.
- 2.1.2.3 The free edge of the stay is to be stiffened.
- 2.1.2.4 The gross section modulus of stays, $Z_{stay-grs}$, is not to be less than that given below. In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck. Where, at the ends of the ship, the bulwark plating is connected to the sheer strake, a width of attached plating, not exceeding 600mm, may also be included.

$$Z_{stay-grs} = 77 h_{blwk}^2 s_{stay} \quad \text{cm}^3$$

Where:

h_{blwk} height of bulwark from the top of the deck plating to the top of the rail, in m

s_{stay} spacing of the stays, in m

- 2.1.2.5 Where mooring fittings subject the bulwark to large forces, the strength of the stays is to be suitably upgraded.
- 2.1.2.6 Bulwark stays are to be supported by, or are to be in line with, suitable under deck stiffening. The stiffening is to be connected by double continuous fillet welds in way of bulwark stay connections.
- 2.1.2.7 Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of openings.
- 2.1.2.8 Bulwarks are to be adequately strengthened and increased in thickness in way of mooring pipes.
- 2.1.2.9 Cuts in bulwarks for gangways or other openings are to be kept clear of breaks of superstructures.
- 2.1.2.10 Where bulwarks are fitted, freeing ports are to be provided as required in 2.1.5. The freeing ports are to comply with the requirements of the individual Classification Society.

2.1.3 Construction of guard rails

- 2.1.3.1 Stanchions of guard rails required by 2.1.1.1 are to comply with the following requirements:
 - (a) fixed, removable or hinged stanchions are to be fitted approximately 1.5m apart
 - (b) at least every third stanchion is to be supported by a bracket or stay
 - (c) removable or hinged stanchions are to be capable of being locked in the upright position
 - (d) in the case of ships with rounded gunwales, the stanchions are to be placed on the flat of the deck
 - (e) in the case of ships with sheer strake, the stanchions are not to be attached to the sheer strake, upstand or a continuous gutter bar.
- 2.1.3.2 The size of openings, below the lowest course of rails and the deck or upstand, is to be a maximum of 230mm. The distance between other courses is not to be greater than 380mm.
- 2.1.3.3 Wire ropes may be accepted, in lieu of guard rails, only in special circumstances and then only in limited lengths. In such cases, they are to be made taut by means of turnbuckles.
- 2.1.3.4 Chains may be accepted, in lieu of guard rails, only where they are fitted between two fixed stanchions and/or bulwarks.

2.1.4 Additional requirements for bulwarks and guard rails related to spill containment

- 2.1.4.1 Generally, open guard rails are to be fitted on the upper deck. Plate bulwarks, with a 230mm high continuous opening, at the lower edge, may be accepted provided the arrangement allows for the acceptable handling of spillage on deck and minimises the possibility for accumulation of volatile gas.
- 2.1.4.2 Deck spills are to be prevented from spreading to the accommodation and service areas and from discharge into the sea by a permanent continuous coaming with a minimum height of 100mm surrounding the cargo deck. Along the sides at the aft end of the cargo deck, the coaming is to have a minimum height of 200mm extending a minimum of 4.5m forward from each corner. At the aft end of the cargo

deck, the coaming is to have a minimum height of 300mm and is to extend from ship-side to ship-side.

2.1.4.3 Where a continuous gutter bar deck coaming is fitted, it is to be constructed of the same material strength and grade as the deck plating to which it is attached.

2.1.4.4 Scupper plugs of mechanical type are to be provided. Means of draining or removing oil or oily water within the coaming are also to be provided.

2.1.5 Additional requirements for deeper loading

2.1.5.1 Ships with Type A or B-100 Freeboard (i.e. a freeboard less than that based on Type B-60) are to have open rails fitted for a minimum of half the length of the exposed parts of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33% of the total area of the bulwark. The freeing area is to be located in the lower part of the bulwark.

2.1.5.2 Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

2.1.5.3 Ships with Type B-60 Freeboard (i.e. a freeboard less than that based on Type B but not less than Type B-60) are to have a minimum freeing area of at least 25% of the total area of the bulwark. The freeing area is to be located in the lower part of the bulwark.

2.2 Tank Access

2.2.1 Access to tanks in the cargo tank region

2.2.1.1 Access to tanks in the cargo tank region is to be in accordance with *Section 5/5*.

2.3 Bow Access

2.3.1 General

2.3.1.1 The ship is to be provided with means to enable the crew to gain safe access to the bow even in severe weather conditions, see *Table 11.2.2*.

Table 11.2.2
Acceptable Arrangements for Access

Table 11.2.2 Acceptable Arrangements for Access					
Locations of Access	Assigned Summer Freeboard	Acceptable Arrangements According to Type of Freeboard Assigned (6)(7)(8)			
		Type A	Type B-100	Type B-60	Type B & B+
Access to Bow Between poop and bow, or Between a deck house containing living accommodation or navigation equipment, or both, and bow, or In the case of a flush deck vessel, between crew accommodation and the forward end of vessel.	$\leq (h_{FB} + h_{ss})$	a e f(1) f(5)			
	$> (h_{FB} + h_{ss})$	a e f(1) f(2)			
Access to Aft End In the case of a flush deck vessel, between crew accommodation and the aft end of vessel.	$\leq 3000\text{mm}$	a b c(1) e f(1)	a b c(1) c(2) e f(1) f(2)	a b c(1) c(2) e f(1) f(2)	a b c(1) c(2) c(4) d(1) d(2) d(3) e f(1) f(2) f(4)
	$> 3000\text{mm}$	a b c(1) d(1) e f(1)	a b c(1) c(2) d(1) d(2) e f(1) f(2)	a b c(1) c(2) c(4) d(1) d(2) d(3) e f(1) f(2) f(4)	
Where:					
h_{ss}	the standard height of a superstructure as defined in <i>ICLL Regulation 33</i>				
h_{FB}	freeboard from the summer load waterline amidships, in m, calculated as a Type A ship, regardless of the type of freeboard actually assigned				
a	a well lit and ventilated under deck passageway with a clear opening with a minimum width of 0.8m, and a minimum height of 2.0m, providing access to the locations under consideration and located as close as practicable to the freeboard deck				
b	a permanently constructed gangway fitted at or above the level of the superstructure deck, on or as near as practicable to the centreline of the vessel, providing a continuous platform of a non-slip surface at least 0.6m in width, with a foot-stop and guard rails extending on each side along its length. Guard rails are to be as required in 2.1.3, except that stanchions are to be fitted with a maximum spacing of 1.5m				
c	a permanent walkway with a minimum width of 0.6m, fitted at the freeboard deck level, consisting of two rows of guard rails, the stanchions of which, are to have a maximum spacing of 3m. The number of courses of rails and their spacing are to be as given in 2.1.3. On Type B freeboard ships, hatchway coamings with a height equal to or greater than 0.6m may be regarded as forming one side of the walkway provided that two rows of guard rails are fitted between the hatchways				

Table 11.2.2 (Continued)
Acceptable Arrangements for Access

d	a rope lifeline with a minimum diameter of 10mm, supported by stanchions approximately 10m apart, or a single hand rail or wire rope attached to the hatch coamings, continued and adequately supported between hatchways
e	<p>a permanently constructed gangway fitted at or above the level of the superstructure deck on, or as near as practicable, to the centreline of the vessel:</p> <ul style="list-style-type: none"> • located so as not to hinder easy access across the working areas of the deck • providing a continuous platform with a minimum width of 1.0m • constructed of fire resistant and non-slip material • fitted with guard rails extending on each side throughout its length. Guard rails are to be as required in 2.1.3, except that stanchions are to be fitted with a maximum spacing of 1.5m • provided with a foot stop on each side • having openings, with ladders to and from the deck, where appropriate. Openings are to be spaced a maximum of 40m apart • having shelters of substantial construction set in way of the gangway at intervals not exceeding 45m, if the length of the exposed deck to be traversed is greater than 70m. Every such shelter is to be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward, port and starboard sides
f	a permanent and efficiently constructed walkway fitted at the freeboard deck level on, or as near as practicable, to the centreline of the vessel, having the same specifications as those defined for a permanent gangway in 'e' above, except for foot-stops. On Type B freeboard ships the hatch coamings may be accepted as forming one side of the walkway, provided that the combined height of the hatch coaming and hatch cover, in the closed condition, is not less than 1m, and that two rows of guard rails are fitted between the hatchways

Note

1. At or near the centreline of the vessel, or fitted on hatchways at or near the centreline of the vessel
2. Fitted on each side of the vessel
3. Fitted on one side of the vessel, provision being made for fitting on either side
4. Fitted on one side only
5. Fitted on each side of the hatchways as near to the centreline as far as practicable
6. In all cases where wire ropes are fitted, adequate devices are to be provided to enable the maintaining of their tautness
7. A means of passage over obstructions, if any, such as pipes or other fittings of a permanent nature is to be provided
8. Generally, the width of the gangway or walkway is not to exceed 1.5m.

Guidance Note

Deviations from some or all of these requirements may be allowed, subject to agreement on a case-by-case basis with the relevant Flag Administration.

3 SUPPORT STRUCTURE AND STRUCTURAL APPENDAGES

3.1 Support Structure for Deck Equipment

3.1.1 General

- 3.1.1.1 Information pertaining to the support structure of deck equipment and fittings, as listed in 3.1.2 to 3.1.7, is to be submitted for approval.
- 3.1.1.2 This sub-section includes scantling requirements for the support structure and foundations of the following pieces of equipment and fittings:
 - (a) anchor windlasses
 - (b) anchoring chain stoppers
 - (c) mooring winches
 - (d) deck cranes, derricks and lifting masts
 - (e) emergency towing arrangements
 - (f) bollards and bitts, fairleads, stand rollers, chocks and capstans
 - (g) other deck equipment and fittings which are subject to specific approval
 - (h) miscellaneous deck fittings which are not subject to specific approval.
- 3.1.1.3 Where deck equipment is subject to multiple load cases, such as an operational load and a green seas load, the operational load and green seas load are to be applied independently for the evaluation of strength of foundations and support structure.

3.1.2 Supporting structures for anchoring windlass and chain stopper

- 3.1.2.1 The windlass is to be efficiently bedded and secured to the deck. The deck thickness in way of the windlass and chain stopper is to be compatible with the deck attachment design.
- 3.1.2.2 In addition to complying with the requirements of 3.1.2.6, the shipbuilder and the windlass manufacturer are to satisfy themselves that the foundation is suitable for the safe operation and maintenance of the windlass equipment.
- 3.1.2.3 The Breaking Strength is defined as the minimum breaking strength of the chain.
- 3.1.2.4 The following plans and information are to be submitted for approval:
 - (a) details of the supporting structure for the anchor windlass
 - (b) details of the windlass foundation design, including material specifications for holding down bolts and the connection of the foundation to the deck
 - (c) details of the chain stopper foundation design, including material specification and the connection of the foundation to the deck.
- 3.1.2.5 The following supporting information is also to be submitted:
 - (a) general arrangement drawing of anchoring equipment.
 - (b) design loads as specified in 3.1.2.8 and 3.1.2.9 and associated reaction forces applied to the foundation and supporting structure.
- 3.1.2.6 The scantlings of the support structure are to be dimensioned to ensure that for each of the load scenarios specified in 3.1.2.8 and 3.1.2.9, the calculated stresses in the support structure does not exceed the permissible stress levels given in 3.1.2.15 to 3.1.2.18.

3.1.2.7 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using gross scantlings.

3.1.2.8 The following load cases are to be examined for the anchoring operation, as appropriate:

- | | |
|---|--------------------------|
| (a) windlass where chain stopper is provided: | 45% of Breaking Strength |
| (b) windlass where chain stopper is not provided: | 80% of Breaking Strength |
| (c) chain stopper: | 80% of Breaking Strength |

Breaking Strength is defined in 3.1.2.3.

3.1.2.9 The following forces are to be applied separately in the load cases that are to be examined for the design loads due to green seas in the forward $0.25L$, see *Figure 11.3.1*:

$$P_x = 200A_x \quad \text{kN, acting normal to the shaft axis}$$

$$P_y = 150A_y f \quad \text{kN, acting parallel to the shaft axis (inboard and outboard directions to be examined separately)}$$

Where:

A_x projected frontal area, in m^2

A_y projected side area, in m^2

$f = 1 + B_W/H$, but not to be taken greater than 2.5

B_W breadth of windlass measured parallel to the shaft axis, in m.
See *Figure 11.3.1*

H overall height of windlass, in m, see *Figure 11.3.1*

3.1.2.10 Forces resulting from green sea design loads in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by a number of bolt groups, N , each containing one or more bolts. See Figure 11.3.2.

3.1.2.11 The axial forces, R_{xi} and R_{yi} , in bolt group (or bolt) i , positive in tension, are given by:

$$R_{xi} = P_x h x_i A_i / I_x$$

$$R_{yi} = P_y h y_i A_i / I_y$$

$$R_i = R_{xi} + R_{yi} - R_{si}$$

Where:

P_x	force acting normal to the shaft axis, in kN
P_y	force acting parallel to the shaft axis, either inboard or outboard, whichever gives the greater force in bolt group i , in kN
h	shaft centre height above the windlass mounting, in cm, see Figure 11.3.1
x_i, y_i	x and y coordinates of bolt group i from the centroid of all N bolt groups, in cm. Positive in the direction opposite to that of the applied force
A_i	cross sectional area of all bolts in group i , in cm ²
I_x	$= \sum A_i x_i^2$ for N bolt groups, in cm ⁴
I_y	$= \sum A_i y_i^2$ for N bolt groups, in cm ⁴
R_{si}	static reaction at bolt group i , due to the weight of windlass, in kN

3.1.2.12 The shear forces, F_{xi} and F_{yi} , applied to the bolt group i , and the resultant combined force F_i , are given by:

$$F_{xi} = (P_x - C_1 g m) / N$$

$$F_{yi} = (P_y - C_1 g m) / N$$

$$F_i = \sqrt{F_{xi}^2 + F_{yi}^2}$$

Where:

C_1	coefficient of friction, 0.5
m	mass of windlass, in tonnes
g	acceleration due to gravity, 9.81m/s ²
N	number of bolt groups

3.1.2.13 The resultant forces from the application of the loads specified in 3.1.2.8 and 3.1.2.9 are to be considered in the design of the supporting structure.

3.1.2.14 Where a separate foundation is provided for the windlass brake, the distribution of resultant forces is to be calculated on the assumption that the brake is applied for load cases (a) and (b) defined in 3.1.2.8.

3.1.2.15 The stresses resulting from anchoring design loads induced in the supporting structure are not to be greater than the permissible values given below, based on the gross thickness of the structure:

$$\text{Direct stress} \quad 1.00 \sigma_{yd}$$

$$\text{Shear stress} \quad 0.58 \sigma_{yd}$$

Where:

σ_{yd}	specified minimum yield stress of the material, in N/mm ²
---------------	--

3.1.2.16 The tensile axial stresses resulting from green sea design loads in the individual bolts in each bolt group i are not to exceed 50% of the bolt proof strength under the

above forces. The load is to be applied in the direction of the chain. Where fitted bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses are not to exceed 50% of the bolt proof strength.

3.1.2.17 The horizontal forces resulting from the green sea design loads F_{xi} and F_{yi} may be reacted by shear chocks. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculation.

3.1.2.18 The stresses resulting from green sea design loads induced in the supporting structure are not to be greater than the permissible values given below, based on the gross thickness of the structure:

Direct stress $1.00 \sigma_{yd}$

Shear stress $0.58 \sigma_{yd}$

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.1.3 Supporting structure for mooring winches

3.1.3.1 Mooring winches are to be efficiently bedded and secured to the deck. The deck thickness in way of mooring winches is to be compatible with the deck attachment design.

3.1.3.2 In addition to complying with the requirements of 3.1.3.6, the shipbuilder and mooring winch manufacturer are to satisfy themselves that the foundation is suitable for the safe operation and maintenance of the mooring winch equipment.

3.1.3.3 The Rated Pull is defined as the maximum load which the mooring winch is designed to exert during operation and is to be stated on the mooring winch foundation/support plan.

3.1.3.4 The Holding Load is defined as the maximum load which the mooring winch is designed to resist during operation and is to be taken as the design brake holding load or equivalent and is to be stated on the mooring winch foundation/support plan.

3.1.3.5 The following plans and information are to be submitted for approval:

- (a) details of the supporting structure for mooring winches
- (b) details of the mooring winch foundation design, including material specifications for hold down bolts and the connection of the foundation to the deck
- (c) design loads as specified in 3.1.3.8 and 3.1.3.9 and associated reaction forces applied to the foundation and supporting structure.

3.1.3.6 The scantlings of the support structure are to be dimensioned to ensure that, for each of the load cases specified in 3.1.3.8 and 3.1.3.9, the calculated stresses in the support structure do not exceed the permissible stress levels specified in 3.1.3.13 and 3.1.3.14, respectively.

3.1.3.7 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using gross scantlings.

3.1.3.8 Each of the following load cases are to be examined for design loads due to mooring operation:

- (a) mooring winch at maximum pull: 100% of the rated pull
- (b) mooring winch with brake effective: 100% of the holding load

- (c) line strength: 125% of the breaking strength of the mooring line (hawser) required by *Table 11.4.2* for the ship's corresponding equipment number

Rated pull and holding load are defined in 3.1.3.3 and 3.1.3.4. The design load is to be applied through the mooring line according to the arrangement shown on the mooring arrangement plan.

- 3.1.3.9 For mooring winches situated within the forward $0.25L$, the load cases for green seas are to be applied as indicated in 3.1.2.9.
- 3.1.3.10 For mooring winches situated within the forward $0.25L$, the resultant forces in the bolts obtained from green sea design loads are to be calculated in accordance with 3.1.2.10 to 3.1.2.12.
- 3.1.3.11 The resultant forces from the application of the loads specified in 3.1.3.8 and 3.1.3.9 are to be considered in the design of the supporting structure.
- 3.1.3.12 Where a separate foundation is provided for the mooring winch brake, the distribution of resultant forces is to take account of the different load path. The brake is only to be considered in relation to the forces in 3.1.3.8, load case (b).
- 3.1.3.13 The stresses resulting from mooring operation design loads, induced in the supporting structure, are not to exceed those given in 3.1.2.15.
- 3.1.3.14 For mooring winches situated within the forward $0.25L$, the stresses resulting from green sea design loads, induced in the bolts and supporting structure, are not to exceed values indicated in 3.1.2.16 through 3.1.2.18.

3.1.4 Supporting structure for cranes, derricks and lifting masts

- 3.1.4.1 Support structures of cranes, derricks and lifting masts with a Safe Working Load greater than 30kN, or a maximum overturning moment to the supporting structure greater than 100kNm, are to comply with the following requirements.
- 3.1.4.2 These requirements apply to the connection to the deck and the supporting structure of cranes, derricks and lifting masts. Where the crane, derrick or lifting mast is to be certified by the Classification Society, additional requirements may be applied by the individual Society.
- 3.1.4.3 These requirements do not cover the following items:
- (a) supports of lifting appliances for personnel or passengers, see 3.1.7.5
 - (b) the structure of the lifting appliance pedestals or post above the area of the deck connection
 - (c) holding down bolts and their arrangement, which are considered part of the lifting appliance.
- 3.1.4.4 The term, Lifting Appliance, is defined as a crane, derrick or lifting mast.
- 3.1.4.5 The Safe Working Load is defined as the maximum load which the lifting appliance is certified to lift at any specified outreach.
- 3.1.4.6 The Self Weight is the calculated gross self weight of the lifting appliance, including the weight of any lifting gear.
- 3.1.4.7 The Overturning Moment is the maximum bending moment, calculated at the connection of the lifting appliance to the ship structure, due to the lifting appliance operating at Safe Working Load, taking into account outreach and self weight.
- 3.1.4.8 The Crane Pedestal and Derrick Mast are as defined in *Figure 11.3.3*.

- 3.1.4.9 The following plans and information are to be submitted for approval:
- details of the supporting structure of the lifting appliance, including its connection of the deck
 - details of the Safe Working Load, self weight, vertical reaction forces and the maximum overturning moment in the supporting structure of the lifting appliance
 - for offshore operation, the maximum sea state in which the lifting appliance is to be used.
- 3.1.4.10 The following supporting information is also to be submitted:
- a general arrangement drawing of the crane/derrick/lifting mast.
- 3.1.4.11 Deck plating and under deck structure is to provide adequate support for derrick masts against the calculated vertical loads and maximum overturning moment. Where the deck is penetrated, the deck plating is to be suitably strengthened.
- 3.1.4.12 Deck plating and under deck structure is to provide adequate support for crane pedestals against the calculated vertical loads and maximum overturning moment.
- 3.1.4.13 In general, structural continuity of the deck structure is to be maintained and deep under-deck members are to be provided to support the crane pedestal.
- 3.1.4.14 Depending on the arrangement of the deck connection in way of crane pedestals, the following additional requirements are to be complied with:
- where the pedestal is directly connected to the deck, without above deck brackets, adequate under deck structure directly in line with the crane pedestal is to be provided. Where the crane pedestal is attached to the deck without bracketing or where the crane pedestal is not continuous through the deck, welding to the deck of the crane pedestal and its under deck support structure is to be made by suitable full penetration welding. This could include a deep penetration welding procedure with a maximum root face of 3mm provided this

results in full penetration and consequently enable ultrasonic lamination testing after welding has been completed. The design of the weld connection is to be adequate for the calculated stress in the welded connection, in accordance with 3.1.4.21.

- (b) where the pedestal is directly connected to the deck with brackets, under deck support structure is to be fitted to ensure a satisfactory transmission of the load, and to avoid structural hard spots. Above deck brackets may be fitted inside or outside of the pedestal and are to be aligned with deck girders and webs. The design is to avoid stress concentrations caused by an abrupt change of section. Brackets and other direct load carrying structure and under deck support structure are to be welded to the deck by suitable full penetration welding. This could include a deep penetration welding procedure with a maximum root face of 3mm provided this results in full penetration and consequently enables ultrasonic lamination testing after welding has been completed. The design of the connection is to be adequate for the calculated stress, in accordance with 3.1.4.21.

(RCN 1, effective from 1 April 2007)

3.1.4.15 Deck plates are to be of a thickness and material strength compatible with the crane pedestal. Where necessary, a thicker insert plate is to be fitted. In no case are doublers to be used where structures are subject to tension.

3.1.4.16 The scantlings of the support structure are to be dimensioned to ensure that for the load cases specified in 3.1.4.18 and 3.1.4.19, the calculated stresses in the support structure do not exceed those given in 3.1.4.21.

3.1.4.17 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or beam element finite-element analysis using gross scantlings.

3.1.4.18 For lifting appliances which are limited to use in harbour, the following load scenario is to be examined:

- (a) 130% of the Safe Working Load added to the lifting appliances self weight.

3.1.4.19 For lifting appliances which may be used for offshore operations the following is to be submitted for approval purposes:

- (a) the maximum sea state in which the lifting appliance is to be used
- (b) the worst case vertical and horizontal accelerations
- (c) the worst case wind loadings for the specified design sea state and wind environment.

The load scenario to be examined is to account for these environmental loads. As a minimum, the following load scenario is to be examined:

- (a) 150% of the Safe Working Load added to the lifting appliances self weight.

When a crane cab is fitted above the slewing ring, the load scenario is to be specially considered.

3.1.4.20 The vertical reaction force and maximum overturning moment, corresponding to the design loads specified in 3.1.4.18 and 3.1.4.19, are to be calculated and used in the assessment of the structure.

3.1.4.21 The stresses induced in the supporting structure are not to exceed the permissible values given below, based on the gross thickness of the structure:

Direct stress $0.67 \sigma_{yd}$

Shear stress $0.39 \sigma_{yd}$

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm²

- 3.1.4.22 The capability of the supporting structure to resist buckling failure is also to be assured.

3.1.5 Supporting structures for components used in emergency towing arrangements on tankers

- 3.1.5.1 Tankers having a deadweight of greater than or equal to 20 000tonnes are to be fitted with an emergency towing arrangement at both ends, complying with *Maritime Safety Committee Resolution MSC 35(63)*.
- 3.1.5.2 The Safe Working Load of emergency towing arrangements is as specified in *IMO Resolution MSC 35(63)*, as follows:
- (a) 1000kN for vessels having a deadweight greater than or equal to 20000tonnes, but less than 50 000tonnes
 - (b) 2000kN for vessels having a deadweight greater than or equal to 50000tonnes.
- 3.1.5.3 The following plans are to be submitted for approval:
- (a) details of the supporting structure for the emergency towing arrangement, including the connection to the deck.
- 3.1.5.4 The following supporting information is also to be submitted:
- (a) details of the emergency towing arrangement showing sufficient detail to enable the position and direction of load actions to be ascertained.
- 3.1.5.5 The deck in way of strong-points and fairleads is to have a minimum gross thickness of 15mm.
- 3.1.5.6 The structural arrangement is to provide continuity of strength.
- 3.1.5.7 The structural arrangement of the ship's structure in way of the emergency towing equipment is to be such that, abrupt changes of shape or section are to be avoided in order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in high stress areas.
- 3.1.5.8 The scantlings of the support structure are to be dimensioned to ensure that for the load cases specified in 3.1.5.10 and 3.1.5.11, the calculated stresses in the support structure do not exceed the permissible stress levels specified in 3.1.5.12.
- 3.1.5.9 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using gross scantlings.
- 3.1.5.10 The design load for the connection of the strong-point and fittings to the deck and its supporting structure is to be taken as twice the Safe Working Load.
- 3.1.5.11 The assessment of the structure is to consider lines of action of the applied design load, taking into account the particular arrangements proposed. See *IMO MSC 35(63)*.
- 3.1.5.12 For the design load specified in 3.1.5.10 and 3.1.5.11 the stresses induced in the supporting structure and welds, in way of strong-points and fairleads, are not to exceed the permissible values given below based on the gross thickness of the structure:

Direct stress 1.00 σ_{yd}

Shear stress $0.58 \sigma_{yd}$

Where:

σ_{yd} specified minimum yield stress of the material, in N/mm²

3.1.5.13 The capability of the structure to resist buckling failure is also to be assured.

3.1.6 Supporting structure for bollards and bitts, fairleads, stand rollers, chocks and capstans

- 3.1.6.1 In general, shipboard fittings (bollards and bitts, fairleads, stand rollers and chocks) and capstans used for mooring, and towing (other than as specified in 3.1.5) of the vessel are to be fitted to the deck or bulwark structures using a purpose designed base or attachment.
- 3.1.6.2 The attachment of shipboard fittings to sheer strakes or sheer stake upstands is to be avoided, as required by *Sections 8/2.2.5.2* and *Section 8/2.2.5.3*.
- 3.1.6.3 Where fairleads are fitted in bulwarks and the imposed loads from mooring or towing lines are high, the thickness of bulwarks may need to be increased. See also 2.1.2.
- 3.1.6.4 The following plans are to be submitted for approval:
- (a) details of the supporting structure for the shipboard fitting and capstan arrangements, including the connection of shipboard fittings and their seats to the deck.
- 3.1.6.5 The following supporting information is also to be submitted:
- (a) details of the shipboard fittings and capstans including the Safe Working Load of shipboard fittings and arrangements showing sufficient detail to enable the position and direction of load actions to be ascertained.
- 3.1.6.6 The structural arrangement is to provide continuity of strength.
- 3.1.6.7 The structural arrangement of the ship's structure in way of the shipboard fittings and their seats and in way of capstans is to be such that, abrupt changes of shape or section are to be avoided in order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in high stress areas.
- 3.1.6.8 The scantlings of the support structure are to be dimensioned to ensure that for the loads specified in 3.1.6.10, 3.1.6.11 and 3.1.6.12, the calculated stresses in the support structure do not exceed the permissible stress levels specified in 3.1.6.13.
- 3.1.6.9 These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two-dimensional grillage or finite-element analysis using net scantlings. The required gross thickness is obtained by adding the relevant full corrosion addition specified in *Section 6/3* to the required net thickness.
- 3.1.6.10 The design load for the connection of shipboard fittings and their seats to the deck and its supporting structure is to be based on the line load as the greater of the following requirements, as applicable for the particular fitting and its intended use:
- (a) in the case of normal towing in harbour or manoeuvring operations, 125% of the maximum towline load as indicated on the towing and mooring arrangement plan, or
 - (b) in the case of towing service other than that experienced in harbour or manoeuvring operations, such as escort service, the nominal breaking strength of towline according to *Table 11.4.2* for the ship's corresponding equipment number, or

- (c) in the case of mooring operations 125% of the nominal breaking strength of the mooring line (hawser) or towline according to *Table 11.4.2* for the ship's corresponding equipment number.
- 3.1.6.11 The design load for the supporting structure for capstans is to be based the following:
- (a) 125% of the maximum hauling in force.
- 3.1.6.12 The assessment of the structure is to consider lines of action of the applied design load, taking into account the particular arrangements proposed, however, the total load applied for towing and mooring scenarios described in 3.1.6.10 need not be more than twice the design load on the mooring line or towline. The acting point for the force on the shipboard fittings is to be taken as the attachment point of the mooring line or towline, or at a change in its direction.
- 3.1.6.13 For the design load specified in 3.1.6.10, 3.1.6.11 and 3.1.6.12 the stresses induced in the supporting structure and welds are not to exceed the permissible values given below based on the net thickness of the structure. The required gross thickness is obtained by adding the relevant full corrosion addition specified in *Section 6/3* to the required net thickness.
- Direct stress $1.00 \sigma_{yd}$
 Shear stress $0.60 \sigma_{yd}$
- Where:
- σ_{yd} specified minimum yield stress of the material, in N/mm²
- 3.1.6.14 The capability of the structure to resist buckling failure is also to be assured.
- 3.1.6.15 The following requirements on Safe Working Load apply for a single post basis (no more than one turn of one cable).
- (a) The Safe Working Load used for normal towing operations (e.g., harbour/manoeuvring is not to exceed 80% of the design load per 3.1.6.10(a) and the Safe Working Load used for other towing operations (e.g., escort) is not to exceed the design load per 3.1.6.10(b). For deck fittings used for both normal and other towing operations, the greater of the design loads of 3.1.6.10(a) and 3.1.6.10(b) is to be used.
- (b) The Safe Working Load for mooring operations is not to exceed 80% of the design load per 3.1.6.10(c).
- (c) The Safe Working Load of each deck fitting is to be marked (by weld bead or equivalent) on the deck fittings used for towing and/or mooring.
- (d) The towing and mooring arrangements plan mentioned in 3.1.6.16 is to define the method of use of towing lines and/or mooring lines.
- 3.1.6.16 The Safe Working Load for the intended use for each deck fitting is to be noted in the towing and mooring arrangements plan available on board for the guidance of the Master. Information provided on the plan is to include in respect of each deck fitting:
- (a) Location on the ship;
 (b) Fitting type;
 (c) SWL;
 (d) Purpose (mooring/harbour towing/escort towing); and
 (e) Manner of applying towing or mooring line load including limiting fleet angles.

This information is to be incorporated into the pilot card in order to provide the pilot proper information on harbour/escorting operations.

3.1.7 Supporting structures for other deck equipment or fittings which are subject to specific approval

- 3.1.7.1 The following requirements relate to other items of deck equipment which are not covered by 3.1.2 to 3.1.6. The scantlings and arrangements of support structure for such items are to be in accordance with the following requirements and the additional requirements of the individual Classification Society.
- 3.1.7.2 The support structure of items not mentioned in this sub-section will be independently considered by the individual Classification Society.
- 3.1.7.3 The following details are to be submitted for approval. They may be indicated separately or may be included on the main structural drawings:
- (a) plans showing the supporting structure for deck equipment/fittings
 - (b) details of the loads imposed on the structure by the deck equipment/fittings.
- 3.1.7.4 The support structure is to be arranged in order to resist both in-plane and out-of-plane loads acting on the deck structure.
- 3.1.7.5 Support for lifting appliances for personnel is to be provided as follows:
- (a) in general, lifesaving appliances (lifeboats, life-rafts and rescue boats) are to be stowed on a purpose built cradle, seat or deployment appliance. The design load imposed on the ship structure is to be established by the supplier of the lifesaving appliance
 - (b) the support structure is to be adequate for the design loads. Local stiffening and a local increase in plating thickness is to be provided. Deep supporting members may be required. Additional National and International Regulations are to be applied, where applicable
 - (c) support structure for crew lifts is to be provided in way of the anchor points of lift operating equipment
 - (d) support structure for boarding (accommodation) ladders is to be provided in way of the anchor points of accommodation ladders.
- 3.1.7.6 Support for mast structures fitted with navigation aids is to be provided as follows:
- (a) adequate primary support members for the mast are to be arranged in the form of bulkheads, deep beams or girders. Such members are to be arranged below or close to the mast structure
 - (b) in order to transmit the loads from the mast structure to the primary support members, under-deck stiffening members are to be arranged below the mast structure forming the attachment of the mast to the deck
 - (c) the deck thickness may be required to be increased to provide an adequate thickness for the weld attachments.
- 3.1.7.7 Supporting structure for breakwaters is to be designed to withstand the same design load as the breakwater itself. It is to be suitable for transmitting the loads from the breakwater into the primary supporting members of the ship. Efficient under-deck stiffening is to be provided in way of the breakwater structure that forms the deck connection.

3.1.8 Support and attachment of miscellaneous deck fittings which are not subject to specific approval

- 3.1.8.1 The following general requirements are to be considered in the design of the support and attachment of miscellaneous fittings which impose relatively small loads on the ship's structure and are not subject to specific approval. The arrangements of such details do not require the approval of plans by the Classification Society.
- 3.1.8.2 Support positions are to be arranged so that the attachment to the ship structure is clear of deck openings and stress concentrations, such as the toes of end brackets. Design of supports is to be such that the attachment to the deck minimises the creation of hard points.
- 3.1.8.3 A cargo manifold support is a self-contained, fabricated assembly designed to support the main pipework used for loading and unloading the ship. The design of the cargo manifold support is to be such as to distribute the loads imposed on the pipework during loading and unloading into the ship structure. To achieve this, the connection of the cargo manifold support to the deck is normally to be arranged to align with stiffening members of the main hull structure. Where this is impracticable, additional stiffening is to be fitted in order to avoid the creation of hard points. Attention is to be paid to the detail design of the structure forming the deck attachment in order to minimise the effects of change of section.

3.2 Docking

3.2.1 Docking arrangements

- 3.2.1.1 The drydocking arrangement itself is not covered explicitly in these Rules.
- 3.2.1.2 The structure of bottom girders is to be sufficiently stiffened to withstand the forces imposed by drydocking the ship.
- 3.2.1.3 For ships of unusual form, or where the Owner of the vessel has specific requirements for docking strength, the builder may need to carry out additional calculations. Such calculations are outside of the scope of Classification, but may be reviewed upon request.

3.2.2 Docking plan

- 3.2.2.1 It is recommended that consideration be given to providing a docking plan for a vessel. The docking plan is to indicate any and all assumptions made during the design, including but not limited to, the arrangement of docking blocks, the maximum permissible loading during docking and the corresponding load at each block.
- 3.2.2.2 The docking plan does not require approval by the Society as a condition of Classification.

Guidance Note:

1. It is recommended that bottom plugs are not fitted in way of the keel plate.

3.3 Bilge Keels

3.3.1 Construction and materials

- 3.3.1.1 The bilge keel is to be of the same material tensile properties as the bilge strake to which it is attached.

- 3.3.1.2 Bilge keels of a different design, from that shown in *Figure 11.3.4*, will be specially considered.
- 3.3.1.3 A plan of all bilge keels is to be submitted for the approval of the material strength and grades, welded connections and detail design.
- 3.3.1.4 The design of single web bilge keels is to ensure that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of the bilge keel does not exceed that of the ground bar.

3.3.2 Ground bars

- 3.3.2.1 Bilge keels, where fitted, are to be attached to the shell by a ground bar, or doubler, as shown in *Figures 11.3.4* and *11.3.5*. In general, the ground bar is to be continuous.
- 3.3.2.2 The gross thickness of the ground bar is not to be less than the gross thickness of the bilge strake or 14mm, whichever is the lesser.
- 3.3.2.3 The ground bar is to be of the same material strength as the bilge strake to which it is attached and constructed of the steel grade given in *Section 6/1.2*, *Tables 6.1.2* and *6.1.3* for bilge strakes.

3.3.3 End details

- 3.3.3.1 The ends of the bilge keel are to be suitably tapered and are to terminate on an internal stiffening member. Typical arrangements complying with the requirements of this subsection are shown in *Figure 11.3.5*. Alternative end arrangements will be accepted, provided that they are considered equivalent.
- 3.3.3.2 The ground bar and bilge keel ends are to be tapered or rounded. Where the ends are tapered, the tapers are to be gradual with a minimum ratio of 3:1. See *Figures 11.3.5(a)*, *11.3.5(b)*, *11.3.5(d)* and *11.3.5(e)*. Where the ends are rounded, details are to be as shown in *Figure 11.3.5(c)*. Cut outs on the bilge keel web, within zone 'A', see *Figures 11.3.5(b)* and *11.3.5(e)*, are not permitted.
- 3.3.3.3 The end of the bilge keel web is to be not less than 50mm and not greater than 100mm from the end of the ground bar. See *Figures 11.3.5(a)* and *11.3.5(d)*.
- 3.3.3.4 An internal transverse support member is to be positioned between the end of the bilge keel web and the halfway point between the end of the bilge keel web and the end of the ground bar. See *Figures 11.3.5(a)*, *11.3.5(b)* and *11.3.5(c)*.
- 3.3.3.5 Where an internal longitudinal stiffener is fitted in line with the bilge keel web, the longitudinal stiffener is to extend to at least the nearest transverse member forward and aft of zone 'A'. See *Figures 11.3.5(b)* and *11.3.5(e)*. In this case, the requirement in 3.3.3.4 relating to the internal transverse support does not apply.

3.3.4 Welding

- 3.3.4.1 The ground bar is to be connected to the shell with a continuous fillet weld, and the bilge keel to the ground bar with a light continuous fillet weld, in accordance with *Table 11.3.1*.
- 3.3.4.2 Butt welds, in the bilge keel and ground bar, are to be well clear of each other and of butts in the shell plating. In general, shell butts are to be flush in way of the ground bar and ground bar butts are to be flush in way of the bilge keel. Direct connection between ground bar butt welds and shell plating, and between bilge keel butt welds and ground bar is to be avoided.

- 3.3.4.3 In general, scallops and cut-outs are not to be used. Crack arresting holes are to be drilled in the bilge keel butt welds as close as practicable to the ground bar. The diameter of hole is to be greater than the width of the butt weld and is to be a minimum of 25mm in diameter, as illustrated in *Figure 11.3.4*. Where the butt weld has been subject to non-destructive examination, the crack arresting hole may be omitted.
- 3.3.4.4 Welds at the end of the ground bar and shell plating, and at the end of the bilge keel web and ground bar connection, within Zone 'B', see *Figures 11.3.5(a)* and *11.3.5(d)* are to have a throat thickness as given in *Table 11.3.1* for "At ends". The toes of these welds are to be ground to blend them smoothly with the base materials.

Figure 11.3.5 (a) - (c)
Bilge Keel End Design

Table 11.3.1 Welding Requirements for End Connections of Bilge Keels		
Structural items being joined	Throat thickness, in mm	
	At ends	Elsewhere
Ground bar to shell	$0.44 t_{grs}$	$0.34 t_{grs}$
Bilge keel web to ground bar	$0.34 t_{grs}$	$0.21 t_{grs}$
Where:		
t_{grs}	gross thickness of the item being attached, in mm	

4 EQUIPMENT

4.1 Equipment Number Calculation

4.1.1 Requirements

- 4.1.1.1 Anchors and chains are to be in accordance with *Table 11.4.1* and the quantity, mass and sizes of these are to be determined by the equipment number (EN), given by:

$$EN = \Delta^{2/3} + 2Bh_{dk} + 0.1A$$

Where:

Δ	moulded displacement, in tonnes, as defined in <i>Section 4/1.1.7.1</i>
B	moulded breadth, in m, as defined in <i>Section 4/1.1.3.1</i>
h_{dk}	$h_{FB} + h_1 + h_2 + h_3 + \dots$, as shown in <i>Figure 11.4.1</i> . In the calculation of h , sheer, camber and trim may be neglected
h_{FB}	freeboard from the summer load waterline amidships, in m
$h_1, h_2, h_3 \dots h_n$	height on the centreline of each tier of houses having a breadth greater than $B/4$, in m
A	profile area of the hull, superstructure and houses above the summer load waterline which are within the length L , in m ² . Superstructures or deck houses having a breadth equal to or less than $B/4$ at any point may be excluded. With regard to determining A , when a screen or bulwark is more than 1.5m high, the area shown in <i>Figure 11.4.2</i> as A_2 is to be included in A
L	rule length, as defined in <i>Section 4/1.1.1.1</i>

Figure 11.4.1
Effective Heights of Deck Houses

Figure 11.4.2
Profile Areas of Screens and Bulwarks

4.2 Anchors and Mooring Equipment

4.2.1 General

- 4.2.1.1 The following anchoring equipment specification is intended for temporary mooring of a vessel within a harbour or sheltered area when the vessel is awaiting berth, tide, etc.

4.2.2 Limitations

- 4.2.2.1 The equipment specified is not intended to be adequate to hold a ship off fully exposed coasts in rough weather or to stop a ship that is moving or drifting. In such a condition, the loads on the anchoring equipment increase to such a degree that its components may be damaged or lost.
- 4.2.2.2 The anchoring equipment specified is intended to hold a ship in good holding ground in conditions such as to avoid dragging of the anchor. In poor holding ground, the ability of the anchors to hold the ship will be significantly reduced.

4.2.3 Assumptions

- 4.2.3.1 The Equipment Number (*EN*) formula for the required anchoring equipment is based on an assumed current speed of 2.5m/s, wind speed of 25m/s and a scope of chain cable between 6 and 10. The scope of chain cable is defined as the ratio between the length of chain paid out and the waters depth.
- 4.2.3.2 It is assumed that under normal circumstances a ship will use only one bow anchor and chain cable at a time.

4.2.4 Documentation

- 4.2.4.1 The following plans and particulars are to be submitted for approval:
- (a) equipment number calculations
 - (b) list of equipment including type of anchor, grade of anchor chain, type and breaking load of steel and fibre ropes
 - (c) anchor design, if different from standard or previously approved anchor types, including material specification
 - (d) windlass design; including material specifications for cable lifters, shafts, couplings and brakes
 - (e) chain stopper design and material specification
 - (f) emergency towing, towing and mooring arrangement plans and applicable Safe Working Load data, and other information related to emergency towing and mooring arrangements that will be available onboard the ship for the guidance of the Master.

4.2.5 Anchors

- 4.2.5.1 Two bower anchors are to be connected to chain cable and stowed in position ready for use.
- 4.2.5.2 A third anchor is recommended to be provided as a spare bower anchor and is listed for guidance only; it is not required as a condition of classification.
- 4.2.5.3 Anchors are to be of an approved design. The design of anchor heads is to be such as to minimize stress concentrations. In particular, the radii, on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.
- 4.2.5.4 The mass per anchor of bower anchors given in *Table 11.4.1* is for anchors of equal mass. The mass of individual anchors may vary 7% above or below the tabulated value, provided that the combined mass of all anchors is not less than that required for anchors of equal mass.

4.2.6 Ordinary anchors

- 4.2.6.1 Anchors are to be of the stockless type. The mass of the head of a stockless anchor, including pins and fittings, is not to be less than 60% of the total mass of the anchor.

4.2.7 High holding power anchors

- 4.2.7.1 Where agreed by the Owner, consideration will be given to the use of special types of anchors. Where these are of a proven increased holding ability, consideration may also be given to some reduction in the basic requirement of anchor mass, up to a maximum of 25 percent from the mass specified in *Table 11.4.1*.
- 4.2.7.2 An anchor for which approval is sought as a high holding power (HHP) anchor is to be tested at sea to show that it has a holding power of twice that approved for a standard stockless anchor of the same mass.
- 4.2.7.3 If approval is sought for a range of sizes then at least two are to be tested. The smaller of the two anchors is to have a mass not less than one-tenth of that of the larger anchor. The larger of the two anchors tested is to have a mass not less than one-tenth of that of the largest anchor for which approval is sought.
- 4.2.7.4 Each test is to comprise a comparison between at least two anchors, one ordinary stockless bower anchor and one HHP anchor. The masses of the anchors are to be approximately equal.
- 4.2.7.5 The tests are to be conducted on at least three different types of bottom, which may be soft mud or silt, sand or gravel, and hard clay or similarly compacted material.
- 4.2.7.6 The tests are generally to be carried out by means of a tug. The pull is to be measured by a dynamometer or determined from recently verified data of the tug's bollard pull as a function of propeller rpm.
- 4.2.7.7 The diameter of the chain cables connected to the anchors is to be as required for the relevant Equipment Number. During the test, the length of the chain cable on each anchor is to be sufficient to obtain an approximately horizontal pull on the anchor. Generally, a horizontal distance between anchor and tug equal to 10 times the water depth will be sufficient.
- 4.2.7.8 High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by 4.2.7.2, irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. A demonstration of these abilities may be required.
- 4.2.7.9 The design approval of high holding power anchors may be given as a general/type approval, and listed in a published document by the Society.

4.2.8 Chain cables

- 4.2.8.1 The total length of chain required to be carried onboard, as given in *Table 11.4.1*, is to be divided approximately equally between the two bower anchors.
- 4.2.8.2 Where the Owner requires equipment for anchoring at depths greater than 82.5m, it is the Owner's responsibility to specify the appropriate total length of the chain cable required. In such a case, consideration can be given to dividing the chain cable into two unequal lengths.
- 4.2.8.3 Chain cables which are intended to form part of the equipment are not to be used as check chains when the vessel is launched.

4.2.9 Chain lockers

- 4.2.9.1 The chain locker is to have adequate capacity and be of a suitable form to provide for the proper stowage of the chain cable, allowing an easy direct lead for the cable into the chain pipes when the cable is fully stowed. Port and starboard cables are to have separate spaces.
- 4.2.9.2 The chain locker boundaries and access openings are to be watertight. Provisions are to be made to minimize the probability of the chain locker being flooded in bad weather. Adequate drainage facilities for the chain locker are to be provided.
- 4.2.9.3 Chain or spurling pipes are to be of suitable size and provided with chafing lips.
- 4.2.9.4 Chain lockers fitted aft the collision bulkhead are to be watertight and the space is to be efficiently drained.

4.2.10 Securing and emergency release of chain cable

- 4.2.10.1 Provisions are to be made for securing the inboard ends of the chain to the structure. This attachment is to be able to withstand a force of not less than 15% or more than 30% of the minimum breaking strength of the as fitted chain cable. The structure to which it is attached is to be adequate for this load.
- 4.2.10.2 The fastening of the chain to the ship is to be arranged in such a way that in case of an emergency, when the anchor and chain have to be sacrificed, the chain can be readily released from an accessible position outside the chain locker. The proposed arrangement for slipping the chain cable must be made as watertight as possible.

4.2.11 Chain stoppers

- 4.2.11.1 Means are to be provided to secure each chain cable once it is paid out. This is normally achieved by means of chain stoppers.
- 4.2.11.2 Securing arrangements of chain stoppers are to be capable of withstanding a load equal to 80% of the breaking load of the chain cable as required by 4.2.8, without undergoing permanent deformation.

4.2.12 Tests

- 4.2.12.1 All anchors and chain cables are to be tested at establishments and on machines recognised by the Society, under the supervision of Surveyors or other Representatives of the Society and in accordance with the relevant requirements for materials of the individual Classification Society.
- 4.2.12.2 Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads applied are to be available. These certificates are to be examined by the Surveyor when the anchors and cables are placed onboard the ship.
- 4.2.12.3 Steel wire and fibre ropes are to be tested in accordance with the relevant requirements for materials of the individual Classification Society.

4.2.13 Mooring lines and towlines

- 4.2.13.1 Except as indicated in 4.3, mooring lines and towlines are not required as a condition of Classification. The hawsers and towlines listed in *Table 11.4.2* are intended as a guide. Where the tabular breaking strength is greater than 490kN, the breaking strength and the number of individual hawsers given in the Table may be modified, provided that their product is not less than that of the breaking strength and the number of hawsers given in the Table.

4.2.14 Increased number or strength of mooring lines

- 4.2.14.1 On a ship regularly using exposed berths, it is recommended that the total strength of mooring lines is twice that indicated in 4.2.13.1.
- 4.2.14.2 Attention is also drawn to the Oil Companies International Marine Forum document, *Mooring Equipment Guidelines*, for guidance on mooring of tankers at exposed locations.

4.2.15 Alternative mooring arrangement

- 4.2.15.1 For ease of handling, fibre ropes should not to be less than 20mm in diameter.
- 4.2.15.2 All ropes having breaking strengths greater than 736kN and used in normal mooring operations should be handled by, and stored on, suitably designed winches. Alternative methods of storing are to give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490kN. In such cases, the breaking strength and the number of individual hawsers given in Table 11.4.2 may be modified, but their product is not to be less than that of the breaking strength and the number of hawsers given in the Table. However, the number of mooring lines is not to be less than six, and no line should have a breaking strength less than 490kN.

4.2.16 Securing mooring lines

- 4.2.16.1 Means should be provided to enable mooring lines to be adequately secured onboard ship. It is recommended that the total number of suitably placed bollards on either side of the ship and/or the total brake holding power of mooring winches is to be capable of holding not less than 1.5 times the sum of the maximum breaking strengths of the mooring lines.

4.2.17 Bollards and bitts, fairleads, stand rollers and chocks

- 4.2.17.1 The strength of shipboard fittings used for normal and/or emergency operations at bow, sides and stern are to comply with the requirements of 4.2.17.2 and 4.2.17.3. The requirements for the support structure of these shipboard fittings are specified in 3.1.6.
- 4.2.17.2 Shipboard fittings are to be designed and constructed in accordance with recognized standards (e.g. ISO3913 Shipbuilding Welded Steel Bollards). The design load used to assess shipboard fittings and their attachments to the hull are to be in accordance with 3.1.6.
- 4.2.17.3 The following requirements on Safe Working Load (SWL) apply to shipboard fittings used for mooring and/or emergency towing:
- (a) the SWL is not to exceed 80% of the design load specified in 3.1.6.10(a) and 3.1.6.10(c) or 100% of the design load specified in 3.1.6.10(b), as applicable
 - (b) the SWL of each fitting is to be marked by weld bead or equivalent
 - (c) the SWL with its intended use, i.e., mooring, towing or emergency towing operations or some combination thereof, for each fitting is to be indicated in the towing/emergency towing and mooring arrangement plans available onboard the ship for the guidance of the Master. The arrangement plans or information is to include information on each fitting detailing location on the ship, fitting type, Safe Working Load, purpose, method of applying load and limiting fleet angle, and it is to explicitly prohibit the use of mooring and/or towing lines outside of their intended function and/or different characteristics

- (d) the requirements of this paragraph apply for a single post basis (no more than one turn of one cable).

4.2.18 Mooring winches

- 4.2.18.1 Mooring winch design and capacity are not subject to approval by the Society as a condition of Classification. Mooring winch plans and information are to be submitted for approval of the supporting structure in way of the winch and for the connection of the mooring winch to its foundation and the connection of the foundation to the deck, as required by 3.1.3.

Guidance Note:

Mooring winches should be fitted with drum brakes, the strength of which is to be sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 percent of that for a rope with breaking strength equal to the greater of the maximum breaking strength of the rope specified on the mooring arrangement plan or that according to *Table 11.4.2* for the ship's corresponding equipment number, as fitted on the first layer on the winch drum.

4.2.19 Windlass

- 4.2.19.1 A windlass of sufficient power and suitable for the size of chain is to be fitted to the ship in accordance with the requirements of the Classification Society. Where an Owner requires equipment significantly in excess of Rule requirements, it is the Owner's responsibility to specify increased windlass power.
- 4.2.19.2 The windlass is to be capable of heaving in either cable.
- 4.2.19.3 The design of the windlass is to be such that access to the chain pipe is adequate to permit the fitting of a cover or seal of sufficient strength over the spurling pipe.
Special consideration will be given to the acceptance of equivalent arrangements that minimize the probability of the chain locker or forecastle being flooded in bad weather.

4.2.20 Anchor windlass trial

- 4.2.20.1 Each windlass is to be tested under working conditions after installation onboard to demonstrate satisfactory operation. Each unit is to be independently tested for the following:
- (a) braking
 - (b) clutch functioning
 - (c) lowering and hoisting of chain cable and anchor
 - (d) proper riding of the chain over the chain lifter
 - (e) proper transit of the chain through the hawse pipe and the chain pipe
 - (f) effecting proper stowage of the chain and the anchor.
- 4.2.20.2 During trials onboard ship, the windlass is to be shown to:
- (a) for all specified design anchorage depths, raise the anchor from a depth of 82.5m to a depth of 27.5m at a mean speed of 9m/min
 - (b) for specified design anchorage depths greater than 82.5m, in addition to (a), raise the anchor from the specified design anchorage depth to a depth of 82.5m at a mean speed of 3m/min.

Where the depth of the water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative.

4.2.21 Stowage and deployment arrangements for anchors

- 4.2.21.1 Arrangements are to be provided to ensure the simple deployment, recovery and stowage of anchors. Such arrangements generally consist of a hawse pipe and anchor housing which may be in the form of a fabricated anchor box or pocket.
- 4.2.21.2 Where hawse pipes are not fitted, alternative arrangements will be specially considered.

4.2.22 Dimensions and scantlings of hawse pipes and anchor pockets

- 4.2.22.1 Hawse pipes are to be of a suitable size and configuration to ensure adequate clearance and an easy lead of the chain cable from the chain stopper through the ship's side.
- 4.2.22.2 Hawse pipes are to be of sufficient strength.
- 4.2.22.3 Anchor pockets are to be of substantial thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor, caused by wave action.
- 4.2.22.4 Hawse pipes and anchor pockets are to have full-rounded flanges or rubbing bars in order to minimize the nip on the cables and to minimize the probability of cable links being subjected to high bending stresses. The radius of curvature is to be such that at least three links of chain will bear simultaneously on the rounded parts of the upper and lower ends of the hawse pipes in those areas where the chain cable is supported during paying out and hoisting and when the vessel is at anchor.

4.2.23 Hull reinforcement

- 4.2.23.1 Hawse pipes are to be securely attached to thick, doubling or insert plates, by continuous welds.
- 4.2.23.2 Framing in way of hawse pipes or anchor pockets is to be reinforced as necessary to ensure a rigid fastening to the hull.
- 4.2.23.3 On ships provided with a bulbous bow, where it is not possible to obtain a suitable clearance between shell plating and the anchors during anchor handling, local reinforcements of the bulbous bow are to be provided in the form of increased shell plate thickness.

4.2.24 Testing

- 4.2.24.1 The anchors are to be shipped and unshipped so that the Surveyor is satisfied that there is no risk of the anchor jamming in the hawse pipe.
- 4.2.24.2 During the windlass trials at sea, the Surveyor is to be satisfied that upon release of the brake, the anchor immediately starts falling by its own weight.
- 4.2.24.3 When in position, hawse pipes and anchor pockets are to be thoroughly tested for watertightness by means of a hose in which the water pressure is in accordance with the requirements given in *Sub-section 5*.

4.3 Emergency Towing

4.3.1 General requirements

- 4.3.1.1 Emergency towing arrangements are to be fitted at both the bow and stern of every tanker with a deadweight of 20000 tonnes or more, as required by the *International Convention for the Safety of Life at Sea, 1974, as amended (Regulation II-1/3-4)*.
- 4.3.1.2 The design and construction of the towing arrangements is to be approved by the applicable Flag Administration, based on *IMO MSC.35(63), Guidelines for Emergency Towing Arrangements on Tankers*. See also 3.1.5 for requirements relating to the support structure of emergency towing equipment.

5 TESTING PROCEDURES

5.1 Tank Testing

5.1.1 Application

5.1.1.1 The following tanks and boundaries are to be tested in accordance with the requirements given in 5.1.3 to 5.1.9, as follows:

- (a) gravity tanks, excluding independent tanks of less than 5m³ in capacity, for their structural adequacy and tightness
- (b) watertight boundaries, other than tank boundaries, for watertightness
- (c) weathertight boundaries for weathertightness.

5.1.2 Definitions

- 5.1.2.1 Watertight means capable of preventing the passage of water through the structure under a head of water for which the surrounding structure is designed.
- 5.1.2.2 Weathertight means that in any sea conditions water will not penetrate into the ship.
- 5.1.2.3 Structural Testing is a hydrostatic test carried out in order to demonstrate structural adequacy of the design. Where severe practical limitations prevail and hydrostatic testing is not feasible, hydropneumatic testing may be carried out instead.
- 5.1.2.4 Leak Testing is an air or other medium test, carried out in order to demonstrate the tightness of the structure.
- 5.1.2.5 Hose Testing is carried out by a jet of water in order to demonstrate the tightness of the structure items which are not subjected to hydrostatic or leak testing, and to other components which contribute to the watertight or weathertight integrity of the hull.
- 5.1.2.6 Hydropneumatic Testing is a combination of hydrostatic and air testing, undertaken by filling the tank with water and applying an additional air pressure. It is carried out in order to demonstrate the tightness of the tanks and the structural adequacy of the design as an alternative to a hydrostatic test.
- 5.1.2.7 Hydrostatic Testing is a test to verify the structural adequacy of the design and the tightness of the tank's structure by means of water pressure, produced by filling water to the level given in *Table 11.5.1*. Hydrostatic testing is the normal means for structural testing, with exception, where severe practical limitations prevent it or where air testing is permitted.
- 5.1.2.8 Shop Primer is a thin coating applied after surface preparation and prior to fabrication as a protection against corrosion during fabrication.
- 5.1.2.9 Protective Coating is the coating system applied to protect the structure from corrosion. This excludes the shop primer.

5.1.3 Test procedures

- 5.1.3.1 Tests are to be carried out in the presence of, and to the satisfaction of the Surveyor. The construction is to be at a stage sufficiently close to completion, after all attachments, outfittings or penetrations, which may affect the strength or tightness of the structure, have been completed, such that the strength and tightness are not subsequently impaired, and before any ceiling and cement work is applied over joints.

5.1.3.2 Specific test requirements are given in *Table 11.5.1*.

5.1.3.3 For the timing of the application of coating in relation to testing, see 5.1.8.

5.1.4 Structural testing

5.1.4.1 Where structural testing is specified by *Table 11.5.1*, hydrostatic testing will be acceptable, except where practical limitations prevent it or where leak testing is permitted by *Note 1* to *Table 11.5.1*. Hydropneumatic testing may be approved in lieu of hydrostatic testing.

5.1.4.2 Hydrostatic testing is to consist of a head of water to the level specified in *Table 11.5.1*.

5.1.4.3 Hydropneumatic testing, where approved, is to simulate the actual loading as far as practicable in relation to the combined water level and air pressure. The requirements and recommendations in 5.1.5 relative to air pressure will also apply.

5.1.4.4 Structural testing may be carried out afloat where testing using water is undesirable in dry dock or on the building berth. When structural testing is carried out afloat it is to be performed by filling each tank and cofferdam separately to the test head given in *Table 11.5.1*.

5.1.4.5 With about half the number of tanks full, the bottom and lower side shell in the empty tanks is to be examined and the remainder of the lower side shell is to be examined when the water has been transferred to the remaining tanks.

5.1.4.6 Tank boundaries are to be tested from at least from one side. Tanks to be tested for structural adequacy (see *Note 1* to *Table 11.5.1*) are to be selected so that all representative structural members are tested for the expected tension and compression.

5.1.5 Leak testing

5.1.5.1 All boundary welds, erection joints, and penetrations including pipe connections, are to be examined in accordance with the approved procedure and under a pressure of at least 0.15bar with a leak indicating solution (e.g. soapy water solution). Pressures greater than 0.20bar are not recommended.

5.1.5.2 It is recommended that the air pressure in the tank be raised to and maintained at 0.20bar for approximately one hour, with a minimum number of personnel around the tank, before being lowered to the test pressure.

5.1.5.3 A U-tube filled with water up to a height corresponding to the required test pressure is to be fitted for verification and to avoid over pressure. The cross sectional area of the U-tube is to be not less than that of the pipe supplying the air. In addition to the U-tube, a master gauge or other approved means is to be provided to verify the pressure.

5.1.5.4 Other effective methods of leak testing, including compressed air fillet weld testing or vacuum testing may be considered upon submission of full particulars.

5.1.6 Hose testing

5.1.6.1 Hose testing is applied to structures not subjected to structural or air testing but that are required to be watertight or weathertight as specified in *Table 11.5.1*.

5.1.6.2 Hose testing is to be carried out with a pressure in the hose of at least 2.0 bar for the duration of the test. The nozzle is to have minimum inside diameter of 12mm and is to be directed at the joint being tested from a distance not exceeding 1.5m.

5.1.6.3 Leak testing or structural testing may be accepted in lieu of hose testing.

5.1.7 Other methods of testing

5.1.7.1 Other methods of testing may be considered upon submission of the full particulars.

5.1.8 Application of coating – protective coating

5.1.8.1 Final coating may be applied prior to the hydrostatic testing provided that leak testing is carried out before the application of the final coating.

5.1.8.2 The cause of any discolouration or disturbance of the coating is to be ascertained, and any deficiencies repaired.

5.1.8.3 For all manual or semi-automatic erection welds, and all fillet weld tank boundary connections, including penetrations, final coating is to be applied after leak testing has taken place. For other welds, the final coating may be applied prior to leak testing, provided the Surveyor, after careful examination prior to the application of coating, is satisfied with the weld. The Surveyor may require leak testing to be carried out prior to final coating of automatic erection welds and manual or automatic pre-erection welds, taking account of the quality control procedure of the shipyard.

5.1.8.4 Final coating is to be applied after all required hose testing is completed.

5.1.9 Temporary coating

5.1.9.1 Temporary coatings which may conceal defects or leaks are to be applied as specified for protective coating, see 5.1.8. This requirement does not apply to shop primer applied before fabrication.

5.1.9.2 Silicate based shop primer may be applied to welds before leak testing. The layer of the primer is to be applied with a maximum thickness of 50 microns. Other primers of uncertain chemical composition are to be applied with a maximum thickness of 30 microns.

Table 11.5.1
Testing Requirements for Tanks and Boundaries

	Structures to be tested	Type of testing	Hydrostatic testing head or pressure	Remarks
1	Double Bottom Tanks	Structural ⁽¹⁾	The greater of - to the top of overflow, or - to the bulkhead deck	Tank boundaries tested from at least one side
2	Double Side Tanks	Structural ⁽¹⁾	The greater of - to the top of overflow, or - to 2.4m above top of tank ⁽²⁾	Tank boundaries tested from at least one side
3	Cargo Tanks	Structural ⁽¹⁾	The greatest of - to the top of overflow, - to 2.4m above top of tank ⁽²⁾ , or - to the top of tank ⁽²⁾ plus setting of any pressure relief valve	Tank boundaries tested from at least one side
	Fuel Oil Bunkers	Structural		
4	Cofferdams	Structural ⁽³⁾	The greater of - to the top of overflow, or - to 2.4m above top of cofferdam	
5a	Peak Tanks	Structural	The greater of - to the top of overflow, or - to 2.4m above top of tank ⁽²⁾	Aft peak tank test to be carried out after installation of stern tube.
5b	Fore Peak not used as a tank	Refer to SOLAS II.1 Reg.14		
5c	Aft Peak not used as a tank	Leak		
6	Watertight Bulkheads in way of dry space	Hose ⁽⁴⁾		Including steps and recesses
7	Watertight Doors below freeboard or bulkhead deck	Hose		For testing before installation ⁽⁵⁾
8	Double Plate Rudder	Structural ^{(1), (6)}	2.4m head of water. Rudder is to be tested while laid on its side	
9	Watertight hatch covers of tanks on combination carriers	Structural testing	The greater of: - to 2.4m above the top of hatch cover, or - setting pressure of the pressure relief valve	At least every second hatch cover is to be tested
10	Weather-tight Hatch Covers, Doors and other Closing Appliances	Hose ⁽⁴⁾		
11	Shell plating in way of pump room	Visual examination		To be carefully examined with the vessel afloat

Table 11.5.1 (Continued)
Testing Requirements for Tanks and Boundaries

	Structures to be tested	Type of testing	Hydrostatic testing head or pressure	Remarks
12	Chain Locker (aft Collision Bulkhead)	Structural	To the top of chain locker spurling pipe	
13	Independent Tanks	Structural	The greater of - to the top of overflow, or - to 0.9 m above top of tank	
14	Ballast Ducts	Structural	Ballast pump maximum pressure or setting of any relief valve for the ballast duct if that is less	
15	Hawse Pipes	Hose		

Note

1. Leak or hydropneumatic testing may be accepted under the conditions specified in 5.1.5, provided that at least one tank for each type is structurally tested, and selected in connection with the approval of the design. In general, the structural testing need not be repeated for subsequent vessels of a series of identical new buildings unless the Surveyor deems the repetition necessary. The structural testing of cargo space boundaries and tanks for segregated cargoes or pollutants on subsequent vessels of a series of identical new buildings are to be in accordance with the requirements of the individual Classification Society.
2. Top of tank is defined as the deck forming the top of the tank excluding hatchways.
3. Leak testing in accordance with 5.1.5 may be accepted, except that hydropneumatic testing may be required in consideration of the construction techniques and welding procedures employed.
4. Where hose testing is impractical due to the stage of outfitting (machinery, cables, switchboard, insulation etc.), it may be replaced at the individual Society's discretion, by a careful visual examination of all the crossings and welded joints. A dye penetrant test, leak test or ultrasonic leak test may be required.
5. Before installation (i.e. normally at manufacture) the watertight access doors or hatches are to be hydrostatically tested with a head of water equivalent to the bulkhead deck at centre, from the side which is most prone to leakage. The acceptance criteria are as follows:
 - no leakage for doors or hatches with gaskets
 - a maximum water leakage of one litre per minute for doors or hatches with metallic sealing.
6. If leak or hydropneumatic testing is carried out, arrangements are to be made to ensure that no pressure in excess of 0.30 bar is applied.

SECTION 12

SHIP IN OPERATION RENEWAL CRITERIA

1 ALLOWABLE THICKNESS DIMINUTION FOR HULL STRUCTURE

1.1 General

1.1.1 Applicability

- 1.1.1.1 The purpose of this Section is to provide criteria for the allowable thickness diminution of the ships' hull structure.
- 1.1.1.2 The criteria apply only to ships in operation that are designed and built in accordance with these Rules.
- 1.1.1.3 Thickness measurements are to be used to assess the ships' structure against the specified renewal criteria.

1.1.2 Wastage allowance concept

- 1.1.2.1 Wastage allowance is comprised of two aspects; local wastage allowance and overall hull girder wastage allowance. Local wastage allowance is defined in 1.4 and the overall hull girder wastage allowance is defined in 1.5.
- 1.1.2.2 Assessment against both local and overall hull girder wastage criteria is required during the operational life of the vessel.
- 1.1.2.3 Steel renewal is required if either the local or overall hull girder wastage allowance is exceeded.
- 1.1.2.4 The newbuilding requirements within these Rules incorporate corrosion additions, see *Section 6/3*, and consider all relevant loads and failure modes (e.g. yielding, buckling, and fatigue). No further assessment of the scantlings against the requirements within these Rules is required during the operational life of the ship provided that the thickness of any structural member remains greater than the renewal thickness specified herein.

1.1.3 Requirements for documentation

- 1.1.3.1 The plans to be supplied onboard the ship, see *Section 3/2.2.3*, are to include both the as-built and renewal thickness as defined in 1.4.2. Any owner's extra thickness is also to be clearly indicated on the drawings.
- 1.1.3.2 The "as-built" Midship Section plan provided by the builder and carried on board the ship is to include a table showing the minimum allowable hull girder sectional properties, as defined in 1.5, for the mid-tank transverse section in all cargo tanks.

1.2 Assessment of Thickness Measurements

1.2.1 General

- 1.2.1.1 The minimum survey requirements for the maintenance of class of double hull oil tankers are defined in *IACS Unified Requirement Z10.4*.
- 1.2.1.2 Thickness measurements are to be conducted in accordance with the requirements of the individual Classification Society and *IACS Unified Requirement Z10.4*.

1.2.2 Assessment of local wastage

- 1.2.2.1 Thickness measurements are to be taken to confirm that the measured thickness is not less than the renewal thickness for general corrosion and local pitting/edge corrosion as defined in 1.4.2 and 1.6 respectively. See also 1.3.

1.2.2.2 When a survey identifies that steel renewal is required or structural defects are present which, in the opinion of the Surveyor, will impair the ships' fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.2.2.3 Re-examination and additional thickness measurements at Annual and Intermediate Surveys are required where the measured thickness, t_m , is less than the allowable thickness at annual survey, t_{annual} , defined as:

$$t_{annual} = t_{as-built} - t_{own} - t_{was} \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness, in mm

t_{was} wastage allowance, as defined in 1.4.2.2

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

1.2.2.4 Where re-examination and additional thickness measurements are required by 1.2.2.3 then additional measurements are to be carried out in accordance with Table 12.1.1 to determine the full extent of the corrosion pattern.

Table 12.1.1 Additional Thickness Measurement in way of Structure Identified with $t_m < t_{annual}$		
Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect areas and adjacent plates	5 point pattern over 1m ²
Stiffeners	Suspect areas	3 measurements in line across web 3 measurements in line across flange

1.2.2.5 At each Special Survey, thickness measurements are to be taken in way of critical areas, as considered necessary by the Surveyor. Critical areas are to include locations throughout the ship with corrosion levels that are likely to contravene 1.2.2.3 and/or are considered prone to rapid wastage.

1.2.3 Assessment of overall hull girder wastage

1.2.3.1 The hull girder sectional properties of the ship are to be calculated for the cross-sections as specified in *IACS Unified Requirement Z10.4*, based on the thicknesses given by the thickness measurements, to confirm that the resulting hull girder sectional properties are not less than the minimum allowable defined in 1.5.2. The actual sectional properties calculated based on measured thicknesses and in accordance with *IACS Unified Requirement Z10.4*, are to be submitted to the Classification Society.

1.3 Categories of Corrosion

1.3.1 General corrosion

1.3.1.1 General corrosion is defined as areas where general uniform reduction of material thickness is found over an extensive area.

1.3.1.2 Renewal criteria for general corrosion are given in 1.4.

1.3.2 Pitting corrosion

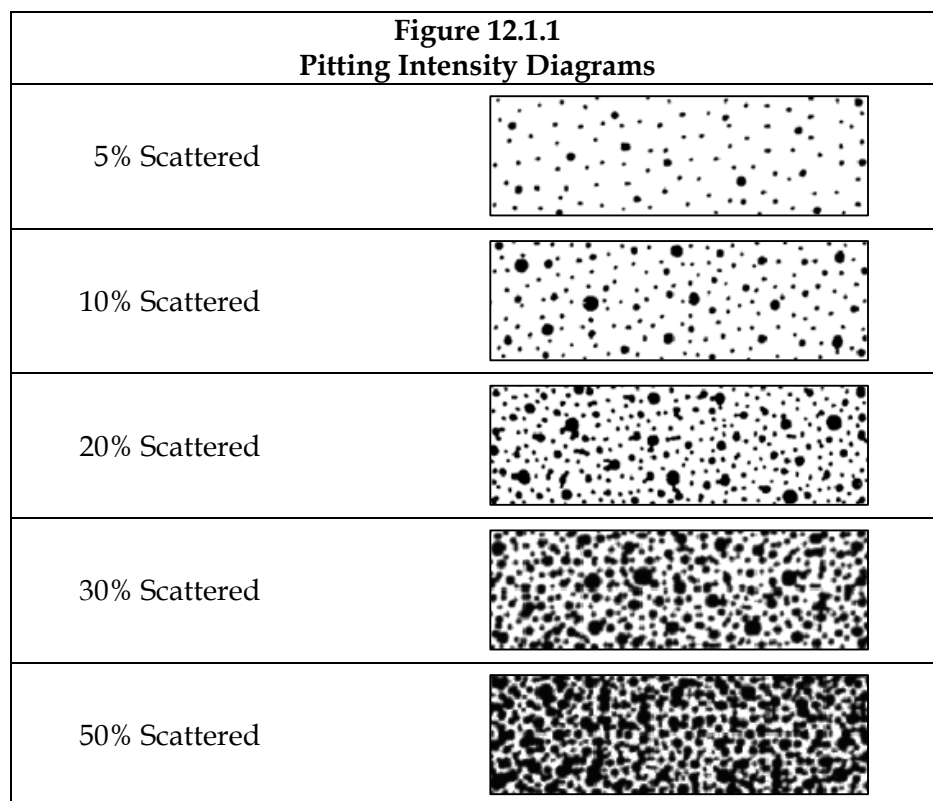

- 1.3.2.1 Pitting corrosion is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area.
- 1.3.2.2 The pitting intensity is defined in *Figure 12.1.1*.
- 1.3.2.3 Renewal criteria for pitting corrosion are given in 1.6.2.

1.3.3 Edge corrosion

- 1.3.3.1 Edge corrosion is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion is shown in *Figure 12.1.2*.
- 1.3.3.2 Renewal criteria for edge corrosion are given in 1.6.3.

1.3.4 Groove corrosion

- 1.3.4.1 Groove corrosion is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion is shown in *Figure 12.1.3*.
- 1.3.4.2 Renewal criteria for groove corrosion are given in 1.6.4.

1.4 Renewal Criteria of Local Structure for General Corrosion

1.4.1 Application

- 1.4.1.1 The renewal criteria in 1.4.2 generally apply to areas of structural members with general corrosion.

1.4.2 Renewal criteria

- 1.4.2.1 Steel renewal is required if the measured thickness, t_{tm} , is less than the renewal thickness, t_{ren} , defined as:

$$t_{ren} = t_{as-built} - t_{was} - t_{own} - t_{corr-2.5} \quad \text{mm}$$

Where:

$t_{as-built}$	as built thickness, in mm
t_{was}	wastage allowance, as defined in 1.4.2.2
t_{own}	owner/builder specified additional wastage allowance, if applicable, in mm
$t_{corr-2.5}$	0.5mm, wastage allowance in reserve for corrosion occurring in the two and a half years between Intermediate and Special surveys

- 1.4.2.2 The wastage allowance, t_{was} , is given by:

$$t_{was} = t_{was-1} + t_{was-2} \quad \text{mm} \quad \text{and rounded up to the nearest 0.5mm}$$

Where:

t_{was}	total wastage allowance of the considered structural member, in mm
t_{was-1}	wastage allowance for side one of the structural member considering the contents of the compartment to which it is exposed, in mm, as given Table 12.1.2
t_{was-2}	wastage allowance for side two of the structural member considering the contents of the compartment to which it is exposed, in mm, as given Table 12.1.2

- 1.4.2.3 In no case is the wastage allowance, t_{was} , to be less than 1.5mm, except in way of internals of dry spaces and pump room where 1.0mm is applicable.
- 1.4.2.4 Wastage allowances for compartments not listed in Table 12.1.2 will be subject to special consideration.
- 1.4.2.5 Areas which need to be renewed based on the renewal criteria in 1.4.2.1 are, in general, to be repaired with inserted material which is to have the same or greater grade/strength as the original and to have a thickness, t_{repair} , not less than:

$$t_{repair} = t_{as-built} - t_{own} \quad \text{mm}$$

Where:

$t_{as-built}$	as built thickness, in mm
t_{own}	owner/builder specified additional wastage allowance, if applicable, in mm

Table 12.1.2			
Local Wastage Allowance for One Side of Structural Elements			
Compartment Type	Structural Member		Ship in Operation Component Wastage Allowance, t_{was-1} or t_{was-2} (mm)
Ballast water tank and chain locker	Face plate of PSM	Within 3m below top of tank ⁽¹⁾	2.0
		Elsewhere	1.5
	Other members ⁽³⁾	Within 3m below top of tank ⁽¹⁾	1.7
		Elsewhere	1.2
Cargo oil tank	Face plate of PSM	Within 3m below top of tank ⁽¹⁾	1.7
		Elsewhere	1.4
	Inner-bottom plating/bottom of tank		2.1
	Other members	Within 3m below top of tank ⁽¹⁾	1.7
		Elsewhere	1.0
Exposed to atmosphere	Weather deck plating		1.7
	Other members		1.0
Exposed to sea water	Shell plating ⁽²⁾		1.0
Fuel and lube oil tank ⁽⁴⁾	Top of tank and attached internal stiffeners		1.0
	Elsewhere		0.7
Fresh water tank	Top of tank and attached internal stiffeners		1.0
	Elsewhere		0.7
Void spaces	Spaces not normally accessed, e.g. access only via bolted manhole openings, pipe tunnels, etc.		0.7
Dry spaces	Internals of deckhouses, machinery spaces, pump room, store rooms, steering gear space, etc.		0.5
Notes			
1. Only applicable to cargo and ballast tanks with weather deck as the tank top.			
2. 0.5mm to be added for side plating in the quay contact region as defined in <i>Section 8/Figure 8.2.2</i> .			
3. 0.5mm to be added to the plate surface exposed to ballast for plate boundary between water ballast and heated cargo oil tanks. 0.3mm to be added to each surfaces of the web and face plate of a stiffener in a ballast tank and attached to the boundary between water ballast and heated cargo oil tanks. Heated cargo oil tanks are defined as tank arranged with any form of heating capability (most common type is heating coils).			
4. 0.7mm to be added for plate boundary between water ballast and heated fuel oil tanks			

(RCN 1, effective from 1 April 2007)

1.5 Renewal Criteria of Hull Girder Sectional Properties for General Corrosion

1.5.1 General

1.5.1.1 The following actual hull girder sectional properties are required to be verified, see 1.5.2-3:

- vertical hull girder moment of inertia, about the horizontal axis, I_v
- hull girder section modulus about the horizontal axis - at deck-at-side, Z_{v-dk}
- hull girder section modulus about the horizontal axis - at keel, Z_{v-kl}
- hull girder section modulus about the vertical axis - at side, Z_{h-side}
- hull girder vertical shear area, A_{v-shr}

1.5.2 Renewal criteria

- 1.5.2.1 Steel renewal is required if the actual hull girder sectional properties, I_{v-tm} , $Z_{v-tm-dk}$, $Z_{v-tm-kl}$, $Z_{h-tm-side}$, $A_{v-tm-shr}$, calculated using the actual thickness measurements are less than the minimum allowable hull girder sectional properties defined in accordance with 1.5.3.
- 1.5.2.2 The actual hull girder sectional properties listed in 1.5.2.1 are to be calculated in accordance with Section 4/2.6, using the measured thicknesses.
- 1.5.2.3 If steel renewal is required due to reduced hull girder sectional properties this is to be done by replacing local corroded structural elements. Any combination of structural elements may be replaced provided that the resulting hull girder sectional properties satisfy 1.5.2.1. Local structural elements being renewed are to be replaced in accordance with the requirements of 1.4.2.3.

1.5.3 Calculation of the minimum allowable hull girder sectional properties

- 1.5.3.1 The minimum allowable hull girder sectional properties listed in 1.5.1.1 are to be calculated in accordance with Section 4/2.6, using the thicknesses defined in 1.5.3.2.
- 1.5.3.2 The minimum allowable hull girder sectional properties in the corroded condition are calculated using the same corrosion thickness reductions that are used during the newbuilding stage, thus linking the newbuilding and ship in operation criteria. Therefore the calculation of the minimum allowable hull girder sectional properties is to be based on a member thickness, t , given by:

$$t = t_{as-built} - 0.5t_{corr} - t_{own} \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness, in mm

t_{corr} corrosion addition, as defined in Section 6/3.2

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

1.6 Allowable Material Diminution for Pitting, Grooving and Edge Corrosion

1.6.1 General

- 1.6.1.1 Steel renewal for pitting, grooving and edge corrosion is required if the measured thickness is less than the criteria defined in 1.6.2, 1.6.3 and 1.6.4 respectively.

1.6.2 Pitting

- 1.6.2.1 For plates with pitting intensity less than 20%, see Figure 12.1.1, the measured thickness, t_{tm} , of any individual measurement is to meet the lesser of the following criteria:

$$t_{tm} \geq 0.7(t_{as-built} - t_{own}) \quad \text{mm}$$

$$t_{tm} \geq t_{ren} - 1 \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness of the member, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

t_{ren} renewal criteria for general corrosion as defined in 1.4.2.1

- 1.6.2.2 The average thickness across any cross section in the plating is not to be less than the renewal criteria for general corrosion given in 1.4.2.1.

1.6.3 Edge corrosion

- 1.6.3.1 Provided that the overall corroded height of the edge corrosion of the flange, or web in the case of flat bar stiffeners, is less than 25%, see *Figure 12.1.2*, of the stiffener flange breadth or web height, as applicable, the measured thickness, t_{tm} , is to meet the lesser of the following criteria:

$$t_{tm} \geq 0.7(t_{as-built} - t_{own}) \quad \text{mm}$$

$$t_{tm} \geq t_{ren} - 1 \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness of the member, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

t_{ren} renewal criteria for general corrosion as defined in 1.4.2.1

- 1.6.3.2 The average measured thickness across the breadth or height of the stiffener is not to be less than that defined in 1.4.2.
- 1.6.3.3 Plate edges at openings for manholes, lightening holes etc. may be below the minimum thickness given in 1.4.2 provided that:
- (a) the maximum extent of the reduced plate thickness, below the minimum given in 1.4.2, from the opening edge is not more than 20% of the smallest dimension of the opening and does not exceed 100mm
 - (b) rough or uneven edges may be cropped-back provided that the maximum dimension of the opening is not increased by more than 10%.

1.6.4 Grooving

- 1.6.4.1 Where the groove breadth is a maximum of 15% of the web height, but not more than 30mm, see *Figure 12.1.3*, the measured thickness, t_{tm} , in the grooved area is to meet the lesser of the following criteria:

$$t_{tm} \geq 0.75(t_{as-built} - t_{own}) \quad \text{mm}$$

$$t_{tm} \geq t_{ren} - 0.5 \quad \text{mm}$$

but is not to be less than

$$t_{tm} = 6 \quad \text{mm}$$

Where:

$t_{as-built}$ as built thickness of the member, in mm

t_{own} owner/builder specified additional wastage allowance, if applicable, in mm

t_{ren} renewal criteria for general corrosion as defined in 1.4.2.1

- 1.6.4.2 Members with areas of grooving greater than those in 1.6.4.1 are to be assessed based on the criteria for general corrosion as defined in 1.4.2 using the average measured thickness across the plating/stiffener.

APPENDIX A

HULL GIRDER ULTIMATE STRENGTH

1 GENERAL

1.1 Definitions

1.1.1 Hull girder bending moment capacity

- 1.1.1.1 The hull girder ultimate bending moment capacity, M_u , is defined as the maximum bending capacity of the hull girder beyond which the hull will collapse. Hull girder failure is controlled by buckling, ultimate strength and yielding of longitudinal structural elements.
- 1.1.1.2 The sagging hull girder ultimate capacity of a hull girder section, is defined as the maximum value on the static non-linear bending moment-curvature relationship $M-\kappa$, see *Figure A.1.1*. The curve represents the progressive collapse behaviour of hull girder under vertical bending.

- 1.1.1.3 The curvature of the critical inter-frame section, κ , is defined as:

$$\kappa = \frac{\theta}{l}$$

Where:

- θ the relative angle rotation of the two neighbouring cross-sections at transverse frame positions
- l the transverse frame spacing, i.e. span of longitudinals

1.2 Application

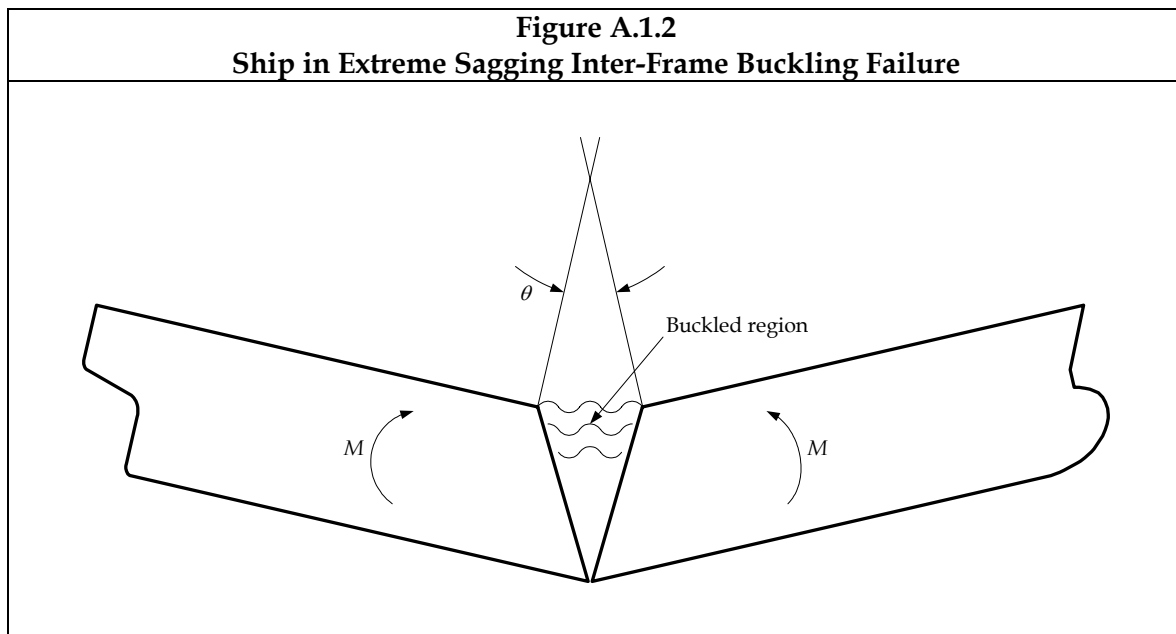

1.2.1 General

- 1.2.1.1 The sagging hull girder ultimate bending capacity is to be assessed by the single step method in 2.1 or the incremental-iterative method in 2.2. This is only applicable to longitudinally framed double hull tankers in the sagging bending condition.
- 1.2.1.2 The magnitudes of the partial safety factors in *Section 9/1.4* have been calibrated for this single step method in 2.1 and are also appropriate for the incremental iterative method in 2.2.

1.3 Assumptions

1.3.1 General

- 1.3.1.1 The method for calculating the ultimate hull girder capacity is to identify the critical failure modes of all main longitudinal structural elements. For tankers, in sagging, the critical mode is generally inter-frame buckling of deck structures, as shown in *Figure A.1.2*.
- 1.3.1.2 Structures compressed beyond their buckling limit have reduced load carrying capacity. All relevant failure modes for individual structural elements, such as: plate buckling, torsional stiffener buckling, stiffener web buckling, lateral or global stiffener buckling; and their interactions, are to be considered in order to identify the weakest inter-frame failure mode.
- 1.3.1.3 For tankers in the sagging condition, only vertical bending is considered. The effects of shear force, torsional loading, horizontal bending moment and lateral pressure are neglected.

1.4 Alternative Methods

1.4.1 General

- 1.4.1.1 Principles for alternative methods for the calculation of the hull girder ultimate bending capacity; e.g. incremental-iterative procedure that may differ from the one defined in 2.2, and non-linear finite element analysis, are given in *Sub-Section 3*.
- 1.4.1.2 Application of alternative methods is to be agreed with the individual Classification Society prior to commencement. Documentation of the analysis methodology and detailed comparison of its results with those of the individual Classification Societies' procedures are to be submitted for review and acceptance. The use of such methods may require the partial safety factors in *Section 9/1.4* to be re-calibrated.

2 CALCULATION OF HULL GIRDER ULTIMATE CAPACITY

2.1 Single Step Ultimate Capacity Method

2.1.1 Procedure

2.1.1.1 The single step procedure for calculation of the sagging hull girder ultimate bending capacity is a simplified method based on a reduced hull girder bending stiffness accounting for buckling of the deck, see *Figure A.2.1*. The hull girder ultimate bending moment capacity, M_U , is to be taken as:

$$M_U = Z_{red} \sigma_{yd} \cdot 10^3 \quad \text{kNm}$$

Where:

$$Z_{red} = \frac{I_{red}}{Z_{dk-mean} - Z_{NA-red}} \quad \text{m}^3$$

I_{red} reduced hull girder moment of inertia, in m^4 . The inertia is to be calculated in accordance with *Section 4/2.6.1.1*, using:

- a hull girder net thickness of t_{net50} for all longitudinally effective members
- the effective net area after buckling of each stiffened panel of the deck, A_{eff}

A_{eff} effective net area after buckling of the stiffened deck panel. The effective area is the proportion of stiffened deck panel that is effectively able to be stressed to yield:

$$= \frac{\sigma_U}{\sigma_{yd}} A_{net50} \quad \text{m}^2$$

Note

The effective area of deck girders is to be taken as the net area of the girders using a thickness of t_{net50} .

A_{net50} net area of the stiffened deck panel, in m^2

σ_U buckling capacity of stiffened deck panel, in N/mm^2 . To be calculated for each stiffened panel using:

- the advanced buckling analysis method, see *Section 10/4* and *Appendix D*
- the net thickness t_{net50}

σ_{yd} specified minimum yield stress of the material, in N/mm^2 , that is used to determine the hull girder section modulus

$Z_{dk-mean}$ vertical distance to the mean deck height, taken as the mean of the deck at side and the deck at centre line, measured from the baseline, in m

Z_{NA-red} vertical distance to the neutral axis of the reduced section measured from the baseline, in m

2.1.1.2 It is to be shown that the ultimate bending moment capacity, M_U , does not give stresses exceeding the specified minimum yield stress of the material, σ_{yd} , in the bottom shell plating. Therefore the ultimate hull girder bending moment capacity, M_U , is not to be greater than:

$$M_U = \sigma_{yd} \frac{I_{red}}{z_{NA-red}} \cdot 10^3 \quad \text{kNm}$$

Where:

σ_{yd} specified yield stress of material, in N/mm²

I_{red} reduced hull girder moment of inertia, as defined in 2.1.1.1

z_{NA-red} vertical distance to the neutral axis of the reduced section measured from the baseline, in m

2.1.2 Assumption

2.1.2.1 The assumption behind this procedure is that the ultimate sagging capacity of tankers is the point at which the ultimate capacity of the stiffened deck panels is reached. If the structural configuration is such that this assumption is not valid, then an alternative method to derive the ultimate capacity is to be used.

2.2 Simplified Method Based on an Incremental-iterative Approach

2.2.1 Procedure

2.2.1.1 In this approach, the ultimate hull girder bending moment capacity M_U is defined as the peak value of the curve with vertical bending moment M versus the curvature κ of the ship cross section as shown in Figure A.1.1.

2.2.1.2 The curve $M-\kappa$ is obtained by means of an incremental-iterative approach; the steps involved in the procedure are given in 2.2.1.7 and illustrated in the flow chart in Figure A.2.2.

- 2.2.1.3 The bending moment M_i which acts on the hull girder transverse section due to the imposed curvature κ_i is calculated for each step of the incremental procedure. This imposed curvature corresponds to an angle of rotation of the hull girder transverse section about its effective horizontal neutral axis, which induces an axial strain ε in each hull structural element. In the sagging condition, the structural elements below the neutral axis are lengthened, whilst elements above the neutral axis are shortened.
- 2.2.1.4 The stress σ induced in each structural element by the strain ε is obtained from the stress-strain curve σ - ε of the element, which takes into account the behaviour of the structural element in the non-linear elasto-plastic domain.
- 2.2.1.5 The force in each structural element is obtained from its area times the stress and these force are summated to derive the total axial force on the transverse section. Note the element area is taken as the total net area of the structural element. This total force may not be zero as the effective neutral axis may have moved due to the non linear response. Hence it is necessary to adjust the neutral axis position, recalculate the element strains, forces and total sectional force and iterate until the total force is zero.
- 2.2.1.6 Once the position of the new neutral axis is known, then the correct stress distribution in the structural elements is obtained. The bending moment M_i about the new neutral axis due to the imposed curvature κ_i is then obtained by summing the moment contribution given by the force in each structural element.
- 2.2.1.7 The main steps of the incremental-iterative approach are summarised as follows (see also *Figure A.2.2*):

Step 1 Divide the hull girder transverse section into structural elements, ie longitudinal stiffened panels (one stiffener per element), hard corners and transversely stiffened panels, see 2.2.2.2.

Step 2 Derive the stress-strain curves (or so called load-end shortening curves) for all structural elements, see 2.3.

Step 3 Derive the expected maximum required curvature κ_F , see 2.2.1.8. The curvature step size $\Delta\kappa$ is to be taken as $\kappa_F/300$. The curvature for the first step, κ_1 is to be taken as $\Delta\kappa$.

Derive the neutral axis z_{NA-i} for the first incremental step ($i=1$) with the value of the elastic hull girder section modulus, $Z_{v-net50}$, see *Section 4/2.6.1*

Step 4 For each element (index j), calculate the strain $\varepsilon_{ij} = \kappa_i (z_j - z_{NA-i})$ corresponding to κ_i , the corresponding stress σ_j , see 2.2.1.9, and hence the force in the element $\sigma_j A_j$.

Step 5 Determine the new neutral axis position z_{NA-i} by checking the longitudinal force equilibrium over the whole transverse section. Hence adjust z_{NA-i} until

$$F_i = 0.1 \sum A_j \sigma_j \text{ kN} = 0$$

Note σ_j is positive for elements under compression and negative for elements under tension. Repeat from step 4 until equilibrium is satisfied. Equilibrium is satisfied when the change in neutral axis position is less than 0.0001m.

Step 6 Calculate the corresponding moment by summing the force contributions of all elements as follows:

$$M_i = 0.1 \sum \left| \sigma_j A_j (z_j - z_{NA-i}) \right| \quad \text{kNm}$$

Step 7 Increase the curvature by $\Delta\kappa$, use the current neutral axis position as the initial value for the next curvature increment and repeat from step 4 until the maximum required curvature is reached. The ultimate capacity is the peak value M_u from the $M-\kappa$ curve. If the peak does not occur in the curve, then κ_F is to be increased until the peak is reached

2.2.1.8 The expected maximum required curvature, κ_F , in m^{-1} , for the sagging condition is to be taken as:

$$\kappa_F = 3 \frac{M_{yd}}{EI_{v-net50}} 10^{-3} \text{ m}^{-1}$$

Where:

M_{yd} vertical bending moment given by a linear elastic bending stress of yield in the deck or keel. To be taken as the greater of :

$Z_{v-net50-dk} \sigma_{yd} 10^3 \text{ kNm}$

$Z_{v-net50-kl} \sigma_{yd} 10^3 \text{ kNm}$

$Z_{v-net50-dk}$ section modulus at deck or bottom, in m^3 , see Section 8/1.2.2.3 and 1.2.2.4,

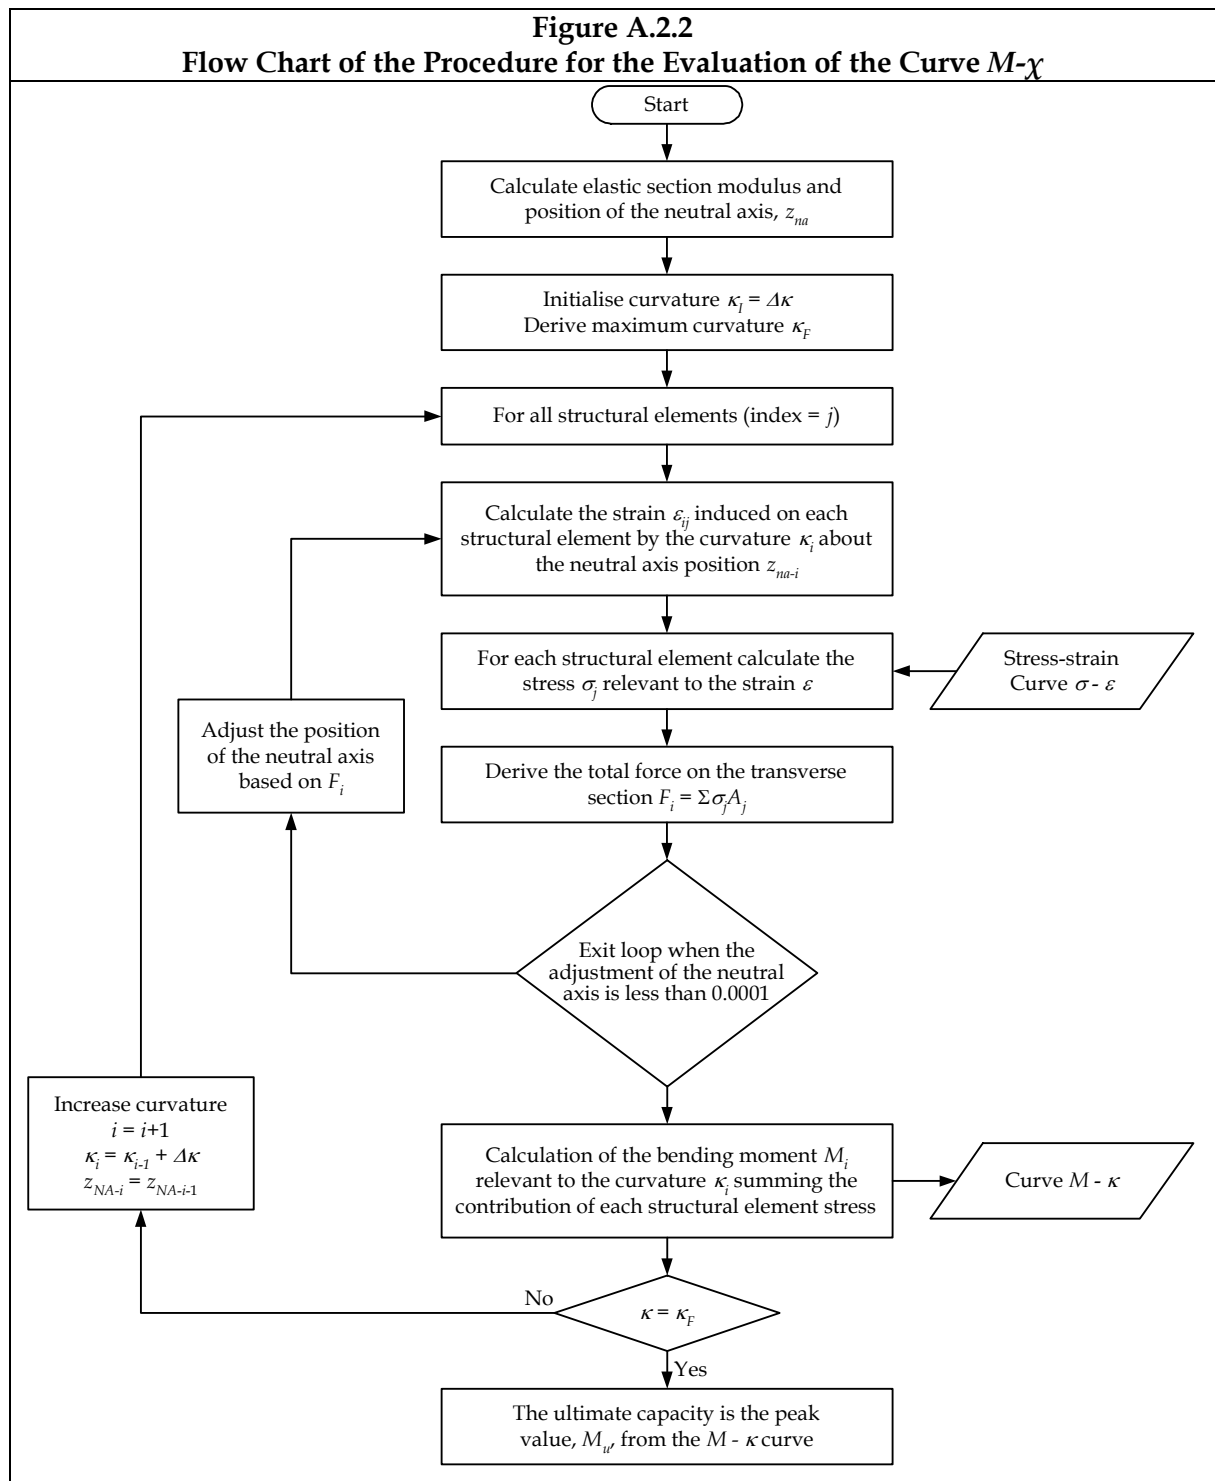

$Z_{v-net50-kl}$

E modulus of elasticity, $2.06 \times 10^5 \text{ N/mm}^2$

σ_{yd} specified minimum yield stress of the material, in N/mm^2

$I_{v-net50}$ hull girder moment of inertia, in m^4 , see Section 8/1.2.1.1

2.2.1.9 For each structural element, the stress σ_j corresponding to the element strain ε_{ij} is to be taken as the minimum stress value from all applicable stress-strain curves $\sigma-\varepsilon$ for that element.

2.2.2 Assumptions and modelling of the hull girder cross-section

2.2.2.1 In applying the procedure described in 2.2.1, the following assumptions are to be made:

- The ultimate strength is calculated at a hull girder transverse section between two adjacent transverse webs.
- The hull girder transverse section remains plane during each curvature increment.
- The material properties of steel are assumed to be elastic, perfectly plastic.

- (d) The hull girder transverse section can be divided into a set of elements which act independently of each other.

2.2.2.2 The elements making up the hull girder transverse section are:

- (a) longitudinal stiffeners with attached plating, the structural behaviour is given in 2.3.1
- (b) transversely stiffened plate panels, the structural behaviour is given in 2.3.1
- (c) hard corners, as defined in 2.2.2.3, the structural behaviour is given in 2.3.2

2.2.2.3 The following structural areas are to be defined as hard corners:

- (a) the plating area adjacent to intersecting plates
- (b) the plating area adjacent to knuckles in the plating with an angle greater than 30 degrees.
- (c) plating comprising rounded gunwales

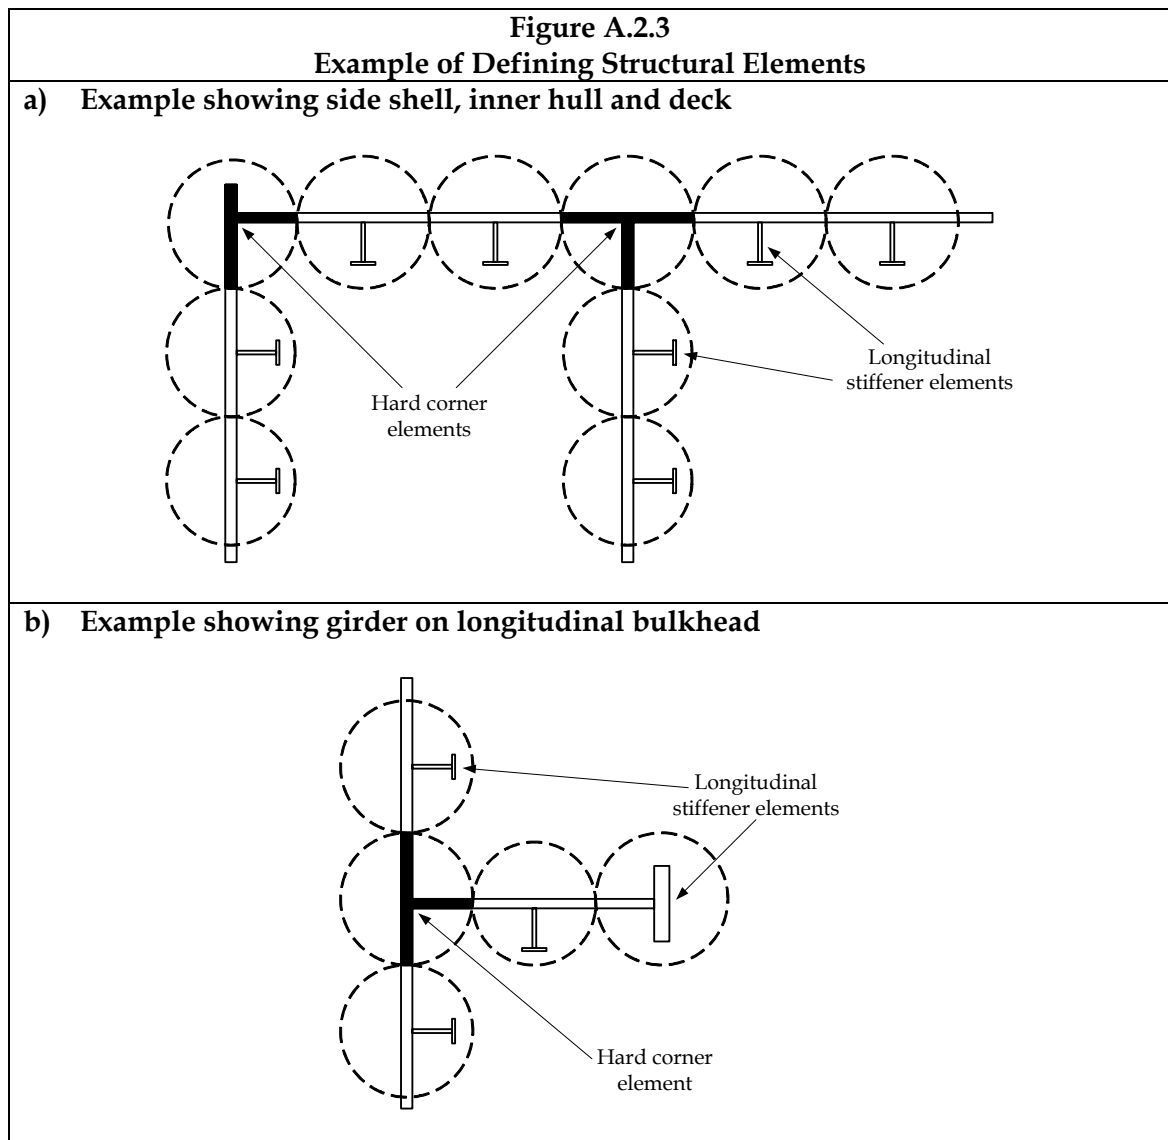

An illustration of hard corner definition for girders on longitudinal bulkheads is given in *Figure A.2.3*. The hard corner size is defined in 2.2.2.4.

2.2.2.4 The size and modelling of hard corner elements is to be as follows:

- (a) it is to be assumed that the hard corner extends up to $s/2$ from the plate intersection for longitudinally stiffened plate, where s is the stiffener spacing
- (b) it is to be assumed that the hard corner extends up to $20t_{grs}$ from the plate intersection for transversely stiffened plates, where t_{grs} is the gross plate thickness.

Note

For transversely stiffened plate, the effective breadth of plate for the load shortening portion of the stress-strain curve is to be taken as the full plate breadth, i.e. to the intersection of other plates – not from the end of the hard corner if any. The area on which the value of σ_{CR5} defined in 2.3.8.1 applies is to be taken as the breadth between the hard corners, i.e. excluding the end of the hard corner if any.

2.3 Stress-strain Curves σ - ϵ (or Load-end Shortening Curves)

2.3.1 Plate panels and stiffeners

2.3.1.1 Plate panels and stiffeners are assumed to fail according to one of the modes of failure specified in *Table A.2.1*. The relevant stress-strain curve σ - ϵ is to be obtained for lengthening and shortening strains according to *Table A.2.1*.

2.3.2 Hard corners

2.3.2.1 Hard corners are sturdier elements which are assumed to buckle and fail in an elastic, perfectly plastic manner. The relevant stress strain curve σ - ϵ is to be obtained for lengthened and shortened hard corners according to 2.3.3.

Table A.2.1
Modes of Failure of Plate Panels and Stiffeners

Element	Mode of failure	Stress-strain curve σ - ε defined in
Lengthened transversely framed plate panels or stiffeners	Elastic, perfectly plastic failure	See 2.3.3
Shortened stiffeners	Beam column buckling	See 2.3.4
	Torsional buckling	See 2.3.5
	Web local buckling of flanged profiles	See 2.3.6
	Web local buckling of flat bars	See 2.3.7
Shortened transversely framed plate panels	Plate buckling	See 2.3.8

2.3.3 Elasto-plastic failure of structural elements

2.3.3.1 The equation describing the stress-strain curve σ - ε or the elasto-plastic failure of structural elements is to be obtained from the following formula, valid for both positive (compression or shortening) of hard corners and negative (tension or lengthening) strains of all elements (see *Figure A.2.4*):

$$\sigma = \Phi \sigma_{yd}$$

Where:

Φ edge function:

$$\Phi = -1 \quad \text{for} \quad \varepsilon < -1$$

$$\Phi = \varepsilon \quad \text{for} \quad -1 < \varepsilon < 1$$

$$\Phi = 1 \quad \text{for} \quad \varepsilon > 1$$

ε relative strain:

$$\varepsilon = \frac{\varepsilon_E}{\varepsilon_{yd}}$$

ε_E element strain

ε_{yd} strain corresponding to yield stress in the element:

$$\varepsilon_{yd} = \frac{\sigma_{yd}}{E}$$

σ_{yd} specified minimum yield stress of the material, in N/mm²

Note

The signs of the stresses and strains in this Appendix are opposite to those in the rest of the Rules

2.3.4 Beam column buckling

2.3.4.1 The equation describing the shortening portion of the stress strain curve σ_{CR1} - ϵ for the beam column buckling of stiffeners is to be obtained from the following formula:

$$\sigma_{CR1} = \Phi \sigma_{C1} \left(\frac{A_{s-net50} + 10^{-2} b_{eff-p} t_{net50}}{A_{s-net50} + 10^{-2} s t_{net50}} \right) \quad \text{N/mm}^2$$

Where:

Φ edge function defined in 2.3.3.1

$A_{s-net50}$ net area of the stiffener, in cm^2 , without attached plating

σ_{C1} critical stress, in N/mm²:

$$\sigma_{C1} = \frac{\sigma_{E1}}{\varepsilon} \quad \text{for } \sigma_{E1} \leq \frac{\sigma_{yd}}{2} \varepsilon$$

$$\sigma_{C1} = \sigma_{yd} \left(1 - \frac{\sigma_{yd} \varepsilon}{4 \sigma_{E1}} \right) \quad \text{for } \sigma_{E1} > \frac{\sigma_{yd}}{2} \varepsilon$$

ε relative strain defined in 2.3.3.1

σ_{E1} Euler column buckling stress, in N/mm²:

$$\sigma_{E1} = \pi^2 E \frac{I_{E-net50}}{A_{E-net50} l_{stf}^2} 10^{-4}$$

E modulus of elasticity, 2.06×10^5 N/mm²

$I_{E-net50}$ net moment of inertia of stiffeners, in cm⁴, with attached plating of width b_{eff-s}

b_{eff-s} effective width, in mm, of the attached plating for the stiffener:

$$b_{eff-s} = \frac{s}{\beta_p} \quad \text{for } \beta_p > 1.0$$

$$b_{eff-s} = s \quad \text{for } \beta_p \leq 1.0$$

$$\beta_p = \frac{s}{t_{net50}} \sqrt{\frac{\varepsilon \sigma_{yd}}{E}}$$

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in Section 4/2.2.1

t_{net50} net thickness of attached plating, in mm

$A_{E-net50}$ net area, in cm², of stiffeners with attached plating of width b_{eff-p}

l_{stf} span of stiffener, in m, equal to spacing between primary support members

b_{eff-p} effective width, in mm, of the plating:

$$b_{eff-p} = \left(\frac{2.25}{\beta_p} - \frac{1.25}{\beta_p^2} \right) s \quad \text{for } \beta_p > 1.25$$

$$b_{eff-p} = s \quad \text{for } \beta_p \leq 1.25$$

(RCN 2, effective from 1 July 2008)

2.3.5 Torsional buckling of stiffeners

2.3.5.1 The equation describing the shortening portion of the stress-strain curve $\sigma_{CR2}-\varepsilon$ for the lateral-flexural buckling of stiffeners is to be obtained according to the following formula:

$$\sigma_{CR2} = \Phi \frac{A_{s-net50} \sigma_{C2} + 10^{-2} s t_{net50} \sigma_{CP}}{A_{s-net50} + 10^{-2} s t_{net50}} \quad \text{N/mm}^2$$

Where:

Φ edge function defined in 2.3.3.1

$A_{s-net50}$ net area of the stiffener, in cm², without attached plating

σ_{C2}	critical stress, in N/mm ² : $\sigma_{C2} = \frac{\sigma_{E2}}{\varepsilon} \quad \text{for } \sigma_{E2} \leq \frac{\sigma_{yd}}{2} \varepsilon$ $\sigma_{C2} = \sigma_{yd} \left(1 - \frac{\sigma_{yd} \varepsilon}{4 \sigma_{E2}} \right) \quad \text{for } \sigma_{E2} > \frac{\sigma_{yd}}{2} \varepsilon$
σ_{E2}	Euler torsional buckling stress, in N/mm ² $\sigma_{E2} = \sigma_{ET}$
σ_{ET}	reference stress for torsional buckling, in N/mm ² , defined in Section 10/3.3.3.1, calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$.
ε	relative strain defined in 2.3.3.1
s	plate breadth, in mm, taken as the spacing between the stiffeners, as defined in Section 4/2.2.1
t_{net50}	net thickness of attached plating, in mm
σ_{CP}	ultimate strength of the attached plating for the stiffener, in N/mm ² : $\sigma_{CP} = \left(\frac{2.25}{\beta_p} - \frac{1.25}{\beta_p^2} \right) \sigma_{yd} \quad \text{for } \beta_p > 1.25$ $\sigma_{CP} = \sigma_{yd} \quad \text{for } \beta_p \leq 1.25$
β_p	coefficient defined in 2.3.4 (RCN 2, effective from 1 July 2008)

2.3.6 Web local buckling of stiffeners with flanged profiles

2.3.6.1 The equation describing the shortening portion of the stress strain curve σ_{CR3} - ε for the web local buckling of flanged stiffeners is to be obtained from the following formula:

$$\sigma_{CR3} = \Phi \sigma_{yd} \left(\frac{b_{eff-p} t_{net50} + d_{w-eff} t_{w-net50} + b_f t_{f-net50}}{s t_{net50} + d_w t_{w-net50} + b_f t_{f-net50}} \right) \quad \text{N/mm}^2$$

Where:

Φ	edge function defined in 2.3.3.1
b_{eff-p}	effective width, in mm, of the plating, defined in 2.3.4
t_{net50}	net thickness of plate, in mm
d_w	depth of the web, in mm
$t_{w-net50}$	net thickness of web, in mm
b_f	breadth of the flange, in mm
$t_{f-net50}$	net thickness of flange, in mm
s	plate breadth, in mm, taken as the spacing between the stiffeners, as defined in Section 4/2.2.1

d_{w-eff}	effective depth of the web, in mm:
$d_{w-eff} = \left(\frac{2.25}{\beta_w} - \frac{1.25}{\beta_w^2} \right) d_w$	for $\beta_w > 1.25$
$d_{w-eff} = d_w$	for $\beta_w \leq 1.25$
β_w	$\frac{d_w}{t_{w-net50}} \sqrt{\frac{\varepsilon \sigma_{yd}}{E}}$
ε	relative strain defined in 2.3.3.1
E	modulus of elasticity, 2.06×10^5 N/mm ²

2.3.7 Web local buckling of flat bar stiffeners

2.3.7.1 The equation describing the shortening portion of the stress-strain curve $\sigma_{CR4}-\varepsilon$ for the web local buckling of flat bar stiffeners is to be obtained from the following formula:

$$\sigma_{CR4} = \Phi \left(\frac{st_{net50} \sigma_{CP} + 10^{-2} A_{s-net50} \sigma_{C4}}{st_{net50} + 10^{-2} A_{s-net50}} \right)$$

Where:

Φ	edge function defined in 2.3.3.1
σ_{CP}	ultimate strength of the attached plating, in N/mm ² , defined in 2.3.5
σ_{C4}	critical stress, in N/mm ² :
$\sigma_{C4} = \frac{\sigma_{E4}}{\varepsilon}$	for $\sigma_{E4} \leq \frac{\sigma_{yd}}{2} \varepsilon$
$\sigma_{C4} = \sigma_{yd} \left(1 - \frac{\sigma_{yd} \varepsilon}{4 \sigma_{E4}} \right)$	for $\sigma_{E4} > \frac{\sigma_{yd}}{2} \varepsilon$
σ_{E4}	Euler buckling stress, in N/mm ² :
$\sigma_{E4} = 160000 \left(\frac{t_{w-net50}}{d_w} \right)^2$	
ε	relative strain defined in 2.3.3.1.
$A_{s-net50}$	net area of stiffener, in cm ² , see 2.3.5.1
$t_{w-net50}$	net thickness of web, in mm
d_w	depth of the web, in mm
s	plate breadth, in mm, taken as the spacing between the stiffeners, as defined in Section 4/2.2.1
t_{net50}	net thickness of attached plating, in mm

(RCN 2, effective from 1 July 2008)

2.3.8 Buckling of transversely stiffened plate panels

2.3.8.1 The equation describing the shortening portion of the stress-strain curve $\sigma_{CR5-\varepsilon}$ for the buckling of transversely stiffened panels is to be obtained from the following formula:

$$\sigma_{CR5} = \min \left\{ \begin{array}{l} \Phi \sigma_{yd} \left[\frac{s}{1000 l_{stf}} \left(\frac{2.25}{\beta_p} - \frac{1.25}{\beta_p^2} \right) + 0.1 \left(1 - \frac{s}{1000 l_{stf}} \right) \left(1 + \frac{1}{\beta_p^2} \right)^2 \right] \\ \sigma_{yd} \Phi \end{array} \right. \quad \text{N/mm}^2$$

Where:

β_p coefficient defined in 2.3.4.1

Φ edge function defined in 2.3.3.1

s plate breadth, in mm, taken as the spacing between the stiffeners, as defined in Section 4/2.2.1

l_{stf} stiffener span, in m, equal to spacing between primary support members

σ_{yd} specified minimum yield stress of the material, in N/mm²

(RCN 2, effective from 1 July 2008)

3 ALTERNATIVE METHODS

3.1 General

3.1.1 Considerations for alternative models

3.1.1.1 The bending moment-curvature relationship, $M-\kappa$, may be established by alternative methods. Such models are to consider all the relevant effects important to the non-linear response with due considerations of:

- (a) non-linear geometrical behaviour
- (b) inelastic material behaviour
- (c) geometrical imperfections and residual stresses (geometrical out-of flatness of plate and stiffeners)
- (d) simultaneously acting loads:
 - bi-axial compression
 - bi-axial tension
 - shear and lateral pressure
- (e) boundary conditions
- (f) interactions between buckling modes
- (g) interactions between structural elements such as plates, stiffeners, girders etc.
- (h) post-buckling capacity.

3.2 Methods

3.2.1 Incremental-iterative procedure

3.2.1.1 The most generally used method to assess the hull girder ultimate moment capacity is to derive the non-linear moment-curvature relationship, $M-\kappa$, by incrementally increasing the bending curvature, κ , of the hull section between two adjacent transverse frames and then identifying the maximum moment along this curve as the ultimate bending capacity, M_U .

3.2.1.2 The $M-\kappa$ curve is to be based on the axial non-linear $P-\varepsilon$ (load/strain) load-shortening curves for individual structural component in the cross-section. The $P-\varepsilon$ curves shall consider all relevant structural effects as listed in 3.1.1.1.

3.2.2 Non-linear finite element analysis

3.2.2.1 Advanced non-linear finite element analyses models may be used for the assessment of the hull girder ultimate capacity. Such models are to consider the relevant effects important to the non-linear responses with due consideration of the items listed in 3.1.1.1.

3.2.2.2 Particular attention is to be given to modelling the shape and size of geometrical imperfections. It is to be ensured that the shape and size of geometrical imperfections trigger the most critical failure modes.

APPENDIX B

STRUCTURAL STRENGTH ASSESSMENT

1 GENERAL

1.1 Application

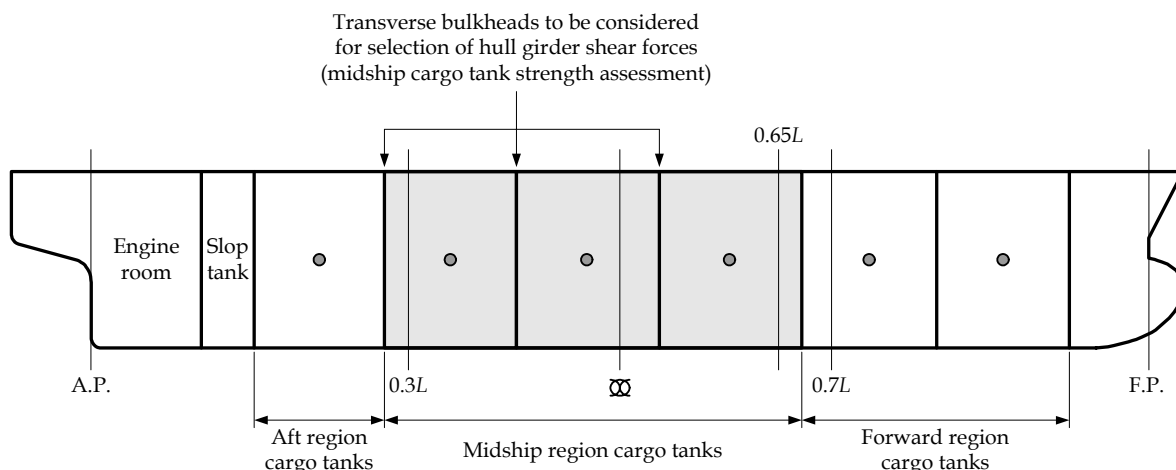

1.1.1 General

- 1.1.1.1 In accordance with *Section 9/2.1*, a finite element (FE) assessment is to be carried out to verify the strength of the hull structure.
- 1.1.1.2 The structural assessment is to be carried out in accordance with the requirements given in this Appendix. The structural assessment is to verify that the acceptance criteria specified are complied with.
- 1.1.1.3 The requirements in this Appendix apply to the assessment of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads of the tanks in the midship cargo region and, in addition, the assessment of strengthening of longitudinal hull girder shear structural members, as defined in *Section 9/2.2.1.1* and *Section 4/Table 4.1.1*, in way of transverse bulkheads for hull girder vertical shear loads in the forward and aft cargo regions. The strength assessment of longitudinal hull girder shear structural members given in this Appendix is not applicable for forward transverse collision bulkhead, engine room transverse bulkhead and slop tank transverse bulkheads.
- 1.1.1.4 For the purpose of the FE structural assessment the cargo tank regions are as defined in *Figure B1.1*.
- 1.1.1.5 Cargo tank structural strength analysis, in accordance with *Appendix B/2*, for the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads in tanks within the midship cargo region, is mandatory. The assessment is to be based on the maximum permissible still water (load combination S) and combined permissible still water and wave hull girder vertical shear forces (load combination S+D) between and including the forward bulkhead of the aft most cargo tank and $0.65L$ from AP, but not including the engine room and slop tank transverse bulkheads, *see Figure B.1.1(a)*.
- 1.1.1.6 The assessment of longitudinal hull girder shear structural members in the forward cargo region, in accordance with *Appendix B/2*, is mandatory. The strengthening of these structural members in way of transverse bulkheads in the tanks of the forward cargo region may be based on the maximum permissible still water (load combination S) and combined permissible still water and wave hull girder vertical shear forces (load combination S+D) at the bulkhead positions forward of $0.65L$ from AP, but not including the forward collision bulkhead, *see Figure B.1.1(b)*.
- 1.1.1.7 Strengthening of longitudinal hull girder shear structural members in way of transverse bulkheads of the tanks in the midship cargo region and the aft cargo region, in accordance with *Appendix B/2*, may be based on the scantling result obtained from the midship cargo tank analysis as described in *1.1.1.5*.
- 1.1.1.8 Alternatively, optional assessment may be carried out to determine the strengthening requirement of longitudinal hull girder shear structural members in way of individual transverse bulkheads based on the permissible still water (load combination S) and combined permissible still water and wave hull girder vertical shear forces (load combination S+D) at the transverse bulkhead position under consideration, *see Figure B.1.1(b)*.

- 1.1.1.9 Fine mesh finite element analysis, in accordance with *Appendix B/3*, and the finite element based fatigue assessment of lower hopper knuckle joint, in accordance with *Appendix B/4*, are mandatory for the midship cargo region.

Figure B.1.1
Definition of Cargo Tank Regions for FE Structural Assessment

(a) Midship cargo tank strength assessment

(b) Assessment of longitudinal hull girder shear structural members

Note

1. Tanks in the forward cargo region are defined as tanks with their longitudinal centre of gravity position forward of $0.7L$ from A.P.
2. Tanks in the midship cargo region are defined as tanks with their longitudinal centre of gravity position at or forward of $0.3L$ from AP and at or aft of $0.7L$ from A.P.
3. Tanks in the aft cargo region are defined as tanks with their longitudinal centre of gravity position aft of $0.3L$ from A.P.

1.2 Symbols, Units and Definitions

1.2.1 General

1.2.1.1 The symbols and definitions, applicable to this section, are given in *Section 4/1*, *Section 7* and as follows:

a_v	vertical acceleration, taken at centre of gravity of tank
a_t	transverse acceleration, taken at centre of gravity of tank
a_{lng}	longitudinal acceleration, taken at centre of gravity of tank
E	Modulus of Elasticity of steel, 2.06×10^5 N/mm ²
M_{wv}	vertical wave bending moment for a dynamic load case
M_{sw}	vertical still water bending moment for a finite element loading pattern
M_h	horizontal wave bending moment for a dynamic load case
Q_{wv}	vertical wave shear force for a dynamic load case
Q_{sw}	vertical still water shear force for a finite element loading pattern
T_{LC}	draught at the loading condition being considered
T_{sc}	scantling draught, as defined in <i>Section 4/1.1.5.5</i>
T_{bal-em}	emergency draught of ship
t_{grs}	proposed new building gross thickness excluding Owner's extras, see <i>Section 2/6.3.4</i>
t_{corr}	corrosion addition, as defined in <i>Section 6/3.2</i>
σ_{yd}	specified minimum yield stress of the material, N/mm ²
σ_{vm}	von Mises stress $= \sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x \sigma_y + 3\tau_{xy}^2}$
σ_x	axial stress in element x direction
σ_y	axial stress in element y direction
τ_{xy}	element shear stress in x-y plane
δ_x	displacement in x direction, in accordance with the coordinate system defined in <i>Section 4/1.4</i>
δ_y	displacement in y direction, in accordance with the coordinate system defined in <i>Section 4/1.4</i>
δ_z	displacement in z direction, in accordance with the coordinate system defined in <i>Section 4/1.4</i>
θ_x	rotation about x axis, in accordance with the coordinate system defined in <i>Section 4/1.4</i>
θ_y	rotation about y axis, in accordance with the coordinate system defined in <i>Section 4/1.4</i>
θ_z	rotation about z axis, in accordance with the coordinate system defined in <i>Section 4/1.4</i>

- 1.2.1.2 The nomenclature of structural components is defined in *Section 4/1.5*.
- 1.2.1.3 Consistent co-ordinate and unit systems are to be used throughout all parts of the structural analysis. However, in calculations using Rule Formulae, the units and co-ordinate system as specified are to be used. Where output values from Rule formulae are in a different unit and/or co-ordinate system as used in the structural analysis, the output values are to be converted to the appropriate unit and co-ordinate system.

1.2.2 Finite element types

- 1.2.2.1 The structural assessment is to be based on linear finite element analysis of three dimensional structural models. The general types of finite elements to be used in the finite element analysis are given in *Table B.1.1*.
- 1.2.2.2 Two node line elements and three or four node plate/shell elements are considered sufficient for the representation of the hull structure. The mesh requirements given in this Appendix are based on the assumption that these elements are used in the finite element models. However, higher order elements may also be used.

Table B.1.1 Types of Finite Element	
Rod (or truss) element	Line element with axial stiffness only and constant cross-sectional area along the length of the element
Beam element	Line element with axial, torsional and bi-directional shear and bending stiffness and with constant properties along the length of the element
Membrane (or plane-stress) plate element	Plate element with bi-axial and in-plane plate element stiffness with constant thickness
Shell (or bending plate) element	Plate element with in-plane stiffness and out-of-plane bending stiffness with constant thickness

- 1.2.2.3 For the cargo tank and fine mesh strength analyses as specified in *Appendix B/2* and *B/3*, the assessment against stress acceptance criteria is to be based on membrane (or in-plane) stresses of plate elements. For the fatigue assessment as specified in *Appendix B/4*, the calculation of dynamic stress range for the determination of fatigue life is to be based on surface stresses of plate elements.

2 CARGO TANK STRUCTURAL STRENGTH ANALYSIS

2.1 Assessment

2.1.1 General

- 2.1.1.1 For tankers of conventional arrangements, the finite element strength assessment of the hull girder and primary supporting structural members is to be in accordance with the requirements in this section.

2.2 Structural Modelling

2.2.1 General

- 2.2.1.1 The longitudinal extent of the midship cargo tank finite element (FE) model is to cover three cargo tank lengths about midships. Where the tanks in the midship cargo region are of different lengths, the middle tank of the finite element model is to represent the cargo tank of the greatest length. The finite element model may be prismatic. The transverse bulkheads at the ends of the model are to be represented. Where corrugated transverse bulkheads are fitted, the model is to include the extent of the bulkhead stool structure forward and aft of the tanks at the model ends. The length of the model extending beyond the end transverse bulkheads is to be kept equal, at both ends. The web frames at the ends of the model are to be modelled. Typical finite element models representing the midship cargo tank region of different tanker configurations are shown in *Figure B.2.1*.
- 2.2.1.2 The assessment of longitudinal hull girder shear structural members, as defined in *Section 9/2.2.1.1* and *Section 4/Table 4.1.1*, against hull girder vertical shear loads in the forward and aft cargo regions may be based on the midship cargo tank finite element model with modification of plate and stiffener properties where appropriate. Where a separate cargo tank finite element model is used for the assessment of shear strength, the model is to cover three tank lengths.
- 2.2.1.3 Both port and starboard sides of the ship are to be modelled. The full depth of the ship is to be modelled.
- 2.2.1.4 All main longitudinal and transverse structural elements are to be modelled. These include inner and outer shell, double bottom floor and girder system, transverse and vertical web frames, stringers and transverse and longitudinal bulkhead structures. All plates and stiffeners on the structure, including web stiffeners, are to be modelled, see 2.2.1.11.
- 2.2.1.5 The reduced thickness used in the FE model of the cargo tanks, applicable to all plating and stiffener's web and flanges is to be calculated as follows:

$$t_{FEM-net50} = t_{grs} - 0.5t_{corr}$$

Where:

t_{grs} gross thickness, as defined in 1.2

t_{corr} corrosion addition, as defined in *Section 6/3.2*

Figure B.2.1

Typical Cargo Tank Model of a VLCC (shows only port side of the full breadth model)

Typical Cargo Tank Model of a Product Tanker (shows only port side of the full breadth model)

2.2.1.6 The plate element mesh is to follow the stiffening system as far as practicable, hence representing the actual plate panels between stiffeners. In general, the plate element mesh is to satisfy the following requirements:

- (a) one element between every longitudinal stiffener, see *Figure B.2.2*.

Longitudinally, the element length is not to be greater than 2 longitudinal spaces

- (b) one element between every vertical stiffener on transverse bulkheads, see *Figure B.2.3*
 - (c) one element between every web stiffener on transverse and vertical web frames, cross ties and stringers, see *Figure B.2.2* and *Figure B.2.4*
 - (d) at least three elements over the depth of double bottom girders and floors, transverse web frames, vertical web frames and horizontal stringers on transverse bulkheads. For cross ties, deck transverse and horizontal stringers on transverse wash bulkheads and longitudinal bulkheads with a smaller web depth, representation using two elements over the depth is acceptable provided that there is at least one element between every web stiffener. The mesh size of adjacent structure is to be adjusted to suit
 - (e) the mesh on the hopper tank web frame shall be fine enough to represent the shape of the web ring opening, see *Figure B.2.2*
 - (f) the curvature of the free edge on large brackets of primary support members is to be modelled accurately to avoid unrealistic high stress due to geometry discontinuities. In general, a mesh size equal to the stiffener spacing is acceptable. The bracket toe may be terminated at the nearest nodal point provided that the modelled length of the bracket arm does not exceed the actual bracket arm length. The bracket flange is not to be connected to the plating, see *Figure B.2.5*. The modelling of the tapering part of the flange is to be in accordance with 2.2.1.14. An acceptable mesh is shown in *Figure B.2.5*. A finer mesh is to be used for the determination of detailed stress at the bracket toe, see *Appendix B/3*.
- 2.2.1.7 Corrugated bulkheads and bulkhead stools are to be modelled using shell plate elements, see *Figure B.2.6*. Diaphragms in the stools and internal longitudinal and vertical stiffeners on the stool plating are to be included in the model. Modelling is to be carried out as follows:
- (a) the shell element mesh on the flange and web of the corrugation is in general to follow the stiffener spacing inside the bulkhead stool
 - (b) where difficulty occurs in matching the mesh on the corrugations directly with the mesh on the stool, it is acceptable to adjust the mesh on the stools in way of the corrugations in order that the corrugation bulkhead will retain its original geometrical shape. However, if the shape of the corrugation is adjusted in order to simplify the modelling procedure, this effect is to be taken into account in evaluation of stresses as described in 2.7.2.6.
 - (c) for a corrugated bulkhead without an upper stool and/or lower stool, it may be necessary to adjust the geometry in order to simplify the modelling. The adjustment is to be made such that the shape and position of the corrugations and primary support members are retained. Hence, the adjustment is to be made on stiffeners and plate seams if necessary.
- 2.2.1.8 The aspect ratio of the plate elements is in general not to exceed three. The use of triangular plate elements is to be kept to a minimum. Where possible, the aspect ratio of plate elements in areas where there are likely to be high stresses or a high stress gradient is to be kept close to one and the use of triangular elements is to be avoided.
- 2.2.1.9 Typical mesh arrangements of the cargo tank structure are shown in *Figure B.2.7*.
- 2.2.1.10 Shell elements, in association with beam elements, are to be used to represent stiffened panels in areas under lateral pressure. Shell elements are to be used to represent unstiffened panels in areas under lateral pressure. Membrane and rod elements may be used to represent non-tight structure under no pressure loads.

Figure B.2.7 (Continued)
Typical Finite Element Mesh Arrangements of Cargo Tank Structure

VLCC

Product tanker

2.2.1.11 All local stiffeners are to be modelled. These stiffeners may be modelled using line elements positioned in the plane of the plating. Beam elements are to be used in areas under the action of lateral loads whilst rod (truss) elements may be used to represent local stiffeners on internal structural members under no lateral loads. The line elements are to have the following properties:

- (a) for beam elements, out of plane bending properties are to represent the inertia of the combined plating and stiffener. The width of the attached plate is to be

taken as $\frac{1}{2} + \frac{1}{2}$ stiffener spacing on each side of the stiffener. The eccentricity of the neutral axis is not required to be modelled.

- (b) for beam and rod elements, other sectional properties are to be based on a cross sectional area representing the stiffener area, excluding the area of the attached plating.

2.2.1.12 The effective cross sectional area of non-continuous stiffeners is to be calculated in accordance with *Table B.2.1*.

Table B.2.1 Effective Cross Sectional Area of Stiffener Line Elements		
Structure represented by line element	Effective area A_e	
Stiffener within a distance $2d_w$ from a sniped (non-continuous) end	All sections	$A_e = 25\% A_{n-net50}$
Stiffener outside a distance $2d_w$ from a sniped (non-continuous) end	All sections	$A_e = 100\% A_{n-net50}$
Where:		
$A_{n-net50}$	average cross sectional area over length of line element	
d_w	depth of stiffener web, excluding attached plate	

2.2.1.13 Web stiffeners on primary support members are to be modelled. Where these stiffeners are not in line with the primary FE mesh, it is sufficient to place the line element along the nearby nodal points provided that the adjusted distance does not exceed 0.2 times the stiffener spacing under consideration. The stresses and buckling utilisation factors obtained need not be corrected for the adjustment. Buckling stiffeners on large brackets, deck transverses and stringers parallel to the flange are to be modelled. These stiffeners may be modelled using rod elements.

2.2.1.14 Face plates of primary support members and brackets may be modelled using rod elements. The effective cross sectional area at the curved part of the face plate is to be calculated in accordance with *Section 4/2.3.4*. The cross sectional area of a rod element representing the tapering part of the face plate is to be based on the average cross sectional area of the face plate in way of the element length.

2.2.1.15 Methods of representing openings in webs of primary support members are to be in accordance with *Table B.2.2*. Cut-outs for local stiffeners, scallops, drain and air holes need not be represented.

Table B.2.2 Representation of Openings in Primary Support Member Webs		
$h_o/h < 0.35$	and $g_o < 1.2$	Openings do not need to be modelled
$0.5 > h_o/h \geq 0.35$	and $g_o < 1.2$	The plate modelled with mean thickness $t_{1-net50}$
$h_o/h < 0.5$	and $2 > g_o \geq 1.2$	The plate modelled with mean thickness $t_{2-net50}$
$h_o/h \geq 0.5$	or $g_o \geq 2.0$	The geometry of the opening is to be modelled
Where:		
g_o	$= 1 + \frac{l_o^2}{2.6(h - h_o)^2}$	
$t_{1-net50}$	$= \frac{h - h_o}{h} t_{w-net50}$	
$t_{2-net50}$	$= \frac{h - h_o}{hg_o} t_{w-net50}$	
$t_{w-net50}$	net web thickness	
l_o	length of opening parallel to primary support member web direction, see Figure B.2.8	
h_o	height of opening parallel to depth of web, see Figure B.2.8	
h	height of web of primary support member in way of opening, see Figure B.2.8	
t_{corr}	corrosion addition, as defined in Section 6/3.2	
<u>Note</u>		
1. For sequential openings where the distance, d_o , between openings is less than $0.25h$, the length l_o is to be taken as the length across openings as shown in Figure B.2.9.		
2. The same unit is to be used for l_o , h_o and h .		

2.3 Loading Conditions

2.3.1 Finite element load cases

- 2.3.1.1 The standard design load combinations to be used in the structural analysis are given in *Tables B.2.3* and *B.2.4* for tankers with two oil-tight longitudinal bulkheads and one centreline oil-tight longitudinal bulkhead respectively.
- 2.3.1.2 For S+D design load combinations (seagoing load cases) the number of dynamic load cases required to be investigated for each loading pattern is indicated by the dynamic load case numbers specified for each loading pattern in *Tables B.2.3* and *B.2.4*. Each S+D design load combination consists of two parts:
- static loads, as described by the loading pattern, ship draught, hull girder still water bending moment and shear force specified, and
 - dynamic loads defined in *Section 7/Table 7.6.2* for the dynamic load case number specified.
- 2.3.1.3 For tankers with two oil-tight longitudinal bulkheads and a cross tie arrangement in the centre cargo tanks, loading patterns A7 and A12 in *Table B.2.3* are to be examined for the possibility that unequal filling levels in transversely paired wing cargo tanks would result in a more onerous stress response. Loading pattern A7 is required to be analysed only if such a non-symmetric seagoing loading condition is included in the ship loading manual. Loading patterns A7 and A12 need not be examined for tankers without a cross tie arrangement in the centre cargo tanks.
- 2.3.1.4 For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A3 and harbour loading pattern A13, with all cargo tanks abreast empty, are to be analysed with a ship draught of $0.55T_{sc}$ and $0.65T_{sc}$ respectively. If conditions in the ship loading manual specify greater draughts for loading pattern A3 or A13, then the maximum specified draught in the ship's loading manual for the loading pattern is to be used.
- 2.3.1.5 For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A5 and harbour loading pattern A11, with all cargo tanks abreast fully loaded, are to be analysed with a ship draught of $0.8T_{sc}$ and $0.7T_{sc}$ respectively. If conditions in the ship loading manual specify lesser draughts for loading pattern A5 or A11, then the minimum specified draught in the ship's loading manual for the loading pattern is to be used.
- 2.3.1.6 For loading patterns A1, A2, B1, B2 and B3, with cargo tank(s) empty, a minimum ship draught of $0.9T_{sc}$ is to be used in the analysis. If conditions in the ship loading

manual specify greater draughts for loading patterns with empty cargo tank(s), then the maximum specified draught for the actual condition is to be used.

- 2.3.1.7 Where a ballast condition is specified in the ship loading manual with ballast water filled in one or more cargo tanks, loading patterns A8 and B7 in *Tables B.2.3* and *B.2.4* are to be examined.

A14 ⁽¹³⁾		T_{sc}	100% (Hog)	100% (-ve fwd) See note 4	Only applicable to strength assessment of midship region (see note 1(a))		

Table B.2.3 (Continued)
FE Load Cases for Tankers with Two Oil-tight Longitudinal Bulkheads

Note

1.
 - (a) For the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads within midship cargo region, *see 1.1.1.5.*
 - (b) For the assessment of strengthening of longitudinal hull girder shear structural members in way of transverse bulkheads for hull girder vertical shear loads, *see 1.1.1.6, 1.1.1.7 and 1.1.1.8.*
2. The selection of permissible SWBM and SWSF for the assessment of different cargo regions of the ship is to be in accordance with *Table B.2.6.* The percentage of the permissible SWBM and SWSF to be applied are to be in accordance with this table.
3. The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.
4. The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used. Where this shear force exceeds the target SWSF (design load combination S) or target combined SWSF and VWSF, calculated in accordance with 2.4.5.2, (design load combination S+D) as specified in the table, correction vertical loads are to be applied to adjust the shear force down to the required value.
5. Correction vertical loads are to be applied to adjust the shear force to the required value specified.
6. For loading pattern A3, with all cargo tanks abreast empty in sea-going condition, a draught of $0.55T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught greater than $0.55T_{sc}$, the maximum specified draught for those loading conditions is to be used in the FE analysis.
7. For loading pattern A5, with all cargo tanks abreast fully loaded in sea-going condition, a draught of $0.8T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught lesser than $0.8T_{sc}$, the minimum specified draught for those loading conditions is to be used in the FE analysis.
8. Loading pattern A7 is only required to be analysed for tankers with a cross tie arrangement in the centre cargo tanks if the ship's loading manual includes a non-symmetrical loading condition with only one of the wing tanks filled. The actual draught from the loading manual for the condition is to be used in the analysis, *see Table B.2.5.*
9. Ballast loading pattern A8 with ballast filled in one or more cargo tanks (i.e. gale ballast/emergency ballast conditions etc.) is only required to be analysed if the condition is specified in the ship's loading manual. The actual loading pattern and draught from the loading manual for the condition is to be used in the analysis, *see Table B.2.5.*
10. Loading patterns A12 is only required for tankers with a cross tie arrangement in the centre cargo tanks. The actual shear force and bending moment that results from the application of local loads to the FE model are to be used. Adjusting vertical loads and bending moments are not applied.
11. For loading pattern A13, with all cargo tanks abreast empty in harbour condition, a draught of $0.65T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught greater than $0.65T_{sc}$, the maximum specified draught for those loading conditions is to be used in the FE analysis.
12. For loading pattern A11, with all cargo tanks abreast fully loaded in harbour condition, a draught of $0.7T_{sc}$ is to be used in the analysis. Where such conditions are specified in the ship's loading manual with a draught less than $0.7T_{sc}$, the minimum specified draught for those loading conditions is to be used in the FE analysis.
13. No dynamic loads are to be applied to Design Load Combination S (harbour and tank testing load cases).

2.3.2 Dynamic load cases

2.3.2.1 The dynamic load cases to be used for the finite element analysis are specified in Section 7/6.4.

2.4 Application of Loads

2.4.1 General

- 2.4.1.1 The application of loads to the finite element model is to be in accordance with *Section 7/6* and the requirements specified in *B/2.4*.
- 2.4.1.2 The load parameters and locations to be used for the calculation of the applied loads and accelerations are to be in accordance with *Table B.2.5* and *Table B.2.6*.
- 2.4.1.3 Constant pressure load, evaluated at the element's centroid, may be applied to a finite plate element. Alternately, a linear pressure distribution between the element's nodal points can be applied.

Table B.2.5 Parameters for Calculation of Loads and Accelerations					
Parameter	Standard Conditions			Optional Conditions	
	Draught T_{sc}	Draught $0.9T_{sc}$	Draught $0.6T_{sc}$	Loaded conditions: A3 (draught > $0.6T_{sc}$) and A7	Gale/emergency ballast conditions: A8 and B7
L	Rule Length			Rule Length	
C_b	block coefficient, as defined in <i>Section 4/1.1.1.1</i>			block coefficient, as defined in <i>Section 4/1.1.1.1</i>	
Ship speed	0.0			0.0	
Roll response					
GM	0.12 <i>B</i>	0.12 <i>B</i>	0.24 <i>B</i>	Corrected GM in the ship's loading manual for the loaded or gale/emergency ballast pattern under consideration, see Note 1	
$r_{roll-gyr}$	0.35 <i>B</i>	0.35 <i>B</i>	0.4 <i>B</i>	See Note 2	
Pitch response, longitudinal and transverse accelerations, horizontal wave bending moment and sea pressures					
Ship draught	T_{sc}	$0.9T_{sc}$	$0.6T_{sc}$	Maximum mean draught in the loading manual for the loading pattern under consideration	Minimum mean draught in the loading manual for the loading pattern under consideration
<u>Note</u> 1. Where GM for optional loaded or gale/emergency ballast conditions is not given in the ship's loading manual, GM is to be determined in accordance with <i>Section 7/3.1.3.2</i> . 2. Where $r_{roll-gyr}$ for optional loaded or gale/emergency ballast conditions is not given in the ship's loading manual, $r_{roll-gyr}$ is to be determined in accordance with <i>Section 7/3.1.3.3</i> . 3. A gale/emergency ballast condition is defined as a ballast condition with one or more cargo tanks filled with ballast.					

Table B.2.6 Locations for the Determination of Loads and Accelerations				
	Strength assessment (1a)	Strength assessment against hull girder shear loads (1b)		
	Midship cargo region	Forward cargo region	Midship cargo region	Aft cargo region
Design load combinations S + D (Sea-going load cases)				
Dynamic wave pressure and green sea load	Transverse section at 0.5L from AP	Transverse section at 0.75L from AP	Transverse section at 0.5L from AP	Transverse section at 0.25L from AP
Acceleration a_v, a_t, a_{lng}	at CG position of midship tanks (i.e. 0.5L from AP is within the tank boundary)	at CG position of forward tanks (i.e. 0.75L from AP is within the tank boundary)	at CG position of midship tanks (i.e. 0.5L from AP is within the tank boundary)	at CG position of aft tanks (i.e. 0.25L from AP is within the tank boundary)
VWBM and SWBM (SWBM is to be based on sea-going permissible values, as defined in Section 7/2.1.1 and 2.1.2)	at 0.5L from AP	at 0.75L from AP	at 0.5L from AP	at 0.25L from AP
HWBM	at 0.5L from AP	\	\	\
VWSF and SWSF (SWSF is to be based on sea-going permissible values, as defined in Section 7/2.1.3 and 2.1.4)	at the transverse bulkhead with maximum combined seagoing permissible SWSF and VWSF in the region (see 1.1.1.5)	at the transverse bulkhead with maximum combined seagoing permissible SWSF and VWSF in the region (see 1.1.1.6) or at individual bulkhead position (see 1.1.1.8)	based on midship cargo tank strength assessment (see 1.1.1.7) or seagoing permissible SWSF and VWSF at individual transverse bulkhead position (see 1.1.1.8)	
Design load combination S (Harbour and tank testing load cases)				
SWBM (SWBM is to be based on harbour permissible values, as defined in Section 7/2.1.1 and 2.1.2)	at 0.5L from AP	at 0.75L from AP	at 0.5L from AP	at 0.25L from AP
SWSF (SWSF is to be based on harbour permissible values, as defined in Section 7/2.1.3 and 2.1.4)	maximum harbour permissible SWSF in the region (see 1.1.1.5)	maximum harbour permissible SWSF in the region (see 1.1.1.6) or at individual bulkhead position (see 1.1.1.8)	based on midship cargo tank strength assessment (see 1.1.1.7) or harbour permissible SWSF at individual transverse bulkhead position (see 1.1.1.8)	
<u>Note</u> 1. The following assessments are to be carried out: (a) for the assessment of scantlings of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads in tanks within midship cargo region, see 1.1.1.5 (b) for the assessment of strengthening of longitudinal hull girder shear structural members in way of individual transverse bulkheads for hull girder shear loads, see 1.1.1.6, 1.1.1.7 and 1.1.1.8. 2. For each FE load case, accelerations are to be calculated at the centre of gravity position of the ballast and/or cargo in accordance with this table. The acceleration calculated for each reference tank is to be applied to the 3 corresponding cargo or ballast tanks along the length of the FE model. 3. Longitudinal distances used in the calculation of loads refer to distance measured forward from the A.P., as defined in Section 4/1.1.12 4. Dynamic wave pressure calculated at the specified section is to be applied to the full length of the FE model 5. Dynamic load combination factors applied to dynamic loads for design load combination S + D (sea-going load cases) as defined in Section 7/6.4. 6. The SWBM and SWSF to be applied are to be in accordance with Tables B.2.3 and B.2.4.				

2.4.2 Structural weight, cargo and ballast density

- 2.4.2.1 The design cargo density is to be taken as 1.025 tonnes/m³, see 2.4.7.2.
- 2.4.2.2 The density of sea water is to be taken as 1.025 tonnes/m³.
- 2.4.2.3 The weight of the structure is to be included in the FE analysis. The density of steel is to be taken as 7.85 tonnes/m³.

2.4.3 Static sea pressure

- 2.4.3.1 The static sea pressure applied to a plate element due to draught immersion is to be calculated in accordance with *Section 7/2.2.2*.
- 2.4.3.2 The still water draught to be considered for each finite element load case is to be in accordance with *Tables B.2.3* and *B.2.4*. A constant draught is to be applied over the full length of the cargo tank FE model.
- 2.4.3.3 The static sea pressure due to immersed draught for the ship in an upright condition is to be applied for all finite element load cases. The static sea pressure change due to rolling of the ship is included in the dynamic wave pressure formulation.

2.4.4 Dynamic wave pressure

- 2.4.4.1 The dynamic wave pressure distribution is to be determined at a transverse section of the hull at the longitudinal position as defined in *Table B.2.6*. The dynamic wave pressure distribution is to be calculated in accordance with *Section 7/6.3.5*. This pressure distribution is to be applied over the full length of the FE model.
- 2.4.4.2 The pressure distribution due to green sea load on the weather deck is to be calculated in accordance with *Section 7/6.3.6* at the longitudinal position as defined in *Table B.2.6*. This pressure distribution is to be applied to the weather deck over the full length of the FE model.

2.4.5 Hull girder vertical bending moment and vertical shear force

- 2.4.5.1 The hull girder vertical bending moment is to reach the following required value, M_{v-targ} , at a section within the length of the middle tank of the three tanks FE model:

$$M_{v-targ} = M_{sw} + M_{wv}$$

Where:

M_{sw} is the still water bending moment to be applied to the FE load case, as specified in *Tables B.2.3* and *B.2.4*.

M_{wv} is the vertical wave bending moment for the dynamic load case under consideration, calculated in accordance with *Section 7/6.3.2*

- 2.4.5.2 Hull girder vertical shear force is to reach the following required Q_{targ} value at the forward transverse bulkhead position of the middle tank:

$$Q_{targ} = Q_{sw} + Q_{wv}$$

Where:

Q_{sw} is the vertical still water shear force to be applied to the FE load case, as specified in *Tables B.2.3* and *B.2.4*.

Q_{wv} is the vertical wave shear force for the dynamic load case under consideration, calculated in accordance with *Section 7/6.3.4*.

- 2.4.5.3 The required hull girder vertical bending moment and shear force are to be achieved in the same load case where required by *Tables B.2.3* and *B.2.4*. The procedure to apply the required shear force and bending moment distributions is described in 2.5.

2.4.6 Hull girder horizontal wave bending moment

- 2.4.6.1 Hull girder horizontal wave bending moment at a section within the length of the middle tank of the three tanks FE model is to reach the value required by the dynamic load case under consideration, calculated in accordance with *Section 7/6.3.3*.
- 2.4.6.2 The procedure to adjust the required hull girder horizontal bending moment is described in 2.5.

2.4.7 Pressure in cargo and ballast tanks

- 2.4.7.1 The total tank pressure, P_{in} , to be applied at the boundary of a cargo or ballast tank in the finite element analysis is to include the static and dynamic components specified in *Section 7/ Table 7.6.1* and *Table B.2.6..*
- 2.4.7.2 For the seagoing load cases (design combination S + D) the cargo tank pressure is to be taken as:

$$P_{in} = f_{density} (P_{in-tk} + P_{in-dyn}) \text{ kN/m}^2$$

where:

$f_{density}$ factor for joint probability of occurrence of cargo density and maximum sea state in 25 years design life

$$= \rho_{max-LM} / \rho_{allowable}$$

ρ_{max-LM} maximum cargo density associated with a full tank from any loading condition in the ship's loading manual. ρ_{max-LM} is not to be taken as less than 0.9 tonnes/m³ for cargo loaded conditions and 1.025 tonnes/m³ for the optional emergency ballast condition (i.e. A8 and B7 in *Tables B.2.3* and *B.2.4* respectively)

$\rho_{allowable}$ design cargo density associated with a full tank to be taken as 1.025 tonnes/m³ unless a higher density is specified by the builder, see *Section 2/3.1.8.1*

P_{in-tk} static tank pressure as given in *Section 7/2.2.3.1*, in kN/m², and with density of fluid in tank equal to the design cargo density, $\rho_{allowable}$

P_{in-dyn} simultaneously acting dynamic pressure given in *Section 7/6.3.7.1*, in kN/m², with simplification given in 2.4.7.3 and with density of fluid in tank equal to the design cargo density, $\rho_{allowable}$

- 2.4.7.3 The envelope vertical acceleration, a_v , at the centre of gravity of tanks is calculated in accordance with *Section 7/3.3.3* with the following simplifications:
- (a) for head sea conditions, a_{roll-z} is taken as 0
 - (b) for beam sea conditions, $a_{pitch-z}$ is taken as 0.
- 2.4.7.4 The vertical, transverse and longitudinal accelerations are to be calculated at the centre of gravity of the abreast tanks at the longitudinal position as specified in

Table B.2.6. These accelerations are to be applied to all corresponding tanks along the length of the three-tank FE model.

- 2.4.7.5 The dynamic tank pressure is to be calculated in accordance with *Section 7/6.3.7.1*, also see *Table B.2.6*.
- 2.4.7.6 For ballast tanks which utilise ballast water exchange by flow-through method, the following are to be considered when calculating tank pressure for seagoing load cases (design combination S + D) as required by *Section 7/Table 7.6.1*:
- Maximum vertical height of the air pipe or overflow pipe, i.e. h_{air} as defined in *Section 7/2.2.3.2* and *Figure 7.2.3*, of all ballast tanks in the cargo region is to be used in the calculation of the dynamic tank pressure due to vertical acceleration (see *Section 7/6.3.7.1*).
 - Maximum value of h_{air} and P_{drop} , as defined in *Section 7/2.2.3.3*, of all ballast tanks in the cargo region are to be used to calculate the static tank pressure.
- 2.4.7.7 The following are to be considered when calculating the static tank pressure in cargo tanks for harbour/tank testing load cases (design combination S) as required by *Section 7/Table 7.6.1*:
- Maximum setting of pressure relief valve, P_{valve} as defined in *Section 7/2.2.3.5*, of all cargo tanks and, where applicable, maximum h_{air} , as defined in *Section 7/2.2.3.2* and *Figure 7.2.3*, of all cargo tanks in the cargo region are to be considered in the calculation of $P_{in-test}$, see *Section 7/2.2.3.5*.
- 2.4.7.8 Where the length of the model is extended beyond the end transverse bulkheads, see 2.2.1.1, tank pressure is only to be applied to the complete tanks within the model length.

2.5 Procedure to Adjust Hull Girder Shear Forces and Bending Moments

2.5.1 General

- 2.5.1.1 The procedure described in this section is to be applied to adjust the hull girder horizontal bending moment, vertical shear force and vertical bending moment distributions on the three cargo tanks FE model to achieve the required values.
- 2.5.1.2 Vertical distributed loads are applied to each frame position, together with a vertical bending moment applied to the model ends to produce the required value of vertical shear force at the forward bulkhead of the middle tank of the FE model, and the required value of vertical bending moment at a section within the length of the middle tank of the FE model. The required values are specified in 2.4.5.
- 2.5.1.3 A horizontal bending moment is applied to the ends of the model to produce the required target value of horizontal bending moment at a section within the length of the middle tank of the FE model. The required values are specified in 2.4.6.

2.5.2 Shear force and bending moment due to local loads

- 2.5.2.1 The vertical shear forces generated by the local loads are to be calculated at the transverse bulkhead positions of the middle tank of the FE model. The vertical bending moment distribution generated by the local loads is to be calculated along the length of the middle tank of the three cargo tank FE model. The FE model can be used to calculate the shear forces and bending moments. Alternatively, a simple beam model representing the length of the 3-tank FE model with simply supported ends may be used to determine the shear force and bending moment values.

- 2.5.2.2 For beam and oblique sea conditions, the horizontal bending moment distribution due to dynamic sea pressure and dynamic tank pressure is to be calculated along the length of the middle tank of the FE model.
- 2.5.2.3 The following local loads are to be applied for the calculation of hull girder shear forces and bending moments:
- (a) ship structural weight distribution over the length of the 3-tank model (static loads). Where a simple beam model is used, the weight of the structure of each tank can be distributed evenly over the length of the cargo tank. The structural weight is to be calculated based on a thickness deduction of $0.5t_{corr}$ as used in the construction of the cargo tank FE model, see 2.2.1.5.
 - (b) weight of cargo and ballast (static loads)
 - (c) static sea pressure, dynamic wave pressure and, where applicable, green sea load. For the Design Load Combination S (harbour/tank testing load cases), only static sea pressure needs to be applied
 - (d) dynamic tank pressure load for Design Load Combination S+D (seagoing load cases).

2.5.3 Procedure to adjust vertical shear force distribution

- 2.5.3.1 The required adjustment in shear forces at the transverse bulkhead positions (ΔQ_{aft} and ΔQ_{fwd} as shown in *Figure B.2.10*) are to be generated by applying vertical load at the frame positions as shown in *Figure B.2.11*. It is to be noted that vertical correction loads are not to be applied to any transverse tight bulkheads, any frames forward of the forward tank and any frames aft of the aft tank of the FE model. The sum of the total vertical correction loads applied is equal to zero.
- 2.5.3.2 The required adjustment in shear forces at the aft and forward transverse bulkheads of the middle tank of the FE model in order to generate the required shear forces at the bulkheads are given by:

$$\Delta Q_{aft} = -Q_{targ} - Q_{aft}$$

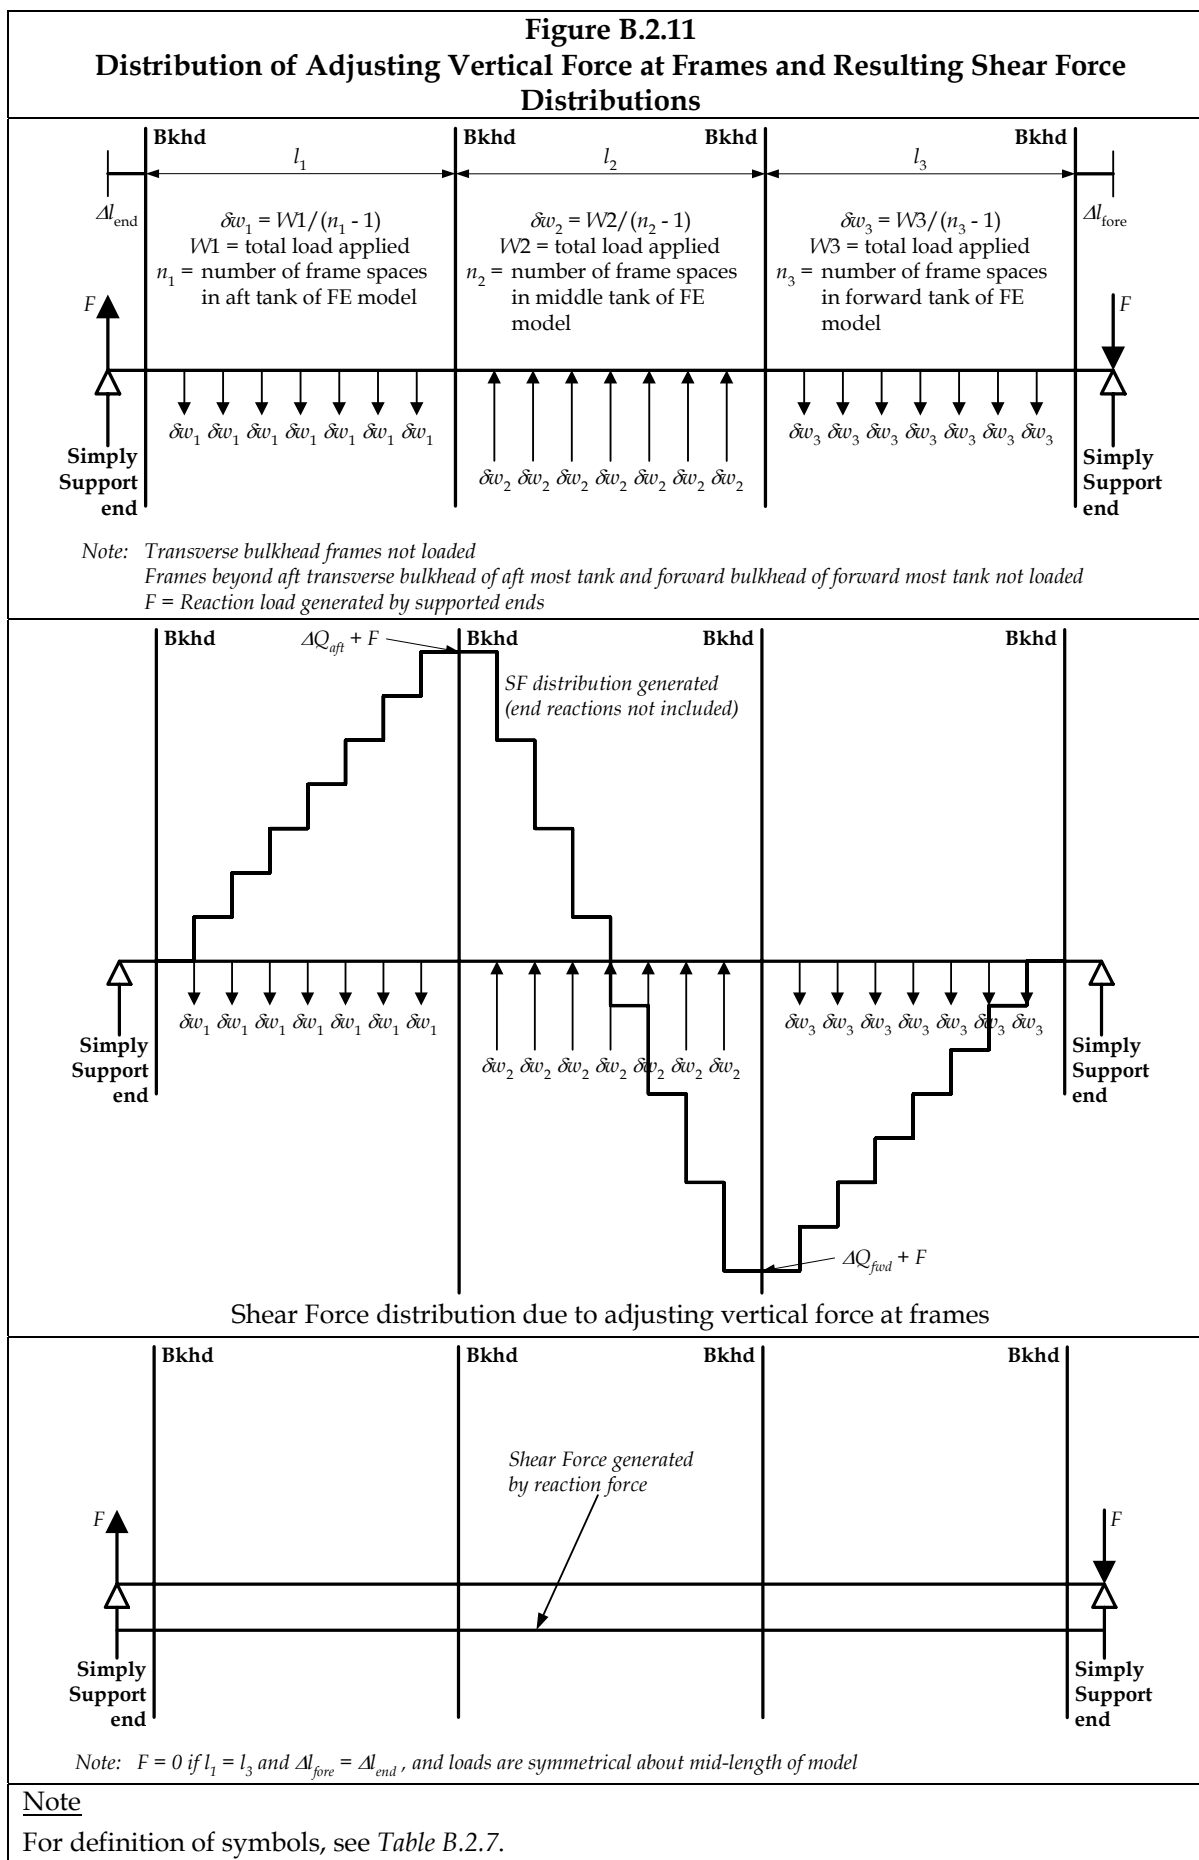

$$\Delta Q_{fwd} = Q_{targ} - Q_{fwd}$$

Where:

ΔQ_{aft}	required adjustment in shear force at aft bulkhead of middle tank
ΔQ_{fwd}	required adjustment in shear force at fore bulkhead of the middle tank
Q_{targ}	required shear force value to be achieved at forward bulkhead of middle tank, see 2.4.5.
Q_{aft}	shear force due to local loads at aft bulkhead of middle tank, see 2.5.2
Q_{fwd}	shear force due to local loads at fore bulkhead of middle tank, see 2.5.2

Figure B.2.10
Position of Target Shear Force and Required Shear Force Adjustment
at Transverse Bulkhead Positions

Condition	Target			Aft Bkhd		Fore Bkhd	
	BM	SF	Bkhd pos	SF	ΔQ_{aft}	SF	ΔQ_{fwd}
	Hog	-ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	$Q_{targ} (-ve)$	$Q_{targ} - Q_{fwd}$
	Hog	-ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	$Q_{targ} (-ve)$	$Q_{targ} - Q_{fwd}$
	Sag	+ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	$Q_{targ} (+ve)$	$Q_{targ} - Q_{fwd}$
	Sag	+ve	Fore	$-Q_{targ}$	$-Q_{targ} - Q_{aft}$	$Q_{targ} (+ve)$	$Q_{targ} - Q_{fwd}$
Note For definition of symbols, see 2.5.3.2.							

2.5.3.3 The value of the vertical loads to be applied to each frame to generate the increase in shear force at the bulkheads may be calculated using a simple beam model. For the case where an uniform frame spacing is used within each tank, the amount of vertical force to be distributed at each frame may be calculated in accordance with *Table B.2.7*. The length and frame spacing of individual cargo tanks may be different.

Table B.2.7 Formulae for Calculation of Vertical Loads for Adjusting Vertical Shear Forces	
$\delta w_1 = \frac{\Delta Q_{aft} (2l - l_2 - l_3) + \Delta Q_{fwd} (l_2 + l_3)}{(n_1 - 1)(2l - l_1 - 2l_2 - l_3)}$	$F = 0.5 \left(\frac{W1(l_2 + l_1) - W3(l_2 + l_3)}{l} \right)$
$\delta w_2 = \frac{(W1 + W3)}{(n_2 - 1)} = \frac{(\Delta Q_{aft} - \Delta Q_{fwd})}{(n_2 - 1)}$	
$\delta w_3 = \frac{-\Delta Q_{fwd} (2l - l_1 - l_2) - \Delta Q_{aft} (l_1 + l_2)}{(n_3 - 1)(2l - l_1 - 2l_2 - l_3)}$	
Where:	
l_1	length of aft cargo tank of model
l_2	length of middle cargo tank of model
l_3	length of forward cargo tank of model
ΔQ_{aft}	required adjustment in shear force at aft bulkhead of middle tank, see <i>Figure B.2.10</i>
ΔQ_{fwd}	required adjustment in shear force at fore bulkhead of middle tank, see <i>Figure B.2.10</i>
F	end reactions due to application of vertical loads to frames, see 2.5.3
$W1$	total evenly distributed vertical load applied to aft tank of FE model, $(n_1 - 1) \delta w_1$
$W2$	total evenly distributed vertical load applied to middle tank of FE model, $(n_2 - 1) \delta w_2$
$W3$	total evenly distributed vertical load applied to forward tank of FE model, $(n_3 - 1) \delta w_3$
n_1	number of frame spaces in aft cargo tank of FE model
n_2	number of frame spaces in middle cargo tank of FE model
n_3	number of frame spaces in forward cargo tank of FE model
δw_1	distributed load at frame in aft cargo tank of FE model
δw_2	distributed load at frame in middle cargo tank of FE model
δw_3	distributed load at frame in forward cargo tank of FE model
Δl_{end}	distance between end bulkhead of aft cargo tank to aft end of FE model
Δl_{fore}	distance between fore bulkhead of forward cargo tank to forward end of FE model
l	total length of FE model (beam) including portions beyond end bulkheads: $= l_1 + l_2 + l_3 + \Delta l_{end} + \Delta l_{fore}$
Notes	
1. Positive direction of loads, shear forces and adjusting vertical forces in the formulae is in accordance with <i>Figures B.2.10</i> and <i>B.2.11</i> .	
2. $W1 + W3 = W2$	
3. Note that the above formulae are only applicable if an uniform frame spacing is used within each tank, see 2.5.3.3. The length and frame spacing of individual cargo tanks may be different.	

2.5.3.4 The amount of adjusting load to be applied to the structural parts of each transverse frame section to generate the vertical load, δw_i is to be in accordance with *Figure B.2.12*. This load is to be distributed at the finite element grid points of the structural parts. Where 4-node or 3-node finite plate elements are used, the load to be applied at each grid point of a plate element is given by:

$$F_{i-grid} = \frac{\sum_{j=1}^n 0.5 A_{i-elm-net50}}{A_{s-net50}} F_s$$

Where:

F_{i-grid}	load to be applied to the i^{th} FE grid point on the individual structural member under consideration, i.e. side shell, longitudinal bulkheads and bottom girders, inner hull longitudinal bulkheads, hopper plates, upper slope plates of inner hull and outboard girders as defined in <i>Figure B.2.12</i>
$A_{i-elm-net50}$	sectional area of each plate element in the individual structural member under consideration (see <i>Figure B.2.12</i>), which is connected to the i^{th} grid point
n	number of plate elements connected to the i^{th} grid point
F_s	total load applied to individual structural member under consideration, as specified in <i>Figure B.2.12</i>
$A_{s-net50}$	plate sectional area of the individual structural member under consideration, i.e. side shell, longitudinal bulkheads, bottom girders, inner hull longitudinal bulkheads, hopper plates, upper slope plates of inner hull and outboard girders as defined in <i>Figure B.2.12</i>

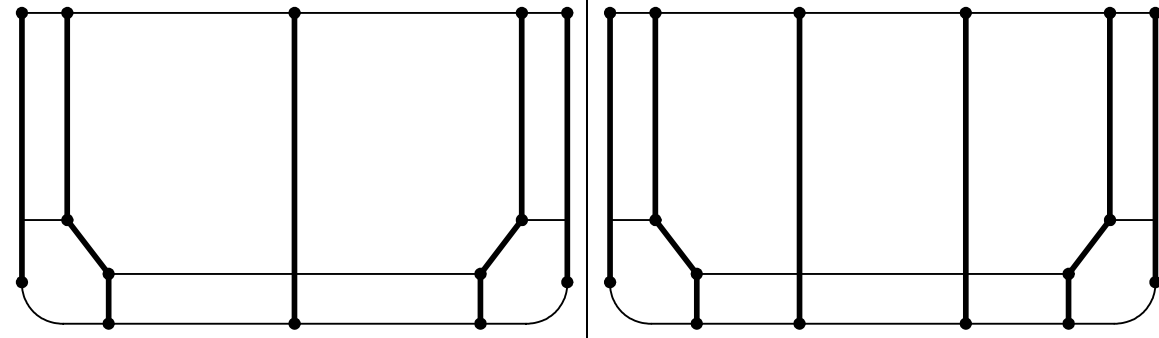

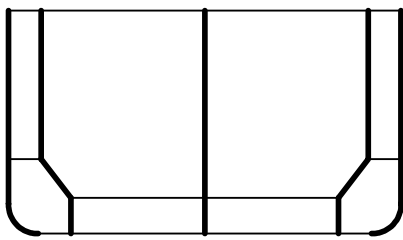

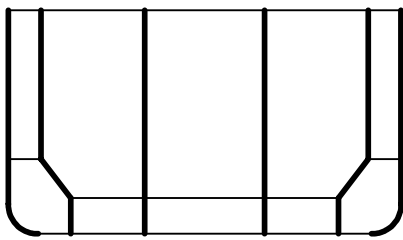

Figure B.2.12 Distribution of Adjusting Load on a Transverse Section	
	
Structural member	Applied load F_s
Side Shell	$f \cdot \delta w_i$
Longitudinal bulkhead including bottom girder beneath	$f \cdot \delta w_i$
Inner hull longitudinal bulkhead (vertical part)	$f \cdot \delta w_i \cdot \frac{A_{lh-net50}}{A_{2-net50}}$
Hopper plate	$f \cdot \delta w_i \cdot \frac{A_{Hp-net50}}{A_{2-net50}}$
Upper slope plating of inner hull	$f \cdot \delta w_i \cdot \frac{A_{Usp-net50}}{A_{2-net50}}$
Outboard girder	$f \cdot \delta w_i \cdot \frac{A_{Og-net50}}{A_{2-net50}}$

Figure B.2.12 (Continued)
Distribution of Adjusting Load on a Transverse Section

Where	
δw_i	vertical load to be applied to each transverse frame section, see 2.5.3.3 and <i>Table B.2.7</i>
f	shear force distribution factor of structural part calculated at the mid-tank position in accordance with <i>Table B.2.8</i>
$A_{lh-net50}$	plate sectional area of individual inner hull longitudinal bulkhead
$A_{Hp-net50}$	plate sectional area of individual hopper plate
$A_{Usp-net50}$	Plate sectional area of individual upper slope plate of inner hull
$A_{Og-net50}$	plate sectional area of individual outboard girder
$A_{2-net50}$	plate sectional area calculated in accordance with <i>Table B.2.8</i>
Note	
1. Adjusting load is to be applied in plane to the hopper slope plate and upper slope plate of inner hull.	
2. Adjusting load given is to be applied to individual structural member.	

Table B.2.8
Shear Force Distribution Factors

	Side Shell	$f = 0.055 + 0.097 \frac{A_{1-net50}}{A_{2-net50}} + 0.020 \frac{A_{2-net50}}{A_{3-net50}}$
	Inner hull	$f = 0.193 - 0.059 \frac{A_{1-net50}}{A_{2-net50}} + 0.058 \frac{A_{2-net50}}{A_{3-net50}}$
	CL longitudinal bulkhead	$f = 0.504 - 0.076 \frac{A_{1-net50}}{A_{2-net50}} - 0.156 \frac{A_{2-net50}}{A_{3-net50}}$
	Side Shell	$f = 0.028 + 0.087 \frac{A_{1-net50}}{A_{2-net50}} + 0.023 \frac{A_{2-net50}}{A_{3-net50}}$
	Inner hull	$f = 0.119 - 0.038 \frac{A_{1-net50}}{A_{2-net50}} + 0.072 \frac{A_{2-net50}}{A_{3-net50}}$
	Longitudinal bulkhead	$f = 0.353 - 0.049 \frac{A_{1-net50}}{A_{2-net50}} - 0.095 \frac{A_{2-net50}}{A_{3-net50}}$
Where:		
$A_{1-net50}$	plate sectional area of individual side shell (i.e. on one side), including bilge	
$A_{2-net50}$	plate sectional area of individual inner hull longitudinal bulkhead (i.e. on one side), including hopper slope plate, double bottom side girder in way and, where fitted, upper slope plating of inner hull.	
$A_{3-net50}$	plate sectional area of individual longitudinal bulkhead, including double bottom girder in way	
<u>Note</u>		
1. Where part of the structural member is not vertical, the area is to be calculated using the projected area in the vertical direction.		
2. All plate areas are to be calculated based on the modelled thickness of the cargo tank FE model, see 2.2.1.5.		
3. For corrugated longitudinal bulkheads, the corrugation thickness for the calculation of shear force distribution factor, f , is to be corrected according to <i>Section 4/2.6.4</i> .		

2.5.4 Procedure to adjust vertical and horizontal bending moments

- 2.5.4.1 An additional vertical bending moment is to be applied at both ends of the cargo tank finite element model to generate the required vertical bending moment in the middle tank of the model. This end vertical bending moment can be calculated as follows:

$$M_{v-end} = M_{v-targ} - M_{v-peak}$$

Where:

M_{v-end} additional vertical bending moment to be applied at both ends of finite element model

M_{v-targ} required hogging (positive) or sagging (negative) vertical bending moment, as specified in 2.4.5

M_{v-peak} maximum or minimum bending moment within the length of the middle tank due to the local loads described in 2.5.2.3 and the additional vertical loads applied to generate the required shear force, see 2.5.3. M_{v-peak} is to be taken as the maximum bending moment if M_{v-targ} is hogging (positive) and as the minimum bending moment if M_{v-targ} is sagging (negative). M_{v-peak} can be obtained from FE analysis. Alternatively, M_{v-peak} may be calculated as follows based on a simply supported beam model:

$$M_{v-peak} = \text{Max} \{ M_o + x F + M_{lineload} \}$$

M_o vertical bending moment at position x , due to the local loads described in 2.5.2.3.

$M_{lineload}$ vertical bending moment at position x , due to application of vertical line loads at frames to generate required shear force, see 2.5.3

F reaction force at ends due to application of vertical loads to frames, see 2.5.3

x longitudinal position of frame in way of the middle tank of FE model from end, see 2.5.4.2

- 2.5.4.2 For beam and oblique sea load cases, an additional horizontal bending moment is to be applied at the ends of the cargo tank FE model to generate the required horizontal bending moment at a section within the length of the middle tank of the model. The additional horizontal bending moment can be calculated as follows:

$$M_{h-end} = M_{h-targ} - M_{h-peak}$$

Where:

M_{h-end} additional horizontal bending moment to be applied to ends of FE model

M_{h-targ} required positive or negative horizontal bending moment, see 2.4.6

M_{h-peak} maximum or minimum horizontal bending moment within the length of the middle tank due to the local loads described in 2.5.2.3. M_{h-peak} is to be taken as the maximum horizontal bending moment if M_{h-targ} is positive (starboard side in tension) and as the minimum horizontal bending moment if M_{h-targ} is negative (port side in tension).

- 2.5.4.3 The vertical and horizontal bending moments should be calculated over the length of the middle tank of the FE model to identify the position and value of each maximum/minimum bending moment as specified in 2.5.4.1 and 2.5.4.2.
- 2.5.4.4 The additional vertical bending moment, M_{v-end} , and horizontal bending moment, M_{h-end} , are to be applied to both ends of the cargo tank model. The bending moments may be applied by either of the methods described in 2.5.4.5 and 2.5.4.6.
- 2.5.4.5 The vertical and horizontal bending moments may be applied at the model ends by distributing axial nodal forces to all longitudinal elements according to the simple beam theory as follows:

$$(F_x)_i = \frac{M_{v-end}}{I_{y-net50}} \frac{A_{i-net50}}{n_i} z_i \quad \text{for vertical bending moment}$$

$$(F_x)_i = \frac{M_{h-end}}{I_{z-net50}} \frac{A_{i-net50}}{n_i} y_i \quad \text{for horizontal bending moment}$$

Where:

M_{v-end}	vertical bending moment to be applied to the ends of the model
M_{h-end}	horizontal bending moment to be applied to the ends of the model
$(F_x)_i$	axis force applied to a node of the i^{th} element
$I_{y-net50}$	hull girder vertical moment of inertial of the end section about its horizontal neutral axis
$I_{z-net50}$	hull girder horizontal moment of inertial of the end section about its vertical neutral axis (normally centreline)
z_i	vertical distance from the neutral axis to the centre of the cross sectional area of the i^{th} element
y_i	horizontal distance from the neutral axis to the centre of the cross sectional area of the i^{th} element
$A_{i-net50}$	cross sectional area of the i^{th} element
n_i	number of nodal points of i^{th} element on the cross section, $n_i = 2$ for 4-node plate element

- 2.5.4.6 The vertical and horizontal bending moments may alternatively be applied to an independent grid point at the intersection of the vertical neutral axis (normally centreline) and the horizontal neutral axis, see *Figure B.2.13*. All nodal points of the longitudinal elements on the end section are to be rigidly linked to the independent point in θ_y (for vertical bending), θ_z (for horizontal bending) and δ_x . This independent point is not to be connected to the model except by the rigid link. The rigid links are to maintain the end plane of the model in keeping plane under the action of the applied bending moment, which is equivalent to imposing a prescribed displacement to the nodal points in accordance with the simple beam theory.

2.6 Boundary Conditions

2.6.1 General

- 2.6.1.1 All boundary conditions described in this section are in accordance with the global co-ordinate system defined in *Section 4/1.4*. The boundary conditions to be applied at the ends of the cargo tank FE model are given in *Table B.2.9*. The analysis may be carried out by applying all loads to the model as a complete load case or by combining the stress responses resulting from several separate sub-cases.
- 2.6.1.2 Ground spring elements, i.e. spring elements with one end constrained in all 6 degrees of freedom, with stiffness in global y degree of freedom are to be applied to the grid points along deck, inner bottom and bottom shell as shown in *Figure B.2.13*.
- 2.6.1.3 Ground spring elements with stiffness in global z degree of freedom are to be applied to the grid points along the vertical part of the side shells, inner hull longitudinal bulkheads and oil-tight longitudinal bulkheads as shown in *Figure B.2.13*.

Table B.2.9
Boundary Constraints at Model Ends

Location	Translation			Rotation		
	δ_x	δ_y	δ_z	θ_x	θ_y	θ_z
Aft End						
Aft end (all longitudinal elements)	RL	-	-	-	RL	RL
Independent Point aft end, see Figure B.2.13	Fix	-	-	-	M_{v-end}	M_{h-end}
Deck, inner bottom and outer shell	-	Springs	-	-	-	-
Side, inner skin and longitudinal bulkheads	-	-	Springs	-	-	-
Fore End						
Fore end (all longitudinal elements)	RL	-	-	-	RL	RL
Independent point fore end, see Figure B.2.13	-	-	-	-	M_{v-end}	M_{h-end}
Deck, inner bottom and outer shell	-	Springs	-	-	-	-
Side, inner skin and longitudinal bulkheads	-	-	Springs	-	-	-
Where:						
- no constraint applied (free)						
RL nodal points of all longitudinal elements rigidly linked to independent point at neutral axis on centreline						
<u>Note</u> 1. All translation and rotation displacements are in accordance with the global coordinate system defined in Section 4/1.4. 2. Where M_{h-end} is not applied, the independent points at the fore and aft ends are to be free in θ_z . 3. Where M_{v-end} is not applied, the independent points at the fore and aft ends are to be free in θ_y . 4. Where no bending moment is applied, the independent points at the fore and aft ends are to be free in θ_y and θ_z . 5. Where bending moment is applied as nodal forces, the independent points at the fore and aft ends are to be free in the corresponding degree of freedom of rotations (i.e. θ_y and/or θ_z).						

2.6.2 Calculation of spring stiffness

2.6.2.1 The stiffness, c , of individual spring elements for each structural member, to be applied at each end of the cargo tank model, is given by:

$$c = \left(\frac{E}{1 + \nu} \right) \frac{A_{s-net50}}{l_{tk} n} = 0.77 \frac{A_{s-net50} E}{l_{tk} n} \quad \text{N/mm}$$

Where:

$A_{s-net50}$	shearing area of the individual structural member under consideration, i.e. plating of deck, inner bottom, bottom shell, side shell, inner hull longitudinal bulkheads or oil-tight longitudinal bulkhead. $A_{s-net50}$ is to be calculated based on the thickness of the cargo tank finite element model for areas indicated in <i>Table B.2.10</i> for the appropriate structural member under consideration, in mm ²
ν	Poisson's ratio of the material
l_{tk}	length of cargo tank, between bulkheads of the middle tank of the FE model, in mm ²
E	Modulus of Elasticity, in N/mm ²
n	number of nodal points to which the spring elements are applied to the structural member under consideration

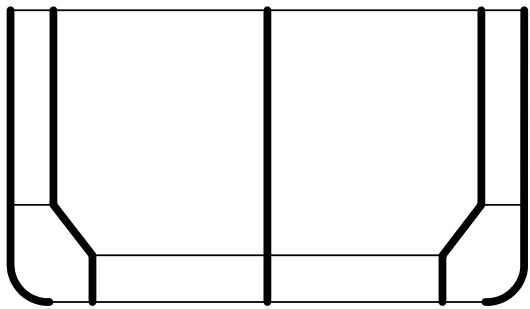

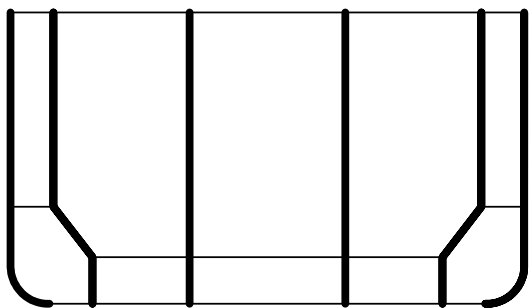

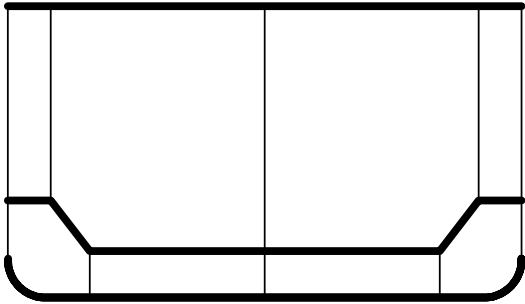

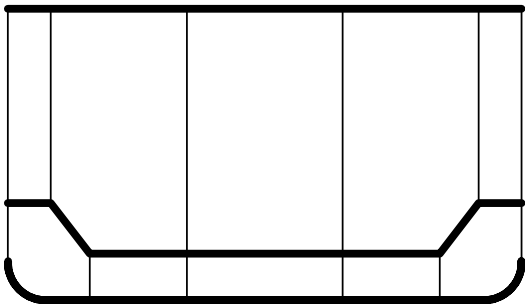

Table B.2.10 Shear Areas to be Considered for the Calculation of Spring Stiffness	
Vertical springs	
	Side Area of side shell plating, including bilge
	Inner hull longitudinal bulkheads Area of inner skin plating, including hopper slope plate and double bottom side girder in way
	Longitudinal bulkheads Area of longitudinal bulkhead plating, including double bottom girder in way
	<p><u>Note</u> Where part of the structural member is not vertical, the area is to be calculated using the projected area in the vertical direction.</p>

Table B.2.10 (Continued)	
Shear Areas to be Considered for the Calculation of Spring Stiffness	
Horizontal springs	
	Deck Area of deck plating
	Inner bottom Area of inner bottom plating, including hopper slope plate and horizontal stringer in way
	Bottom shell Area of bottom shell plating, including bilge
	<p><u>Note</u></p> <p>Where part of the structural member is not horizontal the area is to be calculated using the projected area in the horizontal direction.</p>

2.6.2.2 For vertical corrugated longitudinal bulkheads, the corrugation thickness for the calculation of spring stiffness, c , shall be calculated according to *Section 4/2.6.4*.

2.6.2.3 Alternatively, rod elements may be used instead of spring elements, the equivalent cross section area of the rod is $(c \cdot l)/E$, where l is the length of the rod. One end of the rod is to be constrained in all 6 degrees of freedom.

2.7 Result Evaluation

2.7.1 General

2.7.1.1 Verification of result against acceptance criteria is to be carried out for structural members within longitudinal extent shown in *Figure B.2.14*, which includes the middle tanks of the three cargo tanks FE model and the region forward and aft of the middle tanks up to the extent of the transverse bulkhead stringer and buttress structure. For the strength assessment of tanks in the midship cargo region, stress level and buckling capability of longitudinal hull girder structural members, primary supporting structural members and transverse bulkheads are to be verified. For the assessment of required strengthening in way of transverse bulkheads against hull girder shear load, stress level and buckling capability of inner hull longitudinal bulkheads including upper sloped plate where fitted, side shell, hopper, bottom girders and longitudinal bulkheads are to be verified.

2.7.1.2 Assessment of results is to be carried out for the standard load cases specified in *2.3.1*, and any other load cases specially considered as required by *Section 9/2.2.3*.

2.7.2 Stress assessment

- 2.7.2.1 Stresses are not to exceed the permissible values given in *Section 9/2.2.5*.
- 2.7.2.2 The maximum permissible stresses are based on the mesh sizes and element types described in 2.2.
- 2.7.2.3 The von Mises stress, σ_{vm} , is to be calculated based on the membrane direct and shear stresses of the plate element. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element. Where plate elements are used, the stresses are to be evaluated at the element centroid.
- 2.7.2.4 Except as indicated in 2.7.2.5, the element shear stress in way of openings in webs is to be corrected for loss in shear area in accordance with the following formula. The corrected element shear stress is to be used to calculate the von Mises stress of the element for verification against the acceptance criteria.

$$\tau_{cor} = \frac{h \ t_{mod-net50}}{A_{s-net50}} \tau_{elem}$$

Where:

- τ_{cor} corrected element shear stress
- h height of web of girder in way of opening, see *Figure B.2.8*. Where the geometry of the opening is modelled, h is to be taken as the net height with the height of the modelled opening deducted.
- $t_{mod-net50}$ modelled web thickness in way of opening, see *Table B.2.2*.
- $A_{s-net50}$ actual effective shear area of web, including area lost due to slots for stiffeners, calculated in accordance with *Section 4/2.5*. The thickness of the web is to be based on net thickness obtained by deducting $0.5t_{corr}$ from the gross thickness
- τ_{elem} element shear stress before correction

- 2.7.2.5 Correction of element shear stress due to presence of openings is not required provided that:
- all slots for local support stiffeners are fitted with lugs or collar plates;
 - the difference between the modelled shear area of the plate and the actual effective shear area, $A_{s-net50}$ calculated in accordance with *Section 4/2.5.1*, is less than 20% of the modelled shear area, and

- (c) the yield utilisation factor is less than 80% of the permissible yield utilisation factor given in *Section 9/Table 9.2.1*.

2.7.2.6 Where the corrugation is not modelled with its exact geometric shape, the corrected axial stress in the flange of the corrugation, σ_{fl-act} , is to be taken as the greater of:

$$\sigma_{fl-act} = \sigma_{fl-FEM} \frac{Z_{corr-FEM-net50}}{Z_{corr-act-net50}} \frac{l_{corr-act}}{l_{corr-FEM}}$$

$$\sigma_{fl-act} = \sigma_{fl-FEM}$$

Where:

σ_{fl-FEM} axial stress obtained from the finite element analysis, see *Figure B.2.15*

$Z_{corr-FEM-net50}$ is the section modulus of the modelled corrugation calculated in accordance with *Figure B.2.15*

$Z_{corr-act-net50}$ is the section modulus of the actual corrugation calculated in accordance with *Figure B.2.15*

$l_{corr-act}$ length of corrugation section, as given in *Figure B.2.15*

$l_{corr-FEM}$ length of corrugation section, as given in *Figure B.2.15*

2.7.3 Buckling assessment

2.7.3.1 Buckling capability is to be assessed for the plating and stiffened panels of longitudinal hull girder structural members, primary support members and transverse bulkheads, including deck, double side, side, bottom, double bottom, hopper, transverse and vertical web frames, stringers, transverse and longitudinal bulkhead structures. Buckling capability of curved panels (e.g. bilge), face plate of

- primary support members and tripping brackets is not assessed based on stress result obtained by the finite element analysis.
- 2.7.3.2 The utilisation factor against buckling for all plates and stiffened panels is not to exceed the permissible values given in *Section 9/2.2.5*. The method for carrying out buckling assessment of plates and stiffened panels is described in *Appendix D/5*.
- 2.7.3.3 The buckling assessment is to be based on the stresses obtained from the finite element analysis in conjunction with buckling capacity model based on net thickness obtained by deducting the full corrosion addition, t_{corr} , and any Owner's extras from the proposed thickness. This thickness deduction applies to all plating, stiffener webs and face plates.
- 2.7.3.4 The buckling assessment is to be based on membrane stress evaluated at the centroid of the plate elements. Where shell elements are used, stresses at the mid plane of the element are to be used for the buckling assessment.
- 2.7.3.5 The combined interaction of bi-axial compressive stresses, shear stress and lateral pressure loads are to be considered in the buckling calculation. Where a stress correction is to be applied to the finite element stresses as required by 2.7.2, the buckling assessment is to be based on the corrected stresses.
- 2.7.3.6 For tankers with a cross tie arrangement, the pillar buckling capability of the cross tie structure is to be assessed based on the buckling formulae given in *Section 10/3.5.1*. The average axial compressive stress at the mid span of the cross tie in the ship's transverse direction, weighted by cross section area, is to be used for the buckling assessment.
- 2.7.3.7 In the absence of a suitable advanced buckling method described in *Appendix D/5* for the modelling of bulkhead corrugation, assessment of local buckling of unit corrugation flanges is to be in accordance with *Section 10/3.5.2* and criteria given in *Section 9/2.2.5*. The assessment is to be based only on uni-axial stress (membrane stress evaluated at element centroid) parallel to the corrugation knuckles. Averaged stress between elements is not to be used. For the part of the corrugated plate flange from the lower bulkhead stool top to a level of $s/2$ above, where s is the breadth of the flange, the stress used for the buckling assessment needs not be taken as greater than the value obtained at $s/2$ above the bulkhead stool top. The stress value at $s/2$ may be obtained by interpolation if the stress value cannot be obtained directly from a plate element.
- 2.7.3.8 In the absence of a suitable advanced buckling assessment method described in *Appendix D/5* for the modelling of panel with opening, local buckling of web plates of primary support members in way of openings is to be assessed in accordance with *Section 10/3.4* based on acceptance criteria on buckling utilisation factor given in *Section 9/2.2.5*. The assessment is to be based on FE membrane stress evaluated at the centroid of plate elements. Stresses in the area of the web required for buckling assessment are to be obtained as averaged stresses of the plate elements within the required area. Stress obtained from either the cargo tank analysis or local fine mesh analysis may be used for the assessment. Where the effect of opening is not taken into account in the cargo tank analysis, the stresses obtained from the finite element analysis are to be corrected in accordance with 2.7.2.4 and 2.7.2.5.

3 LOCAL FINE MESH STRUCTURAL STRENGTH ANALYSIS

3.1 General

3.1.1 Application

- 3.1.1.1 For tankers of conventional arrangements, finite element fine mesh analysis of structural details is to be in accordance with the requirements given in this section.
- 3.1.1.2 Additional requirements of fine mesh analysis are to be in accordance with *Section 9/2.3.1.3* and *Section 9/2.3.1.4*.

3.1.2 Transverse web frame and wash bulkhead

- 3.1.2.1 Upper hopper knuckle connections as indicated in *Figure B.3.1* are to be evaluated by fine mesh analysis on a typical transverse web frame in the middle tank of the cargo tank model. Main bracket toes and openings as indicated in *Figure B.3.1* are to be evaluated by fine mesh analysis if the screening criteria given in 3.1.6 are not complied with.
- 3.1.2.2 Where a wash bulkhead is fitted, main bracket toes and openings of the transverse and vertical webs as indicated in *Figure B.3.1* are to be evaluated by fine mesh analysis if the screening criteria given in 3.1.6 are not complied with.
- 3.1.2.3 The web frame which indicates highest von Mises stresses in way of each structural detail from the cargo tank analysis is to be selected for the fine mesh analysis.

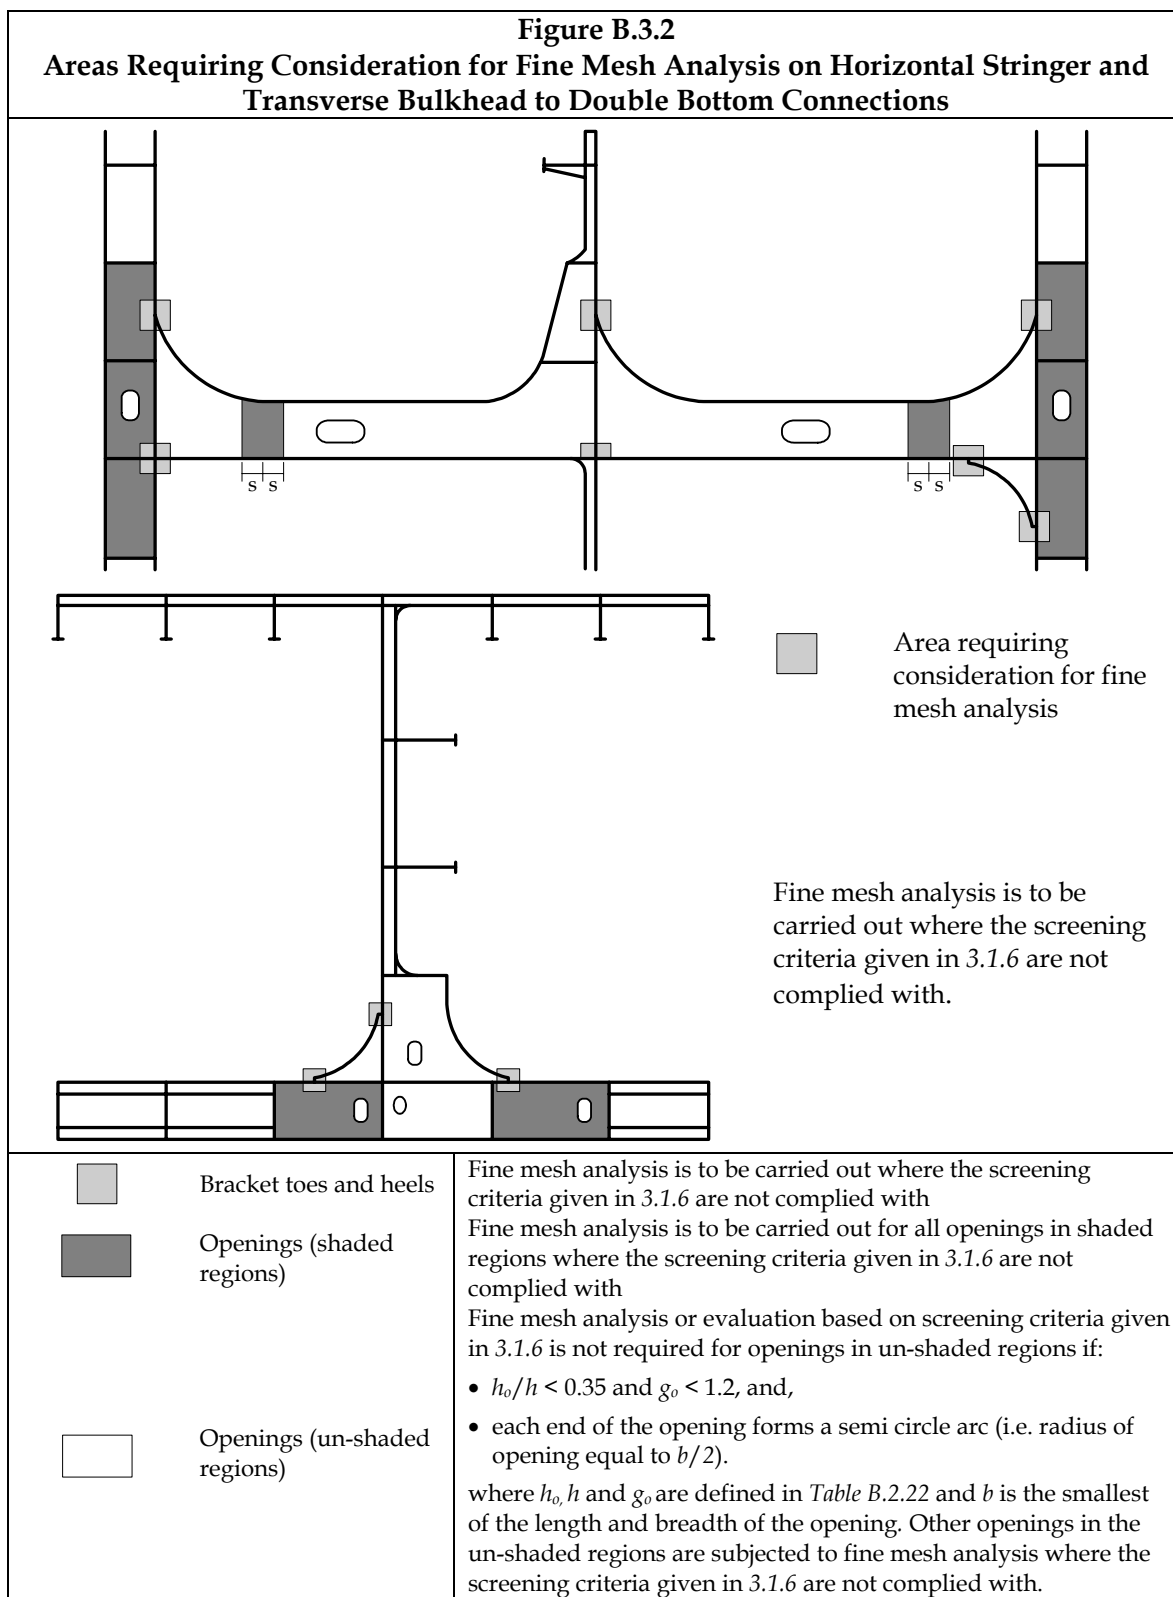

Figure B.3.1 (Continued)
Areas Requiring Consideration for Fine Mesh Analysis on a Typical Transverse Web Frame, Wash Bulkhead and Web Frame adjacent to Transverse Bulkhead

3.1.3 Transverse bulkhead stringers, buttress and adjacent web frame

3.1.3.1 Fine mesh analysis is to be carried out for the following locations where the screening criteria given in 3.1.6 are not complied with:

- (a) main bracket toes, heels and openings on horizontal stringers of a transverse bulkhead specified in Figure B.3.2. The stringers of the forward and aft transverse bulkheads of the middle tank of the FE model which indicate highest

von Mises stresses in way of the structural details from the cargo tank analysis is to be selected for the fine mesh analysis.

- (b) main bracket toes and openings on transverse bulkhead to double bottom connection or buttress structure specified in *Figure B.3.2*. The double bottom connection/buttress structure in way of the forward and aft transverse bulkheads of the middle tank of the FE model which indicates highest von Mises stresses in way of the structural details from the cargo tank analysis is to be selected for the fine mesh analysis.
- (c) main bracket toes and openings specified in *Figure B.3.1* on a web frame adjacent to the transverse bulkhead. Both web frames in way of the horizontal stringers of the forward and aft transverse bulkheads of the middle tank of the cargo tank FE model are to be considered. The web frame which indicates highest von Mises stresses in way of the structural details from the cargo tank analysis is to be selected for the fine mesh analysis.

3.1.3.2 Where the stress level at the heel connection of the transverse bulkhead horizontal stringer to the side horizontal girder exceeds the permissible criteria, it is recommended that a backing bracket be fitted in accordance with *Appendix C/2.5* to reduce the stresses.

3.1.4 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners

3.1.4.1 End connections and attached web stiffeners of the following structural members are to be assessed:

- (a) at least one pair of inner and outer bottom longitudinal stiffeners and adjoining vertical stiffener of transverse bulkhead
- (b) at least one longitudinal stiffener on deck and adjoining vertical stiffener of transverse bulkhead

3.1.4.2 The selection of the longitudinal and vertical stiffeners to be analysed is to be based on the maximum relative deflection between supports, e.g. between floor and transverse bulkhead. Where there is a significant variation in end connection arrangement and scantlings between stiffeners, analysis of additional stiffeners may be required. *Figure B.3.3* shows the areas that require fine mesh analysis in way of deck, inner bottom and bottom longitudinal and transverse bulkhead vertical stiffeners.

3.1.5 Corrugated bulkheads

3.1.5.1 Where no shedder plate or shedder plate without a gusset plate is fitted to a corrugated transverse or longitudinal corrugated bulkhead, connection of corrugation and below supporting structure to lower stool shelf plate, as shown in *Figure B.3.4*, is to be evaluated by fine mesh analysis. Where no lower stool is fitted, connection of corrugation and below supporting structure to inner bottom plate is to be evaluated by fine mesh analysis.

3.1.5.2 Where shedder plate with a gusset plate is fitted to a corrugated transverse or longitudinal corrugated bulkhead, connection of the corrugation at the upper corner of the gusset plate is to be evaluated by fine mesh analysis.

3.1.5.3 The selection of the location of the corrugation unit for fine mesh analysis is to be based on the stress result from the cargo tank analysis. The location with the highest von Mises stress in way of the corrugation connection is to be selected for the analysis.

- 3.1.5.4 Where transverse and longitudinal corrugated bulkheads are of different arrangements or scantlings, the fine mesh analysis is to be carried out for both bulkheads.
- 3.1.5.5 Where the stress level at the connection of corrugation to the lower stool exceeds the permissible criteria, it is recommended that shedder plate and gusset plate be fitted in accordance with *Appendix C/2.5* to reduce the stresses. See *Section 8/2.5.7.9* for required arrangement of supporting structure for corrugated bulkhead without a lower stool.

3.1.6 Screening criteria for Fine Mesh Analysis

- 3.1.6.1 The criteria given in this section are intended to identify areas that require to be investigated by means of fine mesh finite element analysis. These criteria apply to openings, bracket toes and heels of transverse web frames, vertical and transverse webs of wash bulkheads, horizontal stringers of transverse bulkhead and adjoining side horizontal girders, buttress and bottom girders.
- 3.1.6.2 Where the criteria given in this section for the structural detail are complied with, fine mesh finite element analysis of the structural detail may be waived with the exception of 3.1.6.3. The compliance with these criteria is to be verified for all finite element load cases.
- 3.1.6.3 Large openings, for which their geometry is required to be represented in the cargo tank FE model in accordance with *Table B.2.2*, are to be investigated by fine mesh analysis.

Table B.3.1
Fine Mesh Analysis Screening Criteria for Openings in Primary Support Members

A fine mesh finite element analysis is to be carried out where:

$\lambda_y > 1.7$ (load combination S + D)

$\lambda_y > 1.36$ (load combination S)

Where:

λ_y yield utilisation factor

$$= 0.85C_h \left(|\sigma_x + \sigma_y| + \left(2 + \left(\frac{l_o}{2r} \right)^{0.74} + \left(\frac{h_o}{2r} \right)^{0.74} \right) |\tau_{xy}| \right) \frac{k}{235}$$

$C_h = 1.0 - 0.23 \left(\frac{h_o}{h} \right) + 2.12 \left(\frac{h_o}{h} \right)^2$ for openings in vertical web and horizontal girder of wing ballast tank, double bottom floor and girder and horizontal stringer of transverse bulkhead

$= 1.0$ for opening in web of main bracket and buttress (see figures below)

r radius of opening, in mm

h_o height of opening parallel to depth of web, in mm

l_o length of opening parallel to girder web direction, in mm

h height of web of girder in way of opening, in mm

σ_x axial stress in element x direction determined from cargo tank FE analysis according to the coordinate system shown, in N/mm²

σ_y axial stress in element y direction determined from cargo tank FE analysis according to the coordinate system shown, in N/mm²

τ_{xy} element shear stress determined from cargo tank FE analysis, in N/mm², ⁽²⁾

k higher strength steel factor, as defined in Section 6/1.1.4 but not to be taken as less than 0.78 for load combination S + D

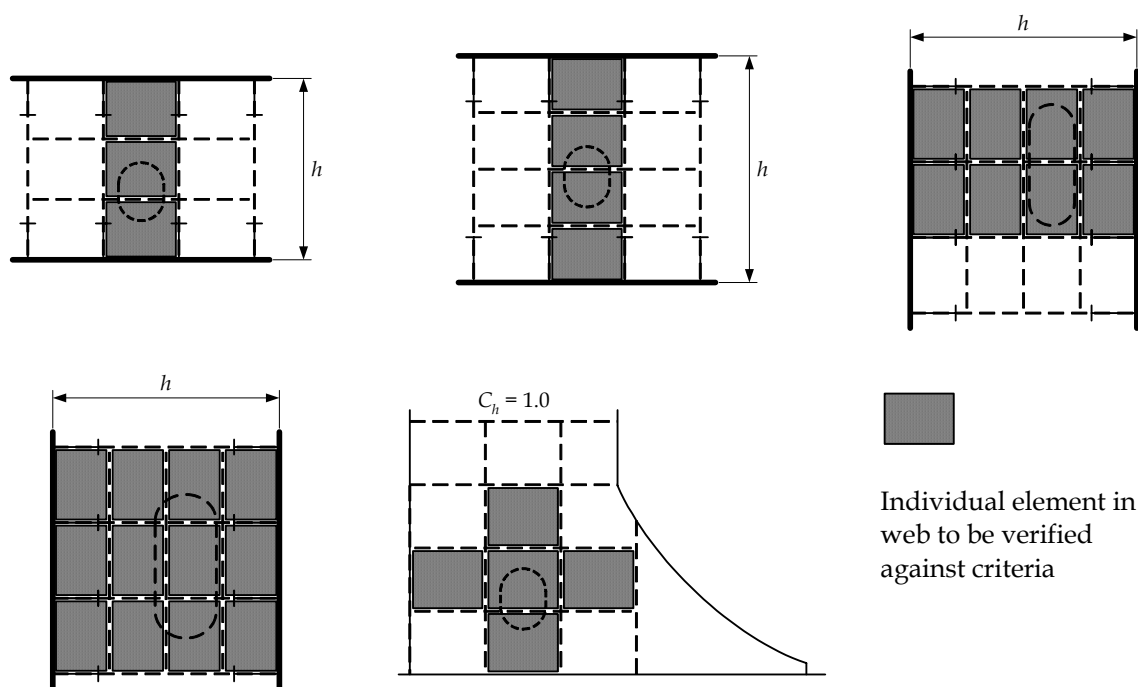

Table B.3.1 (Continued)
Fine Mesh Analysis Screening Criteria for Openings in Primary Support Members

Notes

1. Screening criteria only applicable to opening where its geometry is not required to be represented in the cargo tank FE model in accordance with *Table B.2.2*. Where the geometry of the opening is required to be modelled in accordance with *Table B.2.2*, fine mesh FE analysis is to be carried out to determine the stress level.
2. Where the modelled thickness of the web in way of the opening is reduced in accordance with *Table B.2.2*, the element shear stress is to be adjusted by the ratio of the actual net web thickness (i.e. calculated by deducting $0.5t_{corr}$ from the gross thickness) to the modelled reduced mean thickness (i.e. $t_{1-net50}$ or $t_{2-net50}$ defined in *Table B.2.2*) prior to the evaluation of yield utilisation factor for verification against the screening criteria.
3. Screening criteria is only valid if the cargo tank finite element analysis and the derivation of element stresses is carried out in accordance with *B/2*.

Table B.3.2
Fine Mesh Analysis Screening Criteria for Bracket Toes
of Primary Support Members

A fine mesh finite element analysis is to be carried out where:

$\lambda_y > 1.5$ (load combination S + D)

$\lambda_y > 1.2$ (load combination S)

Where:

λ_y yield utilisation factor

$$= C_a \left(0.75 \left(\frac{b_2}{b_1} \right)^{0.5} |\sigma_{vm}| + 0.55 \left(\frac{A_{bar-net50}}{b_1 t_{net50}} \right)^{0.5} |\sigma_{bar}| \right) \frac{k}{235}$$

$$C_a = 1.0 - 0.2 \left(\frac{R_a}{1400} \right)^2$$

b_1, b_2 height of plate element in way of bracket toe in cargo tank FE model, in mm

$A_{bar-net50}$ sectional area of bar element in cargo tank FE model representing the face plate of bracket, in mm²

σ_{bar} bar element axial stress determined from cargo tank FE analysis, in N/mm²

σ_{vm} von Mises stress of plate element in way of bracket toe determined from cargo tank FE analysis, in N/mm²

t_{net50} thickness of plate element in way of bracket toe, in mm

R_a leg length distance in mm, not to be taken as greater than 1400mm

k higher strength steel factor, as defined in Section 6/1.1.4, but not to be taken as less than 0.78 for load combination S + D

Note

1. Screening criteria is only valid if the cargo tank finite element analysis and the derivation of element stresses is carried out in accordance with B/2.

Table B.3.3
Fine Mesh Analysis Screening Criteria for Heels of Transverse Bulkhead Horizontal Stringers

A fine mesh finite element analysis is to be carried out where:

$$\lambda_y > 1.5 \quad (\text{load combination S + D})$$

$$\lambda_y > 1.2 \quad (\text{load combination S})$$

Where:

λ_y yield utilisation factor

$$= 3.0 |\sigma_{vm}| \frac{k}{235}$$

for heels at side horizontal girder and transverse bulkhead horizontal stringer, i.e. locations 1, 2 and 3 in figures.

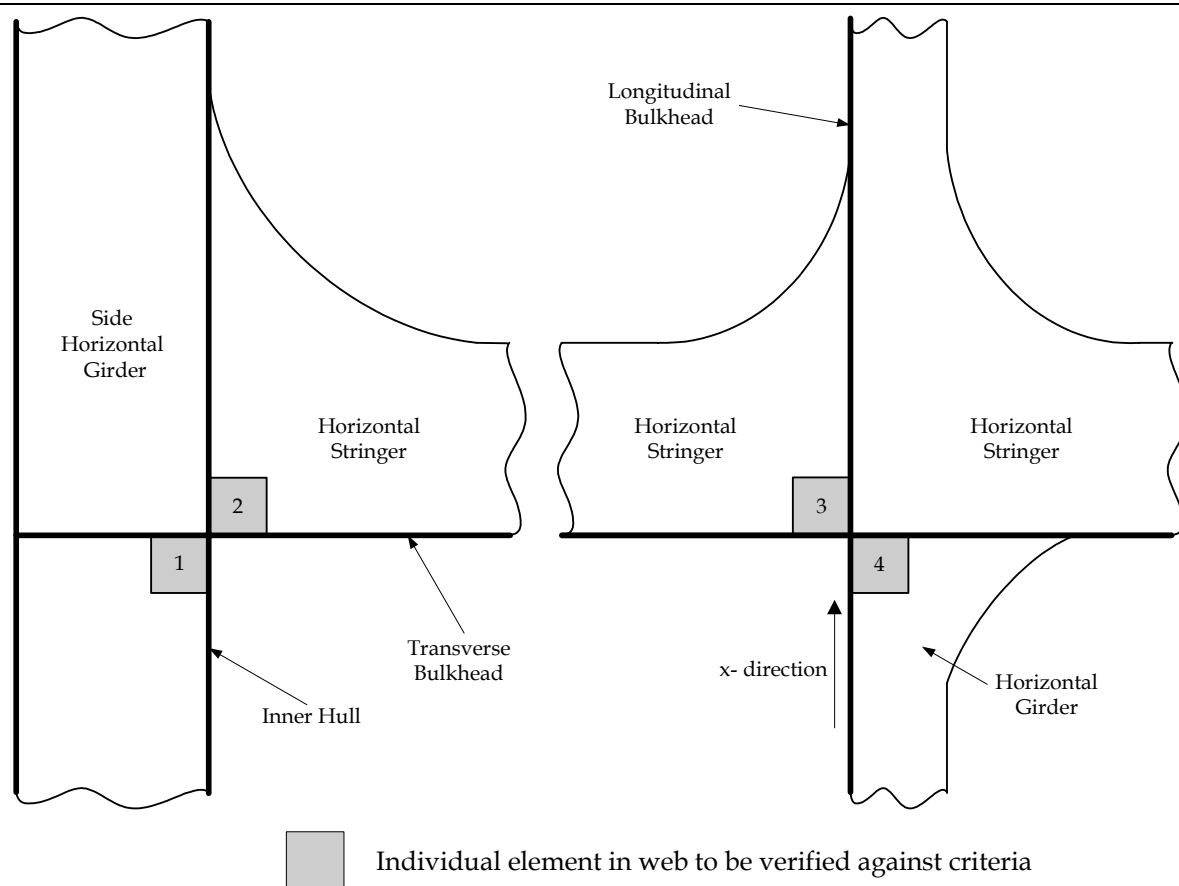

$$= 5.2 |\sigma_x| \frac{k}{235}$$

for heel at longitudinal bulkhead horizontal stringer, i.e. location 4.

σ_x axial stress in element x direction determined from cargo tank FE analysis in accordance with the coordinate system shown, in N/mm²

σ_{vm} von Mises stress of plate element in way of heel determined from cargo tank FE analysis, in N/mm²

k higher strength steel factor, as defined in Section 6/1.1.4, but not to be taken as less than 0.78 for load combination S + D

Note

1. Screening criteria is only valid if the cargo tank finite element analysis and the derivation of element stresses is carried out in accordance with B/2.

3.2 Structural Modelling

3.2.1 General

- 3.2.1.1 Evaluation of detailed stresses requires the use of refined finite element mesh in way of areas of high stress. This fine mesh analysis can be carried out by means of separate local finite element model with fine mesh zones in conjunction with the boundary conditions obtained from the cargo tank model. Alternatively, fine mesh zones incorporated into the cargo tank model may be used.
- 3.2.1.2 The extent of the local finite element model is to be such that the calculated stresses at the areas of interest are not significantly affected by the imposed boundary conditions and application of loads. The boundary of the fine mesh model is to coincide with primary support members, such as girders, stringers and floors, in the cargo tank model.
- 3.2.1.3 The mesh size in the fine mesh zones is not to be greater than 50mm x 50mm. In general, the extent of the fine mesh zone is not to be less than 10 elements in all directions from the area under investigation.
- 3.2.1.4 All plating within the fine mesh zone is to be represented by shell elements. A smooth transition of mesh density is to be maintained. The aspect ratio of elements within the fine mesh zone is to be kept as close to 1 as possible. Variation of mesh density within the fine mesh zone and the use of triangular elements are to be avoided. In all cases, the elements are to have an aspect ratio not exceeding 3. Distorted elements, with element corner angle less than 60° or greater than 120°, are to be avoided. Stiffeners inside the fine mesh zone are to be modelled using shell elements. Stiffeners outside the fine mesh zones may be modelled using beam elements.
- 3.2.1.5 The element inside the fine mesh zone is to be modelled based on the net thickness, obtained by deducting the full corrosion addition, t_{corr} , from the gross thickness. The structure outside the fine mesh zone is to be modelled based on the net thickness obtained by deducting half the corrosion addition, $0.5t_{corr}$, from the gross thickness, as specified in 2.2.1.5, for use in the cargo tank FE analysis.
- 3.2.1.6 Where fine mesh analysis is required for main bracket end connections, the fine mesh zone is to be extended at least 10 elements in all directions from the area of interest, see *Figure B.3.5*. The modelling scantlings in the fine mesh zone are to be in accordance with 3.2.1.5.
- 3.2.1.7 Where fine mesh analysis is required for an opening, the first two layers of elements around the opening are to be modelled with mesh size not greater than 50mm x 50mm, based on the net thickness with deduction of full corrosion addition, t_{corr} . The elements outside the first two layers are to be based on the net thickness with a deduction of corrosion addition, $0.5t_{corr}$, see 3.2.1.5. A smooth transition from the fine mesh to the coarser mesh is to be maintained. Edge stiffeners which are welded directly to the edge of an opening are to be modelled with plate elements. Web stiffeners close to an opening may be modelled using rod or beam elements located at a distance of at least 50mm from the edge of the opening. Typical fine mesh zone around an opening is shown in *Figure B.3.6*.
- 3.2.1.8 Face plates of openings, primary support members and associated brackets are to be modelled with at least three elements across their width.

Figure B.3.5
Fine Mesh Zone Around Bracket Toes

Fine mesh zone

Element size $\leq 50\text{mm} \times 50\text{mm}$

Extent - at least 10 elements in all directions

Face plate modelled by plate elements

Figure B.3.6
Fine Mesh Zone Around an Opening

3.2.2 Transverse web frames

- 3.2.2.1 In addition to the requirements of 3.2.1, the modelling requirements in this subsection are applicable to the analysis of typical transverse web frame.
- 3.2.2.2 Where a FE sub model is used, the model is to have an extent of at least 1 + 1 web frame spaces, i.e. one web frame space extending either side of the transverse web frame under investigation. The transverse web frames forward and aft of the web frame under investigation need not be included in the sub model.
- 3.2.2.3 The full depth and full breadth of the ship shall be modelled, see *Figure B.3.7*.
- 3.2.2.4 *Figure B.3.8* shows a close up view of the finite element mesh at the lower part of the vertical web and backing brackets.

Figure B.3.7
Extent of Sub-Model for Fine Mesh Analysis of Web Frame Bracket Connections and Openings

Figure B.3.8
Close-up View of Finite Element Mesh at the Lower Part of a Vertical Web Frame and Backing Brackets

3.2.3 Transverse bulkhead stringers, buttress and adjacent web frame

- 3.2.3.1 In addition to 3.2.1, the modelling requirements in this sub-section are applicable to the analysis of transverse bulkhead and adjacent web frame as described in 3.1.3.
- 3.2.3.2 Due to the structural interaction between the transverse bulkhead, horizontal stringers, web frames, deck and bottom, it is recommended that the FE sub-model represents a full section of the hull. Longitudinally, the ends of the model should at least be extended one web frame space beyond the areas that require investigation, see *Figure B.3.9*. The full breadth and depth of the ship should be modelled.
- 3.2.3.3 Alternatively, it is acceptable to use a number of sub-models, as shown in *Figure B.3.10*, to analyse different parts of the structure. For the analysis of the transverse bulkhead horizontal stringers the full breadth of the ship should be modelled. For the analysis of buttress structure, the sub-model width should be at least $4 + 4$ longitudinal spaces, i.e. four longitudinal spaces at each side of the buttress.
- 3.2.3.4 *Figure B.3.11* shows the finite element mesh on a transverse bulkhead horizontal stringer. *Figure B.3.12* shows the sub-model for the analysis of buttress connections to transverse bulkhead and double bottom structure, and openings.

Figure B.3.9
Extent of Sub-Model for Fine Mesh Analysis of Transverse Bulkhead and Adjacent Structure

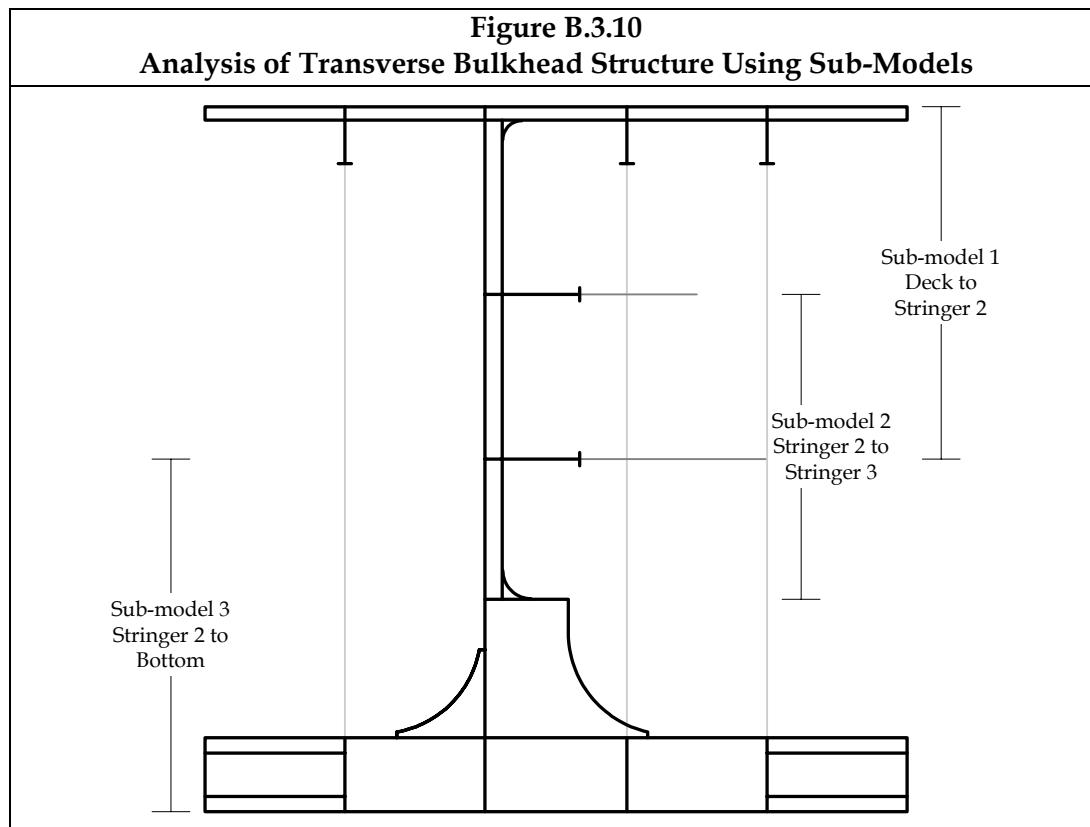

Figure B.3.11
Finite Element Mesh on Transverse Bulkhead Horizontal Stringer
(figure shows port side of model)

Figure B.3.12
Sub-Model for the Analysis of Buttress Connections to Bulkhead and Double Bottom Structure (figure shows port half of model)

3.2.4 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners

- 3.2.4.1 The modelling requirements in this sub-section are applicable specifically to the analysis of longitudinal and vertical stiffener end connections and attached web stiffeners as described in 3.1.4.
- 3.2.4.2 Where a local FE model is used, each end of the model is to be extended longitudinally at least two web frame spaces from the areas under investigation. The model width is to be at least $2 + 2$ longitudinal spaces. *Figure B.3.13* shows the longitudinal extent of the sub-model for the analysis of deck and double bottom longitudinal stiffeners and adjoining transverse bulkhead vertical stiffener.
- 3.2.4.3 The prescribed displacements or forces obtained from the cargo tank FE model should be applied to all boundary nodes which coincide with the cargo tank model.
- 3.2.4.4 The longitudinal and vertical stiffeners under investigation, including web, faceplate, attached plating (within $\frac{1}{2} + \frac{1}{2}$ longitudinal spaces) and associated brackets are to be modelled based on the gross thickness with deduction of the full corrosion addition t_{corr} . Other areas are to be based on gross thickness with deduction of half corrosion addition, $0.5t_{corr}$.
- 3.2.4.5 The web of the longitudinal stiffeners should be represented by at least 3 shell elements across its depth. Similar size elements should be used to represent the plating of the bottom shell and inner bottom. The face plate of the longitudinal stiffeners and brackets should be modelled with at least three elements across its width.
- 3.2.4.6 The mesh size and extent of the fine mesh zone is to be in accordance with 3.2.1.3, see also *Figure B.3.13*.

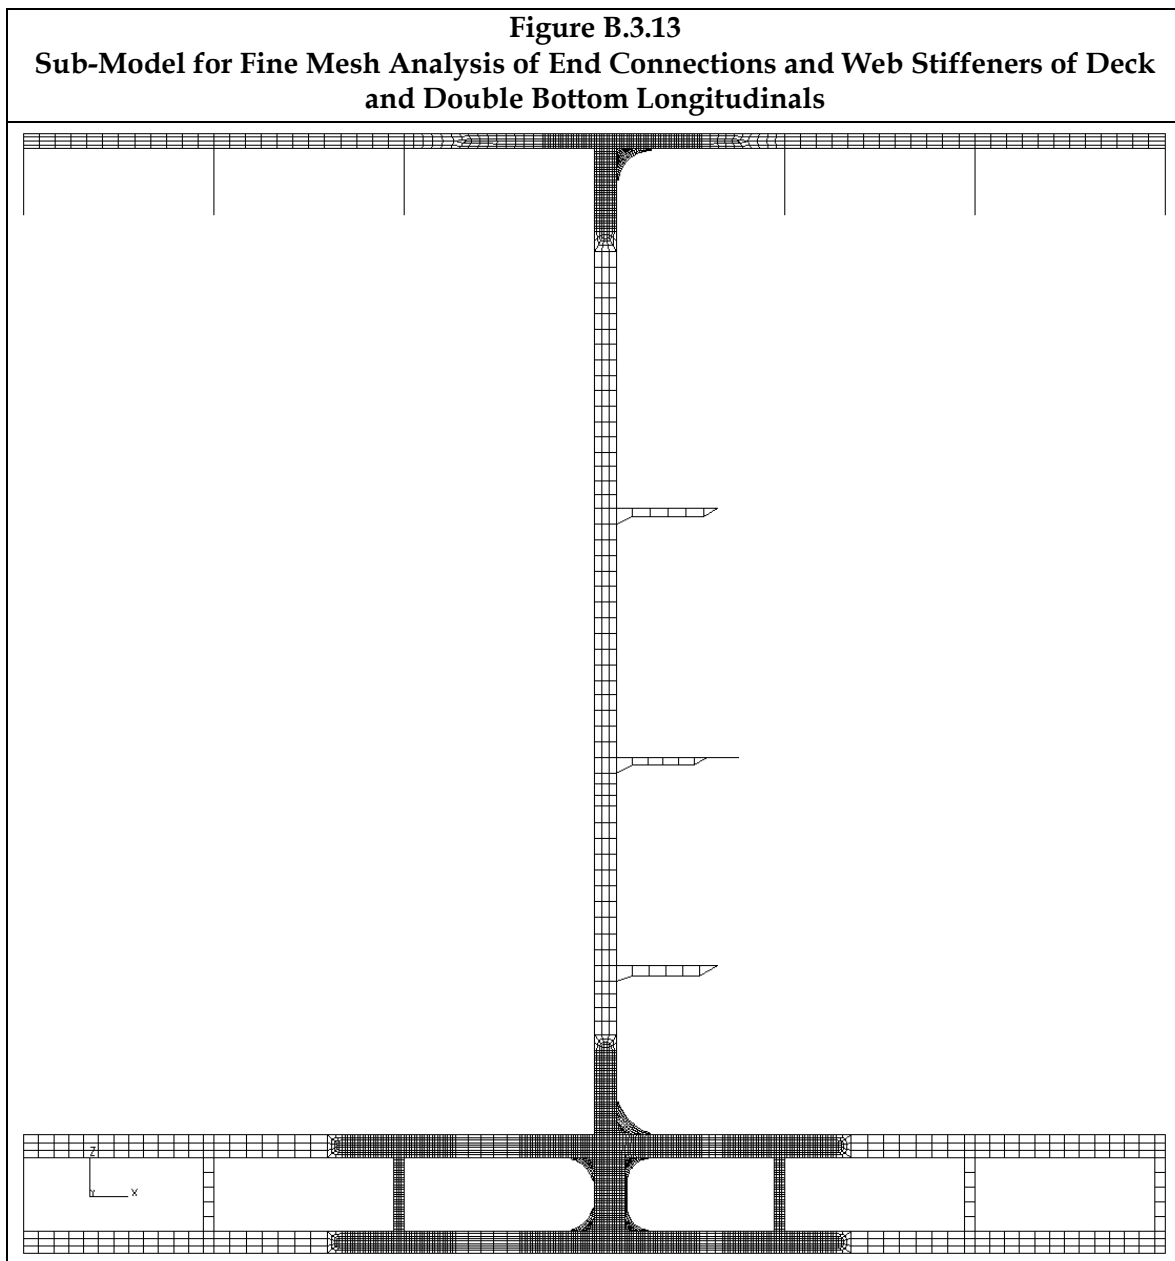

Figure B.3.13 (Continued)
Sub-Model for Fine Mesh Analysis of End Connections and Web Stiffeners of Deck and Double Bottom Longitudinals

3.2.5 Corrugated bulkheads

- 3.2.5.1 In addition to 3.2.1, the modelling requirements in this sub-section are applicable to the analysis of connections of corrugated bulkheads to lower bulkhead stools as described in 3.1.5.
- 3.2.5.2 The minimum extent of the sub-model is as follows, see also *Figure B.3.14*:
- (a) vertically, from the bottom of the bottom bulkhead stool to a level at least 2m above the connection of the corrugation to the upper part of the bulkhead stool. The upper boundary of the sub-model should be coincident with the horizontal mesh line of the cargo tank FE model
 - (b) for transverse corrugated bulkheads, the sub-model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. the sub-model covers two bulkhead stool transverse web spaces). The end diaphragms need not be modelled
 - (c) for longitudinal corrugated bulkheads, the sub-model is to be extended to the nearest web frame on each side of the fine mesh zone (i.e. the sub-model covers two frame spaces). The end web frames need not be modelled
 - (d) where the area under investigation is located close to the intersection of transverse and longitudinal corrugated bulkheads, the sub-model should cover the structure between the diaphragms (in transverse direction) and web frames (in longitudinal direction) closest to the detail, whichever relevant. In addition the sub-model is to be extended at least one diaphragm/web frame outside the intersection of the stools.
- 3.2.5.3 The fine mesh zone is to be extended at least 500mm (10 elements) from the corrugation connection in a vertical direction, see *Figure B.3.14*. In a horizontal direction, the fine mesh zone is to cover at least the corrugation flange under investigation, the adjacent corrugation webs and a further extension of 500mm from each end of the corrugation web (i.e. the fine mesh zone covers four corrugation knuckles), see *Figure B.3.14*. The mesh size within the fine mesh zone is not to be greater than 50mm x 50mm.
- 3.2.5.4 Diaphragm webs, brackets inside the lower stool and vertical stiffeners on the stool side plate are to be modelled at their actual positions within the extent of the sub-model. Shell elements are to be used for modelling of diaphragm, bracket and stiffener webs. Beam elements may be used to represent the flange of stiffeners and brackets.
- 3.2.5.5 Horizontal stiffeners on the lower stool side plate are to be represented by beam elements.
- 3.2.5.6 *Figure B.3.15* shows the finite element sub-model for the fine mesh analysis of longitudinal bulkhead to lower stool connection.

3.3 Loading Conditions

3.3.1 Stress analysis

- 3.3.1.1 The fine mesh detailed stress analysis is to be carried out for the standard load cases specified in 2.3.1, and any other load cases specially considered as required by Section 9/2.2.3.

3.4 Application of Loads and Boundary Conditions

3.4.1 General

- 3.4.1.1 Where a separate local finite element model is used for the fine mesh detailed stress analysis, the nodal displacements from the cargo tank model are to be applied to the corresponding boundary nodes on the local model as prescribed displacements. Alternatively, equivalent nodal forces from the cargo tank model may be applied to the boundary nodes.
- 3.4.1.2 Where there are nodes on the local model boundaries which are not coincident with the nodal points on the cargo tank model, it is acceptable to impose prescribed displacements on these nodes using multi-point constraints. The use of linear multi-point constraint equations connecting two neighbouring coincident nodes is considered sufficient.
- 3.4.1.3 All local loads, including any vertical loads applied for hull girder shear force correction, in way of the structure represented by the separate local finite element model are to be applied to the model.

3.5 Result Evaluation and Acceptance Criteria

3.5.1 Stress assessment

- 3.5.1.1 Stress assessment of the fine mesh analysis is to be carried out for the load cases specified in 3.3.1.
- 3.5.1.2 The von Mises stress, σ_{vm} , is to be calculated based on the membrane direct axial and shear stresses of the plate element evaluated at the element centroid. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element.
- 3.5.1.3 The resulting von Mises stresses are not to exceed the permissible membrane values specified in Section 9/2.3.5.
- 3.5.1.4 The maximum permissible stresses are based on the mesh size of 50mm x 50mm as specified in 3.2.1. Where a smaller mesh size is used, an average von Mises stress calculated over an area equal to the specified mesh size may be used to compare with the permissible stresses. The averaging is to be based only on elements with their entire boundary located within the desired area. The average stress is to be calculated based on stresses at element centroid; stress values obtained by interpolation and/or extrapolation are not to be used. Stress averaging is not to be carried across structural discontinuities and abutting structure.

4 EVALUATION OF HOT SPOT STRESS FOR FATIGUE ANALYSIS

4.1 Application

4.1.1 General

- 4.1.1.1 This Section describes the procedure to perform a finite element analysis using very fine meshes for the evaluation of geometric hot spot stresses for use in the determination of fatigue damage ratio in accordance with *Appendix C/2*.
- 4.1.1.2 The locations where a finite element analysis based fatigue assessment is to be carried out are specified in *Section 9/3.3*.

4.2 Structural Modelling

4.2.1 General

- 4.2.1.1 Evaluation of hot spot stresses for fatigue assessment requires the use of very fine finite element meshes in way of areas of high stress concentration. This very fine mesh analysis can be carried out by means of separate local finite element models with very fine mesh zones in conjunction with the boundary conditions obtained from a cargo tank model. Alternatively, very fine mesh zones incorporated into the cargo tank model may be used.
- 4.2.1.2 All structural parts, within an extent of at least 500mm in all directions leading up to the fatigue hot spot position, are to be modelled based on the net thickness, obtained by deducting half the corrosion addition (i.e. $0.5t_{corr}$) from the gross thickness.
- 4.2.1.3 The cargo tank finite element model for fatigue assessment is to be modelled in accordance with 2.2, but based on net thickness obtained by deducting a quarter of the corrosion addition (i.e. $0.25t_{corr}$) from the proposed thickness. Alternatively, if the cargo tank FE model for the strength assessment is used, which is based on a thickness deduction of $0.5t_{corr}$, the calculated stresses are to be corrected using the modelling reduction factor, f_{model} , given in *Appendix C/2.4.2.7*.
- 4.2.1.4 Where a separate local finite element model is used, the extent of the local model is to be such that the calculated stresses are not significantly affected by the imposed boundary conditions and application of loads. The boundary of the fine mesh model is to coincide with the primary support members, such as girders, stringers and floors, in the cargo tank model. The extent of the local finite element model of a hopper knuckle is described in 4.2.2.
- 4.2.1.5 The evaluation of hot spot stress is to be based on shell element of mesh size $t_{net50} \times t_{net50}$, where t_{net50} is the net thickness of the plate where a potential fatigue crack is most likely to initiate. This mesh size is to be maintained within the very fine mesh zone, extending over at least 10 elements in all directions leading to the fatigue hot spot position. A uniform quadratic mesh is to be used within the very fine mesh zone. A smooth transition of mesh density leading up to the very fine mesh zone is to be maintained.
- 4.2.1.6 Four-node shell elements with bending and membrane properties are to be used inside the very fine mesh zone. The shell elements are to represent the mid plane of the plating and the bending properties of the plate. The geometry of the weld and structural misalignment is not required to be modelled.

- 4.2.1.7 Where stresses are to be evaluated on a free edge or corner welds, such as cut-outs for stiffener connections at web frames, butt welds on edge of plating and around hatch corners, a rod element of negligible cross-section area, e.g. 1mm², is to be used to obtain the required stress value.
- 4.2.1.8 All structure in close proximity to the very fine mesh zones is to be modelled explicitly with shell elements. Triangular elements are to be avoided where possible. Use of extreme aspect ratio (e.g. aspect ratio greater than 3) and distorted elements (e.g. element's corner angle less than 60° or greater than 120°) are to be avoided.

4.2.2 Hopper knuckle connection

- 4.2.2.1 In addition to the general requirements in 4.2.1, the modelling requirements in this sub-section are applicable to the modelling of welded hopper knuckle connections.
- 4.2.2.2 Fatigue assessment is to be carried out for the knuckle joint between inner bottom and hopper plate for at least one transverse frame in the midship cargo tank region, see *Section 9/3.3.3*. The fatigue assessment is only required to be carried out on the structural detail at one side of the hull.
- 4.2.2.3 In general, the hopper knuckle connection at the mid position between transverse bulkheads is to be assessed. Where a wash bulkhead exists, the hopper knuckle connection at the mid position between the wash bulkhead and cargo tank end bulkhead is generally to be assessed. The results from the cargo tank FE analysis described in 2.2 should be examined for the highest transverse in-plane stress on the inner bottom plate adjacent to the lower hopper knuckle line to identify the exact frame position and the side of the hull where the fatigue assessment should be carried out.
- 4.2.2.4 Where a separate local finite element model is used, the minimum extent of the local model is as follows:
- (a) longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the transverse web frame of interest). Transverse web frames at the end of the local model need not to be represented in the sub-model
 - (b) vertically, the model is to extend from the base line to the lower stringer in the double side water ballast tank. Where a fatigue assessment is also carried out for the upper knuckle connection, the model is to be extended to 4 longitudinal spaces above the lower stringer in the double side ballast tank
 - (c) transversely, the model is to extend from the ship side to 4 longitudinal spaces inboard of the double bottom side girder.
- 4.2.2.5 Mesh size in way of the knuckle connection is to be $t_{net50} \times t_{net50}$, where t_{net50} is the net thickness of the inner bottom plate in way of the connection obtained by deducting $0.5t_{corr}$ from the gross thickness as specified in 4.2.1.2. The minimum extent of the $t_{net50} \times t_{net50}$ mesh is to be (see also *Figure B.4.1*):
- (a) inner bottom plate – 10 elements from knuckle in transverse direction, 10 elements forward and aft of the floor in the longitudinal direction
 - (b) scarfing bracket/inner bottom overhang – 10 elements from knuckle in transverse direction, 10 elements forward and aft of the floor in the longitudinal direction
 - (c) hopper sloping plate – 10 elements from knuckle in transverse direction, 10 elements forward and aft of the hopper web in the longitudinal direction
 - (d) girder – 10 elements from knuckle in vertical direction, 10 elements forward and aft of the floor/hopper web in the longitudinal direction

- (e) floor/hopper web – 10 elements from the hopper knuckle in transverse and vertical directions respectively.
- 4.2.2.6 Any scarfing brackets on the web frame adjoining the inner bottom plating, the first longitudinal stiffeners away from the knuckle as well as any carlings and brackets offset from the main frames are to be modelled explicitly using shell elements. Longitudinal stiffeners further away from the knuckle may be modelled by beam elements. The inner bottom plate "overhang" outboard of the girder is to be modelled using shell elements up to the extent of the scarfing bracket. Away from the scarfing bracket, the inner bottom plate "overhang" may be modelled using line elements of equivalent area. Any perforations, such as cut-outs for cabling, pipes and access that are within one stiffener space from the knuckle point are to be modelled explicitly.
- 4.2.2.7 *Figure B.4.1* shows extent of the $t_{net50} \times t_{net50}$ mesh zone and extension of the areas of local thickness reduction.
- 4.2.2.8 *Figures B.4.2 to B.4.4* show typical local finite element models of the hopper knuckle connection and close-up views of the $t_{net50} \times t_{net50}$ mesh zone.

4.3 Loading Conditions

4.3.1 General

- 4.3.1.1 The ship loading conditions to be used to evaluate dynamic stress ranges for fatigue assessment are to be in accordance with *Appendix C/1.3.2*.
- 4.3.1.2 The cargo density to be used for the fatigue assessment is to be taken as the greater of the cargo density specified for the homogeneous scantling draught condition and $0.9t/m^3$.

4.3.2 Finite element load cases for hopper knuckle connection

- 4.3.2.1 The requirements given in this sub-section are specifically applicable to the evaluation of hot spot stress range at hopper knuckle connection.
- 4.3.2.2 Only dynamic loads are considered for the evaluation of fatigue stress range. Static loads need not be included in the finite element analysis.
- 4.3.2.3 The load cases required to derive the component stress ranges for determining the combined stress ranges, see *Appendix C/2.4.2.7*, are given in *Table B.4.1*.
- 4.3.2.4 Stresses induced by vertical and horizontal hull girder bending moments are not to be included in the stress range for fatigue assessment. Stress caused by the bending effect of the hull girder is to be calculated and deduced from the fatigue stress range result in accordance with the procedure described in 4.5.2.

Table B.4.1			
Load Cases for the Evaluation of Component Stress Range for Hopper Knuckle Joint			
Load case	Component Stress	Applied Load	Parameters for calculation of loads
Full load condition			
L1	S_{e1}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is analysed.	Ship draught = midship draught from departure homogeneous full load condition in the ship loading manual, see <i>Appendix C/1.3.2</i> . GM: see <i>Section 7/3.1.3.4</i> $r_{roll-gyr}$: see <i>Section 7/3.1.3.4</i> Cargo density = 0.9t/m ³ (minimum, see 4.3.1.2)
L2	S_{e2}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is not analysed.	
L3	S_{ix}	Dynamic tank pressure (full range) due to longitudinal acceleration.	
L4	S_{iy}	Dynamic tank pressure (full range) due to transverse accelerations.	
L5	S_{iz}	Dynamic tank pressure (full range) due to vertical acceleration.	
Ballast condition			
L6	S_{e1}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is analysed.	Ship draught = midship draught from departure normal ballast condition in the ship loading manual. If normal ballast condition is not defined, then the midship draught from light ballast condition is to be used, see <i>Appendix C/1.3.2</i>
L7	S_{e2}	Dynamic wave pressure (full range) applies only to the side of the hull where the hopper knuckle is not analysed.	
Load cases for bending moment correction			
C1	S_{VBM}	Unit vertical bending moment applies to ends of cargo tank model	No other loads are to be applied
C2	S_{HBM}	Unit horizontal bending moment applies to ends of cargo tank model	

Table B.4.1 (Continued)	
Load Cases for the Evaluation of Component Stress Range for Hopper Knuckle Joint	
Where:	
$S_{e1}, S_{e2}, S_{ix}, S_{iy}, S_{iz}$	component stresses (with proper sign convention used) before correction for bending moment effect ⁽⁵⁾
S_{VBM}	stress response due to the application of unit vertical bending moment at ends of cargo tank model
S_{HBM}	stress response due to the application of unit horizontal bending moment at ends of cargo tank models
Notes <ol style="list-style-type: none"> 1. For dynamic wave pressure load cases, the pressure distribution is to be calculated at mid-ship and this distribution is to be applied along the full length of the cargo tank FE model. 2. For dynamic tank pressure load cases, vertical, transverse and longitudinal accelerations are calculated at the centre of gravity position of the midship cargo tanks. The accelerations calculated for each tank are to be applied to all corresponding cargo tanks along the length of the FE model. 3. Longitudinal, transverse and vertical accelerations at tank centre of gravity position are to be calculated in accordance with <i>Section 7/3.3</i>. The dynamic tank pressure amplitudes due to accelerations are to be calculated in accordance with <i>Section 7/3.5.4.7</i>. The dynamic tank pressure (full range) is to be obtained as two times the dynamic tank pressure amplitude and distributed in accordance with <i>Figure 7.3.9</i>. Note that these pressure distributions are different from those used for strength analysis. 4. The dynamic wave pressure amplitude is to be calculated according to <i>Section 7/3.5.2.3</i>. The dynamic wave pressure (full range) is to be obtained as two times the dynamic wave pressure amplitude. Note that the dynamic wave pressure and distribution is different from that used for strength analysis. 5. Component stresses (with proper sign convention used) calculated from load cases L1 to L7 are to be corrected to deduct the component due to vertical and horizontal bending moment effect, see 4.5.2.2. 	

4.4 Boundary Conditions

4.4.1 Cargo tank model

- 4.4.1.1 The boundary conditions to be applied to the ends of the cargo tank model are to be in accordance with 2.6. The application of unit vertical and horizontal bending moment at the model ends is to be in accordance with 2.5.4.5 or 2.5.4.6.

4.4.2 Local finite element models

- 4.4.2.1 Where a separate local finite element model is used for evaluating the hot spot stress range, the nodal displacements or equivalent nodal forces from the cargo tank model are to be applied to the corresponding boundary nodes on the local model.
- 4.4.2.2 Where there are nodes on the local model boundaries which are not coincident with the nodal points on the cargo tank model, it is acceptable to impose prescribed displacements on these nodes using multi-point constraints. The use of linear multi-point constraint equations connecting two neighbouring coincident nodes is considered sufficient.
- 4.4.2.3 All local loads in way of the structure represented by the separate local finite element model are to be applied to the model.

4.5 Result Evaluation

4.5.1 General

- 4.5.1.1 The fatigue damage calculation is to be based on the hot spot stress range evaluated close to the potential crack location in a direction perpendicular to the potential direction of the crack.
- 4.5.1.2 For welded structural details, the hot spot stress range is to be obtained as surface stress acting in a direction perpendicular to the weld at a distance of $0.5t_{net50}$ from the weld toe location, where t_{net50} is the net thickness of the plate where the fatigue crack is likely to initiate, see *Appendix C/2.4.2.6*.
- 4.5.1.3 For fatigue assessment of the free edge, a rod element is used to obtain stress at free edge. The stress range is to be based on the axial stress in the rod element.
- 4.5.1.4 For fatigue damage calculation of hopper knuckle connection, see 4.5.2.

4.5.2 Hopper knuckle connection

- 4.5.2.1 Hot spot stress ranges for fatigue assessment of welded hopper knuckle joints are to be based on element direct stress along a direction perpendicular to intersection of the inner bottom plate and hopper plate. The stress ranges are to be evaluated on the upper surface of the hopper and inner bottom plate at a distance of $0.5t_{net50} + x_{wt}$ from the intersection line, where t_{net50} is the net thickness of the inner bottom plate and x_{wt} is weld toe distance, see *Figure C.2.1*. The stress at the required location can be obtained by linear interpolation based on the surface stresses evaluated at the centroid of the 1st and 2nd elements from the intersection of the hopper slope plate, and the inner bottom plate.
- 4.5.2.2 The component stress ranges are to be obtained by eliminating the stress induced by hull girder vertical and horizontal bending moments from the component stress determined from load cases L1 to L7 in *Table B.4.1* as follows:

$$S_{c_i} = |s_{c_i} - M_{V_i} s_{VBM} - M_{H_i} s_{HBM}|$$

Where:

S_{c_i}	$S_{e1}, S_{e2}, S_{ix}, S_{iy}$ or S_{iz} , component stress range after correction for bending moment effects
s_{c_i}	$s_{e1}, s_{e2}, s_{ix}, s_{iy}$ or s_{iz} , component stress (with proper sign convention used) including vertical and horizontal bending moment effects obtained from load cases L1 to L7, see <i>Table B.4.1</i>
M_{V_i}	is the vertical hull girder bending moment due to loads applied to the cargo tank FE model obtained from load case L1, L2, L3, L4, L5, L6 or L7. The bending moment is to be calculated at the longitudinal position where the centroid of shell element under evaluation is located
M_{H_i}	is the horizontal hull girder bending moment due to loads applied to the cargo tank FE model obtained from load case L1, L2, L3, L4, L5, L6 or L7. The bending moment is to be calculated at the longitudinal position where the centroid of shell element under evaluation is located
s_{VBM}	stress due to unit vertical bending moment obtained from load

case C1, see *Table B.4.1*

S_{HBM} stress due to unit horizontal bending moment obtained from load case C2, see *Table B.4.1*

4.5.2.3 The hull girder vertical and horizontal bending moments in 4.5.2.2 may be evaluated at the frame position where the hopper knuckle is under evaluation if the longitudinal distance from the element centroid to the frame position is less than 500mm.

4.5.2.4 The component stress range, S_i , due to dynamic tank pressure resulting from longitudinal, transverse and vertical accelerations for the full load condition is given by:

$$S_i = 0.4|S_{ix}| + 0.9|S_{iy}| + 0.9|S_{iz}|$$

4.5.2.5 The combined hot spot stress ranges required for fatigue damage calculation are to be calculated in accordance with *Appendix C/2.4.2.7*.

4.5.2.6 Fatigue damage and fatigue life calculation is to be in accordance with *Appendix C/1.4.1*.

APPENDIX C

FATIGUE STRENGTH ASSESSMENT

1 NOMINAL STRESS APPROACH

1.1 General

1.1.1 Applicability

- 1.1.1.1 This sub-section defines the procedure for a simplified fatigue assessment which is to be used to evaluate the fatigue strength of the ships structural details. The fatigue assessment uses a nominal stress approach based on beam theory.
- 1.1.1.2 The fatigue assessment is to be applied to welded connections where the steel has a minimum yield strength of less than 400N/mm².

1.1.2 Assumptions

- 1.1.2.1 The following assumptions are made in the fatigue assessment:
 - (a) a linear cumulative damage model, i.e. Palmgren-Miner's Rule, has been used in connection with the S-N data in 1.4.5
 - (b) for longitudinal stiffener end connections, nominal stresses obtained by empirical formulae, see 1.4.2 to 1.4.4, and Rule based loads, see 1.3, form the basis of the nominal stress based fatigue assessment
 - (c) the long term stress ranges of a structural detail can be characterized using a modified Weibull probability distribution parameter, ξ , as described in 1.4.1.5 and 1.4.1.6
 - (d) structural details are idealised and classified in 1.5.
- 1.1.2.2 The structural detail classification in 1.5 is based on typical joint geometry under simple loadings. When a structural detail is considered different from those shown in 1.5, a suitable finite element (FE) analysis should be used to demonstrate the adequacy of the detail in terms of fatigue strength. See 2.1.1.3.
- 1.1.2.3 Where the loading or geometry considered is too complex for a simple classification, a finite element (FE) analysis of the detail is to be carried out to determine the fatigue stress of that detail. *Sub-section 2* defines the procedure for a finite element based assessment to determine hot spot stresses that is to be used for weld toe locations that are typically found at welded hopper knuckle connections in way of transverse primary support members. For bent type knuckle connections, recommendation is given in 2.1.1.2.

1.2 Corrosion Model

1.2.1 Net thickness

- 1.2.1.1 The net thickness and corrosion additions, as indicated in *Section 6/3* are to be incorporated into the representation of the structural capacity models.

1.3 Loads

1.3.1 General

- 1.3.1.1 Ship structures are subjected to various types of loads, which include:
 - (a) static loads including cargo and lightship weights
 - (b) wave induced loads
 - (c) impact loads, such as bottom slamming, bow flare impacts and sloshing in partially filled tanks

- (d) cyclic loads resulting from main engine or propeller induced vibratory forces
- (e) transient loads such as thermal loads
- (f) residual stresses.

1.3.1.2 The fatigue strength analysis considers the following wave induced loads for calculation of the long term distribution of stresses:

- (a) hull girder loads (i.e. vertical and horizontal wave bending moments)
- (b) dynamic wave pressures
- (c) dynamic tank pressure loads resulting from ship motions.

1.3.2 Selection of loading conditions

1.3.2.1 Fatigue analyses are to be carried out for representative loading conditions according to the intended ship's operation. The following two loading conditions are to be examined:

- (a) full load condition at design draught at departure, T_{full} , see *Section 4/1.1.5.4*
- (b) ballast condition at normal ballast draught at departure, T_{bal-nr} , see *Section 4/1.1.5.3*. If a normal ballast condition is not defined in the loading manual, minimum ballast draught, T_{bal} , see *Section 4/1.1.5.2*, should be used.

1.3.2.2 The relevant draught at midships is to be used for the determination of fatigue loads.

1.3.3 Determination of loads

1.3.3.1 Loads applied to the structure are to be calculated in order to determine the stress ranges for the relevant loading conditions.

1.3.3.2 Combined stresses resulting from the action of global and local loads are to be calculated in accordance with 1.4.4, with consideration given to the probability level of 10^{-4} .

1.3.4 Vertical wave bending moment

1.3.4.1 The vertical wave bending moment is to be calculated based on *Section 7/3.4.1*. The pseudo amplitude (half range) values of the vertical wave bending moment, $M_{wv-v-amp}$, for full load and ballast condition are to be taken as:

$$M_{wv-v-amp} = 0.5(M_{wv-hog} - M_{wv-sag}) \quad \text{kNm}$$

Where:

M_{wv-hog} hogging vertical wave bending moment, in kNm

M_{wv-sag} sagging vertical wave bending moment, in kNm

1.3.5 Horizontal wave bending moment

1.3.5.1 The horizontal wave bending moment is to be calculated based on *Section 7/3.4.2*. The pseudo amplitude (half range) values of the horizontal wave bending moment, $M_{wv-h-amp}$, for full load and ballast condition are to be taken as:

$$M_{wv-h-amp} = 0.5(M_{wv-h-pos} - M_{wv-h-neg}) \quad \text{kNm}$$

Where:

$M_{wv-h-pos}$ positive horizontal wave bending moment, in kNm
 $= M_{wv-h}$

$M_{wv-h-neg}$ negative horizontal wave bending moment, in kNm
 $= -M_{wv-h}$

1.3.6 Dynamic wave pressure

1.3.6.1 The dynamic wave pressure is to be calculated according to *Section 7/3.5.2*.

1.3.6.2 Considering the stretching of the external pressure due to intermittent wet and dry area, a pseudo amplitude of external pressure (half pressure range), P_{ex-amp} , is defined in *Section 7/3.5.2.3* in detail and illustrated in *Figure C.1.1*.

1.3.7 Dynamic tank pressure

1.3.7.1 The dynamic tank pressure amplitude, P_{in-amp} , is to be calculated according to *Section 7/3.5.4.5* and *Section 7/3.5.4.6*. No dynamic internal pressure is considered for the deck.

1.4 Fatigue Damage Calculation

1.4.1 Fatigue strength determination

1.4.1.1 The fatigue assessment of the structure is based on the application of the Palmgren-Miner cumulative damage rule given below. When the cumulative fatigue damage ratio, DM , is greater than 1, the fatigue capability of the structure is not acceptable. DM is to be taken as:

$$DM = \sum_{i=1}^{i=n_{tot}} \frac{n_i}{N_i}$$

Where:

n_i number of cycles of stress range S_i

N_i number of cycles to failure at stress range S_i

n_{tot} total number of stress range blocks

1.4.1.2 Assessment of the fatigue strength of welded structural members includes the following three phases:

- (a) calculation of stress ranges
- (b) selection of the design S-N curve
- (c) calculation of the cumulative damage.

1.4.1.3 The cumulative fatigue damage ratio, DM , is to be less than 1 for the design life of the ship. The design life is not to be less than 25 years. Unless otherwise specified the resultant cumulative damage is to be taken as:

$$DM = \sum_{i=1}^2 DM_i$$

Where:

DM_i cumulative fatigue damage ratio for the applicable loading condition

i = 1 for full load condition
= 2 for normal ballast condition

1.4.1.4 Assuming the long term distribution of stress ranges fit a two-parameter Weibull probability distribution, the cumulative fatigue damage DM_i for each relevant condition is to be taken as:

$$DM_i = \frac{\alpha_i N_L}{K_2} \frac{S_{Ri}^m}{(\ln N_R)^{m/\xi}} \mu_i \Gamma\left(1 + \frac{m}{\xi}\right)$$

Where:

N_L number of cycles for the expected design life. Unless stated otherwise, N_L to be taken as:

$$= \frac{f_0 U}{4 \log L}$$

The value is generally between 0.6×10^8 and 0.8×10^8 cycles for a design life of 25 years

f_0 0.85, factor taking into account non-sailing time for operations such as loading and unloading, repairs, etc.

U design life, in seconds
= 0.788×10^9 for a design life of 25 years

L rule length, in m, as defined in Section 4/1.1.1.1

m S-N curve parameter as defined in 1.4.5.5

K_2 S-N curve parameter as defined in 1.4.5.5

α_i proportion of the ship's life:
 $\alpha_1 = 0.5$ for full load condition
 $\alpha_2 = 0.5$ for ballast condition

S_{Ri} stress range at the representative probability level of 10^{-4} , in N/mm^2

N_R 10 000, number of cycles corresponding to the probability level of 10^{-4}

ξ Weibull probability distribution parameter, as defined in 1.4.1.6

Γ	Gamma function
μ_i	coefficient taking into account the change in slope of the S-N curve
	$\mu_i = 1 - \frac{\left\{ \gamma\left(1 + \frac{m}{\xi}, v_i\right) - v_i^{-\Delta m/\xi} \gamma\left(1 + \frac{m + \Delta m}{\xi}, v_i\right) \right\}}{\Gamma\left(1 + \frac{m}{\xi}\right)}$
v_i	$\left(\frac{S_q}{S_{Ri}}\right)^\xi \ln N_R$
S_q	stress range at the intersection of the two segments of the S-N curve, see <i>Table C.1.6</i> , in N/mm ²
Δm	slope change of the upper-lower segment of the S-N curve =2
$\gamma(a, x)$	incomplete Gamma function, Legendre form

- 1.4.1.5 The probability density function of the long term distribution of stress ranges (hull girder + local bending) is to be represented by a two-parameter Weibull distribution. This assumption enables the use of a closed form equation for calculation of the fatigue life when the two parameters of the Weibull distribution are determined. The probability density function, $f(S)$, is to be taken as:

$$f(S) = \frac{\xi}{f_1} \left(\frac{S}{f_1}\right)^{\xi-1} \exp\left(-\left(\frac{S}{f_1}\right)^\xi\right)$$

Where:

S	stress range, in N/mm ²
ξ	Weibull probability distribution parameter, as defined in 1.4.1.6
f_1	scale parameter $= \frac{S_R}{(\ln N_R)^{1/\xi}}$
N_R	number of cycles corresponding to the probability of exceedance of $1/N_R$
S_R	stress range with probability of exceedance of $1/N_R$, in N/mm ²

- 1.4.1.6 For each structural detail considered, the Weibull shape parameter is to be selected with due consideration given to the load categories contributing to the cyclic stresses. The Weibull probability distribution parameter, ξ , is to be taken as:

$$\xi = f_{Weibull} \left(1.1 - 0.35 \frac{L-100}{300}\right)$$

Where:

L	rule length, in m, as defined in <i>Section 4/1.1.1.1</i>
D	moulded depth, in m, as defined in <i>Section 4/1.1.4.1</i>
$f_{Weibull}$	area dependent modification factor, as given in <i>Table C.1.1</i> and <i>Figure C.1.2</i>

Table C.1.1 Distribution of $f_{Weibull}$ factors	
Plating Area	$f_{Weibull}$ (see note)
Bottom	0.9 at centreline and 0.95 at side
Side and bilge	1.1 at up to draught T_{LC} and 1.0 at deck
Deck	1.0
Inner bottom	1.0
Inner Hull Longitudinal Bulkhead	1.1 up to D/2 and 1.0 at deck
Inner Longitudinal Bulkhead	1.1 up to D/2 and 1.0 at deck
Centreline Longitudinal Bulkhead	1.1 up to D/2 and 1.0 at deck
Note: Intermediate values to be linearly interpolated	

1.4.1.7 The cumulative fatigue damage ratio, DM , may be converted to a calculated fatigue life using the relationship given below. In this format, the calculated fatigue life is to be equal or greater than the design life of the ship.

$$\text{Fatigue life} = \frac{\text{Design life}}{DM} \quad \text{years}$$

1.4.2 Stresses to be used

- 1.4.2.1 The nominal stresses are to be determined taking into account the overall geometric changes of the detail. The effect of stress concentrations due to structural discontinuities, presence of attachments and the weld profile is not considered.

1.4.3 Nominal stress calculation

- 1.4.3.1 This Sub-Section outlines a simplified approach to determine the combination of global and local stress components of the stress response of the ship.
- 1.4.3.2 Stress responses are to be calculated with varying levels of detail. The following approach has been adopted in this simplified procedure:
- (a) the hull girder is treated as a simple beam as a way of obtaining reasonable approximations to the nominal stress level in longitudinal hull girder elements. This is used for the evaluation of hull girder stress levels in way of critical details
 - (b) the structural member with effective attached plating is used in determining the nominal stress response of longitudinal and transverse frames due to dynamic wave pressure and dynamic tank pressure loads. The member end restraints and moments are considered.

1.4.4 Definition of stress components

- 1.4.4.1 Dynamic stress variations are referred to as either *stress range*, S , or *stress amplitude*, σ .
- 1.4.4.2 The global dynamic stress components (primary stresses) considered in fatigue analysis are vertical wave hull girder bending stress, σ_v , and horizontal wave hull girder bending stress, σ_h .
- 1.4.4.3 The local dynamic stress amplitudes considered are defined as the total local stress amplitude due to dynamic wave pressure loads or dynamic tank pressure loads, σ_{e-i} .
- 1.4.4.4 The local stress components are defined as secondary stress resulting from bending of girder systems, σ_2 , stress amplitude produced by bending of stiffeners between girder supports, σ_{2A} , and tertiary stress amplitude produced by bending of unstiffened plate elements between longitudinals and transverse frames, σ_3 . See figure C.1.3.
- 1.4.4.5 The total local stress due to dynamic wave or dynamic tank pressure loads, σ_{e-i} , is to be taken as:

$$\sigma_{e-i} = \sigma_2 + \sigma_{2A} + \sigma_3 \quad \text{N/mm}^2$$

Where:

σ_2	local stress component, in N/mm ² , as defined in 1.4.4.4
σ_{2A}	local stress component, in N/mm ² , as defined in 1.4.4.4
σ_3	local stress component, in N/mm ² , as defined in 1.4.4.4

1.4.4.6 For the calculation of stress components, the vertical wave hull girder stress, σ_v , is given by:

$$\sigma_v = \frac{M_{wv-v-amp}}{Z_{v-net75}} 10^{-3} \quad \text{N/mm}^2$$

Where:

$M_{wv-v-amp}$ pseudo amplitude (half range), in kNm, as defined in 1.3.4

$$Z_{v-net75} = \frac{I_{v-net75}}{|z - z_{NA-net75}|} \quad \text{m}^3 \quad \text{see Section 4/2.6.1}$$

$I_{v-net75}$ net vertical hull girder moment of inertia, of hull cross-section about transverse neutral axis (openings deducted), in m^4

$I_{v-net75}$ is to be calculated based on gross thickness, minus the corrosion addition $0.25t_{corr}$ of all effective structural elements, see Section 4/2.6.1.3

z distance from baseline to the critical location of the considered member, i.e. top of flange of longitudinal stiffener, in m

$z_{NA-net75}$ distance from baseline to horizontal neutral axis consistent with $I_{v-net75}$, in m

1.4.4.7 The corresponding stress range due to vertical wave bending moment, S_v , is to be taken as:

$$S_v = 2\sigma_v \quad \text{N/mm}^2$$

Where:

σ_v vertical wave hull girder stress, in N/mm^2 , as defined in 1.4.4.6

1.4.4.8 The horizontal wave hull girder stress, σ_h , is to be taken as:

$$\sigma_h = \frac{M_{wv-h-amp}}{Z_{h-net75}} 10^{-3} \quad \text{N/mm}^2$$

Where:

$M_{wv-h-amp}$ in kNm, as defined in 1.3.5

$Z_{h-net75} = \frac{I_{h-net75}}{|y|} \quad \text{m}^3 \quad \text{see Section 4/2.6.2}$

y distance from vertical neutral axis of hull cross section to the critical location of the considered member, in m. i.e. top of face plate of longitudinal stiffener

$I_{h-net75}$ net horizontal hull girder moment of inertia, of the hull cross-section about the vertical neutral axis (openings deducted), in m^4 .

$I_{h-net75}$ is to be calculated based on gross thickness, minus the corrosion addition $0.25t_{corr}$ for all effective structural elements

1.4.4.9 The corresponding stress range due to horizontal wave bending moment, S_h , is to be taken as:

$$S_h = 2\sigma_h \quad \text{N/mm}^2$$

Where:

σ_h horizontal wave hull girder stress, in N/mm^2 , as defined in 1.4.4.8

1.4.4.10 The effect of secondary stress σ_2 , as defined in 1.4.4.4, is in general small for double hull tankers and is therefore not taken into consideration.

1.4.4.11 The stress amplitude produced by bending of stiffeners between girder supports (e.g. frames, bulkheads), σ_{2A} , is to be taken as:

$$\sigma_{2A} = K_n K_d \frac{M}{Z_{net50}} 10^3 \quad \text{N/mm}^2$$

Where:

K_n stress factor for unsymmetrical profiles, as defined in 1.4.4.15

K_d stress factor for bending stress in longitudinal stiffeners caused by relative deformation between supports, may be determined by FE analysis of the cargo hold model where the actual relative deformation is taken into account or taken as follows:

1.0 at frame connections

1.15 for all longitudinals at transverse bulkhead connections including wash bulkheads except:

(a) in full load condition:

1.3 for side and bilge longitudinals at mid position between lowest side stringer and deck at side

1.15 for side and bilge longitudinals at lowest side stringer and deck at side

to be linearly interpolated between these two positions

- 1.5 for bottom longitudinals at mid position between longitudinal bulkhead, bottom girders or buttress structure
 - 1.15 for bottom longitudinals at longitudinal bulkhead, bottom girders or buttress structure
- to be linearly interpolated between these two positions

See *Figure C.1.4*

(b) in ballast condition:

- 1.5 for bottom longitudinals in the mid position between longitudinal bulkhead, bottom girders or buttress structure
- 1.15 for bottom longitudinals at longitudinal bulkhead, bottom girders or buttress structure

to be linearly interpolated between these two positions

M moment at stiffener support adjusted to weld toe location at the stiffener (e.g. at bracket toe), in kNm:

$$= \frac{Ps l_{bdg}^2 10^{-3}}{12} r_p$$

s stiffener spacing, in mm

l_{bdg} effective bending span, of longitudinal stiffener, as shown in *Figure C.1.5*, in m. See also *Figure 4.2.1* and *4.2.2* in *Section 4* for soft toe brackets. Top stiffeners with a soft toe are to be treated the same as flat bars with a soft toe bracket. The span point is to be taken at the point where the depth of the end bracket, measured from the face of the member, is equal to half the depth of the member

Z_{net50} section modulus of longitudinal stiffener with associated effective plate flange *b_{eff}*, in cm³, calculated based on gross thickness minus the corrosion addition $0.5t_{corr}$.

b_{eff} as defined in *Section 4/2.3.3*

r_p moment interpolation factor, for interpolation to weld toe location along the stiffener length:

$$= \left| 6 \left(\frac{x}{l_{bdg}} \right)^2 - 6 \left(\frac{x}{l_{bdg}} \right) + 1.0 \right| \quad \text{where} \quad 0 \leq x \leq l_{bdg}$$

p where *x* is the distance to the hot spot, in m. See *Figure C.1.5*. lateral dynamic pressure amplitude at the mid-span between the frame considered and the neighbouring frame, in kN/m². *P_{in-amp}* for dynamic tank pressure, is to be taken as defined in *1.3.7*

P_{ex-amp} for dynamic wave pressure, is to be taken as defined in *1.3.6*

1.4.4.12 The stress range due to external wave or internal tank pressure, S_e or S_i , is to be determined as:

$$S_e = 2\sigma_{2Ae} \quad \text{N/mm}^2$$

$$S_i = 2\sigma_{2Ai} \quad \text{N/mm}^2$$

Where:

σ_{2Ae} stress amplitude, in N/mm², as defined in 1.4.4.11 when P_{ex-amp} is used

σ_{2Ai} stress amplitude, in N/mm², as defined in 1.4.4.11 when P_{in-amp} is used

1.4.4.13 Longitudinal local tertiary plate bending stress amplitude in the weld at the plate, transverse frame or bulkhead intersection, σ_3 , is not relevant to the critical locations being considered and is to be neglected.

1.4.4.14 The effective breadth of plate flanges of stiffeners (longitudinals) in bending (due to the shear lag effect), exposed to uniform lateral load for bending at ends, is defined in Section 4/2.3.3.

1.4.4.15 The stress concentration factors at the flange of un-symmetrical stiffeners on laterally loaded panels, K_{n1} and K_{n2} , as shown in Figure C.1.6, are to be taken as:

$$K_{n1} = \frac{1 + \lambda\beta}{1 + \lambda\beta^2\psi_z} \quad \text{at the flange edge}$$

$$K_{n2} = \frac{1 + \lambda\beta^2}{1 + \lambda\beta^2\psi_z} \quad \text{at the web}$$

K_{n2} is typically used in the fatigue analysis of longitudinal end connections

Where:

$$\beta = 1 - \frac{2b_g}{b_f} \quad \text{for built-up profiles}$$

$$1 - \frac{t_{w-net50}}{b_f} \quad \text{for rolled angle profiles}$$

b_g breadth of flange from web centreline, in mm, see Figure C.1.7

$t_{w-net50}$ net web thickness, in mm

d_w depth of stiffener web, see Figure C.1.7, in mm

λ factor, as defined in 1.4.4.17

ψ_z ratio between section modulus of the stiffener web with plate flange, as calculated at the flange and the section modulus of the complete panel stiffener

$$\frac{d_w^2 t_{w-net50}}{4Z_{net50} 10^3} \text{ may be used as an approximate value}$$

Z_{net50} section modulus of stiffener including the full width of the attached plate, s , with respect to a neutral axis normal to the stiffener web, in cm³. It is to be calculated based on the gross thickness minus the corrosion addition $0.5t_{corr}$

- $t_{w-net50}$ net web thickness, in mm
- $t_{p-net50}$ net plate thickness, in mm
- s plate width between stiffeners, in mm

Table C.1.2 HP Equivalent Built-up Profile Dimensions				
HP- bulb		Equivalent built-up flange		
Height (mm)	Web thickness t_w (mm)	b_f (mm)	t_f (mm)	b_g (mm)
200	9 – 13	$t_w + 24.5$	22.9	$(t_w + 0.9)/2$
220	9 – 13	$t_w + 27.6$	25.4	$(t_w + 1.0)/2$
240	10 – 14	$t_w + 30.3$	28.0	$(t_w + 1.1)/2$
260	10 – 14	$t_w + 33.0$	30.6	$(t_w + 1.3)/2$
280	10 – 14	$t_w + 35.4$	33.3	$(t_w + 1.4)/2$
300	11 – 16	$t_w + 38.4$	35.9	$(t_w + 1.5)/2$
320	11 – 16	$t_w + 41.0$	38.5	$(t_w + 1.6)/2$
340	12 – 17	$t_w + 43.3$	41.3	$(t_w + 1.7)/2$
370	13 – 19	$t_w + 47.5$	45.2	$(t_w + 1.9)/2$
400	14 – 19	$t_w + 51.7$	49.1	$(t_w + 2.1)/2$
430	15 – 21	$t_w + 55.8$	53.1	$(t_w + 2.3)/2$

- 1.4.4.18 For each loading condition, combined local stress components due to simultaneous dynamic tank and dynamic wave pressure loads are to be combined with global stress components induced by hull girder wave bending.

1.4.4.19 Total combined stress range, S , is given by:

$$S = f_{SN} \left| f_1 S_v + f_2 S_h + f_3 S_e + f_4 S_i \right| \quad \text{N/mm}^2$$

Where:

f_1, f_2, f_3 and f_4 stress range combination factors, representing the phase correlation between total stress range and each stress range component which is between 1.0 and -1.0, as defined in *Tables C.1.3 to C.1.5*. Where the factor is greater than 1.0 it is to be taken as 1.0. Where the factor is less than -1.0 it is to be taken as -1.0

f_{SN} 1.06, factor to account for joints in combined protected and unprotected environment.

S_v corresponding stress range due to vertical bending moment, in N/mm², as defined in 1.4.4.7

S_h corresponding stress range due to horizontal bending moment, in N/mm², as defined in 1.4.4.9

S_e stress range due to external wave or internal tank pressure, in N/mm², as defined in 1.4.4.12

S_i stress range due to external wave or internal tank pressure, in N/mm², as defined in 1.4.4.12

1.4.4.20 The stress range combination factors, f_1, f_2, f_3 and f_4 , which are to be applied to the following zones, are given in *Tables C.1.2 to C.1.4*:

- (a) Zone M: Midship region. This zone extends over the full length of all tanks where the tank LCG lies between 0.35L and 0.8L from AP.
- (b) Zone A: Aft region. This zone starts at the middle of the tank immediately aft of Zone M and extends aftwards to include all the aftmost tanks.
- (c) Zone F: Forward region. This zone starts at the middle of the tank immediately forward of Zone M and extends forwards to include all the foremost tanks.
- (d) Zone AT: Aft transition region between Zone M and Zone A. The stress range combination factors are to be calculated by linear interpolation between the stress range combination factors for Zones M and A.
- (e) Zone FT: Forward transition region between Zone M and Zone F. The stress range combination factors are to be calculated by linear interpolation between the stress range combination factors for Zones M and F.

Note

Where ballast tanks, centre and wing cargo tanks do not have the same lengths e.g. if slop tank is present, the middle position is to be taken at the middle of the longer tank.

Table C.1.3 Stress Range Combination Factors for Zone M							
	Stiffener location		f_1	f_2	f_3	f_4	f_i
